## Preface to the Revised Edition

In the twenty-five years of its existence, the *Harvard Dictionary of Music* has become a standard book of music literature. Contrary to my assumption—stated in the initial sentence of the original Preface—that it was “predestined to be read without leisure and to be consulted (somewhat like a dentist) in the case of an emergency only,” many people have read it extensively, and not a few from cover to cover.

The interest aroused by the book has been reflected by the extraordinarily great number of comments made by colleagues, students, professional musicians, and amateurs, who have expressed approval or disapproval, indicated mistakes, questioned statements, or suggested emendations of various kinds. Moreover, a large amount of research published in books and periodicals has been taken into consideration. All this material has been incorporated in the Second Edition. In addition, the editorial staff of the Harvard University Press has eliminated a great many errors.

In the years since the original publication of this dictionary, the field of musicology has grown enormously, so that it has become virtually impossible for a single individual to be conversant with all the specialized branches of the field. This new and greatly enlarged edition of the dictionary includes the efforts of many persons who gave generously of their time and talents to contribute new articles and revise old ones. Many are eminent scholars, as a glance at the list of contributors will reveal. In numerous instances, contributors assisted with the preparation of articles other than their own. Without the painstaking research and careful checking of all those involved, this edition would be considerably less complete and less accurate.

Since the publications consulted in preparing this revision number in the thousands, it is impossible to cite them in detail. For spellings of composers' names and dates of birth and death, I have relied largely on *Baker's Biographical Dictionary of Musicians*, Fifth Edition, except in the article Editions, for which the sources themselves were followed exactly. Some of the illustrations of instruments are based on N. Bessaraboff's *Ancient European Musical Instruments*, for which grateful acknowledgment is made to the Harvard University Press.

In addition to those whose names appear as contributors, I am especially grateful to the following for their valuable assistance in the preparation of

## PREFACE

the Second Edition; Luciano Berio, Juilliard School of Music; David Burrows, New York University; Hans Busch and Ralph T. Daniel, Indiana University; Phyllis A. Cooper, Cambridge, Massachusetts; Alice P. Davison, Lincoln, Massachusetts; Hans Eppstein, Stocksund, Sweden; Paul Hooreman, Lausanne, Switzerland; David G. Hughes, Nino Pirrotta, and John M. Ward, Harvard University; Janet Knapp, Brown University; R. B. Lenaerts, Louvain, Belgium; Mary Lou Little, Loeb Music Library, Harvard University; Caroline Lockwood Busch, Bloomington, Indiana; William S. Newman, University of North Carolina; Mary Rasmussen, Durham, New Hampshire; David Stone, Temple University; James Reginald Wilson, Rutgers University; illustrator Carmela Ciampa; research editor Camilla H. Conley; and researchers Henry Gibbons, James Hinchliff, Kathleen Kohl, Keith Larsen, Joel Lazar, Beth Petrow, Margaret Radin, Carl Schmidt, Elizabeth Kady Schmidt, and Paul van Sickle.

Willi Apel

Bloomington, Indiana

*Note to the Sixth Printing:* It is hardly possible that a publication consisting of specific and detailed information on several thousands of subjects and terms should be free of errors. The *Harvard Dictionary of Music*, Second Edition, is no exception to this rule. In the present printing, many—I would not dare say all—of these errors have been corrected.

W.A.

## Contributors

- A.B. André Boucourechliev, Paris (Aleatory music; Atonality; Electronic music; Expressionism; *Musique concrète*).
- A.E. Alfred Einstein, Smith College (Madrigal comedy).
- A.G. Anne Gombosi, All-Newton Music School, West Newton, Mass. (rev. Switzerland).
- A.T.D. Archibald T. Davison, Harvard University (Glee; Hymn, English; Psalter).
- A.T.M. A. Tillman Merritt, Harvard University (Harmonic analysis).
- A.W. Allen Winold, Indiana University (Music therapy).
- B.J.O. Barbara J. Owen, Organ Historical Society (Fuge tune; Organ XII; *Rückpositif*; rev. Tremulant; add. to Vocabulary; *Zymbelstern*).
- B.N. Bruno Nettl, University of Illinois (rev. American Indian music I).
- B.S. Bence Szabolcsi, Bartók Archivium, Budapest (Hungary).
- C.B.F. Charles B. Fisk, Gloucester, Mass. (Organ and related articles).
- C.G.R. Clare G. Rayner, California State College, Long Beach (add. to Dictionaries).
- C.T. Caldwell Titcomb, Brandeis University (rev. Orchestration, various percussion instruments).
- D.D. Dorothea Doig, Athens, Greece (Tests and measurements in music).
- D.J.G. Donald J. Grout, Cornell University (Ballet in opera; Comic opera; Opera and related articles).
- D.M. David Morton, University of California, Los Angeles (Thailand).
- D.P.McA. David P. McAllester, Wesleyan University (American Indian music II).
- D.S. Donald Sur, Seoul, Korea (Korea).
- E.A.L. Edward A. Lippman, Columbia University (Sociology of music).
- E.B.H. Everett B. Helm, *Musical America* (Degrees; Profession of music; Scholarships; Societies).
- E.C.G. Eunice Crocker Gilmore, Wellesley Hills, Mass. (Canzona).
- E.C.K. Ernst C. Krohn, Webster Groves, Mo. (Dulcimer 2).
- E.M.R. Edwin M. Ripin, Forest Hills, N.Y. (Clavichord; Electronic instruments; rev. Piano).
- E.R. Eduard Reeser, Instituut voor Muziekwetenschap, Utrecht (rev. Netherlands).

## CONTRIBUTORS

- E.S. Ezra Sims, Cambridge, Mass. (Microtone and related articles).
- E.V. Edith Vogl, Brookline, Mass. (Czechoslovakia).
- E.W.F. Edward W. Flint, Lincoln, Mass. (Organ I–XI).
- E.Z. Ella Zonis, University of Chicago. (Persia).
- F.A.K. Fritz A. Kuttner, New York, N.Y. (Strobocoenn).
- F.B.Z. Franklin B. Zimmerman, University of Pennsylvania (rev. England, Ireland, and related articles).
- F.H. Frank Hubbard, Waltham, Mass. (Harpsichord; Pedal harpsichord; Spinnet 1).
- F.N. Frederick Neumann, University of Richmond (*Inégales*).
- F.W.S. Frederick W. Sternfeld, Oxford University (Film music).
- G.C. Grosvenor Cooper, University of Chicago (Accent 1; rev. Meter, Rhythm, and related articles).
- G.W.W. G. Wallace Woodworth, Harvard University (Music appreciation; Symphony).
- H.C.S. H. Colin Slim, University of California, Irvine (rev. Ricercar).
- H.G.M. Henry G. Mishkin, Amherst College (Academy).
- H-J.H. Hans-Jörgen Holman, Andrews University (Norway).
- H.K. Helmut Kallmann, Canadian Broadcasting Corporation (Canada).
- H.L. Hugo Leichtentritt, Harvard University (Music criticism).
- H.N. Hugo Norden, Boston University (Bowing).
- H.P. Henri Pousseur, Malmédy, Belgium (Period; Serial music).
- I.B. Ingrid Brainard, West Newton, Mass. (rev. Ballet; Dance music and related articles).
- I.H. Isobel Henderson, Oxford University (Greece I–III; Pyknon).
- J.F. John Ferris, Memorial Church, Harvard University (Organ I–XI).
- J.F.O. John F. Ohl, Northwestern University (Recorder).
- J.H. John Horton, Brentwood, Essex, England (rev. Denmark, Finland, Sweden).
- J.LAR. Jan La Rue, New York University (Computer; Plate numbers; Style analysis).
- J.M. José Maceda, University of the Philippines (Philippines).
- J.O-S. Juan Orrego-Salas, Indiana University (Latin American music articles).
- J.R.W. John Reeves White, Pro Musica Antiqua, New York, N.Y. (Aleatory music; *Klangfarbenmelodie*; rev. Music criticism).
- J.S. Joel Sheveloff, Boston University (Mazurka; rev. Poland).
- J.T.H. John Tasker Howard (Negro music; American Indian music I).
- J.W. James Walker, Harvard University (Band; Brass band; Military music; Symphonic band).

- J.W.W. John Wesley Work, Fisk University (add. to Negro music; Jazz and related articles).
- K.L. Kenneth Levy, Princeton University (rev. Russia I).
- K.N. Kalman Novak, South End Music Center, Boston (rev. Sight-reading).
- L.B.S. Lincoln B. Spiess, Washington University (Tune book).
- L.E. The Rev. Leonard Ellinwood, Washington, D.C. (Anglican chant; Anglican church music and related articles).
- L.G. Lawrence Gushee, University of Wisconsin (rev. Tonus, Trope 1, 3).
- L.G.R. Leonard G. Ratner, Stanford University (Development).
- L.H. Lloyd Hibberd, West Texas State University (Blues; Dictionaries).
- L.H.M. Lawrence H. Moe, University of California, Berkeley (Passamezzo, Romanesca, and related dances).
- M.H. Mantle Hood, University of California, Los Angeles (Bali; Ethnomusicology; Java).
- M.K. Masakata Kanazawa, Tokyo (Japan and related articles).
- M.V. Milos Velimirović, Yale University (Bulgaria; Gusle; Yugoslavia).
- N.P. Norman Phelps, Ohio State University (Theory).
- N.S. Nicolas Slonimsky, University of California, Los Angeles (Russia II).
- O.A. Olga Averino, Longy School of Music, Cambridge, Mass. (rev. Voice).
- O.W. Owen Wright, University of London (Arab music).
- P.A. Putnam Aldrich, Stanford University (Ornamentation and related articles).
- P.L.M. Philip Lieson Miller, New York Public Library (Phonograph).
- R.A. Ross Allen, Indiana University (Radio and television broadcasting).
- R.A.R. Robert A. Rosevear, University of Toronto (Music education).
- R.B. Rose Brandel, Hunter College of the City University of New York (Africa).
- R.C.P. Rulan C. Pian, Harvard University (China and related articles).
- S.B. Steven Barwick, Southern Illinois University at Carbondale (rev. Spain and related articles).
- S.K. Sylvia Kenney, Smith College (rev. Descant; Discant).
- T.J.Y. T. J. Young, Wellington, New Zealand (Australia II).
- T.V.K. Trân Van Khê, Centre National de Recherche Scientifique, Paris (Vietnam).
- V.H.D. Vincent H. Duckles, University of California, Berkeley (rev. Libraries).
- V.P.D. Vernon Perdue Davis, Courtland, Virginia (Liturgical books III; Response; Suffrages).

## CONTRIBUTORS

- V.Y. Victor Yellin, New York University (United States).  
V.Z. Victor Zuckerkandl, St. John's College, Annapolis (Schenker system).  
W.C. William Christ, Indiana University (add. to Degrees).  
W.D.D. William D. Denny, University of California, Berkeley (Böhm system;  
Orchestration; various instruments).  
W.H.C. William H. Cavness, WGBH, Boston (rev. Radio and television  
broadcasting).  
W.K. Walter Kaufmann, Indiana University (India).  
W.P. Walter Piston, Harvard University (Harmonic rhythm).

# Abbreviations

Abbreviations used in this dictionary are grouped in the following sections below: Periodicals; Books; Collective Publications; Signs and Symbols.

## Periodicals

Reference is usually made by annual volume numbers (i, ii, iii), if a list of contents is given with the volume. Otherwise, copy or page numbers are added. Special methods of reference (e.g., when volume numbering is inconsistently used) are indicated below. When the title of an article is essentially identical with that of the subject under consideration, this title is usually omitted. "Editions" refers to the article on Editions, historical, in the body of the book.

- AM* *Acta musicologica*, 1928–; the first two volumes were published as *Mitteilungen der internationalen Gesellschaft für Musikwissenschaft*.
- AMF* *Archiv für Musikforschung*, 1936–43.
- AMW* *Archiv für Musikwissenschaft*, 1918–27; 1952–.
- AnM* *Anuario musical*, 1946–.
- AnnM* *Annales musicologiques*, 1953–.
- BAMS* *Bulletin of the American Musicological Society*, 1936–48.
- BJ* *Bach Jahrbuch*, 1904–.
- BSIM* Abbreviation for a monthly publication that appeared from 1905 to 1914 under five different titles, as follows: i–iii, *Le Mercure musical*; iv–v, *Bulletin français de la Société internationale de musique*; vi–vii, *S.I.M. revue musicale mensuelle*; viii–ix, *Revue musicale S.I.M.*; x, *La Revue musicale S.I.M.* See also *RMC*.
- BUM* *Bulletin de la société "Union musicologique"*, 1921–26.
- DM* *Die Musik*, 1901–15 in 24 copies per year, numbered i.1–i.24 to xiv.1–xiv.24; 1922–42 in 12 copies per year, numbered xv.1–xv.12, etc.
- GSJ* *The Galpin Society Journal*, 1948–.
- JAMS* *Journal of the American Musicological Society*, 1948–.
- JMP* *Jahrbücher der Musikbibliothek Peters*, 1894–1940.
- JMT* *Journal of Music Theory*, 1957–.
- JMW* *Jahrbücher für musikalische Wissenschaft*, 2 vols., 1863, 1867.
- KJ* *Kirchenmusikalisches Jahrbuch*, 1886–1938, 1950–; preceded by *Cäcilien Kalender*, 1876–85.
- LRM* *La Rassegna musicale*, 1928–.
- MA* *The Musical Antiquary*, 1909–13.
- MD* *Musica disciplina*, 1948–; the first volume was published as *Journal of Renaissance and Baroque Music*, 1946–47.
- MF* *Die Musikforschung*, 1948–.
- MfM* *Monatshefte für Musik-Geschichte*, 1869–1905.
- ML* *Music and Letters*, 1920–.
- MM* *Modern Music*, 1924–46.
- MQ* *The Musical Quarterly*, 1915–.
- MR* *The Music Review*, 1940–.
- Notes* *Notes for the Music Library Association*, Series One, nos. 1–15, July 1934–December 1942; Second Series i, 1, December 1943.

## ABBREVIATIONS

- PAMS** *Papers Read by Members of the American Musicological Society*, 1936–41; this periodical appeared under various similar titles.
- PMA** *Proceedings of the [Royal] Musical Association*, 1874–; the designation *Royal* was added beginning with vol. lxxi.
- RBM** *Revue belge de musicologie*, 1946–.
- RCG** *Revue du chant grégorien*, 1892–1939.
- RdM** *Revue de musicologie*, 1922–; preceded by *Bulletin de la Société française de musicologie*, 1917–21. Three volumes (1942–44) appeared under the title *Société française de musicologie, rapports et communications*. References are made by year and page. The volume numbering is inconsistent.
- RG** *Revue grégorienne*, 1911–; there was an English language edition for the years 1954–58.
- RM** *La Revue musicale*, 1920–. References are made to year (1920, etc.) and number.
- RMC** *La Revue musicale*, ed. J. Combarieu, 1901–10; the first volume was called *Revue d'histoire et de critique musicales*; in 1911 it was merged with *BSIM*.
- RMI** *Rivista musicale italiana*, 1894–1955.
- SIM** *Sammelbände der internationalen Musikgesellschaft*, 1899–1914.
- SJ** *Schweizerisches Jahrbuch für Musikwissenschaft*, 1924–38.
- StM** *Studien zur Musikwissenschaft* (Beihefte der *Denkmäler der Tonkunst in Österreich*), 1913–34, 1955–.
- TG** *La Tribune de Saint-Gervais*, 1895–1929.
- TV** *Tijdschrift der Vereeniging voor Noord-nederlands Muziekgeschiedenis*, 1882–. Vols. xviiff entitled *Tijdschrift voor Muziekwetenschap*.
- VMW** *Vierteljahrsschrift für Musikwissenschaft*, 1885–94.
- ZIM** *Zeitschrift der internationalen Musikgesellschaft*, 1899–1914.
- ZMW** *Zeitschrift für Musikwissenschaft*, 1918–35.

## Books

- AdHM** G. Adler, *Handbuch der Musikgeschichte*, 2 vols., 1930.
- ApGC** W. Apel, *Gregorian Chant*, 1958.
- ApMZ** W. Apel, *Musik aus früherer Zeit für Klavier*, 2 vols., 1934.
- ApNPM** W. Apel, *The Notation of Polyphonic Music 900–1600*, 5th ed., 1961.
- AR** *Antiphonale sacrosanctae Romanae ecclesiae*, 1949 (no. 820A, edition in neumatic signs).
- BeMMR** H. Besseler, *Die Musik des Mittelalters und der Renaissance*, 1931 (part of *BüHM*).
- BG** Bach-Gesellschaft, *Johann Sebastian Bachs Werke*, 46 vols., (1851–1900).
- BüHM** E. Bücken, ed., *Handbuch der Musikwissenschaft*, 13 vols., 1927–31.
- BuMBE** M. F. Bukofzer, *Music in the Baroque Era*, 1947.
- BWV** W. Schmieder, ed., *Bach-Werke-Verzeichnis*, 1950–61.
- CS** C.-E.-H. de Coussemaker, *Scriptorum de musica medii aevi novam seriem a Gerbertina alteram collegit nuncque primum edidit E. de Coussemaker*, 4 vols., 1864–76; fac. ed., 1931, 1963.
- DdT** *Denkmäler deutscher Tonkunst*, 65 vols., 1892–1931 (see Editions XIII).
- DTB** *Denkmäler der Tonkunst in Bayern*, 36 vols., 1900–31 (see Editions XIV).
- DTO** *Denkmäler der Tonkunst in Österreich*, 115 vols., 1894– (see Editions XV).
- EiBM** A. Einstein, *Beispielsammlung zur Musikgeschichte*, 1930 (incorporated in his *A Short History of Music*, 2nd ed., 1938).
- GD** G. Grove, *Grove's Dictionary of Music and Musicians*, 4th ed. (H. C. Colles), 5 vols., 1940.
- GDB** G. Grove, *Grove's Dictionary of Music and Musicians*, 5th ed. (E. Blom), 9 vols., 1954.

- GéHM* T. Gérold, *Histoire de la musique des origines à la fin du XIV<sup>e</sup> siècle*, 1963.
- GR* *Graduale sacrosanctae Romanum ecclesiae*, 1961 (no. 696, edition in neumatic signs).
- GrHWM* D. J. Grout, *A History of Western Music*, 1960.
- GS* M. Gerbert, *Scriptores ecclesiastici de musica sacra potissimum*, 3 vols., 1784; fac. ed., 1931, 1963.
- HAM* *Historical Anthology of Music*, ed. A. T. Davison and W. Apel, 2 vols., rev. ed., 1949, 1950.
- LavE* A. Lavignac, *Encyclopédie de la musique*, 1913–31; *Histoire*: i.1–5; *Technique*: ii.1–6.
- LBCM* P. Lang and N. Broder, ed., *Contemporary Music in Europe*, 1965 (also in *MQ* li).
- LU* *Liber usualis missae et officii*, 1961 (no. 801, edition in neumatic signs).
- MaMI* S. Marcuse, *Musical Instruments: A Comprehensive Dictionary*, 1964.
- MGG* *Die Musik in Geschichte und Gegenwart*, ed. F. Blume, 13 vols. to date, 1949–.
- NBA* *Neue Ausgabe Sämtlicher Werke* [J. S. Bach], 1954; 8 ser. (projected c. 84 vols.); each vol. has a summary (Kritischer Bericht) in a separate vol.
- NOH* *New Oxford History of Music*, vols. i–iii, 1954–60.
- OH* *The Oxford History of Music*, vols. i–vi, 1901–05; mainly vol. i.
- ReMMA* G. Reese, *Music in the Middle Ages*, 1940.
- ReMR* G. Reese, *Music in the Renaissance*, rev. ed., 1959.
- RiHM* H. Riemann, *Handbuch der Musikgeschichte*, 5 vols., 1904–13.
- RiMB* H. Riemann, ed., *Musikgeschichte in Beispielen*, 1912.
- RISM* *Répertoire international des sources musicales*, 1960–.

- SaRM* C. Sachs, *Real-Lexikon der Musikinstrumente*, 1913.
- SchGMB* A. Schering, ed., *Geschichte der Musik in Beispielen*, 1931.
- SSR* O. Strunk, ed., *Source Readings in Music History from Classical Antiquity through the Romantic Era*, 1952.
- TaAM* G. Tagliapietra, ed., *Antologia di musica . . . per pianoforte*, 18 vols., 1931–32.
- WoGM* J. Wolf, *Geschichte der Mensural-Notation von 1250–1460*, 3 vols., 1904.
- WoHN* J. Wolf, *Handbuch der Notationskunde*, 2 vols., 1913–19.

### Collective Publications

The abbreviation *CP* is used for the following collective publications (reports of congresses, and *Festschriften*):

- CP 1900* *Congrès international d'histoire de la musique tenu à Paris . . . 1900* (1901).
- CP 1906* *Bericht über den zweiten Kongress der internationalen Musikgesellschaft zu Basel . . . 1906* (1907).
- CP 1909* *Haydn-Zentenarfeier: III. Kongress der internationalen Musikgesellschaft, Wien . . . 1909* (1909).
- CP 1911* *Report of the Fourth Congress of the International Musical Society, London . . . 1911* (1912).
- CP 1924* *Bericht über den musikwissenschaftlichen Kongress in Basel . . . 1924* (1925).
- CP 1925* *Bericht über den I. musikwissenschaftlichen Kongress der deutschen Musikgesellschaft in Leipzig . . . 1925* (1926).
- CP 1927* *Beethoven-Zentenarfeier Wien . . . 1927: Internationaler musikhistorischer Kongress* (1927).
- CP 1930* *Société internationale de musicologie, premier congrès, Liège 1930* (1931).
- CP 1939* *Papers Read at the International Congress of Musicology . . . New York . . . 1939* (1944).

## ABBREVIATIONS

- CP 1949 *Société internationale de musicologie, quatrième congrès, Bâle . . . 1949* (n.d.).
- CP 1950 *Atti del congresso internazionale di musica sacra . . . Roma . . . 1950* (1952).
- CP 1950a *Kongress-Bericht Gesellschaft für Musikforschung Lüneburg 1950* (n.d.).
- CP 1952 *Société internationale de musicologie, cinquième congrès, Utrecht . . . 1952* (1953).
- CP 1953 *Bericht über den internationalen musikwissenschaftlichen Kongress Bamberg 1953* (1954).
- CP 1955 *Les Colloques de Wégimont: II-1955: L'Ars nova* (1959).
- CP 1956 *Bericht über den internationalen musikwissenschaftlichen Kongress Wien Mozartjahr 1956* (1958).
- CP 1956a *Bericht über den internationalen musikwissenschaftlichen Kongress Hamburg 1956* (1957).
- CP 1958 *Bericht über den siebenten internationalen musikwissenschaftlichen Kongress Köln 1958* (1959).
- CP 1961 *International Musicological Society: Report of the Eighth Congress New York 1961*, vol. i (1961).
- CP 1962 *Bericht über den internationalen musikwissenschaftlichen Kongress Kassel 1962* (1963).
- CP Abert *Gedenkschrift für Hermann Abert* (1928).
- CP Adler *Studien zur Musikgeschichte: Festschrift für Guido Adler* (1930).
- CP Anglés *Miscelánea en homenaje a Monseñor Higinio Anglés*, 2 vols. (1958, '61).
- CP Apel *Essays in Musicology: A Birthday Present for Willi Apel* (1967).
- CP Bartók *Studia memoriae Belae Bartók sacra* (1956).
- CP Besseler *Festschrift Heinrich Besseler zum sechzigsten Geburtstag* (1961).
- CP Blume *Friedrich Blume Festschrift* (1963).
- CP Borren *Hommage à Charles van den Borren* (1945).
- CP Borren, 1964 *Liber amicorum Charles van den Borren* (1964).
- CP Closson *Mélanges Ernest Closson* (1948).
- CP Davison *Essays on Music in Honor of Archibald Thompson Davison* (1957).
- CP Fellerer *Festschrift Karl Gustav Fellerer zum sechzigsten Geburtstag* (1962).
- CP Kretzschmar *Festschrift Hermann Kretzschmar* (1918).
- CP Kroyer *Theodor Kroyer-Festschrift* (1933).
- CP Laurencie *Mélanges de musicologie offerts à M. Lionel de la Laurencie* (1933).
- CP Liliencron *Festschrift . . . Rochus Freiherrn von Liliencron* (1910).
- CP Masson *Mélanges . . . offerts à Paul-Marie Masson*, 2 vols. (1955).
- CP Nef *Festschrift Karl Nef* (1933).
- CP Orel *Festschrift Alfred Orel* (1960).
- CP Osthoff *Festschrift Helmuth Osthoff zum 65. Geburtstage* (1961).
- CP Reese *Aspects of Medieval and Renaissance Music: A Birthday Offering to Gustave Reese* (1966).
- CP Riemann *Riemann-Festschrift* (1909).
- CP Sachs *The Commonwealth of Music in Honor of Curt Sachs* (1965).
- CP Sandberger *Festschrift . . . Adolf Sandberger* (1918).
- CP Schering *Festschrift Arnold Schering* (1937).
- CP Scheurleer *Gedenkboek aangeboden an Dr. D. F. Scheurleer* (1925).
- CP Schmidt-Görg *Festschrift Joseph Schmidt-Görg* (1957).
- CP Schneider *Festschrift Max Schneider zum 60. Geburtstag* (1935).
- CP Schneider, 1955 *Festschrift Max Schneider zum achtzigsten Geburtstage* (1955).
- CP Seiffert *Musik und Bild: Festschrift Max Seiffert* (1938).
- CP Waesberghe *Organicae Voces: Festschrift Joseph Smits van Waesberghe* (1963).
- CP Wagner *Festschrift Peter Wagner* (1926).
- CP Wolf *Musikwissenschaftliche Beiträge: Festschrift für Johannes Wolf* (1929).

## Signs and Symbols

For the method employed to indicate octaves, see under Pitch names.

\* indicates that this subject is covered in a separate article (whose exact title sometimes differs slightly from the starred word, e.g., \* Greek music is covered under Greece, \* intermezzi under Intermezzo, etc.)

‡ indicates publication consisting mainly or exclusively of music

## A

**A.** (1) See Pitch names; Letter notation; Hexachord; Pitch. (2) On the title page of \*partbooks of the 16th century *A* stands for *altus*. In liturgical books it stands for antiphon. (3) *A*; *à* [It.; F.], to, at, with; e.g., \**a piacere*; *a 2*, *a 3 voci*, etc.

**Ab** [G.]. Off, with reference to organ stops or mutes.

**Abandonné** [F.], **con abbandono** [It.]. Unrestrained, free.

**A battuta** [It.]. See *Battuta*.

**Abbellimenti** [It.]. Embellishments, \*ornaments.

**Abbreviations.** The most important abbreviations used in musical notation are indicated in the accompanying illustration.

The illustration shows ten examples of musical notation abbreviations, labeled 'a' through 'k'.  
**a**: A treble clef staff with a series of eighth notes.  
**b**: A treble clef staff with a series of eighth notes, some with flags.  
**c**: A treble clef staff with a series of eighth notes.  
**d**: A treble clef staff with a series of eighth notes.  
**e**: A treble clef staff with a series of eighth notes.  
**f**: A treble clef staff with a series of eighth notes, labeled '(pianoforte)'.  
**g**: A treble clef staff with a series of eighth notes, labeled '(violin)'.  
**h**: A treble clef staff with a series of eighth notes.  
**i**: A treble clef staff with a series of eighth notes, labeled 'segue'.  
**j**: A treble clef staff with a series of eighth notes.  
**k**: A treble clef staff with a series of eighth notes, labeled 'con 8<sup>va</sup>'. Below the staff, it says 'con 8<sup>va</sup> bassa'.

Abbreviations

**Abdämpfen** [G.]. To mute, especially kettle-drums.

**Abduction from the Seraglio.** See *Entführung aus dem Serail*, *Die*.

**Abegg Variations.** R. Schumann's Variations for piano op. 1, dedicated to his friend Meta Abegg. The first five notes of the theme, a<sup>b</sup> b<sup>b</sup> e<sup>g</sup> g<sup>g</sup>, read, in German pitch names, A-B-E-G-G.

**Abendmusik** [G.]. Evening musical performances, usually of a religious or contemplative nature. The term applies particularly to the famous concerts started in 1673 by Dietrich Buxtehude in the Marienkirche of Lübeck in North Germany. These took place annually on the five Sundays before Christmas, following the afternoon service, and consisted of organ music and concerted pieces of sacred music for orchestra and chorus [see *DdT* 14]. They continued until 1810. In 1705 J. S. Bach walked 200 miles from Arnstadt to Lübeck to hear the *Abendmusik*.

Lit.: C. Stiehl, *Die Organisten an der St. Marienkirche und die Abendmusiken zu Lübeck* (1885); W. Stahl, *Die Lübecker Abendmusiken* (1937); W. Maxton, in *ZMW* x.

**A bene placito** [It.]. Same as \**a piacere*.

**Abgesang** [G.]. See *Bar* form.

**Abnehmend** [G.]. Diminuendo.

**Abschieds-Symphonie** [G., Farewell Symphony]. Popular name for Haydn's Symphony no. 45 in F-sharp minor, composed in 1772. It refers to the last movement, whose closing section is so designed that the players can leave one by one, the last measures being played by only two violins. This charming jest was meant to inform the Prince of Esterháza, whom Haydn served as a conductor, of the orchestra's desire to leave his summer palace in the country and return to Vienna.

**Abschnitt** [G.]. Section.

**Absetzen** [G.]. (1) To separate, either notes [*détaché*; see *Bowing* (b)] or phrases. (2) In 16th-

century terminology, *absetzen in die Tabulatur* means to transcribe (vocal music) into \*tablature.

**Absolute music.** Music that is free from extra-musical implications. The term is used most frequently in contradistinction to \*program music, in which pictorial or poetic ideas are portrayed. It usually excludes vocal music, especially the type in which the text clearly influences the musical language and structure (e.g., a song by Schubert). Occasionally the term is employed in a stricter sense, excluding not only program and vocal music but also music of a definite emotional character (romantic music), so that Bach and, to some extent, Mozart are considered composers of absolute music.

**Absolute pitch** [G. *absolute Tonhöhe*]. Properly, "the position of a tone in reference to the whole range of pitch . . . , conceived as independently determined by its rate of vibration" (Webster). Usually, however, the term is used for what might more accurately be called "absolute judgment of (absolute) pitch," i.e., the capacity of a person to identify a musical sound immediately by name, without reference to a previously sounded note of different pitch [see Relative pitch]. This faculty, called in German *absolutes Gehör*, is a tonal memory that is sometimes innate but can also be acquired by training, as recent experiments have shown. The faculty, whether innate or acquired, is found chiefly in persons possessing some degree of musical experience or aptitude but can by no means be considered a yardstick of musical talent. Many instrumentalists have absolute pitch (probably acquired through years of training), but among outstanding composers and performers it is probably as often lacking as not. While Mozart had an extremely acute sense of absolute pitch, Wagner and Schumann are reputed to have lacked it.

Absolute pitch is in various respects a valuable asset to a musician, particularly to a conductor, but it may prove a real inconvenience when music must be transposed in performance to another key, as often happens in vocal music to accommodate the range of the singer. Whether it is an advantage or a disadvantage to hear a composition "all wrong" simply because it is a half-tone higher or lower is indeed questionable. All the discussions about the "true pitch" of Beethoven's C-minor Symphony, for example, are entirely pointless unless the standard pitch of Beethoven's day is taken into account. Since

standard pitch has gradually changed (greatly in the case of Bach), usually to become higher, it could be said that, from the standpoint of absolute pitch, all present-day performances of music written prior to the general acceptance of the modern concert pitch [see Pitch (2)] are "wrong." If a musician with absolute pitch who lived one hundred years ago were alive today, he would be horrified to hear Beethoven's Fifth Symphony played in what would be to him C-sharp minor.

Wellek, *Das absolute Gehör und seine Typen* (1938), bibl.; C. E. Seashore, *The Measurement of Musical Memory* (1917); O. Abraham, in *SIM* iii, viii; F. Auerbach, in *SIM* viii; H. Riemann, in *ZIM* xiii; J. Kobelt, in *AMW* ii, bibl.; G. Révész, "Über die beiden Arten des absoluten Gehörs" (*ZIM* xiv); N. Slonimsky, in *American Mercury* xxi; W. K. Sumner, "A History of Musical Pitch" (*Hinrichsen's Musical Year Book* vii); E. B. Hartman, "The Influence of Practice . . . on the Absolute Identification of Pitch" (*The American Journal of Psychology* lxvii).

**Absonia** [L.]. See under *Musica ficta* II.

**Abstossen** [G.]. (1) In violin playing, same as *abgestossen*, i.e., *détaché* [see Bowing (b)]. (2) In organ playing, to take off a stop [see *Ab*].

**Abstract music.** Same as \*absolute music.

**Abstrich** [G.]. Down-bow.

**Abzug** [G.]. \*Scordatura. Also, older term for \*appoggiatura.

**Academic Festival Overture.** See *Akademische Festouvertüre*.

**Academy.** A term used for scholarly or artistic societies and musical organizations of various types. The rediscovery, in the late 15th century, of Greek antiquity and Greek literature led to the foundation in 1470 of an Accademia di Platone at the court of Lorenzo de' Medici in Florence, in direct imitation of Plato's Academy. In the 16th century a number of academies were established in France, among them Baïf's Académie de Poésie et Musique (1567), which played a role in the development of the \**vers mesurés*. With the beginning of the 17th century, the movement spread enormously in Italy; every place of some repute had its *accademia*, and larger cities had numbers of them. They were of

two types: (a) Learned societies founded for the promotion of science, literature, and the arts, part of whose activity was the encouragement and cultivation of music. The most famous of these was the A. dei Arcadi of Rome (founded 1692), which included among its members the musicians Marcello, Corelli, A. Scarlatti, and Gluck. Handel attended many meetings but as a foreigner was not eligible for membership. Other institutions of the same type existed in Florence: A. della Crusca (1588), A. dei Filarmonici; in Bologna: A. dei Gelati (1588), A. dei Concordi (1615), A. dei Filomusi (1622); in Venice: A. Pellegrina (1550), A. degli Olimpici; in Verona: A. Filarmonica (1543), probably the earliest musical academy; and elsewhere. (b) Organizations of professional and amateur musicians whose sole purpose was the cultivation of music. The activities of these groups were varied; they gave public and private concerts, carried on research in the history of music and in the science of sound, founded music schools, and even launched operatic enterprises. The most important of these was the A. dei Filarmonici of Bologna, founded in 1666 by Count Vincenzo Carrati, which included among its members such distinguished figures as Bassani (c. 1657–1716), Corelli (1653–1713), Torelli (1658–1709), Domenico Gabrielli (c. 1650–90), Padre Martini (1706–84), Mozart (1756–91), Rossini (1792–1868), and Busoni (1866–1924).

Today there are many similar institutions (some no longer using the name “academy”), which can be divided into three categories: (a) Learned associations, part of whose activity is the promotion of musical studies. They usually have a membership limited to those of demonstrable ability, hold periodic discussions and proceedings that often are published, and generally offer honors, medals, or prizes for achievement in composition or research. Many of these are state-supported: Paris, Institut de France, division Académie des Beaux Arts; Berlin, Akademie der Künste; Brussels, Académie Royale; others in Stockholm and Moscow. (b) Organizations for the presentation of operas and concerts: Paris, Théâtre national de l’Opéra (formerly Académie nationale de Musique); London, Royal Academy of Music and Academy of Ancient Music; Munich, Akademie der Tonkunst; New York, Metropolitan Opera Association (formerly the Academy of Music); Brooklyn, Academy of Music (founded 1861), etc. [see Opera houses]. (c) Institutions of musical education: London, Royal Academy of

Music; Berlin, Staatliche Akademie für Kirchen- und Schulmusik; Munich, Königliche Akademie der Tonkunst (founded 1846); Philadelphia, Academy of Music (1870); New York, Academy of Allied Arts (School of Music, 1928). For a medieval institution of a similar nature, see *Puy*. See also Societies.

H.G.M. and W.A.

**Acalanto** [Port.]. A Brazilian cradle song, also known as *cantigas de ninar*. These have developed within a great variety of folk traditions, including some originating in northeastern Indian cultures that still retain pure Portuguese influences.

J.O.S.

**A cappella** [It.]. Designation for choral music without instrumental accompaniment. Originally the name referred to unaccompanied church music like that written by Palestrina. Today it is used for all unaccompanied choral music, whether sacred or secular. Historians of the 19th century believed that all “early music”—i.e., music before 1600—was *a cappella*. Recent investigations, however, have clearly shown that instruments played a prominent role in the performance of medieval music, at least as an *ad libitum* addition to or substitution for one voice-part or another [see Performance practice]. Probably it was not until 1450 (motets and Masses of Ockeghem) that purely choral performance became generally accepted and universally practiced in the field of sacred music. Often the term *a cappella* has the connotation of a specific style, namely that of Palestrina.

Lit.: J. Handschin, “Die Grundlagen des a cappella-Stils,” in *Hans Häusermann und der Häusermannsche Privatchor* (1929), p. 109; T. Kroyer, “Acappella [sic] oder Conserto?” (*CP Kretzschmar*); *id.*, in *AMW* ii; *id.*, in *AM* vi.

**Acathistus**. \*Akathistos.

**Accacciatura**. Erroneous spelling for *\*acciaccatura*.

**Accelerando** [It.]. Becoming faster.

**Accent** (1) Emphasis on one note or chord. In this sense, the term is equivocal, because the emphasis may be physically discernible, or it may lie solely in the way the listener perceives musical movement. Physically, a note or chord may be louder than its surroundings (dynamic accent), or it may be higher (\*tonic accent), or of longer duration (\*agogic accent). See Ex. 1. On the other hand, since the listener perceives music as sound in motion, an upbeat (or a more extended anacrusis) is felt as leading somewhere, and the note or chord to which it leads is thus emphasized (accented) in the mind, even if the goal of motion should be softer, lower, or shorter than its surroundings; in like manner, a feminine rhythm is perceived as an accent followed by a movement away from it.

In measure-music [see Measure], both physical and mental accents normally fall on the downbeat, with secondary accents occurring in the middle of the measure in compound meters, e.g., on the third beat in 4/4 time. Frequently, however, irregular accents are found on weak beats [see Syncopation]. Irregular dynamic accent is usually indicated by signs such as *sf*, >, —. Ex. 2 (Mozart, Symphony in G minor no. 40) shows an irregular dynamic accent that is at the same time tonic and agogic. The emphasis on the weak beat is often enhanced by means of striking dissonances, as in Ex. 3. The tonic accent has played a role in the discussions on Gregorian chant and other types of medieval monophonic music.

See G. W. Cooper and L. B. Meyer, *The Rhythmic Structure of Music* [1960], *passim*; V. d'Indy, *Cours de composition musicale*, 2 vols. in 3 pts. [1902?–10], vol. i, pp. 29–46.

(2) [F.]. In French music of the 17th and 18th centuries, an ornament belonging to the class

of \*Nachschläge. In Bach's table of ornaments (*Klavierbüchlein für Wilhelm Friedemann Bach*), a long appoggiatura.

(3) Signs used in ancient Greek writing to indicate a change of pitch of the voice in recitation: *accentus acutus* ^, for a rise; *a. gravis* ` , for a lowering; *a. circumflexus* ^ , for an inflection (rise, followed by lowering) of the voice. These signs are now thought to be the origin of the (accent) neumes [see Neumes II] and certain other related systems of notation, called \*ecphonic notation.

(4) The notational signs used in Jewish chant [see Jewish music II]. (1) by G.C.

**Accentualists.** See under Gregorian chant VI.

**Accentuation.** The proper placement of accents, especially in music set to a text. See Text and music.

**Accentus, concentus.** Terms introduced (?) by Ornithoparchus (in his *Musicae activae micrologus*, 1517) for two opposite types of plainsong: the simple recitations, such as lesson tones, psalm tones (*accentus*); and the chants having distinctive melodic contours, such as antiphons, responsories, hymns, Mass chants, etc. (*concentus*). The terms also imply a distinction between two kinds of performer: the *accentus* is sung by the priest; the *concentus* by the trained musicians (*schola*, with soloists and choir). See P. Wagner, *Einführung in die Gregorianischen Melodien*, iii (1921), 4.

**Acciaccatura.** Italian name for an ornament of keyboard (harpsichord) music (c. 1675–1725) that calls for the playing, together with the normal note, of its neighboring tone (usually the lower second), which is to be released immediately “as if the key were hot” (Geminiani). This ornament usually occurs in connection with chords, the chords often including two and occasionally even three *acciaccatura* tones. The tones are written as ordinary notes, so that the chord takes on the appearance of an extremely dissonant \*tone cluster [Ex. 1]. Such formations occur in several compositions by A. Scarlatti [\*Editions X, 13, p. 90] and figure prominently in a sonata by D. Scarlatti [Ex. 2; see HAM, no. 274]. A simpler example occurs in the Scherzo of Bach's Partita no. 3 [Ex. 3]. The French counterpart is the *arpègement figuré*, in which the dissonant tone (usually only one) is indicated by a diagonal dash, and which, as the name implies, is performed as an arpeggio [Ex. 4]. A sonata by Blasco de Nebra (c. 1750–84) contains similar

forms, in which, however, the dissonant note is obviously intended to be held [Ex. 5; see *HAM*, no. 308].

For an erroneous usage, common in modern writings, of the term *acciaccatura* (often misspelled *accacciatura*), see *Appoggiatura* III.

**Accidentals.** I. *General.* The signs used in musical notation to indicate chromatic alterations or to cancel them. The alterations valid for the entire composition are contained in the \*key signature, while the term “accidentals” refers specifically to those alterations introduced for single notes. The signs for chromatic alteration, together with their names in English, French, German, Italian, and Spanish, are given in the following table:

	#	b	✕
E.	sharp	flat	double sharp
F.	dièse	bémol	double dièse
G.	Kreuz	Be	Doppelkreuz
It.	diesis	bemolle	doppio diesis
Sp.	sostenido	bemol	doble sostenido

	bb	q
E.	double flat	natural
F.	double bémol	bécarre
G.	Doppel-Be	Auflösungszeichen, Quadrat
It.	doppio bemolle	bequadro
Sp.	doble bemol	becuadro

The sharp raises the pitch one semitone, the flat lowers it one semitone; the double sharp and double flat raise and lower two semitones respectively; the natural cancels any of the other signs. The use of the compound signs  $\sharp\sharp$ ,  $\flat\flat$ ,  $\sharp\flat$  to cancel partly or entirely a previous  $\sharp$  or  $\flat$  is quite common but unnecessary. The simple

signs #, b, ♭ answer the purpose [Ex. 1]. In modern practice a sign affects the note immediately following and is valid for all the notes of the same pitch (but not in different octaves) within the same measure. Modern composers frequently add bracketed accidentals to those demanded by this rule in order to clarify complicated passages or chords.

II. *History.* All the signs used for chromatic alteration developed from the same sign, namely, the letter b, which indicates the whole tone above a. The fact that in the diatonic scale no perfect fourth above f is available necessitated, as early as the 10th century, the introduction of another b, a semitone lower than the diatonic b [see Hexachord]. These two b's were distinguished by their shape, the higher one being written in a square form and called *b quadratum* (also *b durum*; L. *durus*, hard, angular), the lower in a rounded form and called *b rotundum* (also *b molle*; L. *mollis*, soft, round). It is from these designations that the German names *Dur* and *Moll* for major and minor mode are derived.

$\sqcap = b$  quadratum  
 $\circ = b$  rotundum

When in the ensuing period the introduction of other chromatic tones became necessary, the square b (*b durum*) and its later modifications (b, #) were used to indicate the higher of two semitones, and the rounded b (*b molle*) or b the lower one. Thus, in early music, bf is not f natural but f-sharp; likewise, bf is not f-flat, but f (in contradistinction to a previous f-sharp; see Ex. 2, from Frescobaldi's *Canzone*, 1628). Bach

continued to use the sign  $b$  for the cancellation of a previous  $f\sharp$ . In Germany, during the 15th century, the square  $b$  for *b durum* was erroneously interpreted as the letter  $h$ , to which it bears some visual resemblance. Hence, in German terminology  $h$  denotes the  $b$  natural, and  $b$  the  $b$ -flat.

In the printed books of the 16th century the sharp sign usually occurs in a diagonal position. The double sharp (used as early as 1615 in G. M. Trabaci's *Il Secondo Libro de ricercare*) originally appeared as a sharp with doubled lines, in either a straight or a diagonal position. The present sign is a simplification of the latter.

Early shapes	✱	Sharp
	##	Double sharp
	✱	Double sharp

In music prior to 1700 (probably even later) an accidental is not valid for the entire measure but only for the next note and immediate repetitions of the same note [see Ex. 3]. This practice

was still observed by Bach, as seen in Ex. 3, reproduced from his autograph of the *Fantasia super Komm heiliger Geist* (fac. ed. by P. Wackernagel, 1950; alto of meas. 6). Note that Bach did not write a flat for the E at the beginning of meas. 7, although it is separated from the preceding E-flat by a bar line.

For the problem of accidentals in music of the 13th to 16th centuries, see *Musica ficta*. See F. Niecks, "The Flat, Sharp, and Natural" (*PMA* xvi).

**Acclamation.** A type of Byzantine poetry and music that served as a salutation for the emperor (also the empress and the Patriarch) in the ceremonial of the Byzantine court of the 9th and 10th centuries. The acclamations are practically the only type of nonliturgical Byzantine music known today. Acclamations are still used in Russia and the Balkans for welcoming high church dignitaries. Those beginning with the traditional phrase "Many be the years" were called *polychronia*. [See the examples in *ReMMA*, p. 77, and in *MQ* xxiii, 207.]

Lit.: *AdHM* i, 128; E. Wellesz, *A History of Byzantine Music and Hymnography*, rev. ed. (1961), *passim*; H. Tillyard, in *Annual of the British School of Athens* xviii.

**Accolade** [F.]. \*Brace.

**Accompagnato** [It.]. See *Recitative II* (c).

**Accompaniment.** I. The musical background provided for a principal part. For instance, in piano music the left hand often plays chords that are an accompaniment for the melody played by the right hand. Similarly, a solo singer or instrumentalist may be accompanied by a pianist or an orchestra. The auxiliary role of the accompaniment frequently leads to underestimation, by the soloist as well as the audience, of its musical and artistic importance. Vocalists especially are inclined to demand undue subordination of their accompanists, condemning them to complete slavery in questions of interpretation, tempo, dynamics, etc.

The modern church organist, as well as the leader of a choir, is frequently confronted with the problem of providing suitable accompaniment, either improvised or written out, for the singing of the congregation or the chorus. Following are a number of books on this subject: J. F. Bridge, *Organ Accompaniment of the Choral Service* [1885]; D. Buck, *Illustrations in Choir Accompaniment* (1877); W. Hickin, *Pianoforte Accompaniment* (1923); A. H. Lindo, *The Art of Accompanying* (1916); C. W. Pearce, *The Organist's Directory to the Accompaniment of Divine Service* (1908); A. M. Richardson, *Modern Organ Accompaniment* (1907); E. Evans, *How to Accompany at the Piano* [1917]; J. R. Tobin, *How to Improvise Piano Accompaniments* (1956). See also *Vamp*.

In Roman Catholic services Gregorian chant, although properly monophonic, is usually considered to need organ accompaniment, frequently in the style of 19th-century harmony. Attempts have been made to replace this style with modal harmonies, e.g., H. Potiron, *Practical Instruction in Plainsong Accompaniment* (1949); J. H. Arnold, *Plainsong Accompaniment* [1927]; E. Evans, *The Modal Accompaniment of Plain Chant* [1911] or with even more archaic idioms, such as \*quartal harmonies or parallel organum [see Bernard Jones, *An Ambrosian Mass* (1962)].

II. There are many references to instrumental accompaniment of songs in the Bible (accompaniment on some stringed instrument is suggested by the term "Neginoth" in the heading of Ps. 6 in the King James Version; see also Pss. 91 [92] and 143 [144]) and in the writings of the ancient Greeks. Pictorial reproductions and literary documents of the Middle Ages show the use of harps, fiddles, bells, small drums, trumpets, etc., in connection with the monophonic songs of the troubadours and minnesingers, and in conjunction with dance music. In neither

ancient nor medieval music was this improvised type of accompaniment ever of a harmonic nature; it was merely a unison (or octave) doubling of the voice-part, with occasional heterophonic elements [see Heterophony]. The same type of accompaniment is to be found in the East, especially China, India, and Arabia. While the texture of polyphonic music of the 9th to 13th centuries (organa, motets) does not permit its separation into parts of greater or less importance, such separation does occur in the French secular compositions of the 14th and early 15th centuries (*ballades*, *virelais* by G. de Machaut and his successors [see *Ars nova*]; *chansons* of Dufay and his contemporaries [see Burgundian school]). It disappears again with the rise of Flemish sacred music and Flemish counterpoint (Ockeghem, Obrecht), which are essentially opposed to any distinction between principal and auxiliary parts. The instrumental doubling of vocal parts that was occasionally practiced in this period can scarcely be considered an accompaniment. In the 16th century the renewed emphasis on the secular immediately led to a revival of accompanied melody, e.g., in the lute songs of the German Schlick (1512), of the Spanish Valderrabano (1547), and of the English Dowland (1597).

III. A new era of accompaniment began with the period of thoroughbass (baroque period, 1600–1750), which called for a harmonic accompaniment to be improvised upon the notes of the bass. Moreover, the growing interest in florid and singable melody brought about a gradually increasing separation of the musical substance into a predominant melody with subordinate accompaniment (e.g., in the aria). While throughout the baroque period the written-out accompaniment (and consequently also the improvised one) shows many traits of contrapuntal and harmonic interest, it degenerated in the second half of the 18th century into a stereotyped pattern of plain chords, arpeggios, \*Alberti-bass figures, etc. As a curiosity it may be mentioned that, about 1760, sonatas were frequently written for the “pianoforte with the accompaniment of a violin or flute” (Mondonville, 1734, see Editions XLIX, 9; Schobert, see *DdT* 34; Edelmann, see *HAM*, no. 304), that is, with the violin or flute merely duplicating the upper part of the piano. Thus Samuel Wesley speaks of J. S. Bach’s violin sonatas as “six sonatas for harpsichord with an obbligato violin accompaniment.”

IV. About 1780 Haydn and Mozart evolved a new type of accompaniment known as accom-

*panimento obbligato*, characterized by a greater individuality of the lower parts, by the occasional introduction of fugal elements, by the occasional shift of the melody from the higher part into a lower part, etc. This style is particularly evident in the quartets written in this period. Because of these efforts Beethoven was able to say of himself: “Ich bin mit einem obligaten Accompaniment auf die Welt gekommen” (I was born with an *obbligato* accompaniment). What Haydn and Mozart did in the field of instrumental music, Schubert achieved in the field of song, freeing the piano accompaniment from the slavery of mere chord-filling and making it an independent (sometimes the most interesting) part of the composition. Composers such as Schumann, Brahms, and H. Wolf adopted his method, whereas others (e.g., Tchaikovsky) rarely went beyond a chordal accompaniment in lush harmonies of rather ephemeral interest. Other composers (Mahler, Strauss) have repeatedly used the whole orchestra as an instrumental background for a solo singer.

V. The extraordinary growth of accompanied melody in the songs of the 19th century had a deplorable effect upon the minds of musical scholars and editors engaged in the study and publication of early monophonic music (Greek music, exotic melodies, Gregorian chant, the songs of the *trouvères*, *minnesingers*, etc.). Numerous volumes have been published in which the melodies of the pre-Christian era or the Middle Ages are coupled with cheap accompaniments in the style of Schumann, Brahms, or Debussy. Even well-known scholars have not withstood this temptation [see O. Fleischer, *Reste der altgriechischen Tonkunst* (1899) or J. Ribera’s edition of the \**cantigas*]. For literature on the 17th-century accompaniment see Thoroughbass. See also Additional accompaniment.

**Accord** [F.]. (1) Chord. (2) Manner of tuning, especially of such instruments as the lute, for which various systems of tuning were in use during the 17th century [see *WoHN* ii, 91; *ApNPM*, p. 71f]. See *Scordatura*.

**Accordare** [It.], **accorder** [F.]. To tune.

**Accordatura** [It.]. See **Accord** (2).

**Accordion**. A portable musical instrument consisting of two rectangular headboards connected by a folding bellows. Inside the headboards are metal tongues that act as free-beating reeds. The instrument has pushed-out and drawn-in reeds,

the former sounding when the headboards are moved outward (expiration), the latter when they are moved inward (inspiration). The modern accordion has a keyboard on the right side for playing melody notes, while buttons on the left side operate bass notes and full chords. See *ill.* under Wind instruments. The earliest instruments of this type were made by Buschmann (1822), Buffet (1827), and Damian (1829).

A similar instrument, preferred in England, is the concertina, invented by Wheatstone in 1829. It is hexagonal in shape and has a number of studs on each side. It possesses a full chromatic scale and produces the same note whether the bellows are pressed or drawn. Artistically, this instrument is superior to the accordion and has occasionally been used in the orchestra (Tchaikovsky, *Orchestral Suite* op. 53). Much solo music has been written for it by such virtuosos as G. Regondi, W. B. Molique, G. A. Macfarren, and E. Silas. The *bandoneon* is an Argentine variety of accordion with buttons on each side, for single tones only.

**Accordo** [It.]. Chord.

**Accusé** [F.]. With emphasis.

**Achromatic.** \*Diatonic.

**Achtel, Achtelnote; Achtelpause** [G.]. Eighth note; eighth rest. See Notes.

**Achtfuss** [G.]. Eight-foot (stop). See Foot (2).

**Acis and Galatea.** A dramatic cantata composed by Handel (about 1720) for the Duke of Chandos. Originally designated as masque, pastorale (pastoral play), or *\*serenata*, it was intended to be sung in costume but without action. Based on the Greek legend, the work includes some selections for a chorus, which plays the role of commentator as does the chorus in ancient Greek drama.

**Acoustic bass** (also called resultant bass). On organs, a 32-foot stop that is obtained as a differential tone of a 16-foot stop and a 10 $\frac{2}{3}$ -foot stop. According to the acoustic phenomenon of the differential tones [see Combination tones], the simultaneous sounding of C (produced by the 16-foot) and of G (produced by the 10 $\frac{2}{3}$ -foot) produces the tone C<sub>1</sub> (32-foot). The acoustic bass is frequently used where the great expense of the large 32-foot pipes is prohibitive.

**Acoustics.** The science that treats of sounds and therefore describes the physical basis of music. For the musician the most important problems

of acoustics are: (1) the nature of musical sound; (2) intervals; (3) consonance and dissonance; (4) resonance; (5) architectural acoustics. Only the first subject will be treated here; for the others, see the respective entries. [For the method of indicating the different octaves, see Pitch names II.]

I. *Vibration.* The generation of sound is invariably bound up with the vibration of an elastic body, i.e., a body that, when displaced from its normal position, develops internal forces that tend to restore the body to its original position. (The body may be a solid, like a violin string, or a gas, like the air in an organ pipe.) When the body has returned to its rest position, it is still moving and its momentum carries it past its rest position so that a new contrary displacement results. This leads to a repetition of the whole movement in the reverse direction and, in fact, to a succession of movements back and forth that would continue indefinitely were it not for friction, which causes the successive displacements to diminish and finally to stop. A tongue of steel fastened at one end may serve as an example [Ex. 1].

The movement A-B-A (or A-C-A or B-A-C) is called a "single vibration" (half vibration); the movement A-B-A-C-A (or B-A-C-A-B) is called a "double vibration" or simply a "vibration" or "cycle" (in modern writings usually the double vibration is used as the unit of measure). The distance A-C [Ex. 1] is called the *amplitude*. The number of double vibrations or cycles made in one second is called the *frequency*.

Ex. 2 represents a vibration of three cycles per second. In order to understand the relation of this graph to the vibration it is meant to represent, one may imagine the lowest point of the tongue, A, to be made luminous and then photographed. If during the exposure the film is moved rapidly downward, the picture will show a wavy curve [Ex. 3] of the same shape as that of Ex. 2.

If the same tongue is plucked with different degrees of force, the initial displacements will be different. Then the vibrations will have different amplitudes and the sounds heard by the ear will have different loudnesses [see Bel]; *the greater the amplitude of the vibration, the louder the sound*. As the amplitude diminishes [Ex. 4] the sound fades away.

If the photographic experiment described above is repeated with a shorter tongue, the vibrations will be more rapid—of higher frequency—so that (if the speed of the moving film is the same) the waves of the curve will be closer

3.

4.

5.

6.

1. Elastic tongue fixed at O; A, rest position; B, position after initial displacement; C, position after first half-cycle of vibration. 2. Vibration of three cycles per second;  $a$  = amplitude;  $l$  = one wavelength, i.e., a distance corresponding to one cycle. 3. Photograph of tip of vibrating tongue on moving film. 4. Fading sound: reduction in amplitude without change in frequency. 5. Vibration of six cycles per second. 6. Vibrating string; A, B, fastened ends of string; C, point of plucking.

together [Ex. 5] and the pitch of the corresponding sound will be higher. In fact, *the pitch of a sound depends only on the frequency of the vibration that produces it.*

A sound of sufficient loudness is audible if its frequency is between approximately 16 and 20,000 cycles per second; the tones of the piano vary from about 30 to 4,000, those of the violin from about 200 to 3,000 cycles per second. The frequency of middle  $a$  ( $a'$ ) at concert pitch is 440 cycles per second.

In the italicized statement above, the word *only* is of particular importance. As every musician knows, the pitch of a vibrating string is not altered by altering the force with which the string is set into vibration. In other words, the pitch does not depend upon the amplitude. The piano player obtains a tone of the same pitch regardless of whether he uses a pianissimo or fortissimo touch. Similarly, the pitch of a sound does not change as the loudness decreases and the sound dies away.

II. *Vibrating strings.* If a violin string is plucked or bowed, each single point of the string will make a back-and-forth vibration comparable to that made by the lowest point of the steel tongue previously described. All these vibrations have the same frequency but differ in amplitude. For the purpose of our explanation, we can fix our attention on the point of the string that has the largest amplitude, i.e., the point at which the string is plucked. If this is the middle point of the string, the resulting phenomenon can be roughly illustrated by Ex. 6.

III. *Frequency, vibrating length, and pitch.* The pitch of the sound produced by a vibrating string depends upon its weight per unit length (i.e., its material and its diameter), its tension, and its length. For the present purpose it is sufficient to consider only the last factor, the others being regarded as constant. These conditions are realized in the case of a single string whose vibrating length can be changed by stopping (violin) or by means of a movable bridge (\*monochord). The following fundamental law results: *The frequency of vibration of a string is inversely proportional to the vibrating length.* This means that if a string one yard long gives a sound of the frequency 600 cycles per second, a string one-half yard long gives a sound of the frequency 1200 cycles per second, while a string two-thirds of a yard long produces a frequency of  $600 \times \frac{3}{2} = 900$  cycles per second, and so on. The results have a more general application, however, if they are expressed in terms of fre-

quency rather than in terms of vibrating lengths. Thus expressed, they remain unchanged regardless of whether the sound is produced by a vibrating string or by a vibrating air column in a pipe, and they do not depend upon additional factors, such as the tension, thickness, or material of the string.

The fundamental principle is: *If the frequency of a tone is  $n$ , that of its octave is  $2n$ , that of the fifth is  $\frac{3}{2}n$ , and that of the major third is  $\frac{4}{3}n$ .* From these tones, all the others of the diatonic scale can be derived [see Intervals, calculation of, II]. The result is as follows:

	c	d	e	f	g	a	b	c'
Frequency ( $n = 1$ ):	1	$\frac{9}{8}$	$\frac{5}{4}$	$\frac{4}{3}$	$\frac{3}{2}$	$\frac{5}{3}$	$\frac{15}{8}$	2
Frequency ( $n = 24$ ):	24	27	30	32	36	40	45	48
Vibrating length:	1	$\frac{8}{9}$	$\frac{4}{5}$	$\frac{3}{4}$	$\frac{2}{3}$	$\frac{3}{5}$	$\frac{8}{15}$	$\frac{1}{2}$

The illustration [Ex. 7] shows a number of frequencies calculated for the tone  $f' = 360$  (the correct frequency for  $f'$  is 352). It must be noted that these frequencies give the tones of \*just intonation, not of equal temperament [see Temperament].

IV. *Harmonics, overtones.* A string or other elastic body vibrating in the manner described above would produce what is called a pure tone, consisting of a single frequency. However, practically no vibrating body produces a pure tone. All musical instruments produce composite tones, consisting of many pure tones, called

harmonics, produced simultaneously. The harmonic of lowest frequency is called the fundamental, and because it is louder than the others it determines the pitch of the composite tone. The frequencies of the other harmonics are exact multiples of the frequency of the fundamental; thus if the frequency of the fundamental is  $n$ , the other harmonics have frequencies of  $2n, 3n, \dots, 20n$  or more. The illustration [Ex. 8] shows the first 16 harmonics of the tone C.

The harmonics above the fundamental are also called overtones. If the terms are properly used, the first overtone is the second harmonic, the second overtone is the third harmonic, and so on. Another term for the harmonics is partial tones, or partials. Although the terms harmonics and partials are frequently used as if interchangeable, the latter term has, in scientific studies, a wider significance, since it also includes nonharmonic overtones like those that occur in bells and in the complex sounds called noises. With the exception of the octaves (2, 4, 8), no harmonics are tones of equal temperament. Those that result from the factors 3 and 5 (3, 5, 6, 9, 10, 12, etc.) are tones of just intonation (see the table of frequencies above), whereas the harmonics 7, 11, 13, and 14 (indicated by black notes) can be only approximately identified with tones available in our system of tuning and notation. As can easily be seen, the 7th harmonic, which is  $7 = \frac{63}{9}$ , is lower than the b-flat of just intonation, which is  $\frac{15}{8} \times 4 = \frac{15}{2}$ ; this, in turn, is slightly lower than the b-flat of equal temperament (the three tones form intervals, from c, of 969, 996, and 1000 \*cents respectively). Similarly, the 11th harmonic, which is  $11 = \frac{44}{4}$ , is lower than the f-sharp of just intonation ( $\frac{15}{8} \times \frac{3}{2} = \frac{45}{4}$ ) and, in fact, is as close to the f as to the f-sharp of equal temperament ( $f = 500$ , 11th harmonic = 551, f-sharp = 600 cents). Finally, the 13th harmonic is  $13 = \frac{39}{3}$ , whereas the a of just intonation is  $\frac{5}{4} \times 8 = \frac{10}{1}$ . Thus the 13th harmonic is actually closer to the g-sharp than to the a of equal temperament (g-sharp = 800, 13th harmonic = 840, a = 900 cents).

The physical cause of the harmonics is that a vibrating body, such as a string, vibrates simultaneously as a whole and in sections of one-half, one-third, one-fourth, etc., of its entire length [Ex. 9]. The secondary vibrations, however, have a much smaller amplitude, approximately one-fifth to one-fiftieth of that of the fundamental, and the tones they produce are correspondingly less loud. Points on the string, such as the fixed ends, where the displacement is always zero, are called nodes; points midway between adjacent nodes, where the amplitude of vibration is greatest, are called antinodes or loops. The distance from one node to the next is one-half wavelength [cf. Ex. 2].

The existence of these additional tones in what the ear believes to be a single sound was shown first by Helmholtz (1821-94), who used \*resonators of various sizes that reinforce one frequency and eliminate all the others. The harmonics can be easily demonstrated by the following simple experiment on the piano: depress the key for C without producing the sound, i.e., merely raise the damper of the string for C; then strike forcibly the key for  $C_1$  and release it at once; the higher C, corresponding to the tone of the depressed key, will be clearly heard. The experiment can be repeated by depressing the keys for G, c, e, g, etc., and striking each time the key for  $C_1$ . In every case, the tone corresponding to the depressed key will be heard. The explanation of this phenomenon is that the harmonics C, G, c, . . . produced by the fundamental tone  $C_1$  generate, by way of resonance, sympathetic vibrations in the shorter strings corresponding to these tones.

The harmonics are the cause of three important musical phenomena, namely, \*timbre, the natural tones of \*wind instruments, and the \*harmonics of the violin.

V. *Pipes.* In pipes (organ pipes, and all wind instruments) an enclosed air column is caused to vibrate. The molecules of air vibrate (in directions parallel to the length of the pipe) in such a way that the density of the air at any point in the pipe changes regularly from a highest to a lowest value and back again. In an open pipe (i.e., one open at both ends) the changes in density of the air are greatest; these points correspond to antinodes. Between them is a place where the density does not change; this is a node (N). The wavelength of the fundamental tone of an open pipe is therefore twice the length of the pipe ( $\lambda = 2AB$ ). In a stopped pipe (i.e., closed at one end and open at the other) there is a loop (L) at the open end and a node (N) at the closed end. The wavelength of the fundamental is therefore four times the length of the pipe ( $\lambda = 4AB$ ). Since wavelength is inversely proportional to frequency, the open pipe has a fundamental an octave above that of a closed pipe of the same length. An open pipe sounding C measures approximately eight feet [see Foot (2)].

Like a vibrating string, an air column vibrates not only as a whole but also in parts ( $\frac{1}{2}$ ,  $\frac{1}{3}$ ,  $\frac{1}{4}$ ,  $\frac{1}{5}$ , etc., of its length), thus producing harmonics. While an open pipe produces all the harmonics (as does a string), a stopped pipe segments so as to give out only the odd-numbered harmonics, 1, 3, 5, etc. The reason is that an even harmonic (e.g., 2) would call for an antinode at both ends of the pipe, while in a stopped pipe there must

always be a node at the closed end [see Wind instruments III; Organ IX].

**VI. Interference.** This is the technical term (not a very apt one) for the numerous phenomena resulting from the superposition of two or more air vibrations. The general principles of this very complex phenomenon can be grasped from the drawing [Ex. A], showing two original vibrations (I, II) of the same frequency as well as one possible result of their superposition (III = I + II). More important is the interference of vibrations of different frequencies, e.g., of 2 and 3 cycles per second, or of 12 and 14 cycles per second [Ex. B]. The example illustrates the manner in which \*beats are produced, in the present case 2 (14 – 12) per second. For a more complicated phenomenon of interference, see Combination tone.

Daugherty, *A Bibliography of Periodical Literature in Musicology* (1940), pp. 117ff.

**Action.** Any kind of mechanism used in instruments as a means of transmitting the motion of the fingers (or feet) to the sound-producing parts; in other words, a sort of artificial extension of the fingers (or feet). On keyboard instruments, the action forms an essential, even the characteristic, part of the instrument [see Piano I; Organ II]. The term is applied to the key mechanism of woodwind instruments, which enables the player to control holes that are beyond the hand's reach (e.g., the \*Böhm system for the flute). The action of the harp is the mechanism, controlled by the player's feet upon the pedals, by which a transposition of a semitone or a whole tone can be effected [see Harp].

**Act tune.** See Entr'acte.

**Actus tragicus** [L.]. An early cantata (no. 106) by Bach, composed in Weimar (1708–17) for an occasion of mourning. The German title is *Gottes Zeit ist die allerbeste Zeit* (God's Time Is Best).

**Adagietto** [It.]. (1) A tempo somewhat faster than adagio. (2) A short composition in slow speed.

**Adagio** [It.]. (1) Designation for slow tempo, between andante and largo. See Tempo marks. (2) A composition in slow tempo, especially the second (slow) movement of a sonata, symphony, etc.

**Adagissimo.** Extremely slow.

**Adaptation.** \*Arrangement.

**Added sixth.** The sixth added to a triad, or the entire chord thus obtained; e.g., c–e–g–a. In classical harmony, the chord of the added sixth occurs preferably on the fourth degree, i.e., with a subdominant function (f–a–c'–d' in C major; also f–a<sup>b</sup>–c'–d'). It is usually explained as the first inversion of the seventh chord on the second degree (d–f–a–c'). Although according to strict rules the chord must be resolved into the dominant or the tonic, it is used in some works (\*im-

pressionism) as a color modification of the triad that does not call for resolution. Jazz musicians have abundantly availed themselves of this cloying effect, especially for the final chord of a piece.

**Additional accompaniment.** Designation for 19th-century revisions or enlargements of earlier orchestral scores, especially of the 17th and 18th centuries. With the ever increasing size of the 19th-century orchestra and concert hall, the need was felt for expanded instrumentation; but with the ever diminishing understanding of true baroque style, many stylistic incongruities were perpetrated. Thus, not only were admissible and sometimes necessary changes made (replacement of obsolete instruments by newer ones, doubling of certain parts, etc.), but the voice leading was changed, the writing was "improved," new parts were added, and in many instances the original intention of the composer was thoroughly misunderstood or disregarded. The composers whose works were most frequently subjected to arrangement were Handel and Bach. The *Messiah* of Handel has been particularly unfortunate in this regard. Mozart was among the first to make a more modern arrangement of it; subsequently various other musicians made further arrangements of Mozart's arrangement. Many other works of Handel's have fared similarly, e.g., at the hands of Mendelssohn, who later expressed regret for having published his arrangements. Bach's cantatas suffered mistreatment by Robert Franz. Wagner made arrangements of Beethoven's Ninth Symphony, Gluck's *Iphigénie en Aulide*, etc. The 20th century has witnessed a growing understanding of the baroque style and a consequent demand for authentic, unarranged performances. See Performance practice. See N. Kilburn, "Additional Arrangements to Handel's *Acis*" (*SIM* iii); A. Hutchings, "A Note on the 'Additional Accompaniments'" (*MR* vii, 161).

**Adelaide.** A famous song by Beethoven (op. 46), composed in 1795 or 1796 to words by F. von Matthisson.

**Adélaïde Concerto.** A violin concerto attributed to Mozart and edited by Marius Casadesus from a violin part dedicated to the French Princess Adélaïde. The orchestral accompaniment was added by Casadesus. Although it is known that Mozart did write such a piece for the Princess, it is almost certain that this is not the work.

**Adeste, Fideles** [L.]. A Latin hymn usually sung today in the English translation, beginning "O come, all ye faithful." The words and music are attributed to John F. Wade, and it was published in 1750 for use in the English Roman Catholic College in Lisbon; hence, the tune name "Portuguese Hymn."

**À deux** [F.]. See *A due*.

**Adieux, Les** [F.]. Beethoven's Sonata for piano op. 81a, in E-flat (1809), entitled (in full) *Les Adieux, l'absence, et le retour* (Farewell, Absence, and Return). Also known as the Farewell Sonata, it was inspired by the Archduke Rudolf's departure from Vienna.

**Ad libitum** [L.]. An indication that gives the performer liberty to: (1) vary from strict tempo (contrast *a battuta*); (2) include or omit the part of some voice or instrument (contrast *\*obbligato*); (3) include a *\*cadenza* according to his own invention.

**Adoración.** See under *Aguinaldo*.

**Adriana Lecouvreur.** Opera in four acts by F. Cilea (libretto after E. Scribe and Legouvé), produced in Milan, 1902. Setting: Paris, 1739.

**A due** [It.]. Direction in orchestral parts indicating that two instruments notated on one staff (e.g., Flute 1 and 2) should play in unison (*All'unisono*) [see Unison]. However, the term is also used in the almost opposite meaning, synonymous with *\*divisi*. The same ambiguity exists with the French term *à deux*. *A due corde*, see *Due corde*. *A due mani*, for two hands; *a due voci* (*cori, stromenti*, etc.), for two voices (choirs, instruments, etc.).

**Aeolian, aeolian mode.** See under Church modes; Modality.

**Aeolian harp.** A sound-producing contrivance consisting of a long narrow box with six or more gut strings stretched inside over two bridges. The strings are tuned in unison but vary in thickness and, therefore, tension. If the box is placed in a free current of air (preferably in an open window), the strings vibrate differently, according to their different tensions, and thus produce a large variety of harmonics over the same fundamental (cf. the "singing" of telephone wires). The sound varies considerably with the changing force of the wind and produces a romantic, mysterious effect. The instrument was known in ancient China and India, and in Europe during the Middle Ages. It enjoyed special popularity in

the romantic period about 1800. Its intimate charm is beautifully described in Eduard Mörike's poem "Die Aeolsharfe" with musical settings by Brahms and (especially) Hugo Wolf.

Various attempts have been made to harness this elusive sound to a keyboard, with an artificial jet of wind provided by foot bellows (J.-J. Schnell's *Anémocorde* or *Aeroclavichord*, 1789; H. Herz's *Piano éolien*, 1851). See *SaRM*, p. 16; J. G. Kastner, *La Harpe d'Éole* (1856).

**Aeoline.** Old name for mouth organ [see Harmonica]. Also, an early type of \*harmonium (*aeolodicon*).

**Aeolopantalon.** An instrument invented in 1825 by Jozé Dlugosz, Warsaw; it was a combination of a harmonium-like instrument (*aeolomelodikon*, with brass tubes affixed to the reeds) and a piano, so that both instruments could be used in alternation. It is remembered largely because the young Chopin played on it in various recitals.

**Aequalstimmen** [G.]. (1) The eight-foot pipes of the organ. (2) \*Equal voices.

**Aer.** See under Aria II.

**Aerophon.** See Aerophor.

**Aerophones.** See under Instruments III.

**Aerophor.** A device invented by B. Samuel in 1912 that provides the player of a wind instrument with additional air from a small bellows operated by the foot. By means of a tube with a mouthpiece, air can be supplied to the player's mouth whenever his breath is not sufficient for long-held tones or long melodies in full legato. R. Strauss has written passages requiring this device, as in his *Alpensinfonie* (where it is incorrectly called "aerophon").

**Aesthetics of music.** I. Aesthetics is generally defined as the philosophy or study of the beautiful. Musical aesthetics, therefore, should be the study of the beautiful in music, the ultimate goal of such a study being the establishment of criteria that would allow us to say whether or not a particular composition is beautiful, or why one is beautiful while another is not. The main objection to such a point of view is that beauty is by no means the only (and possibly not even the foremost) criterion of what may be roughly described as "merit" or "artistic worth." Music, like other works of art, may be aesthetically satisfying without necessarily being "beautiful." Therefore a definition such as the following provides a much better basis for the study in

question: *Musical aesthetics is the study of the relationship of music to the human senses and intellect.* This definition corresponds to the original meaning of the Greek word *aisthesis*, i.e., feeling, sensation. The following words by Robert Schumann (*Gesammelte Schriften über Musik und Musiker*, rev. ed., 1914, i, 44) adequately describe the peculiar problem of musical aesthetics [trans. by W. A.]: "In no other field is the proof of the fundamentals as difficult as it is in music. Science uses mathematics and logic; to poetry belongs the decisive, golden word; other arts have taken nature, whose forms they borrow, as their arbiter. Music, however, is a poor orphan whose father and mother no one can name. But, perhaps, it is precisely this mystery of her origin which accounts for the charm of her beauty."

II. For more than two thousand years philosophers have tried to solve the mystery of music. Among them we find Pythagoras (550 B.C.), who explained music as the expression of that universal harmony which is also realized in arithmetic and astronomy; Plato (400 B.C.), to whom, like Confucius, music seemed the most appropriate means of social and political education; Plotinus (d. 270), who interpreted music as a mystic and occult power; Boethius (d. 524), who divided music into three fields, *musica mundana* (the Pythagorean harmony of the universe), *musica humana* (the harmony of the human soul and body), and *musica instrumentalis* (music as actual sound), a classification that prevailed in musical theory for more than ten centuries; J. Kepler (*Harmonices mundi libri v*, 1619), who erected a great edifice of ideas in which he correlated musical tones and intervals with the movements of the planets and their astrological functions; G. W. Leibnitz (1646–1716), who paved the way for the psychological system of musical aesthetics by interpreting music as an "unconscious exercise in arithmetic"; A. Schopenhauer (*Die Welt als Wille und Vorstellung*, 1819), who considered music the purest incarnation of the "absolute will" and the expression of human feelings (love, joy, horror) in their abstract interpretation as metaphysical ideas; G. T. Fechner (1801–87), called the founder of experimental aesthetics, who insisted that music is the expression of "general mood" rather than specific "feelings"; and finally C. Stumpf (*Tonpsychologie*, 2 vols., 1883, '90), who inaugurated the scientific study of musical psychology on the basis of experiments and statistics, especially with regard to the problem of

consonance and dissonance. Stumpf's procedure has been the point of departure for many investigations along similar lines, especially in America, e.g., C. E. Seashore, *Psychology of Music* (1938); M. Schoen, ed., *The Effects of Music* (1927), and others [see Tests]. For a criticism of these methods, see C. C. Pratt, *The Meaning of Music* (1931), pp. 131ff.

Not until the advent of the 19th century did these theories of music begin to accord with the present-day interpretation of musical aesthetics as defined above. This statement should not be construed as deprecating the much broader and, in a sense, more profound views—cosmic, political, or theological—held by the philosophers of antiquity and the Middle Ages. Whereas in those periods justification for music was considered to have its origin in the state, in the universe, or in God, today music has lost these transcendental affiliations but has gained instead a secure place in everyday life.

III. Musicologists, as might be expected, aim at a more technically detailed penetration into the subject of musical aesthetics, usually being concerned with the study of specific techniques or compositions rather than with music in the abstract. Their various theories of aesthetics can be divided into two groups, according to whether they consider music (1) as a heteronomous art, i.e., as the expression of extramusical elements, or (2) as an autonomous art, i.e., as the realization of intrinsic principles and ideas (F. Gatz).

(a) In the former class are the *Affektenlehre* (doctrine of \*affections), according to which music in its various manifestations is the expression of human temperaments, passions, moods, etc. In the 17th century, music was frequently treated as an oratorical art (*Figurenlehre*, doctrine of \*figures), its structural and stylistic elements (such as *repetitio*, *fuga*, *climax*) being related to corresponding rhetorical devices. In the romantic period the interpretation of musical compositions was largely based upon programmatic and allegorical concepts. Music was thought of as a sort of psychological drama and explained in terms such as "desperate struggle," "the knocking of Fate," "threatening fortissimo," or "gloomy minor." An early exponent of this school of thought was A. B. Marx, in his *Ludwig van Beethoven* (1859). A more intelligent use of this approach was attempted by H. Kretzschmar, the inventor of *musikalische Hermeneutik* [see Hermeneutics]. He considered music a *Sprachkunst*, i.e., a language, of less clarity but with finer shades and deeper effects than ordi-

nary speech. He harked back to the "affects" of the 18th century, which, according to him, should be based upon the study of musical elements (themes, intervals, rhythm, etc.). He also related the composer's music to his life (Beethoven's "period of happiness," etc.). The last point was emphasized by H. Riemann, who maintained that the written composition as well as the actual performance is nothing but a means of transferring an experience (*Erlebnis*) from the fancy of the composer to that of the listener. Kretzschmar's method has been elaborated by A. Schering. An American book, E. Sorantin's *The Problem of Musical Expression* (1932), represents an example of 20th-century *Affektenlehre*.

(b) In strong contrast to all these theories is the more recent school of thought that rejects the allegorical, emotional, programmatic, poetical foundation of musical aesthetics and explains music as a purely musical phenomenon, as an autochthonous and autonomous creation that can be understood only in its own terms. An early "autonomist" was M. de Chabanon, who in 1785 published a book entitled *De la Musique considérée en elle-même*. The main representative of musical autonomy has been E. Hanslick, who, in his *Vom Musikalisch-Schönen* (1854), formulated the sentence: "Musik ist tönend bewegte Form"—"music is form in tonal motion" (trans. by D. Ferguson; the term \*form, naturally, must be taken in its broadest sense, including all structural and stylistic elements of music). He admits the use of designations such as "powerful," "graceful," "tender," "passionate," but only in order to illustrate the musical character of the passage, not to suggest a definite feeling on the part of composer or listener. Still further in this direction went A. Halm (*Von zwei Kulturen der Musik*, 1913), one of the most outstanding writers on musical aesthetics. The following quotation from the Talmud, given at the beginning of his book, is a very apt expression of the central thought of musical autonomy: "If you want to understand the invisible, look carefully at the visible." Halm, as well as his successors, E. Kurth, H. Mersmann, F. Jöde, and others, advocated the separation of the musical work from the emotional worlds of both composer and listener and the emancipation of musical thought from "sensuous intoxication and hallucination."

**Aevia.** An artificial word, consisting of the vowels of \*alleluia (u = v). It is occasionally used as an abbreviation in manuscripts of Gregorian chant. See *Euouae*.

**Affabile** [It.]. Gentle, pleasing.

**Affannato, affannoso** [It.]. Excited, hurried, agitated.

**Affections, doctrine of** [also doctrine of affects; G. *Affektenlehre*]. An aesthetic theory of the late baroque period, formulated by A. Werckmeister (*Harmonologia musica*, 1702), J. D. Heinichen (1711), J. Mattheson (1739), J. J. Quantz (1752), F. W. Marpurg (*Kritische Briefe*, vol. ii, 1763), and other 18th-century writers. It was treated in greatest detail by Mattheson (*Der vollkommene Capellmeister*, 1739), who enumerates more than twenty affections and describes how they should be expressed in music, e.g.: "Sorrow should be expressed with a slow-moving, languid and drowsy melody, broken with many sighs," and "Hate is represented by repulsive and rough harmony and a similar melody." He also describes the affections (characteristic emotions) of numerous dances, saying that the gigue expresses "heat and eagerness," the courante, "sweet hope and courage." These rather trite explanations reveal the difficulty involved in any attempt to formulate the doctrine of affections. There can be no doubt, however, that musicians of the late baroque, particularly in Germany,

were fully familiar with this aesthetic approach and often incorporated its tenets in their compositions. A basic aspect of the doctrine of affections is the principle that each composition (or, in the case of composite forms, each movement) should embody only one affection.

Although the term *Affektenlehre* is associated with the 18th century, the close relationship between music and the human affections has often been recognized and emphasized not only in Western music (Plato, Aristotle, Isidore of Seville, Ramos de Pareja, Glareanus, Monteverdi, Descartes) but also in that of the Orient, especially in the Hindu conception of the *ragas* [see India I]. Also see Aesthetics of music III(a); *Musica reservata*.

Katz, *Die musikalischen Stilbegriffe des 17. Jahrhunderts* (1926); F. T. Wessel, "The Affektenlehre in the Eighteenth Century" (diss. Indiana Univ., 1955); M. Kramer, "Beiträge zu einer Geschichte des Affektbegriffs in der Musik von 1550-1700" (diss. Halle, 1924); H. Abert, in *AMW* v; H. Kretzschmar, in *JMP* xviii, xix; F. Stege, in *ZMW* x; A. Schering, in *JMP* xlv; H. Lenneberg, in *JMT* ii (Mattheson); R. Schäfke, in *AMW* vi (Quantz); G. Frotscher, in *CP* 1925 (Bach).

**Affektenlehre** [G.]. See Affections, doctrine of.

**Affetti** [It.]. The term appears in the title of various publications of the late 16th and early 17th centuries [*Dolci Affetti*, 1582; S. Bonini, *Affetti spirituali . . . in stile di Firenze o recitativo*, 1615; B. Marini, *Affetti musicali*, op. 1, 1617; G. Stefani, *Affetti amorosi*, 1621, see Editions V, 3], probably to emphasize the affective character of the music. It is also used in early violin sonatas to designate a certain type of ornament, either tremolo or arpeggio [see *SchGMB*, no. 183; *RiHM* ii, 2, 120].

**Affettuoso** [It.]. Tender.

**Affinales** [L., sing. *affinalis*]. In medieval theory of the church modes, name for the pitches a, b, and c', which occur as the finals of transposed chants [see *Speculum musicae*; *CS* ii, 248a]. In a *Tonale* ascribed to Bernard of Clairvaux (1091-1153), it is stated that the first \**maneria* has the finals d and a, the second e and b, the third f and c', the fourth only g [see *GS* ii, 266a]. Many of the Ambrosian chants close on the *affinales*, including the d'. See Transposition II.

**Affrettando** [It.]. Hurrying.

**Africa.** The musical cultures of Africa may be very broadly classified as North African (essentially Islamic; see Arab music) and sub-Saharan. The latter is considered here in its traditional aspects.

I. *Background.* The interpenetration of sub-Saharan tribal Africa with Western and Eastern civilization has resulted in a vivid cultural dualism, reflected in a fast-diminishing body of traditional, tribal music on the one hand and a slowly emerging nucleus of art and "city" music on the other. Unfortunately, a historic view of the tribal music remains vastly limited, owing to the relative sparsity, prior to c. 1950, of notated examples, and the fact that recorded evidence, such as that supplied to E. M. von Hornbostel by the Czekanowski Central African Expedition of 1907-08, begins only with the 20th century. However, some of the history may be reconstructed by tracing the musical legacies of past contacts with other cultures. Preliminary observations concerning possible legacies of the Malayo-Polynesian migrations (c. 2000 B.C.-c. A.D. 500) to Malagasy (Madagascar) and the African mainland, for example, include the following: (1) C. Sachs shows that several instruments of Malagasy, including an idiochordic tube zither tuned in thirds (*valiha*) and a free-log thigh-supported xylophone, are of Malayan origin (the xylophone especially is known from Celebes to the Molucca islands). He also relates the resonated xylophones of the African mainland to those of Indonesia. (2) Certain African xylophone tunings, as pointed out by J. Kunst (*PMA* lxii) and others, strongly resemble (but may not necessarily derive from) some "ideal" (theoretic) isotonic tunings of the Far East, notably the five-step Indonesian *sléndro* and the seven-step isotonic scale of Thailand [see III C below]. (3) The use of double xylophone beaters in one hand, held or fastened at an angle, has been noted among some African peoples, e.g., the Azande of the Congo-Kinshasa (Democratic Republic of the Congo) and the Venda of South Africa, and also in Indonesia.

Musical ties, particularly rhythmic, with the Middle East and India may be even stronger than those with the Far East. Such ties may have been gradually defined through early migrations, invasions of ancient Egypt south of the Sudan, the South Indian trade on the East African coast during the third or second centuries B.C., and, of course, throughout the period of Islamic spread in Africa.

Sub-Saharan Africa includes a large variety of tribes and languages. While anthropologists and linguists have been able to map important culture and language areas (which, incidentally, are generally not congruent—e.g., Bantu languages cut across both cattle and agricultural areas), a similar delineation of musical style areas has thus far not proved practicable. For example, although there is, at first glance, a preponderance of polyphony in parallel fourths and fifths in the eastern and southern regions and in parallel thirds in the central and western regions, further study reveals greater intermingling of intervals than hitherto believed.

II. *Social function and professionalism.* Music and dance permeate nearly all phases of African tribal life. They are vital to the many rituals, such as those concerned with birth, puberty and secret-society initiation, marriage, etc., and rituals of "livelihood," e.g., hunting, farming, etc. Ceremonial music, costumes, masks, and instruments usually attain an aura of sacredness. Each of the Watutsi (Watusi) royal drums, for example, has been thought to possess a "soul," represented by a large pebble inside the drum, that can do away with evil spirits.

Music may also serve in legal, political, and historical capacities. Thus, there are public litigation ceremonies, such as those of the Bambala (Congo-Kinshasa), in which the litigants present portions of their legal briefs in song; there are songs of criticism, or of praise, directed at chiefs, employers, governments, etc.; and there are songs narrating historical or current events, such as the warrior epics of the Watutsi of Rwanda.

There is also a great deal of music and dance for entertainment. This ranges from the highly informal to a more "theatrical," prepared type, such as the *chikona*, the leading ceremonial and social dance of the Venda (South Africa), which features a circle of men playing vertical flutes of reed in hocket and dancing counterclockwise around drummers, most of whom are women.

Various levels of musical professionalism, engaged in mostly by men but also by women, have long been apparent in African tribal life, in addition to communal music-making. Thus, there are trained instrumentalists, dancers, master instrument builders, and tuning specialists (composing is usually subsumed under the performer's craft), some attached to a chief's or king's court, others traveling as paid performers, as well as the skilled leaders of a singing or dancing community group, who are perhaps also official or semi-

official religious leaders. Training, which may be long and involved, is generally informal and based on rote learning, often with such mnemonic aids as the singing of nonsense or stylized syllables (especially for drum patterns). Such aids recall similar methods in Hindu drumming and Japanese *\*gagaku*.

III. *Style*. Although diversity of style is evident, there are certain elements that represent a reasonably common musical denominator.

A. *Rhythm and tempo*. Probably the most outstanding feature of much African music is the complexity of rhythmic structure, a complexity no doubt well comprehended by musicians trained in unequal-beat styles (Sachs' "additive" category), such as those of the Middle East and India and of the Western Renaissance and 20th century. The essence of what the present writer has termed the "African hemiola style" lies in the contrast of two unequal "conductor" beats in a 2:3 length-ratio, e.g., ♩. or ♩., both horizontally and vertically. Horizontally, the 2:3 contrast may be texturally (1) concentrated, i.e., the two unequal conductor beats appear close to each other within a short space, as in a pattern of  $6/8 + 3/4$  (the European hemiola; see Ex. 4, line 2) or in measures (appearing individually or in any combination) such as  $5/8, 7/8, 8/8$  (e.g., the *dochmiac* ♩.♩.),  $12/8$  (e.g., ♩.♩.♩.; see Ex. 4, top line and Ex. 2, line 2), etc.; or the 2:3 contrast may be (2) wide-paced and sectional, involving change from the short to the long beat (or vice versa) by sections, one section (several measures) perhaps featuring the ♩ in  $3/4$  time and another the ♩ in  $6/8$ ; or (3) the 2:3 contrast may be entirely absent in an individual line, so that equal-beat rhythm prevails, as in the steady reiteration of the dotted-quarter beat in  $3/8$  figures (e.g., Ex. 1, line 1; Ex. 2, lines 3, 4). Furthermore, whatever the type of beat contrast, a line often features one distinctive rhythmic pattern constantly repeated [see Ex. 1, line 1; Ex. 2, lines 2-4; Ex. 4, lines 1, 2], somewhat like the Hindu *tāla* patterning. However, patterns are open to variation, especially in vocal music (owing to text requirements) and in certain "leader" parts, such as that of the master drummer.

Vertical realization of the hemiola style is a direct concomitant of the strong African propensity for "orchestral," polyphonic music. The contrast of the two unequal conductor beats in their multipart setting may then take on the greatest intricacy, an intricacy deriving from true vertical *\*polyrhythm*. In such polyrhythm each line maintains a certain degree of rhythmic

independence, especially with respect to the organization of the conductor beats. Specifically, in African polyrhythm [see Ex. 1-4] each line may carry its own distinctive beat pattern (in Hindu music all parts are controlled by one common beat pattern). This means that beats may not coincide vertically: the two unequal beats obviously cannot coincide, because one beat is one and one-half times as long as the other, and equal beats may not coincide because each line pattern may enter at a different point (Ex. 2, lines 3 and 4). In other words, there may be vertical overlapping of entire patterns and of their internal beats. Clearly, this is not syncopation, in which all lines are subsumed under one underlying regular beat and in which any kind of line-independence is considered to derive from "off-beat" stress of the one equal-beat base.

1 ♩ = 189 ♩. = 126

2 ♩ = 336 Solo

Kàràngó drum

Aguda drum

Ìyá Ìlù "mother" or master drum

1. Watutsi royal drums excerpt (Rwanda) [R. Brandel]. 2. Yoruba song with dundún drums of Ògún, war god (Nigeria) [A. King].

3 ♩ = c. 96 Right hand forefinger . . . . . thumb

4 ♩ = c. 177 ♩ = c. 118

3. *Lemba deze*, i.e., *sanza* (South Africa) [P. R. Kirby]. 4. *Ewe dance figure with portion of ensemble* (Ghana) [R. Brandel].

The vertical tug between the two unequal beats and between the simultaneous independent patterns in which they are set is further complicated by the appearance of a subtle rhythmic Gestalt, the "over-all perception" pattern, or composite, of all (or some) of the lines. Mainly through timbre and pitch accents, especially vivid in tuned drum ensembles, this composite pattern is ever fluid and changing, sometimes resulting from the variation techniques of the master drummer, sometimes from changing orchestral density and texture, and also from other factors. The performer, particularly, must to some extent be aware of such an over-all pattern for the sake of ensemble coordination (or else each part would theoretically require its own conductor). But no doubt there are various Gestalt perceptions, depending on the type of participation (dancer's, singer's, etc.), the skill of the performer, and the kind of material he executes (variations, unchanging ostinatos, one or two lines at a time—in the last case, as singer-player, dancer-player, player of "harmonic" instrument, etc.). An ensemble usually pays

special attention to the part of the master drummer, which may give rhythmic signals for changes in dance steps, changes in tempo, type of section to be performed, etc., and frequently to the part of some over-all tempo-setter, such as the *adawuraa*, the boat-shaped iron idiophone of the Akan (Ghana), which may perhaps also act as a central "rhythmic post" for the entire ensemble. Dance rhythms may also play an important "governing" role.

Tempo, as judged from the speed of the basic units, such as the ever-present "running eighths" from which the ♩ and ♩ beats are constructed, tends on the whole toward the very rapid (in distinct contrast with music of the Middle East and India). The eighth-note units may average roughly from ♩ = c. 240 to c. 450, thus giving conductor beats of ♩ = c. 120 to c. 225, and ♩ = c. 80 to c. 150.

B. *Polyphony*. Another distinguishing characteristic of African music is a strong tendency toward polyphony, both vertical ("harmonic") and horizontal ("contrapuntal"). The codevelopment of polyrhythm and some degree of harmony in this music is an interesting contrast with the nonharmonic but rhythmically complex music of the Middle East and India. A further comparison may be made with the polyrhythmic emphasis of the Western Renaissance and its gradual movement toward harmonic and equal-beat emphasis.

The principal African polyphonic types are parallel intervals (mainly thirds, fourths, fifths), overlapping choral antiphony and solo-choral response (particularly the latter), ostinato and drone-ostinato (but not the Hindu continuous drone), and, less frequently, polymelody (mainly double). The types may often intermingle within one piece and may appear in any vocal and instrumental combination. The characteristic orchestral attitude frequently results in the piling up of parts, so that vertical densities of three and four different pitches are not uncommon, whether achieved through parallel block motion or through contrapuntal techniques [see Ex. 6]. Such densities are in constant flux, however, even in parallel motion, so that continuous triads throughout an entire piece, for example, are rare. "Spot" or intermittent fullness resulting from sudden choral *divisi* or solo interjection of variational segments, often at strategic cadential or phrase points, is a favored practice.

Parallel thirds, which frequently move diatonically, are found in numerous areas [see I, above]. Ex. 5 illustrates parallel fourths and fifths, to-

gether with responsorial technique. Whether overlapping or not, the responsorial or antiphonal section in African music may be a repetition of the first phrase (Ex. 5), which may result in canonic imitation, or the section may contain new melodic material, such as a brief punctuating refrain, a completion of the first phrase, or a distinctly contrasting melody.

The African ostinato, usually quite small in length and pitch range, may be continuous or intermittent, vocal or instrumental, and may appear above or below the main line. Frequently there is a multi-ostinato, two or more ostinatos moving contrapuntally, with or without a longer melodic line. The African propensity for \*hocket (especially favored by the Mambuti Pygmies) is often allied to multi-ostinato. In Ex. 6, five ivory horns (part of a professional band), playing one note (pitch) each, execute melodic and harmonic hocket (largely through sustaining notes) in two ostinato lines, the top line being a kind of forecast of the vocal melody.

Although complex polymelody (simultaneous independent melodies of some length and inner organization) is not common, there are many simple varieties, involving phrases longer than those of the multi-ostinato. Also, there are certain types of heterophonic variations on a theme, which often achieve a distinctness of line movement approaching genuine polymelody.

There are hints of some functioning "chordal" relationships in African polyphony, although these are not the Western major-minor system, nor are they formally and verbally articulated. The type of functioning, involving concepts of tension-relaxation, dissonance-consonance (which are by no means fixed universals), cannot as yet be gauged. It is clear, however, that there are varieties of "chord" clusters (as there are varieties of scales), and that some level of harmonic patterning may be aimed at through oral tradition. A few samples, resulting either from parallel or contrapuntal motion, follow (all hyphenated notes are to be read vertically). It should be noted that interval sizes are not those of equal temperament: (1) a repeated tritonic (augmented fourth) "chord" in a minor seventh or larger span, e.g.,  $a-c'-e^{b'}-f'-g'-a'$  of Ex. 6 (cents given in the next section below), popular among the Mambuti Pygmies and in many parts of Central Africa, and also appearing elsewhere; (2) a cadential sequence resting on parallel major thirds, with roots a major second apart, e.g., Gangele (Angola),  $c'-e'-g'$ ,  $b^b-d'-f'$ ,  $c'-e'-g'$ , and Baduma (Congo-

Brazzaville),  $b^b-d'$ ,  $c'-e'$ ; (3) another cadence-like sequence of the Baduma (bracketed notes are the most important),  $e'-g'$ ,  $a-d'-f^{\sharp'}$ ,  $a-c'-e'-g'$ ; (4) "plagal" motion with roots (or focal notes) a fourth apart, e.g., Babinga Pygmies (Congo-Brazzaville),  $b^b-e^{b'}-f'-a'-c''$ ,  $c'-e^{b'}-g'-a'$ , and a related (reversed and inverted) form of the Venda (South Africa),  $g'-c''-e^{b''}$ ,  $f'-a'-c''-e^{b''}$ . See also the patterning of Ex. 5, e.g., (meas. 6),  $g'-c''$ ,  $e^{b'}-b^{b'}$ ,  $c'-g'$ .

6. Kukuya ivory horns (Congo-Brazzaville) [R. Brandel].

C. *Scale and melody.* Among the large variety of African scales there is no one scale that is more idiomatic than the others. However, scales and melodies of very small range, two or three notes spanning the interval of a second or a third, appear somewhat infrequently (other than in ostinato accompaniments, which are usually part of pieces with larger scale gamuts). Tetrachordal and pentachordal spans are common, while scales and melodies of even larger range are quite prevalent. (A ladder of thirds spanning a ninth, F-A-C-E-G, may be found in a Batwa Pygmy song of Rwanda.) Furthermore, scales and melodies may be chasmatonic (gapped) or diatonic, within any span. Thus, there are chasmatonic five-note octaves, e.g., C-D-E<sup>b</sup>-G-B<sup>b</sup>-C of Ex. 5, and A-C-E<sup>b</sup>-F-G-A of Ex. 6 with its tritonic melodic and harmonic emphasis (the diatonic upper tritone tends to descend, as in Ex. 6 and among the Mambuti Pygmies; see also the vocal line of a Chopi piece in Kirby, p. 65); chasmatonic five-note hexachords, e.g., C-D-E-G-A, often featuring triadic tunes; dia-

tonic octaves, e.g., C-D-E-F(F#)-G-A-B(B<sup>b</sup>)-C; diatonic hexachords, e.g., G-A-B-C-D-E, etc. In addition, there appear to be some equal-stepped or isotonic scales, e.g., some Uganda harps with a four-step octave (among the Bagwere) or with a five-step octave (among the Baganda), and some xylophones with a five-step octave (parts of both Congos, Uganda) or with a seven-step octave (among the Chopi of Mozambique). Scales and melodies are frequently constructed in a "plagal" manner, featuring a central pivot note with a lower fourth and an upper fifth, e.g., G-C-G.

Interval sizes vary greatly, pointing up a variety of scale temperaments, especially evident in the tuning of instruments. (Ex. 6 horn intervals in cents reveal two small "minor" thirds and a large and a small "major" second: 279, 283, 227, 191.) Temperament norms, however, are not always easy to gauge.

The influence of the tonal languages (Bantu, etc.) on melody is marked but not rigid. Although high-pitched and low-pitched speech syllables (pitch height governs meaning and grammar) tend to be set to correspondingly pitched melodic notes [see Ex. 2], melodic flow is often controlled by purely musical considerations. Over-all melody shapes are varied, octave tunes often curving downward and tunes sometimes zigzagging through interlocking thirds.

D. *Form*. The most prevalent form is the litany type, i.e., immediate (but not necessarily exact) repetition of a musical idea throughout a piece. The length of melodic phrases, however, will vary from the very brief (one or two measures) to long-lined melodies of several measures. Frequently the length and inner organization are such that a two- or three-sectional "sentence" with contrasting phrases is apparent, often executed in the popular antiphony or response. There is also evidence of some verse forms, such as those found in various Akan songs of Ghana. A sense of larger sectional formation and contrast is often achieved through the repetition of two or more melodies, e.g., A... B... A... C... etc. (the form of the complete piece of Ex. 5). Such sectional contrast is heightened by some abrupt shifts in tonality in a Mangbetu choral piece (Brandel, *The Music of Central Africa*, p. 111). Lengthy ceremonies may provide even broader formal contrast through a series of musical "acts," each consisting of a piece repeated numerous times. Variation is common, but developmental techniques are rare.

E. *Performance style*. Density and motion are perhaps the best clues to over-all performance texture, both vocal and instrumental: masses of sound tend to pile up "orchestraly," timbres—often pungent and staccato—are contrasted, *tessitura* are juxtaposed, dynamic levels are usually high, and motion is constant, hurried, and complex as melodies, musical rhythms, and rhythms of dancers' and players' muscles converge with as much "action" as possible within a short span of time. This is, of course, a broad generalization. The qualities of speed and concentration are not always present. An evening story-singer, a private session on the musical bow or on the *sanza* may be quite different.

Vocal styles often point up emphatic, full-voice singing, at times punctuated by shouts and screams. Timbres are often tense-hoarse, somewhat guttural, and tenorlike for the men, owing to a predominant use of the arytenoid vocal muscles at great intensities and at high pitch ranges, as well as to some laryngeal constriction by neck muscles. Women's voices frequently are strident, owing to a predominant use of the thyroid group of vocal muscles at great intensities and at generally lower pitch ranges. Special effects may include glissando (especially at phrase endings); excessive nasality (perhaps for disguise or spirit imitation); excessive breathiness (often as a timbre accent); *Sprechstimme*; among some peoples, yodeling (e.g., Babinga Pygmies and N'Gundi of Congo-Brazzaville, and Bushmen) and humming (as in some Watutsi bard songs), and a variety of animal imitations. Most singing is highly syllabic (non-melismatic), vibratoless, and nonornamented, except where Arab influence is evident (e.g., in some Watutsi bard songs).

Hocket is a favorite instrumental and vocal device, and, in its achievement of rapid timbre contrast, decidedly contributes to the over-all performance texture. Dance styles include broad, outflowing motions, often part of depictive dances, and self-contained, sometimes convulsive movement, usually set within abstract or symbolic contexts.

IV. *Instruments*. Orchestral emphasis is an important feature of African music. An ensemble consisting of hand-clapping singers, several different instruments, often including a set of one type, and usually dancers (or dancer-singers, dancer-players) is very common. *A cappella* as well as purely instrumental performance is also prevalent. In addition, certain instruments, notably the *sanza* and instruments of the chordo-

phone family, are frequently used in a solo, nonensemble capacity, particularly to accompany a singer (who may be his own instrumentalist). Ensemble instruments center about idiophones (especially rattles, xylophones, bells) and membranophones, although aerophone bands are also popular. Many instruments (mainly slit drums, but also membrane drums, bells, horns, flutes, etc.) are used also for the purpose of telegraphy, which usually consists of duplication of actual speech tones and rhythms, particularly of stylized proverbs.

Idiophones include a variety of rattles, single or strung, manually operated or tied to the body, made of gourd, woven fibers, skin, etc. Percussion sticks and pounded bamboos occasionally occur in "tuned" sets (as in Southeast Asia). Iron bells are of many sizes and forms and are usually clapperless and struck; two-toned double bells, joined by an arch or a common handle, are found mainly in western, central, and south central regions. West Africa (and also parts of Ethiopia and Egypt) features a double bell, such as the *nnawuta* of Ghana, with two unequal components, pitched perhaps a fifth or more apart. There is also a type of folded, flattened iron, sometimes bell-like (Uganda, Congo-Kinshasa) and sometimes reminiscent of the slit drum and somewhat banana- or boat-shaped (e.g., the *kende* of the Kissi of Liberia; it is also found in West Central Africa and has been excavated in Rhodesia). Kunst has noted the same split-banana shape in the metal *kemanak* of Java and considers a common origin in the East Mediterranean or the Caucasus. The metal disk of the Far East, the gong, seems to be entirely absent from Africa.

The idiophonous slit drum, important in signaling, is made of wood and is stick-beaten; it may be cylinder-shaped, wedge-shaped, or footed and animal-shaped. The edges of the slit are usually of different thickness to produce two pitches. The trapeze-shaped *lukumbi* of the Batetela (Congo-Kinshasa) can emit six different pitches, three on each side of the drum.

Xylophones are quite widespread and are frequently played in ensembles, both small and large. Chopi *timbila* bands, popular in mining camps, may contain 20 to 30 xylophones in three or four different sizes, ranging from "soprano," with c. 15 slabs, to "bass," with c. 4 slabs. There are two main types of xylophone: (a) The rudimentary loose-key xylophone, without resonators, resting on tree trunks, is found in both Congos, Uganda, Central African Republic,

Cameroon, etc. A root name in the northern Congo-Kinshasa is *padingbwa*; (b) the fixed-key xylophone, sometimes suspended from the shoulders, usually has resonators and is found in most areas. A root name in the southern Congo-Kinshasa is *malimba* or *madimba*. The wooden slabs are fixed to a frame, and beneath each slab is an acoustically matched resonator, usually of calabash, which may be round (e.g., Mandingo people, Liberia; Chopi, Mozambique) or long (e.g., Yaswa, Congo-Brazzaville; Venda, South Africa). The latter recalls the vertical resonance tubes of the Indonesian *gendèr*. Buzzing timbres are often produced by fixing spider-webbing over a small lower-end hole in the calabash. The xylophone is frequently played by two or more persons, and one or two mallets may be used in each hand. The number of keys may exceed 20, and tunings, some of which appear to be isotonic, vary considerably in different areas [see III C above].

Indigenous to Africa is the *sanza* (Central Africa, Mozambique, etc.), *mbira* (Southeast Africa), *kembe* (Central Africa), or *limba* (East Central and Southeast Africa), a relatively small plucked idiophone with a set of flexible iron (sometimes bamboo) tongues fixed across a board or box; underneath, a calabash resonator may be attached or may loosely enclose the board. Tuning is accomplished by shifting the tongues, thereby altering their vibrating lengths. The number of tongues varies greatly (c. 5 to 25 or more), as do the tunings; unlike the xylophone, the lowest-pitched tongues not infrequently are set in the center of the board and the upper ones to either side, or tongues may be intermingled in various ways. Thumbs, and at times other fingers, produce a delicately metallic, hocketlike pizzicato [see Ex. 3], sometimes enlarged by the rattling or buzzing of attached devices. The *sanza* may be played singly or in sets of two or three.

Membranophone drums, usually used melodically as well as rhythmically, are of numerous sizes and shapes; single- and double-headed; with laced, nailed, or glued skins; hand-beaten (fingers, palms, base, fist), stick-beaten, and rubbed; and are commonly played in tuned sets of various numbers. Pitch (and timbre) contrast may also be obtained on a single drum by utilizing different striking points or by altering membrane tension (pressing on the skin or its fastenings). The long, conelike single-headed drum, such as the *ndungu* of the Babembe (Congo-Brazzaville), is one of the most popular. Others

include the kettledrum, e.g., the hemispherical, stick-beaten *ngoma* of the Venda (South Africa), and the West African hourglass "pressure" drum (also found in ancient and modern India and in the Far East), e.g., the professional shoulder-suspended *dùndún* types (Ex. 2) of the Yoruba (Nigeria), which are played with a hooked stick and are capable of variable pitch via elbow or hand manipulation of the thongs connecting the two skins. (In Ex. 2 this method is used only for the master drum.) There are also barrel and goblet drums; footed, stool-like drums with open lower ends, e.g., the *igbin* of the Yoruba and the *ganda* of the Digo (Kenya); clay-pot drums, e.g., the *bompili*, a women's drum of the Mbole (Congo-Brazzaville); frame drums, of Arab origin, e.g., the *mantshomane* of the Thonga (South Africa); and many others. Drums are among the major ceremonial instruments, although they are also used for secular purposes, and skilled drummers (especially the master drummer) may be trained from childhood.

Aerophones include vertical wooden or bamboo flutes (often without finger holes); whistles; mirlitons; the typically African transverse trumpets and horns of ivory (frequently with raised embouchures), e.g., the *bompate* of the Nkundo (Congo-Kinshasa), or of animal horn, wood, or gourd; and ocarinas. Ensembles of c. 5 or more horns (Ex. 6) or flutes (with or without other instruments), often playing in hocket, are common in many areas. Winds also include flutes with finger holes, e.g., the 4-holed notched *endere* of the Baganda (Uganda), panpipes, transverse flutes, end-blown trumpets, occasionally nose flutes, and the free aerophone, the bullroarer, often associated with circumcision rites.

Chordophones are important solo and song-accompanying instruments. One of the most common is the musical bow, frequently appearing with attached resonator at one end or at a midpoint where the string is divided in two; the mouth often acts as resonator. Partial above the fundamental may be emphasized, melodically and harmonically, through fingering or changing mouth resonance. Related to the bow and especially prevalent in Central Africa is the multiple-bow lute (Sachs: *Bogenlaute*), which consists of 5 to 8 one-stringed bows attached at one end (the strings above, the bows below) to a resonance case. Mainly playing with a vine plectrum rolled around the thumb, a professional *longombe* player of the Nkundo (Congo-Kinshasa) used to be carried around the village on a plat-

form, singing and playing for an all-night celebration. Zithers, frequently with resonators, exist in stick, board, raft, trough, and frame forms (e.g., the 6-stringed triangular frame zither of the Bassa of Liberia, which recalls the Persian *chank*). The trough is especially characteristic of Central East Africa (e.g., the *inanga* of Rwanda). Harps (usually arched) and lyres, possibly based on Egyptian models, are generally not common below the Equator. Rudimentary one-stringed fiddles are in many instances derived from Arab sources. As for Western instruments, the guitar, frequently used in nightclub ensembles (e.g., "high life"), has become one of the most popular. Modern trends in art music include use of traditional material in Western symphonic, operatic, church, and other forms.

**Africaine, L'** [F., The African Woman]. Opera in five acts by G. Meyerbeer (libretto by E. Scribe), produced in Paris, 1865. Setting: Lisbon and Madagascar, end of 15th century.

**Afternoon of a Faun, The.** See *Après-midi d'un faune, L'*.

**Agende** [G.]. The German Protestant counterpart of the Roman Catholic liturgy or the Anglican rites, i.e., the entire ritual of the service of the German Protestant Church. See R. von Liliencron, *Liturgisch-musikalische Geschichte der evangelischen Gottesdienste vom 1523 bis 1700* (1893); F. Smend, *Neue Beiträge zur Reform unserer Agenden* (1913).

**Agevole** [It.]. Easy, smooth.

**Agiatamente** [It.]. With ease.

**Agilmente** [It.]. Nimbly, with agility.

**Agitato** [It.]. Excited.

**Agnus Dei.** The last item (except for the "Ite, missa est") of the Ordinary of the Mass [see Mass A and B III]; therefore, the final movement in Mass compositions. It consists of three invocations: "Agnus Dei, qui tollis peccata mundi: miserere nobis. Agnus Dei, . . . miserere nobis. Agnus Dei, . . . dona nobis pacem." It was introduced into the Roman Mass by the Greek Pope Sergius I (687-701). There exist about 300 melodies, 20 of which are in present-day use. The most common structure of the music is a a a or a b a. See *ApGC*, p. 418.

The Agnus Dei was retained in the first English Prayer Book (1549) but was suppressed in the second (1552). It is now commonly used in the Anglican service.

In the polyphonic Masses of the 16th century, the third invocation is often composed in a more involved style, using special contrapuntal devices, particularly canons. Examples are found in *\*L'Homme armé* Masses of Josquin and La Rue (triple, quadruple mensuration canon; see

*HAM*, no. 89; *ApNPM*, p. 181) and in many of the Masses of Palestrina.

**Agogic.** An accent is said to be agogic if it is effected not by dynamic stress or by higher pitch but by longer duration of the note [see Accent]. The German term *Agogik* (translated "agogics") is used to denote all the subtleties of performance achieved by modification of tempo, as distinct from *Dynamik* (dynamics), i.e., gradations that involve variety of intensity. Thus, the use of *rallentando* and *accelerando*, of tempo rubato, the dwelling on certain notes, as well as rests, breathing signs, fermatas, etc., all fall under *Agogik*. The term was introduced by H. Riemann (*Musikalische Dynamik und Agogik*, 1884) to describe those deviations from strict tempo and rhythm that are necessary for an intelligent rendering of the musical phrase.

**Agréments** [F.]. The ornaments introduced in French music of the 17th century, which were finally adopted into all European music and were generally indicated by stenographic signs or notes in small type. The *agréments* are characterized by a definitely stereotyped melodic contour, a close relationship with a single note of the melody to be ornamented, and a small melodic range. See Ornamentation II. P.A.

**Aguinaldo** [Sp.]. Religious folksong of Spanish origin based on texts praising Jesus, the saints, or the angels, sung throughout Latin America. Prevaillingly modal, it has a simple melodic structure and follows the conventional pattern of refrain (*estribillo*)-stanza (*copla*)-refrain (*estribillo*). Also called *alabanza*, *adoración*, and *\*villancico*. J.O-S.

**Aïda.** Opera in four acts by Verdi (libretto by A. Ghislanzoni), commissioned by the Khedive of Egypt for the celebration of the opening of the Suez Canal and produced in Cairo, 1871. Setting: Egypt under the Pharaohs. Although reputedly making use of a few Egyptian musical themes, the general style is that of Italian grand opera. Striking features are the brief atmospheric prelude (in place of a conventional operatic overture) and the use of a few *\*leitmotifs*.

**Air.** (1) French 17th- and 18th-century term for song in general [see under *Chanson*]. *Air à boire*, drinking song. (2) In French opera and ballet of the 17th-18th centuries, an instrumental or vocal piece designed to accompany dancing but not cast in one of the standard dance patterns such as the minuet, gavotte, etc. Some-

times the composer (e.g., Rameau) qualifies it as *air tendre*, *air gracieux*, etc. (3) In the suites written about and after 1700, a movement, found in the optional group, of a melodic rather than dancelike character—in a way, a “song without words” [cf. Bach’s Partitas nos. 4 and 6]. Early examples occur in the suites of Locke and Purcell. (4) See Ayre.

**Air de cour** [F.]. A type of short strophic song, sometimes with a refrain, for one or more voices with lute or harpsichord accompaniment, which was cultivated in France in the late 16th and in the 17th centuries, and which appears for the first time in Le Roy and Ballard’s *Livre d’airs de cour* (1571). The songs are in simple syllabic style and binary form. The texts are chiefly love poems in affected *précieux* language, some of them in *\*vers mesuré*. The repetition of each of the two sections was frequently ornamented at will by the singer. Principal composers are Pierre Guédron (c. 1565–1625), Antoine Boësset (c. 1585–1646), Jean de Cambefort (d. 1661), and Michel Lambert (1610–96).

Lit.: T. Gérold, *L’Art du chant en France au XVIIe siècle* (1921); L. de La Laurencie, A. Mairy, and G. Thibault, *Chansons au luth et airs de cour français du XVIe siècle* (1934); ‡\*Editions V, 7; D. P. Walker, “The Influence of *Musique mesurée* . . . on the *Airs de cour*” (*MD* ii, 141ff); J. Dodge, “Les Airs de cour d’Adrien Le Roy” (*BSIM* 1907, p. 1132); O. Chilesotti, “Gli ‘Airs de cour’ . . . di J. B. Besard” (*Atti del congresso internazionale di scienze storiche* viii [1905], 131); A. Arnheim, in *SIM* x. D.J.G.

**Aire** [Sp.]. Dance-song form cultivated in Argentina and Chile between 1830 and 1860 and almost extinct today. It consisted of two sections. The first, called *relación* or *estrofa*, was always sung to a kind of pantomime in which men and women dancers approached each other from opposite corners but never actually touched. The second section, much livelier and purely instrumental, accompanied a sort of tapping dance, which usually ended with shouts of “Aire!” when the man, kneeling on the floor, looked at his partner circling around him. Most of the examples preserved are bimodal, and only a few use the major mode. J.O.S.

**Ais, aisis** [G.]. A-sharp, a-double-sharp; see Pitch names.

**Akademie** [G.]. \*Academy. About 1800 the term was also used for concerts or recitals. Beethoven

in one of his letters says: “Heute keine Akademie,” i.e., “No concert tonight.”

**Akademische Festouvertüre** [G., Academic Festival Overture]. Orchestral composition by Brahms, op. 80, written for the University of Breslau in appreciation for the degree of doctor of philosophy conferred on him in 1879. It includes several German student songs, skillfully arranged and connected.

**Akathistos** [Gr.]. A famous hymn of the Byzantine Church in honor of the Virgin, originally sung on the Feast of the Annunciation (March 25), now sung in part during certain Matins of Lent and in its entirety during the vigil of the fifth Saturday of Lent. According to one of several legends, it was written by the Patriarch Sergios in 626 on the occasion of the deliverance of Constantinople from the Persians and was sung by the choir and congregation standing throughout a nightlong service of thanksgiving [Gr. *Akathistos*, not seated]. The Akathistos belongs to the general species of Byzantine poetry known as *kontakion* [see Byzantine chant II] and consists of a prologue and 24 stanzas whose initial letters comprise the Greek alphabet (acrostic). It is the only *kontakion* that has remained intact, the rest having been reduced to the prologue and first stanza. The authorship of the Akathistos has not been settled, although some indications point to Romanos (*fl.* 500–555), one of the greatest Byzantine hymnographers, who joined the clergy of the Theotokos Church in Constantinople at the time of Anastasius I (491–518).

Lit.: E. Wellesz, *A History of Byzantine Music and Hymnography*, rev. ed. (1961), pp. 191ff and *passim*; *id.*, ‡*The Akathistos Hymn* (1957); \*Editions XXIX, C, 9; G. G. Meersseman, *Der Hymnos Akathistos im Abendland*, 2 vols. (1958, ’60); E. Wellesz, in *MF* vi, xi, xiv, *id.*, in *Dumbarton Oaks Papers* ix, x.

**Akkord** [G.]. Chord.

**Akoluthia** [Gr.]. The order of service of the Byzantine Church, particularly that of the Office, thus usually not including the Mass (which was called *leiturgeia*, “liturgy”). The term was also used for the sequence of eight odes that form the *kanon* [see Byzantine chant II]. The theory advanced by W. Christ (*Anthologia Graeca carminum Christianorum*, 1871, p. lvii) that the medieval term “sequence” was the Latin translation of *akoluthia* is without foundation.

**Akzent** [G.]. Accent.

**Akzentneumen** [G.]. Accent neumes. See Neumes II.

**Al** [It.], **à la** [F.]. To the, at the; see, e.g., *Al fine*.

**A la**. See *Al*; *Alla*.

**Alabado** [Sp.]. Originally, a Spanish hymn in praise of the Eucharist, brought to the New World by the Franciscans, probably during the 17th century. It became a hymn in praise of Jesus, the Virgin Mary, and other saints. Some forms of *alabado* (occasionally called *alabanza*) have survived in numerous Roman Catholic communities of Mexico, New Mexico, etc., especially in the unusual rites of the Penitent Brothers. See J. B. Rael, *The New Mexico Alabado* (1951); A. B. McGill, "Old Mission Music" (*MQ* xxiv); L. T. Shaver, "Spanish Mission Music" (*Proceedings of the MTNA* [1919]).

**Alabanza** [Sp.]. See under *Aguinaldo*; *Alabado*.

**Alalá**. A type of folksong from northwest Spain (Galicia) expressing passion and longing. Older examples use syllables such as "la-la" or "ai-le-lo-la" and are interesting because of the preservation of plainsong-like elements. See F. Pedrell, *‡Cancionero musical popular español* (1918–22), ii, 127ff.

**A la mi re, alamire**. See under Hexachord III.

**Alba** [Prov.]. In the repertory of the troubadours, a poem dealing with the lover's departure in the early morning. It is usually cast in the form of a dialogue between the lover and a watchman (*gaite de la tore*, guard of the tower), who warns him of approaching danger. The oldest known prototype is an 11th-century Latin poem, "Phebi claro nondum orto." Three Provençal *albas* are preserved with music: Guiraut de Bornelh's "Reis glorios" [*HAM*, no. 18c], Cadenet's "S'anc fui belha," and an anonymous "Gaite de la tor" [see *ReMMA*, p. 214f]. The minnesinger counterpart of the *alba* is the *Tagelied* [G., day song] or *Wächterlied* (guard song), which Wagner revived in the second act of *Tristan und Isolde* (Brangäne's warning call). Many examples of the *Tagelied*, however, are of a more devotional nature, serving as a sort of morning prayer [see, e.g., "Ein ander tagwyss (Tageweise) graff Peters von Arberg," in P. Runge, *‡Die Sangesweisen der Colmarer Handschrift* (1896), p. 173]. See also *Alborada*; *Aubade*.

**Albert Herring**. Comic opera in three acts by B. Britten (libretto by E. Crozier after "Le Rosier de Madame Husson" by De Maupassant), produced in Glyndebourne, 1947. Setting: England, late 19th century.

**Alberti bass**. Stereotyped figures of accompaniment for the pianist's left hand, consisting of broken chords [see also Murky]. They are named

for Domenico Alberti (1710–40?), who used them extensively. Similar broken-chord patterns occur in the works of the virginalists (c. 1600) and in various keyboard compositions of the 17th century, e.g., the fourth variation of the G-minor aria in Pachelbel's *Hexachordum Apollinis* of 1699 [see *DTB* 2; *TaAM* ix, 46]. They are still common in the works of Haydn, Mozart, and the early Beethoven. See G. A. Marco, "The Alberti Bass Before Alberti" (*MR* xx).

**Albisphe**. See under Flute I (d).

**Alborada** [Sp.]. A type of Spanish (Galician, particularly) music, played on the *dulzaina* (rustic oboe) and *tamboril* (small drum), originally a morning song [see G. Chase, *The Music of Spain*, 1941, p. 237]. Ravel's *Alborada del gracioso* (The Jester's Morning Song; 1905) derives certain features from the Spanish *alborada*. See also *Alba*; *Aubade*.

**Albumblatt** [G., album leaf]. A fanciful name for a short piece of 19th-century music, such as might be inscribed in an autograph album.

**Alceste**. Opera in three acts by Gluck (Italian libretto by R. di Calzabigi, based on Euripides' tragedy), produced in Vienna, probably 1767. Rev. French version produced in Paris, 1776. Setting: Thessaly, in legendary times. Written in simple, nonvirtuoso style, *Alceste* was one of the first of Gluck's "reform" operas, embodying his theories about the proper relation of drama and music. Its French version touched off the famous quarrel between the "Gluckists" and the "Piccinnists" (supporters of Niccolò Piccinni), who favored traditional Italian operatic style.

**Aleatory music**. Music in which the composer introduces elements of chance or unpredictability with regard to either the composition or its performance. The terms *aleatoric*, *chance*

music, music of indeterminacy have been applied to many works created since 1945 by composers who differ widely as to the concepts, methods, and rigor with which they employ procedures of random selection. Chance may be involved in the process of composition, in performance, or in both. In the composition process, pitches, durations, degrees of intensity, etc., and/or their distribution in time may be chosen by dice throwing, interpretations of abstract designs (Cage), etc., or according to certain mathematical laws of chance (Xenakis). In performance, chance is allowed to operate by leaving some elements and/or their order of appearance to the performer's discretion (Boulez, Stockhausen, Pousseur, *et al.*), thus introducing the idea of choice. Most of these procedures are derived from and motivated by new general concepts of music, according to which form and structure are no longer regarded as definitely fixed and final but as subject to partial or total transformations from one performance to another (open forms, mobile forms). The composers adhering to such ideas are part of a general movement—in science and philosophy as well as in the arts—that tends to consider, and therefore to express, the world in terms of possibility rather than necessity.

"Dice music" was well known in the 18th century. The most famous example is a *Musikalisches Würfelspiel* of unknown authorship but attributed by several publishers to Mozart (K. Anh. C 30.01). It appeared in London in 1806 with the description: "Mozarts Musical Game, fitted in an elegant box, showing by an easy system to compose an unlimited number of Waltzes, Rondos, Hornpipes, and Reels." It consists of a set of first measures, second measures, etc., from each of which a measure is selected by a throw of the dice. J. P. Kirnberger contributed to this entertainment in his *Der allezeit fertige Polonaisen- und Menuettenkomponist* of 1757. A number of similar publications followed, among them one ascribed to Haydn, one to K. P. E. Bach, and the *Würfelspiel* mentioned above. See P. Löwenstein, "Mozart-Kuriosa" (*ZMW* xii, 342); O. E. Deutsch, *ibid.*, p. 595; H. Gerigk, in *ZMW* xvi, 350; A. Laszló, *The Dice Composer* (1941).

The first well-known example of 20th-century aleatory composition was John Cage's *Music of Changes* for piano (1951). In this work the pitches or pitch aggregates are precisely notated, while their duration and frequency of occurrence are dictated by the *I-Ching* (Book of Changes),

an ancient Chinese prescription for arriving at random numbers by throwing coins or sticks. In other compositions Cage has employed templates (*Music for Carillon*) and incidental imperfections of the music paper (*Music for Piano* 21–52) to determine compositional elements. Cage's *Concert* for piano and orchestra (1958) is a prime example of indeterminacy in performance. Its 63-page piano part contains 84 different sound-aggregates to be played in whole or in part and in any sequence. The wind and string parts are of a similar nature, and the *Concert* includes an "Aria" for soprano that may or may not be sung simultaneously.

Considerably less license is given in some scores involving alternatives from which the performer may—indeed, must—choose, preferably at the moment of performance. Karlheinz Stockhausen's *Klavierstück XI* (1956) has nineteen sections to be played in any order, and the pianist may choose from six different tempos, dynamics, and kinds of touch (legato, staccato, etc.). His *Zyklus* (1959) for one percussion player is a spiral-bound score that may be read from any point clockwise or counterclockwise and even upside down. The work ends when the player returns to his starting point. Perhaps the ultimate in indeterminacy of performance is reached in Mauricio Kagel's *Sonant* for guitar, harp, and percussion, where one is told, "the player may mimic his part or rebel against it entirely."

The use of mathematical laws of chance, such as theory of probability, games theory, etc., is represented by the Greek composer Yannis Xenakis, most of whose works belong to this general category, which he calls *stochastic* music. In such works as *ST/10-1,080262* and *Stratégie* (both 1962), he also uses the assistance of computers.

Lit.: U. Eco, *Opera aperta* [1962]; J. Cage, *Silence; Lectures and Writings* [1961]; W. Mellers, *Music in a New Found Land* [1964], pp. 177–93; *Die Reihe* (German ed. [1955—], English ed. [1958—], *passim*; *Incontri musicali* nos. 1–4 (1956–60), *passim*; *Perspectives of New Music* [1962—], *passim*; J. Cage, "To Describe the Process of Composition Used in 'Music for Piano 21–52'" (*Die Reihe*, Eng. ed., iii, 41ff); P. Boulez, "Sonate, que me veux-tu?" (*Perspectives of New Music* i, 32); *id.*, "Alea" (*Incontri musicali* iii, 3); Y. Xenakis, "Musiques Formelles" (*RM* nos. 253–4, 1963).

J.R.W. and A.B.

**Al fine** [It., to the end]. Indication to repeat a composition from the beginning (*da capo*) or

from the sign § (*dal segno*) to the place marked *fine*.

**Aliquot strings, aliquot scaling.** \*Sympathetic strings added by some piano makers (first by Blüthner) above the strings of the upper register in order to produce a fuller sound through resonance.

**Alla, all'** [It.], **à la, à l'** [F.]. In the manner of; e.g., *alla \*turca*, *alla \*zingarese*, etc.; *à l'espagnol*, in the Spanish manner.

**Alla breve** [It.]. A tempo mark (♩) indicating quick duple time, i.e., with the half note rather than the quarter note as the beat; in other words, 2/2 instead of 4/4. Both the name and the sign are a vestige of \*mensural notation and of the \*proportions (*tempus imperfectum diminutum*). Originally (and properly) *alla breve* meant that the unit of musical time (*tactus*) was represented by the *brevis* (corresponding to our double whole note), not, as was usual, by the *semibrevis* (corresponding to our whole note). Today it means that the half note should be regarded as the unit of time, instead of, as is usual, the quarter note. It should be noted, however, that at least in earlier practice this unit could be fairly slow. An example in point is the overture to *Don Giovanni*, marked *andante* and ♩. Mozart obviously wanted the music to be interpreted in a more animated tempo but, at the same time, in much broader terms than is customarily done by modern conductors, who play it *largo* and often employ eight beats to the measure instead of two.

**Allargando** [It.]. Slowing down, usually accompanied by a crescendo at a climax.

**Allegretto** [It.]. (1) A tempo between *andante* and *allegro*; see Tempo marks. (2) A short piece in fast (*allegro*) tempo.

**Allegro** [It.]. (1) General indication for fast speed [see Tempo marks]. Originally the term was employed primarily as an expression mark [It., cheerful, joyful], as appears from designations such as "*allegro e presto*" (M. Cazzati, *Il Secondo Libro delle sonate*, op. 8, 1648) or "*andante allegro*" (first movement, Handel's Organ Concerto no. 6, op. 4). (2) A composition in fast tempo, especially the first and last movements of a sonata, symphony, etc.

**Alleluia** [L.]. An exclamation of praise to God (from the Hebrew \**hallelujah*, praise ye the Lord), which occurs at the beginning or end of Psalms 110–118 (111–113, 115–117). It is men-

tioned by Tertullian, St. Jerome, and particularly St. Augustine, who describes and extols it as an "old tradition of the Church." Jerome says it was sung at festive meals and also by the plowmen in the fields. Sidonius Apollinaris (born c. 430) says that it was sung by the boatmen on the Loire, and Bede reports that the Britons used it as a battle cry in 448. In liturgical use it occurs as an expression of rejoicing added to antiphons, introits, offertories, communions, etc., during Eastertide and on Christmas Day, Corpus Christi, and other feast days. A special type of chant is the alleluatic antiphon, consisting of the word "alleluia" repeated three or more times [e.g., *LU*, p. 776kk].

More specifically, Alleluia refers to an elaborate chant sung as the third item of the Proper of the Mass. (Concerning its alleged introduction by Pope Damasus I, reigned 366–84, see *ApGC*, p. 376f.) There is evidence that about 450 it was sung in Rome only once during the year, on the first day of Easter; that before St. Gregory (reigned 590–604) it was sung during the period from Easter to Pentecost (Paschaltide), and that Gregory extended its use, probably from Advent to the last Sunday after Epiphany. Finally it was introduced into all Masses except during Lent, for which the original \*tract was preserved. During Paschaltide (more correctly, from Saturday after Easter to Friday after Pentecost) the Mass includes two Alleluias, one in place of the Gradual.

The Alleluia of the Mass consists of the word "alleluia" followed by a brief sentence referring to the occasion, the so-called verse (*versus alleluaticus*, abbr. *V*), e.g.: "Alleluia. *V* Surrexit Dominus de sepulcro" [see *LU*, p. 790; also *HAM*, no. 13]. The music for the word "alleluia" closes with a long vocalization on the final "a," the so-called \*jubilus [see also Neuma]. In nearly all Alleluias the music of the jubilus (often that of alleluia plus jubilus) recurs at the end of the verse [see Rhyme]. The jubilus melodies and also the melismas found within the verses frequently show repeat structures such as a a b, a a b b c, etc. [see *ApGC* pp. 386ff]. Many Alleluia melodies reveal their relatively late date (10th, 11th cent.) by their use of extended scale formations, usually in descending motion. See also Gregorian chant III; Psalmody II; Sequence II.

**Allemande** [F.]. A dance in moderate duple time that first appeared in the early 16th century. Early examples occur in T. Susato's *Het derde musyck Boexken* (Third Music Book) of 1551; in

C. Gervaise's *Troisième Livre de danceries* (1556; see *HAM*, no. 137); in B. Schmid, *Zwey Bücher einer neuen kunstlichen Tabulatur* (1577; see W. Merian, *Der Tanz in den deutschen Tabulaturbüchern*, 1927, p. 111); and in the *Fitzwilliam Virginal Book* (c. 1620), where the name "Alman," "Almayne," is used. Arbeau, in his *Orchésographie* (1589), considers the dance already outmoded [see Dance music II]. The 16th-century allemande shows a plain, essentially homophonic style. The dance steps were simple, as appears from the following description by T. Morley (*A Plaine and Easie Introduction to Practicall Musicke*, 1597, p. 181): "The Alman is a more heaue daunce then this [i.e., the galliard] (fitlie representing the nature of the people [German], whose name it carieth) so that no extraordinarie motions are used in dauncing of it." Like the pavane and passamezzo, the allemande was frequently followed by a jumping

dance in triple meter (called *tripla*, *Proportz*) or, in the 17th century, by the *courante*. In the 17th century the allemande became a stylized dance type that was regularly used as the first movement of the \*suite. These allemandes are in very moderate 4/4 time, with a short upbeat, and frequently make use of short running figures that are passed through the various voices of a pseudocontrapuntal fabric. The examples here (1. Ammerbach, 1571; 2. Purcell, c. 1660; 3. J. K. F. Fischer, c. 1690) illustrate the stylistic development of the dance [examples in *HAM*, nos. 216, 232, 250, 253].

In the late 18th century the name *Allemande* was used in South Germany as an equivalent for *deutscher Tanz*, a quick waltzlike dance in 3/4 or 3/8 time. Cf. Beethoven's "à l'Allemande" in his *Bagatellen* op. 119, and his *Zwölf deutsche Tänze* (1795) for orchestra. See Dance music III.

Lit.: E. Mohr, *Die Allemande* (1932); A. Anders, "Untersuchungen über die Allemande als Volksliedtyp des 16. Jahrhunderts" (diss. Frankfurt, 1940).

**Allentando** [It.]. Slowing down.

**Alliteration.** A characteristic feature of ancient North European poetry (*Beowulf*, *Edda*), consisting of the use of words with the same initial letter. This principle was adopted by Wagner in *Ring des Nibelungen*, e.g., "Nach Welten-Wonne mein Wunsch verlangte aus wild webendem Bängen."

**All' ongarese.** See *Ongarese*.

**All' ottava** [It.]. See *Ottava*.

**All' unisono** [It.]. See *Unison*.

**Alman, almayne.** A 16th-century English corruption of \*allemande.

**Alma Redemptoris Mater** [L.]. One of the Marian antiphons; see Antiphon 2. Dunstable, Dufay [see *HAM*, no. 65], Ockeghem, Obrecht, Josquin, and others composed polyphonic settings. Leonel's *Missa Alma Redemptoris Mater* is the earliest known *cantus firmus* Mass.

**Almérie** [F.]. A variety of lute invented c. 1650 by Jean Lemaire (not c. 1750 by Louis Lemaire). The name is an anagram on the inventor's name. See M. Brenet, *Les Concerts en France sous l'ancien régime* (1900), p. 54.

**Alpensinfonie, Eine** [G., An Alpine Symphony]. A long symphonic poem in one movement by R. Strauss, op. 64 (1911–15), describing a day of

Alpine climbing. Particularly noteworthy for its time is the extreme dissonance and daring use of instruments in the section entitled "Erscheinung."

**Alphabet** (in music). See Pitch names; Letter notation; Tablature.

**Alphorn, alpine horn.** A primitive wind instrument, still used by herdsmen in the Alps for signaling over a great distance and for simple melodies. Made of wooden staves bound with strips of birch bark, it is 3 to 10 feet long and appears in various shapes, straight or bent. The tones produced are the harmonics [see Acoustics IV], somewhat modified by the material and the irregular width of the inner tube. In particular, the fourth (11th harmonic) is halfway between f and f-sharp (Alphorn fa) [see *Ranz des vaches*]. Similar instruments are found in Scandinavia, Poland, Rumania, and among the South American Indians. See *SaRM*, p. 7; H. Szadrowsky, in *Jahrbuch des schweizer Alpenclub* iv; K. Nef, in *De Muziek* v. See ill. under Brass instruments.

**Alpine Symphony, An.** See *Alpensinfonie, Eine*.

**Al segno.** See *Segno*.

**Also sprach Zarathustra** [G., *Thus Spake Zarathustra*]. \*Symphonic poem by R. Strauss, op. 30, completed in 1896. It is based on Nietzsche's work of the same name.

**Alt.** (1) Term for the tones of the octave above the treble staff (g'' to f'''), which are said to be "in alt." The tones of the next higher octave are called "in altissimo." (2) In German, the lower of the two female voices, i.e., the contralto [see Alto]. In connection with instruments, the term denotes the second highest member of the family (*Altclarinette*, alto clarinet; *Altsaxophon*, alto saxophone). See the various instruments. *Altgeige* is the viola alta [see Violin family (d)], rarely the ordinary viola.

**Alta** [It., Sp.]. The *alta*, or *alta danza*, is a dance of the 15th century, which, according to the Italian theorist A. Cornazano ("Libro dell' arte del danzare," 1455?), was the Spanish equivalent of the Italian saltarello, the French *pas de Brabant* (It., *passo brabant*). Each of the numerous *basse danse* melodies could also be used for the *alta* [see *Basse danse*]. An *Alta* by Francesco de la Torre (for three instruments; *HAM*, no. 102a) is based on the *basse danse* melody *Il Re di Spagna* [see *Spagna*].

The term also occurs in the phrase *alta musica*

(Tinctoris, c. 1435–1511) as a designation for an ensemble of loud instruments, such as trombone, shawm, bombarde.

**Alteration.** (1) See Mensural notation III. (2) The raising or lowering of a note by means of a sharp or flat, also called chromatic alteration. See Accidentals; Chromaticism; Harmonic analysis V.

**Altered chord.** See Harmonic analysis V.

**Alternation (alternatim).** A term used with reference to early liturgical compositions (12th–16th cent.), primarily to indicate the alternation of polyphony and plainsong, a method that developed from a similar practice in Gregorian chant of alternation between the soloists (*cantores*) and choir (*schola*) [see Responsorial singing; Psalmody II]. Polyphonic composition of such chants (Graduals, responsories, Alleluias) was restricted to their solo sections, which therefore alternated with sections sung in plainsong by the choir. Among the earliest examples is an "Alleluia Angelus Domini" from c. 1100 [Chartres, MS 109; see *HAM*, no. 26]. Consistent application of this principle occurs in the organa of the school of Notre Dame [see Organum V]. In the 15th and 16th centuries the *alternatim* method was used particularly in psalms and the \*Magnificat but also for sequences and hymns. An interesting example of a relatively late date is Tallis' setting of the responsory "Audi vocem" [*HAM*, no. 127].

The practice of alternation is even more important in liturgical organ music. Here not only the psalms, the Magnificat, the \*Salve Regina, and the hymns consisted of organ music alternating with plainsong, but also the various items of the Mass [see Organ Mass]. The normal scheme for the Kyrie was as follows (organ music in italics): *Kyrie Kyrie Kyrie Christe Christe Christe Kyrie Kyrie Kyrie*.

**Alternativo** [It.], **alternativement** [F.]. Indication for one section to alternate with another, as in an A B A structure (ternary form; see Binary and ternary form). In the suites of Bach, an indication such as "Bourrée I, alternativement—Bourrée II" calls for repeat of section A (first *bourrée*) after section B (second *bourrée*). Schumann occasionally used the term *alternativo* as a designation for an internal section.

**Altgeige** [G.] See under Alt (2).

**Althorn.** See under Brass instruments III (f).

**Altissimo** [It.]. See **Alt**.

**Altistin** [G.]. A contralto singer.

**Alto** [It.]. (1) A female voice of low range, also called contralto. See **Voices**, range of. (2) Originally the alto was a high male voice [It. high], which through use of \*falsetto nearly reached the range of the female voice (contralto). This type of voice, also known as \*countertenor, was cultivated especially in England, where the church music of the 16th and 17th centuries definitely implies its use. [For an explanation of the term, see **Contratenor**.] (3) The second highest part of the normal four-part chorus; L. *altus*. (4) In French and Italian, the second highest instrument of the violin family, i.e., the viola. (5) Applied to clarinet, flute, saxophone, etc., the term refers to the third or fourth highest member of the family.

Lit.: G. E. Stubbs, *The Adult Male Alto or Counter-Tenor Voice* (1908); A. H. D. Prendergast, "The Man's Alto in English Music" (*ZIM* i); W. J. Hough, "The Historical Significance of the Countertenor" (*PMA* lxiv).

**Alto clef**. See **Clef**.

**Alto Rhapsody**. See *Rhapsodie aus Goethe's 'Harzreise im Winter.'*

**Altra volta** [It.]. Encore.

**Altschlüssel** [G.]. Alto clef.

**Altus** [L.]. See under **Alto** (3).

**Alzati** [It.]. Indication to remove the mutes.

**Amabile** [It.]. Amiable, with love.

**Amahl and the Night Visitors**. Opera in one act by Gian Carlo Menotti (to his own libretto), produced in New York by N.B.C.-TV Opera Theater on Christmas Eve, 1951, the first opera commissioned specifically for television. Stage premiere, Indiana University, 1952. Setting: near Bethlehem, birth of Jesus.

**Ambitus** [L.]. The range of the melodies of Gregorian chant, varying from a fourth (in some of the simple antiphons) to an octave or more (Graduals, Alleluias, etc.). In the Graduals the ambitus of the verse is often one or two tones higher than that of the respond, e.g., in "Universi" [*LU*, p. 320]. The same is true of the Offertories and their verses (no longer used). The largest ambitus is found in the Offertory "Tollite portas" and its two verses, namely two octaves (from F to f'). In the theory of the church modes

the ambitus is the chief mark of distinction between an authentic and a plagal mode. [See **Gregorian chant** V (b); **Church modes**.] See F. Krasuski, *Über den Ambitus der gregorianischen Messgesänge* (1903); *ApGC*, pp. 133ff, 144ff.

**Amboss** [G.]. \*Anvil.

**Ambrosian chant**. A repertory of liturgical chant named after St. Ambrose (340?-397), Bishop of Milan, and still in use today in the cathedral of that city; therefore also called Milanese chant. It constitutes one of the four (or five) branches of Western Christian chant [see **Chant**]. Its connection with St. Ambrose is even more nominal than that of Gregorian chant with St. Gregory, modern investigations having made it seem probable that most of its melodies are even later than those of the Gregorian repertory, perhaps belonging to the 10th and 11th centuries [see *ApGC*, p. 508f]. Like the Gregorian Mass, the Ambrosian includes ten musical items, only three of which, however, belong to the Ordinary, there being no Kyrie or Agnus (the Credo is called *Symbolum*). The seven items of the Ambrosian Proper are shown here together with the corresponding items of the Gregorian:

<i>Ambrosian</i>	<i>Gregorian</i>
Ingressa	Introit
Psalmellus	Gradual
Hallelujah (Cantus)	Alleluia (Tract)
Post Evangelium	—
Offertorium	Offertory
*Confractorium	—
Transitorium	Communion

Among the Ambrosian offices, that of Vespers is noteworthy for its elaborate structure, including (in addition to the Gregorian items) the \**lucernarium*, *responsorium* (two), *psallenda* (two), and *completorium* (four), as well as a threefold Kyrie.

The Ambrosian psalm tones lack the mediation [see **Psalm tones**] but are much more diversified and flexible than the Gregorian in the selection of the reciting tone and termination (clausula), both of which are determined in a rather intricate manner by the antiphon. They contain no reference to the eight-mode or eight-tone system of Gregorian chant, and neither antiphons nor any other chants are ever assigned to a mode. A considerable number of chants close on the \**affinales*, that is, a, b, c', d'. In contrast to the Gregorian repertory there is very

little uniformity of style within a given category of chant. Thus, some of the *ingressae* are very simple and short and others quite long and highly melismatic. In many other details as well, the Ambrosian repertory lacks the thorough organization of the Gregorian (or, from another point of view, shows greater freedom from strict rule and system).

Selective quotation has done much to spread the misconception that Ambrosian chant in general is prolix and ornate in the extreme, whereas in fact most of its melodies are comparable to those of the Gregorian repertory. Occasionally, however, one encounters extraordinarily long melismas (up to 200 or more notes), particularly in the responsories of Matins. A number of Ambrosian chants have Gregorian counterparts, and in these cases the Ambrosian version is always much more elaborate than the Gregorian [see *HAM*, no. 10; *SchGMB*, no. 2; *BeMMR*, p. 58; *LavE* i.1, 561; O. Ursprung, *Die katholische Kirchenmusik*, 1931, p. 20; A. Gastoué, *Cours . . . de chant grégorien*, 1917, pp. 67, 128, 149]. Possibly these chants represent a later stage characterized by a tendency toward amplification and paralleling the period of troping in Gregorian chant. See Ambrosian hymns.

Lit.: *ApGC*, pp. 465ff; M. Huglo, *Fonti e paleografia del canto ambrosiano* (1956); R. Jesson, "Ambrosian Chant: The Music of the Mass" (diss. Indiana Univ., 1955); R. G. Weakland, in *CP Reese*; K. Ott, "L'Antifonia ambrosiana," in *Rassegna gregoriana* v (1906), and similar articles in v-viii, x (1906-11); ‡\*Editions XLII, A, 5, 6; ‡\**Antiphonale missarum . . . sanctae ecclesiae Mediolanensis* (1935); ‡\**Liber vespertialis . . . sanctae ecclesiae Mediolanensis* (1939).

**Ambrosian hymns.** The hymns of the Roman and Milanese (Ambrosian) rites written by St. Ambrose (340?-397), or others of the same type written later.

I. *Text.* Formerly nearly all the hymns (c. 120) of the *antiphonarium* were ascribed to Ambrose, under the generic name *hymni Ambrosiani*. Actually the number of true Ambrosian hymns is much smaller, hardly more than a dozen. With four of them Ambrose's authorship is placed beyond doubt by the testimony of St. Augustine; these are "Aeternae rerum conditor," "Deus Creator omnium," "Jam surgit hora tertia," and "Veni Redemptor gentium." [See J. P. Migne, *Patrologiae cursus completus*, Latin series, 221 vols. (1844-64), xxxii, col. 618; xxxii, col. 777; xlv, col. 284; xxxix, cols. 1662-63]. Two others,

"Illuxit orbi" and "Bis ternas horas," are mentioned by Cassiodorus (d. c. 583). The scheme of all the Ambrosian hymns is simple, consisting of eight stanzas of four lines each, in iambic tetrameter, e.g.:

Vēnī Rēdēptōr gēntiūm  
Ōstēndē pārtūm vīrgīnīs  
Mīrētūr ōmnē sēcūlūm  
Tālīs dēcēt pārtūs dēūm.

[For the early history of hymnody, see Hymn I, II.]

II. *Music.* The earliest source for an Ambrosian hymn is the \**"Musica enchiriadis"* of c. 900, which contains, in \*daseian notation, a melody for "Aeterna Christi munera" [see *GS* i, 154; *HAM*, no. 9b]. In these circumstances the question of whether this or other melodies are compositions of Ambrose, "early Christian folksongs" (as has been surmised), or products of a later period remains entirely open. Scholars who believe that they date from the 4th century have reconstructed an "original form," i.e., strictly syllabic (the melodies as preserved often contain groups of two or three notes over a

a

Ae - ter - na Chri - sti mu - ne - ra

et mar - tyr - um vic - to - ri - as

b

Ae - ter - na Chri - sti mu - ne - ra

et mar - tyr - um vic - to - ri - as

syllable) and in triple meter. The accompanying example shows a melody (a) in its 9th-century form and (b) in its hypothetical reconstruction [see also *HAM*, no. 9]. The rhythmic interpretation rests on a passage in Augustine's *De musica*, which defines an iambic foot as "a short and a long, of three beats" (*brevis et longa, tria temporum*). Since Augustine's work is a treatise not on music but on poetic versification, this evidence is of rather doubtful validity [see *ApGC*, p. 428f].

The term "Ambrosian hymn" [G. Ambrosi-

*anischer Lobgesang*] is erroneously used for the \*Te Deum.

Lit.: L. Biraghi, *Inni sinceri . . . di S. Ambrogio* (1862); E. Garbagnati, *Gli Inni del breviario ambrosiano* (1897); G. M. Dreves, *Aurelius Ambrosius* (1893); G. Bas, in *Musica divina* xvii; J. Jeannin, in *TG* xxvi, 115.

**Ambrosian modes.** See under Church modes II.

**Âme** [F.]. The sound post of the violin.

**Amelia al ballo** [It., Amelia Goes to the Ball]. Opera in one act by Menotti (to his own libretto), produced (in English) in Philadelphia, 1937. Setting: Milan, 1910.

**Amen.** A Hebrew word, meaning "so be it," which occurs in the Scriptures as an affirmative expression (e.g., in Numbers 5:22 and at the end of Ps. 40 [41]) and is widely used in Christian rites. It is usually spoken by the congregation (or recited by the choir) as a confirming answer to the lection or the prayer of the priest [see *AR*, p. 35\*]. In Gregorian chant it occurs at the end of the lesser \*doxology ("in saecula saeculorum. Amen.") and in the Mass at the end of the Gloria ("in gloria Dei Patris. Amen.") as well as of the Credo ("Et vitam venturi saeculi. Amen."). In the polyphonic Masses of the 17th and 18th centuries the confirming character of the Amen led to the writing of extensive closing sections in fugal style, called Amen fugue or Amen chorus, in which the word is repeated over and over. This practice began with Antonio Bertali (1605-69; see *AdHM* i, 516) and continued throughout the periods of Handel (Amen chorus in *Messiah*), Bach, Mozart, Beethoven, etc. In Cherubini's D-minor Mass, at the end of the Credo the soprano alone repeats the word 107 times. Also noteworthy is the parodistic Amen chorus in Berlioz' *Damnation de Faust* (Part II). For Amen cadence, see Plagal cadence.

**Amener** [F.]. A 17th-century dance in moderate triple time with phrases of six measures (three plus three or four plus two) as a characteristic feature. It occurs in the suites of Heinrich Biber, J. K. F. Fischer, Alessandro Poglietti, in the instrumental suites edited by Écorcheville (*Vingt Suites d'orchestre*, 1906), etc. The derivation of the *amener* from the *basse danse*, given in most reference books, is very questionable. More likely, it is one of the numerous species of \**branle*, a *branle à mener*, i.e., a *branle* in which one couple led while the others followed. See also Minuet.

**American Guild of Organists.** See Societies, musical, I (1).

**American Indian music.** I. *North America.* Although the collection and scientific study of North American Indian music did not commence until the late 19th century, numerous earlier references to it are found, beginning shortly after the coming of the English colonists.

In the 18th century, F. W. Marpur, the German music historian, published *Remarks on Three Songs of the Iroquois* (Berlin, 1760), and an early attempt at adaptation of an actual Indian melody, called *Alknomook* or *Alkmoonok* ("The death song of the Cherokee Indians"), was first published in London in 1784. In America, James Hewitt included *Alkmoonok* in the score he arranged and composed for the ballad opera *Tammany* (1794).

The first serious study of Indian music was undertaken by Theodore Baker, a German-American student at the University of Leipzig, who chose as the subject for his doctoral thesis the music of the North American Indians. In his *Über die Musik der nordamerikanischen Wilden* (Leipzig, 1882), he analyzed some forty songs, discussing their poetry, systems of notation, vocalization, scales, melodic progressions, and rhythms. A little later, Alice C. Fletcher visited the Omaha and Pawnee tribes. She was assisted by John C. Fillmore of Harvard University, who provided piano accompaniments for the melodies she transcribed. Miss Fletcher's findings were published at intervals from 1883 to 1911 by the Peabody Museum of American Archaeology and Ethnology at Harvard University and by the U. S. Bureau of American Ethnology. B. I. Gilman and J. W. Fewkes were pioneers in applying the scientific method to the analysis of Indian melodies. Gilman, who joined the Hemenway Southwestern Expedition, measured the interval structure of Zuni and Hopi melodies by a mechanical device. Fewkes was one of the first to use the phonograph to record Indian singing (1890). Further studies of Pueblo songs were made by Natalie Curtis Burlin, and music of the Ojibways in Minnesota and Wisconsin was transcribed by Frederick R. Burton.

In 1911, the United States Government first undertook the perpetuation of Indian tribal melodies by appointing trained investigators to make phonograph recordings of the melodies with annotations for the Smithsonian Institution. Reports on research have been issued by the Bureau of American Ethnology. The most

prominent worker under these auspices was Frances Densmore, who studied the music and customs of the Chippewa, Teton Sioux, Northern Ute, Mandan, Hidatsa, Cheyenne, Arapaho, Nootka, Menominee, and other tribes. Among later students of this field are Helen H. Roberts, George Herzog, David P. McAllester, Bruno Nettl, Alan P. Merriam, and Gertrude P. Kurath.

It is inaccurate to refer to American Indian music as though it were a unified body of material with a single style. The Indians of North America comprised more than fifty basic linguistic stocks and some six or eight distinct culture areas. However, a number of traits are common to the musical culture of all or most tribes. Music is rarely performed for its own sake; generally, songs are associated with some specific activity or with the performance of some tribal custom or religious rite. There are ceremonial songs, songs for treating the sick, for bringing success in battle, for singing at the time of death, to accompany passage from one age-grade group to another. There are game and gambling songs, songs learned in dreams or visions, children's songs, and songs of courtship. Common to some tribes was the idea of regarding a song as the property of its composer. Some tribes regarded all songs as having supernatural origin; others accepted the idea that songs could be performed by human beings, or "found" in dreams, or learned from other tribes. Some regarded accuracy in performance essential, others considered it possible to make coincidental and intentional changes.

Although there are important regional differences, the following traits characterize most North American Indian music: Most of the music by far is vocal. There is hardly any melodic instrumental music except for flute pieces, many of which may also be sung. Most singing is accompanied by drum or rattle but is monophonic. Men have the leading role in singing, which has a relatively tense, harsh, strident character. Scales are often (but not always) pentatonic, hexatonic, or tetratonic (in order of frequency). Most tribes also have a group of simple two- or three-tone melodies used for children's and gambling songs. The most prestigious instruments in many tribes are the drums, beaten with sticks, but rattles exceed them in number and variety. In some tribes, each ceremony has its own type of rattle.

The regional styles coincide to some extent with the culture areas, but not with the language families. Six main musical areas have been

identified north of Mexico: (1) the Eskimo-Northwest Coast style, whose chief characteristics are complex rhythm, especially in the drumming, and relatively small intervals such as minor seconds; (2) the California-Yuman area, which includes most of California and the Yuman-speaking tribes of the Southwest, characterized by a type of form in which a short, sometimes repeated section alternates with one at higher pitch; (3) the Great Basin area (Nevada, Utah, northern California), characterized by a form in which each phrase is repeated, e.g., a a b b; (4) the Athabaskan area, comprising the Navaho and Apache, characterized by the use of simple rhythms with only two note values, e.g., eighths and quarters, and occasional use of a clear falsetto voice; (5) the Plains-Pueblo area, which combines the complex songs of the Pueblo Indians of New Mexico and Arizona with the simpler ones of the Great Plains, and which is characterized by harsh, tense, pulsating vocal technique, descending, terrace-like melodic movement, and forms in which the stanza consists of two sections that are identical except that the second is an incomplete repetition of the first; and (6) the East, in many ways similar to (5) but distinguished by the occasional use of responsorial singing, by more regular rhythmic units, and some isorhythmic structure. The areas of greatest complexity are the Pueblo, the Northwest Coast, and the area adjoining the Gulf of Mexico. Little is known about aboriginal Mexican Indian music. Presumably the Aztecs and Mayans had a very advanced musical culture that greatly influenced the North American Indians. South American Indian music is in many respects similar to that of North America, but more variety of style and many more instruments seem to have been developed in South America. [See II below.]

There is evidence that the various tribal styles have changed greatly in the last several hundred years, partly because of the impact of Western civilization. The fact that there is some variety in each of many tribal repertoires indicates that change also occurred in earlier times, and indeed one cannot assume that Indian music was static for thousands of years. Western civilization has affected Indian music mainly in an indirect fashion, causing different tribes to be thrown into intimate contact and giving rise to new religious movements. The most important of the latter, the Peyote cult, is known to many tribes and is accompanied by a special musical style that uses a more complex version of the Plains form

together with Athabascan rhythm, a rapid accompaniment of drum and rattle, and a high, whining singing style. Also of recent origin is a pan-Indian movement that mixes tribal traditions and uses a musical style similar to that of the Plains for many tribes, who evidently feel that Indian culture can best be preserved by the merging of tribal differences.

Considering the fact that there were never more than about one million Indians in North America, their large musical repertoires and the fullness of their musical lives are truly amazing. Certainly music played a great role in even the simplest Indian cultures.

Indian music has had some impact on art music in the United States. Edward MacDowell used Indian melodies in his Second Orchestral ("Indian") Suite of 1896, C. S. Skilton in his *Two Indian Dances* and *Suite Primeval*, C. W. Cadman in *Thunderbird Suite* and other works, Frederick Jacobi in his *Indian Dances*, C. T. Griffes in *Two Sketches on Indian Themes*, and Victor Herbert in the opera *Natoma*; H. W. Loomis, Arthur Farwell, Thurlow Lieurance, Carlos Troyer, Henry F. Gilbert, and others have made many settings of tribal material. Among European composers, Dvořák with his symphony "From the New World" and F. B. Busoni with his *Indianisches Tagebuch* may be mentioned.

II. *Central and South America.* Native American music south of the United States border is more difficult to distinguish. For one thing, the native city-states of Central and South America, with their populations in the millions, had a far different history from the relatively isolated tribes of North America.

The Spanish conquest was followed by 400 years of ready mingling of races and cultures. Conquistadors married into royal native families, and patents of nobility were granted by Spain to Indians who had helped the adventurers assume control.

Today, in the cities, composers who may be of Indian or European descent, or both, write symphonies and cantatas drawing on a combination of European and Indian sources. In the villages as well as in cities, the violin and harp may play dance tunes of 16th-century Spain, or one may hear guitars accompanying *huapangos*, fast fiesta songs that are thought to derive from Andalusia during the early colonial period. At church festivals in Mexico the *danza del arco* is accompanied by the fiddle, but also by rattles and a percussion instrument sounded by snapping the

string of a small bow, and feather headdresses (traditionally Indian) are part of the costume.

European influence tends to diminish in more rural areas. In relatively isolated Indian communities, celebrations like the Yaqui deer dance in northern Sonora, Mexico, are aboriginal in purpose and performance, including the music, but still they are performed under the aegis of the Church. Dances incorporating native features into Catholic ritual are common in Central and South America, particularly in Mexico and Guatemala.

The *Pascola* dances are performed at festivals, especially during Easter week. A man, wielding rattles and often wearing other rattles as part of his costume, like the strings of pebble-filled cocoons of the Yaquis, performs a high-stepping dance to the accompaniment of various combinations of flutes, harps, violins, and drums. The *Matachines*, also part of the Easter Week celebration, are danced in parades or in church; the figures are quadrille-like, and the music may be in responsorial sequences between two instruments, such as a pair of violins or a violin and a harp. In the Andes, the dance of the *Chunchus* and *Qollas* portrays incidents from the Conquest, as do the *Danza de la Conquista* and the *Moros y Christianos* of Mexico and the *Tecum Uman* of Guatemala. The *Chunchus* represent Spanish soldiers, led by the king, and the *Qollas* are Indians betrayed by the white man. The *Chunguinada* is fiesta music to accompany processions in which images of the saints are carried, and it also serves as dance music. The harp provides a base in old church chord progressions against flutes carrying characteristic Peruvian melodies in parallel minor thirds.

In Andean music a major role is played by the flute and drums, which may be played simultaneously by one man, and by batteries of panpipes in ensembles of up to 50 or 60 performers.

The chief differences between North and Latin American Indian music are the urban quality of all the latter as well as the profusion and manner of use of musical instruments. Early Spanish accounts of religious observances and state occasions mention processions of instrumentalists. The orchestra with the addition of European instruments has continued to be a feature of Central and South American Indian musical life. The list of musical instruments depicted in inscriptions and recovered from archaeologic excavations, numbering into the hundreds, includes trumpets of shell, pottery, and bamboo,

whistles and panpipes, and many kinds of drum, flute, rattle, and bell. Many of these are in use today in recognizable forms. Musical instruments, used solo or in orchestral combinations, are found even in the hinterlands of the Amazon jungle and the Mato Grosso, where the social organization is tribal and vocal music is often somewhat similar to that of the North American Indians.

At many cultural levels, then, a wide spectrum of musical forms has to be recognized as "Indian." However unclear it may be for definition, there is no doubt as to its vitality and its many-faceted appeal.

II by D.P.MCA.

**American in Paris, An.** See under Symphonic poem IV.

**American Musicological Society.** See under Societies I (2).

**American Negro music.** See Negro music.

**American organ.** See under Harmonium.

**Amfiparnaso, L'.** See under Madrigal comedy.

**Am Frosch** [G.]. Indication to use the portion of the violin bow nearest the right hand.

**Am Griffbrett** [G.]. In violin playing, bowing near the fingerboard (\**sul tasto*). See Bowing (l).

**Amor brujo, El** [Sp., Love the Sorcerer]. Ballet by Manuel de Falla, produced in Madrid, 1915. The music includes numerous dance pieces inspired by folk dances, the best known being the "Ritual Fire Dance." A unique feature is the inclusion of two songs for the ballerina.

**Amorevole, con amore** [It.]. Amiable, with love.

**Amorschall** [G.]. See under Horn II.

**Amour des trois Oranges, L'.** See *Love for Three Oranges*.

**Amphibrach** [Gr.]. See under Poetic meter I.

**Amplitude.** See under Acoustics I.

**Am Steg** [G.]. In violin playing, bowing near the bridge (\**sul ponticello*). See Bowing (k).

**Anabole** [Gr.]. Humanist (16th-century) name for prelude.

**Anacrusis.** Upbeat.

**Analysis.** With reference to music, the study of a composition with regard to form, structure, thematic material, harmony, melody, phrasing, orchestration, style, technique, etc. Analysis of composition plays a predominant part in musical instruction (as a practical application of technical studies in harmony, counterpoint, orchestration) and in writings on music. Analysis is of little value if it is mere enumeration of statistics; such methods, frequently encountered in modern writings, overlook the synthetic element and the functional significance of the musical detail. Another drawback is the one-sided application of only one point of view, for instance, that of form (D. F. Tovey, *A Companion to Beethoven's Pianoforte Sonatas*, 1931) or of phrasing (H. Riemann, *L. van Beethovens sämtliche Klavier-Solosonaten*, 3 vols., 1919-20). In present-day education special emphasis is placed on analysis

of harmony and of form; melodic analysis, however, perhaps the most important and most informative of all, is all too often neglected [see Melody]. Also see Style analysis.

Lit.: A. J. Goodrich, *Complete Musical Analysis* (1889); J. Chailley, *Traité historique d'analyse musicale* (1951); M. McMullin, "The Symbolic Analysis of Music" (*MR* viii); K. Westphal, in *DM* xxiv; A. Halm, in *DM* xxi; W. Karthaus, in *DM* xxi; I. Krohn, in *CP* 1911, p. 250.

**Anapest, anapaest.** See under Poetic meter I.

**Anche** [F.]. \*Reed. *Anche battante*, beating reed; *anche double*, double reed; *anche libre*, free reed. Also *anches*, reed stops of the organ; *trio d'anches*, trio for reed instruments.

**Ancia** [It.]. \*Reed. *Ancia battente, doppia*, etc., as under \**anche*.

**Ancora** [It.]. Once more (repeat). *Ancora più forte*, still louder.

**Ancus.** See under Neumes I (table).

**Andächtig, mit Andacht** [G.]. With devotion.

**Andamento** [It.]. In 18th-century writings: (1) \*Sequence. (2) A special type of fugal subject [see *Soggetto*]. (3) In more recent writings the term is used (preferably) to denote fugal episodes.

**Andante** [It.]. Tempo mark indicating very moderate walking speed, between allegretto and adagio [see Tempo marks]. To the present day there is no agreement among musicians as to whether andante belongs to the quick or the slow tempo. While this question as such would seem to be rather irrelevant, it becomes important in the case of terms such as *più andante*, *meno andante*, *molto andante*, *andantino*. According to the former interpretation, which is supported by the literal meaning of the word, *più andante* and *molto andante* indicate a tempo quicker than the normal andante, while *meno andante* indicates a slower speed. Brahms was undoubtedly aware of this meaning of the term when, at the end of his Andante from the Piano Sonata op. 5, he wrote "andante molto"; the tempo of this closing section is, of course, quicker than that of the preceding *andante espressivo*. However, other composers (perhaps the majority) use *molto andante* to mean a tempo still slower than andante. See Andantino.

**Andante con mòto.** See *Mòto*.

**Andantino.** Diminutive of andante, used mainly to characterize a short piece of andante tempo or character. If used as a tempo mark, it means a slight modification of andante, whose direction is, unfortunately, a matter of divergent opinion [see Andante]. Beethoven was puzzled by the question of whether andantino was to be understood as meaning faster or slower than andante, as appears from a letter he wrote to George Thomson [see *Thayer's Life of Beethoven*, ed. E. Forbes, 2 vols. (1964), i, 555]. Most modern musicians apparently use the term to indicate a tempo quicker than andante.

**An die ferne Geliebte** [G., To the Distant Beloved]. Song cycle by Beethoven, op. 98 (1816), consisting of six songs to poems by A. Jeitteles.

**Andrea Chénier.** Opera in four acts by Umberto Giordano (libretto by Luigi Illica), produced in Milan, 1896. Setting: Paris, French Revolution.

**Anemochord.** See under Aeolian harp; *Sostenente piano*.

**Anenaiki.** The term refers to an abuse of Russian chant [see *Znamenny chant*], practiced chiefly in the 16th and 17th centuries, in which long coloraturas were sung to meaningless syllables such as *a-ne-na*. This method was also known as *chomonie*, a term referring to the replacement of the Slavic half vowels by the full vowel *o*, resulting in syllables such as *chom* or *chomo* [see O. von Riesenmann, in *CP Riemann*, p. 196f]. A similar method used in the Byzantine chant of the same period is known as *teretism*, owing to the use of such syllables as *te-re-rem* for the same purpose. The Russian syllables are probably related to the early Byzantine *enechamata* [see *Echos*]. They appear in a manuscript as early as the 12th century [see *ReMMA*, p. 99, n. 17]. See also *Noeane*.

**Anfang** [G.]. Beginning; *vom Anfang*, same as \**da capo*.

**Angelica** [L.], **angélique** [F.]. See under Lute III.

**Angelito** [Sp.]. A kind of Latin American funeral song performed for the death of a child. Also called *cantos de velorio*, they originated in the idea that a dead child goes to heaven and becomes a guardian angel to his living relatives. The songs, monotonous and repetitious in rhythm, vaguely follow certain liturgical modes. In the Barvolento region in Venezuela, they are known among Negroes as *mampulorios* and accompany a strange funeral game in which a member of the audience tries to blow out a can-

dle held in front of the dead child's face while naming various objects being dropped into a hat on his lap. Among Colombian Negroes these songs are known as *chigualos*. J.O-S.

**Angklung.** See under Java.

**Anglaise** [F.]. A 17th- and 18th-century dance in fast duple time, obviously derived from the \*country dance. It occurs in J. S. Bach's French Suite no. 3 and, under the name "balet anglois" or "air anglois," in J. K. F. Fischer's *Musicalischer Parnassus* of c. 1690. The name was also used for other dances of English origin or character, e.g., the (syncopated) hornpipe and, c. 1800, the country dance and the *écossaise*. See Dance music III.

**Anglican chant.** The harmonized singing of prose psalms and \*canticles, so called because it is extensively used in the Church of England. Extended four-part settings by Tallis, Byrd, and Gibbons, which had the Gregorian psalm tone in the tenor and which were referred to as "festival psalms," were published in John Barnard's *The First Book of Selected Church Musick* (1641). These correspond to the *falsobordone* settings of Josquin des Prés, Victoria, and others on the Continent.

The modern abbreviated form was first published in 1644 in the second edition of James Clifford's *The Divine Services*. The psalm tone remained in the tenor part until the 18th century, when all memory of plainsong singing had passed and melodies were shifted to the treble or soprano part. The following example is "Christ Church Tune," psalm tone I<sub>4</sub>, as printed in William Boyce's *Cathedral Music* (1760):

This is a "single chant," designed for use with a single verse of the psalm at a time. "Double chants" are twice as long and take two verses at a time. [Ex. also in P. Scholes, *The Oxford Companion to Music* (1955), p. 32.]

The prose texts to be sung with these chants are "pointed" to indicate the manner in which the words fit the music. The actual method of pointing varies somewhat among Psalters, but

the following will give an example to fit the tune above. (The strokes coincide with the bar lines. The dot following the word "unto" indicates that those two syllables have to be sung to a single note, preferably by singing that measure as if it contained a triplet of three half-notes. The bold-face type on the syllable "va" indicates that it must be extended over two notes, i.e., a full measure of the chant.)

O Come let us sing | unto . the | Lord; ||  
let us heartily rejoice in the strength of | our  
sal | **va** | tion.||

When sung in speech rhythm by well-trained choirs, Anglican chant can be as aesthetically satisfying as Gregorian chant. Unfortunately, it is most often judged on the basis of untrained congregational singing, where there is a tendency to hurry the initial reciting tones, putting a heavy "Anglican thump" on the last syllable before the bar line, and to stress unduly the final syllable of each line.

Until the 20th-century revival of the use of Gregorian plainsong, Anglican chant was used by churches of many denominations, including Roman Catholic churches. With the return to unison hymn singing among many Protestant congregations, there has been a corresponding trend toward Gregorian chanting in the vernacular, using the editions of Winfred Douglas, Francis Burgess, and others.

Lit.: I. M. McWilliam, *Steps toward Good Chanting* (1938); A. Ramsbotham, in *ML* i, 208-17; R. Bridges, in *MA* ii, 125-41, iii, 74-86; L. Ellinwood, "From Plainsong to Anglican Chant," in *Essays on Church Music in Honor of Walter E. Buszin*, ed. J. Riedel (1966); introduction to *American Psalter* (1929), etc. L.E.

**Anglican church music.** The music of the churches in various countries that derive from the Church of England (e.g., the Protestant Episcopal Church in the U. S. A.), known collectively as the Anglican Communion. For the liturgy of the various services, each national church uses its own Book of Common Prayer, which is closely patterned on the original 1549 Book of Common Prayer of the Church of England, in turn basically an abridgment of the Roman Catholic Breviary and Missal.

In most parish church services, music consists largely of congregational hymn singing and the \*chanting of certain Psalms and \*canticles [see Anglican chant]. Organ compositions are played

as "preludes" and "postludes" before and after services. Until the late 19th century, it was customary to play an organ "voluntary" after the Psalms at Morning and Evening Prayer; this was often an improvisation.

Cathedrals and the larger urban churches employ professional organist-choirmasters and trained singers. In these churches, \*anthems are sung during the collection of alms, and varying amounts of \*service music are used. When the \*Preces, Psalms, \*Suffrages, and \*Collects are chanted in Morning Prayer, the service is frequently called Matins, while that of Evening Prayer is called Evensong. In a fully choral Eucharist (the service of Holy Communion) the proper Collect, Epistle, Gospel, and Sursum Corda are intoned by the celebrant, while the \*Decalogue or \*Kyrie, \*Sanctus, \*Benedictus qui venit, \*Agnus Dei, and \*Gloria are sung by the choir. On some occasions a choral setting of the Creed will be sung by the choir. At other times, it and the Lord's Prayer may be intoned by the entire congregation.

Most of the chanting is done as \*Anglican chant, but since c. 1850 there has been considerable use of plainsong (the medieval Gregorian \*psalm tones and other melodies) adapted to English texts. Service music is always sung with English or other vernacular texts. While the works of Anglican composers are favored, anthems, cantatas, motets, etc., by other composers (Palestrina, Bach, Franck, Tchaikovsky, etc.) also are used. These are sometimes sung in the original language, with translations provided for the congregation to follow.

Mixed choirs of men and women are commonly found in parish churches. Most cathedrals and some larger city churches continue to use the traditional choir of men and boys. Although at the end of the 16th century Byrd and Gibbons extended the tonal range of choral music somewhat, that of the modern Anglican choir of men and boys dates only from the Restoration, when the Chapel Royal choir was revived under Captain Henry Cooke (c. 1616–72). In addition to the bass and tenor parts, men are used for the alto parts, singing either in falsetto or natural countertenor. Boys sing only the treble or soprano parts, with a clear, extremely flexible head tone and a range up to c<sup>'''</sup>. The boys' voices, blended with the men's voices, give a purity of choral tone that can be matched by no other ensemble.

Important early collections of Anglican church music are *Certain Notes . . . to be Sung at the Communion, and Evening Praier*, 2nd ed.

(1565); John Barnard, *The First Book of Selected Church Musick* (10 partbooks; 1641); William Boyce, *Cathedral Music*, 3 vols. (1760–73; 2nd ed. 1788; 3rd ed. enlarged and ed. by Joseph Warren, 1849); Samuel Arnold, *Cathedral Music*, 4 vols. (1790; 2nd ed. 1847 by E. Rimbault). For a list of leading composers, see under Service and Anthem.

Douglas, *Church Music in History and Practice*, ed. by L. Ellinwood (1962); E. Walker, *A History of Music in England*, rev. ed. (1952); G. L. H. Gardner and S. H. Nicholson, *A Manual of English Church Music*, rev. ed. (1936); *Papers of the Church Music Society* (1913—). Also see under Church music.

L.E.

**Angoscioso** [It.]. Sorrowful, grieved.

**Anhemitonic**. An anhemitonic scale (also called tonal scale) possesses no semitones, e.g., one of the four pentatonic scales (c–d–f–g–a–c') or the whole-tone scale.

**Anmutig** [G.]. Graceful.

**Années de pèlerinage** [F., Years of Pilgrimage]. Collective title for three volumes of piano music by Liszt. Each volume contains several pieces with descriptive titles.

**Anonymous**. Of unknown authorship. The medieval Latin word *Anonymus* (abbr. *Anon.*) stands for certain unknown writers of medieval treatises in the collections of Gerbert and Coussemaker [see *Scriptores*], in which they are referred to as Anon. I, Anon. II, etc. It should be noted, however, that the same numbering begins anew in each of the several volumes edited by Coussemaker and Gerbert. Therefore, to prevent possible confusion with another Anonymous IV, the famous treatise known as Coussemaker's *Anon. IV* [see Theory II, 11] should be more precisely referred to as *Anon. IV* of Coussemaker i (CS i).

**Anreissen** [G.]. Forceful attack in string playing.

**Ansatz** [G.] (1) In singing, the proper adjustment of the vocal apparatus. (2) In playing wind instruments, proper adjustment of the lips [see Embouchure (2)]. (3) Crook or shank of brass instruments [see Wind instruments IV (b)]. (4) In violin playing, \*attack.

**Anschlag** [G.]. (1) In piano playing, touch. (2) An ornament explained by K. P. E. Bach [see *Appoggiatura*, double, III].

**Anschwellend** [G.]. Crescendo.

**Answer.** In fugal writing, the answer is the second (or fourth) statement of the subject, so called because of its relationship to the first (or third) statement. Hence, the succession of statements is subject—answer—subject—answer. See M. Zulauf, in *ZMW* vi. See *Fugue*; Tonal and real; Antecedent and consequent.

**Antar.** Symphonic suite (op. 9) composed in 1868 (rev. 1875, '97) by Rimsky-Korsakov. In four movements, it is a descriptive piece based on the legend of Antar, an Arabian hero of the 6th century.

**Antara.** Quechuan name for a Peruvian panpipe of Nazca origin made of three to fifteen reeds or clay tubes that are tied or cemented together. In Peru the instrument is also known by the Spanish name *zampoña*, while in Ecuador it is called *rondador*, in Colombia *capador*, and in Bolivia *sico*. J.O-S.

**Antecedent and consequent.** The terms are usually applied to melodic phrases that stand in the relationship of question and answer or statement and confirmation, as in the accompanying example (Beethoven, String Quartet op. 18, no. 2).

Here, as in other examples, the dialogue character of the melody is emphasized by its distribution between two instruments [see *Durchbrochene Arbeit*]. The terms are also used as synonymous with subject and answer in fugues and canons [see *Answer*].

**Ante-Communion.** The initial portion of the Anglican Holy Communion, usually ending with the Creed or the Prayer for the Whole State of Christ's Church. It is used as a separate service, similar to the Roman Catholic Mass of the Catechumens.

**Anthem.** A choral composition in English, with words from the Bible or some other religious text, performed during the worship service of Protestant churches, where it holds a position

similar to that of the motet in the Roman Catholic rites. An anthem may be unaccompanied or accompanied by the organ or orchestra.

The anthem dates from the Reformation and the consequent establishment of English as the liturgical language of Great Britain. Although the anthem developed from the Latin motet, the first anthems, written by Christopher Tye (c. 1500–c. 1573), Thomas Tallis (c. 1505–85), and Robert White (c. 1530–74), are markedly different in style from previous and contemporary motets. They are rhythmically square, more harmonically conceived, more syllabic, and in shorter phrases, all features resulting from the greater consideration given to text and pronunciation. However, a few anthems are merely motets with texts translated into English (e.g., Tallis' "I call and cry" from *O sacrum convivium*; Byrd's "Bow thine ear" from *Civitas sancti tui*). Toward the end of the 16th century a new form, the verse anthem, was introduced by William Byrd (regarding an isolated earlier example, by Richard Farrant, see G. E. P. Arkwright, in *MA* i, 65n) and developed by Thomas Tomkins (1572–1656) and Orlando Gibbons (1583–1625) [see *HAM*, nos. 151, 169, 172]. This form, in which sections for full chorus alternate with sections for one or more solo voices, was preferred throughout the 17th century, with the full (i.e., completely choral) anthem returning to prominence in the subsequent period. Whereas in the Elizabethan verse anthem the parts are contrapuntally conceived, with the solo part accompanied by instruments, about 1630 a new declamatory arioso style of Italian origin [see *Monody*] was introduced in the anthems of Monteverdi's pupil Walter Porter (c. 1595–1659; see Arkwright, in *MA* iv, 246f), Thomas Tomkins (1572–1656), and, particularly, William Child (1606–97; see the list of his anthems in *GD* i, 623; *GDB* ii, 210; ex. in *OH* iii, 206). The Restoration anthem is represented by Henry Cooke (c. 1616–72), Matthew Locke (c. 1630–71), Henry Aldrich (1647–1710), Pelham Humphrey (1647–74; *HAM*, no. 242), Michael Wise (c. 1648–87), John Blow (1648/9–1708; see *GD* i, 396; *GDB* i, 772ff), Henry Purcell (c. 1659–95), and Jeremiah Clarke (c. 1673–1707). Blow and Purcell introduced instrumental interludes into the anthem, an innovation whereby it came to resemble the cantata. Another characteristic feature of the Restoration anthem, adopted in numerous later works, is a concluding hallelujah chorus, often in fugal style. The use of two choruses, called "dec(ani)" and "can(toris)," pre-

vails in the anthem as well as in service music [see Polychoral style].

The baroque anthem reached its high point in the grandiose anthems of Handel, nearly all of which were written for special festive occasions where an unusual display was possible and appropriate (Chandos anthems, 1716–18; coronation anthems, 1727; Dettingen Te Deum, 1743). Other composers of this period were William Croft (1678–1727; *HAM*, no. 268), John Weldon (1676–1736), and Maurice Greene (1695–1755; *HAM*, no. 279). Their anthems, as well as those of William Boyce (1710–79; see *GD* i, 441; *GDB* i, 864), are modeled after the somewhat simpler style of Purcell.

The outstanding figure of the 19th century was S. S. Wesley (1810–76), whose two volumes of anthems, published in 1853, contain such standard works as “Blessed by the God and Father.”

In America from 1762 until the mid-19th century, one or more simple anthems was included in most of the tune books that were used in churches and singing schools. Until the advent of octavo-size sheet music, they were almost the sole outlet for anthems by both native-born and foreign composers. Prolific but mostly inferior composers were John Goss (1800–80), Joseph Barnby (1838–96), John Stainer (1840–1901), George M. Garrett (1834–97), Arthur Sullivan (1842–1900), Charles Lee Williams (1853–1935), George C. Martin (1844–1916), and the Americans Dudley Buck (1839–1909), Harry Rowe Shelley (1858–1947), and James Hotchkiss Rogers (1857–1940).

Early 20th-century composers of distinction who moved away from the insipid harmonies of the Victorians were Charles Villiers Stanford (1852–1924), Charles Wood (1866–1926), Edward Elgar (1857–1934), Edward Bairstow (1874–1946), Henry Walford Davies (1869–1941), John Ireland (1879–1962), and, most important throughout his long life, Ralph Vaughan Williams (1872–1958). Across the Atlantic, there are the Canadian Healey Willan (b. 1880) and the Americans H. Everett Titcomb (b. 1884), David M. Williams (b. 1887), Joseph W. Clokey (1890–1960), and Philip James (b. 1890).

Among the more important later composers of anthems in England are Herbert Howells (b. 1892), Edmund Rubbra (b. 1901), Michael Tippett (b. 1905), and Benjamin Britten (b. 1913); in America, Randall Thompson (b. 1899), Samuel Barber (b. 1910), and Vincent Persichetti (b. 1915).

Lit.: E. H. Fellowes, *English Cathedral Music from Edward VI to Edward VII*, rev. ed. (1945); M. B. Foster, *Anthems and Anthem Composers* (1901); E. A. Wienandt, *Choral Music of the Church* (1965); R. T. Daniel, “The Anthem in New England before 1800” (diss. Harvard Univ., 1955); W. J. King, “The English Anthem from the Early Tudor Period through the Restoration Era” (diss. Boston Univ., 1962); G. E. P. Arkwright, “Purcell’s Church Music” (*MA* i, 63, 234); H. W. Shaw, in *ML* xix, 429ff (Blow); L. A. Gill, in *MD* xi (Tomkins); R. T. Daniel, in *JAMS* xii, 49ff; W. Palmer, in *ML* xxxv, 107. For anthologies, see under Anglican church music. rev. L.E.

**Anticipation.** See under Nonharmonic tones I; also Nachschlag.

**Antienne** [F.]. (1) \*Antiphon. (2) \*Anthem.

**Antimasque.** See Masque.

**Antiphon.** A term denoting various categories of Gregorian chant, all of which are remnants of the early method of antiphonal psalmody [see under (3) below].

(1) Short texts from the Scriptures or elsewhere, set to music in a simple syllabic style and sung before and after a psalm or canticle. On greater feasts the entire antiphon is sung both before and after the psalm; at other times only the first word or so is sung before, and the whole after [for more details, see under Psalm tones]. The repertory of Gregorian chant includes more than 1,000 such antiphons. The melodies are not all different and can be classified into about 40 (according to Gevaert, 47) groups of chants related to each other through an identical beginning and sometimes through additional common material. [See F. A. Gevaert, *La Mélodie antique dans le chant de l’église latine*, 1895, pp. 225ff; W. H. Frere, *Antiphonale Sarisburiense*, 4 vols., 1901–25, i, 64ff; P. Ferretti, *Esthétique grégorienne*, 1938, pp. 112ff; *ApGC*, pp. 394ff.] The antiphons for the canticles, particularly the Magnificat, are somewhat more elaborate textually as well as musically than the psalm antiphons [see *LU*, pp. 326, 333, etc.; see also O antiphons].

(2) The name “antiphon” is also used for two other types of chant that are not strictly antiphons, since they do not as a rule embrace a psalm or canticle but are independent songs of considerable length and elaboration. The first of these types includes the antiphons that are sung at certain feasts (Palm Sunday, Purification)

during processions (processional antiphons). They are usually of a narrative character, containing verses from the New Testament referring to the occasion, e.g., for Palm Sunday: "Occurrunt turbae cum floribus et palmis" [LU, p. 584]. Comprising the second class of pseudo-antiphons are the four antiphons *B.M.V.* (*Beatae Mariae Virginis*) or *B.V.M.* (Blessed Virgin Mary): \*Alma Redemptoris Mater,\* \*\*Ave Regina caelorum,\* \*\*\*Regina caeli laetare,\* and \*\*\*Salve Regina" [see LU, pp. 273–76]. Each of these chants, also known as Marian antiphons, is sung during one of the four seasons of the year, at the end of Compline (said at the end of each other Office hour). Although of a relatively late date (11th, 12th centuries), they are justly famous for their beauty. In the 15th and 16th centuries they were frequently composed polyphonically, for voices or for organ [see HAM, nos. 65, 100, 139].

(3) While the chants mentioned above are the only ones called antiphons in present-day liturgical books, in historical studies the name is also applied to certain chants of the Mass Proper, namely, the Introit (Introit antiphon, *antiphona ad introitum*), the Offertory (*antiphona ad offerendum*), and the Communion (Communion antiphon, *antiphona ad communionem*). The justification for this terminology is that these chants originally sprang from the same method of antiphonal psalmody that also survives, in a different form, in the antiphons embracing a psalm or a canticle [see Psalmody III].

**History.** In Greek theory, *antiphonia* (literally, countersound) means the octave, in contradistinction to \**symphonia*, the unison, and \**paraphonia*, the fifth. In the early Christian rites, *antiphonia* came to denote the singing of successive verses of a psalm by alternating choruses. This meaning of the term probably originated in the fact that the second chorus consisted at first of women or boys who repeated the melody at the higher octave. In the 4th century antiphonal psalm singing was enriched by the addition of a short sentence sung by the whole choir and repeated after each verse or pair of verses as a refrain. It was this additional text and melody that finally came to be known as antiphon. For a survey of the various forms that sprang from antiphonal psalmody, see Psalmody III; also Gregorian chant IV (c).

**Antiphonal, antiphonary, antiphoner** [L. *antiphonale, antiphonarium*]. A liturgical book containing all the chants for the Office as opposed to

a gradual, which contains all the chants for the Mass. Originally, *antiphonale* (*liber antiphonarius*) was a general designation for books containing the texts (and later texts and music) of the musical items of the Roman rite, as opposed to those containing the spoken texts (lectionaries, evangeliaries—readings from the Scriptures, the Gospels). Books consisting of the musical items for the Office or for the Mass were distinguished respectively as *antiphonale officii* (= antiphonal) and *antiphonale missarum* (= gradual). See Gradual (2); Liturgical books I (4).

**Antiphonal singing.** Singing in alternating choruses. Originally and properly the term should be applied to plainsong [see Antiphon, under *History*]. Regarding the present-day use of antiphonal singing in Gregorian chant, see Responsorial. The term is also used with reference to polyphonic music composed for two or more alternating groups (polychoral).

**Antiphonarium Mediceum.** A name formerly applied to a famous MS of the Medicean library at Florence (Bibl. Laur., *plut.* 29.i). Actually, it is not a book of plainsong but the most extensive collection of polyphonic music of the school of Notre Dame. See Sources, no. 3.

**Antiphonia.** In Greek theory, the octave. See Antiphon, under *History*.

**Antony and Cleopatra.** Opera in three acts by S. Barber (libretto by F. Zeffirelli), produced in New York, 1966. Setting: Alexandria and Rome, 1st century B.C.

**Antwort** [G.]. Answer, in fugues.

**Anvil.** Small steel bars struck with a hard wooden or metal mallet that have sometimes been used as a percussion instrument in operas, usually as a stage property (Auber, *Le Maçon*, 1825; Verdi, *Il Trovatore*; Wagner, *Das Rheingold*).

**À peine entendu.** See *Peine entendu*.

**Aperto** [It.]. Open. (1) In horn playing, the opposite of \**chiuso*. (2) In 14th-century music, see *Ouvert*.

**A piacere** [It.]. Indication for the performer to use his discretion, particularly as to tempo and rhythm.

**Apollo Club.** A name given to American male singing organizations, generally amateur, corresponding to the French \**Orphéon* and the German \**Männergesangverein*. Remarkable for

their high ambitions are the Apollo clubs of Boston (founded in 1871), Brooklyn (1878), Chicago (1872; see L. Edlund, *The Apollo Musical Club of Chicago*, 1946), Cincinnati (1882), and St. Louis (1893). Some of the clubs were expanded into mixed choruses.

**Apollonicon.** See under Mechanical instruments III.

**Apollon Musagète** [Apollo, Leader of the Muses]. Ballet for string orchestra by Stravinsky, produced in Washington, D.C., 1928 (rev. 1947). It consists of a prologue depicting the birth of Apollo, a group of allegorical dances in neo-classical ballet style, and a final apotheosis in which Apollo leads Terpsichore and the Muses to their eternal home on Mt. Parnassus.

**Apostropha.** See under Neumes I.

**Apothéose.** See under Lament (2).

**Apotome.** See under Pythagorean scale.

**Appalachian Spring.** See under Ballet III.

**Apparebit repentina dies** [L., Suddenly shall the day appear]. Cantata for full chorus and brass instruments by Hindemith, commissioned in 1947 for the Harvard Symposium on Music Criticism. The text is a medieval Latin poem describing the day of judgment [see *The Oxford Book of Medieval Latin Verse*, ed. Stephen Gaselee (1928)]. The music is in a series of neo-classic forms and includes a lengthy recitative for the entire bass section of the chorus.

**Appassionata, Sonata appassionata** [It.]. Name customarily given to Beethoven's Piano Sonata op. 57, in F minor. The title was not his but was added by a publisher. The original title is "Grande Sonate pour Piano" (1805). It may be said to form the "dark" companion piece to the \*Waldstein Sonata composed two years earlier. Strikingly contrasted in character, the sonatas are similar in structure: each consists of three movements, the first and the last very long, the second forming a lyrical interlude leading directly into the final movement.

**Applicatur.** An 18th-century German term for fingering.

**Appoggiando** [It.]. "Leaning," i.e., emphasized; also, full legato.

**Appoggiatura** [It.]. (1) In modern parlance, a rhythmically strong dissonant note occurring in place of a harmonic note [see Nonharmonic

tones II]. (2) Originally, appoggiatura [F. *port de voix*; E. forefall, backfall, half-fall; G. *Vorschlag*; Sp. *apoyadura*] was an ornamental note, usually the lower second, that was melodically connected with the main note that followed it (i.e., the appoggiatura was sung in the same breath or played with the same stroke of the bow or articulation of the tongue or, in the case of keyboard instruments, slurred to the following note). It was indicated by means of a small note or special sign but was also frequently introduced extemporaneously in performance. The interpretation of the appoggiatura has varied considerably since the 17th century, when it first became a conventional ornament.

I. In the baroque period the appoggiatura was exceedingly flexible as regards both notation and rhythmic execution. Ex. 1A shows the various ways of indicating the appoggiatura and Ex. 1B the methods of performance that were prevalent around 1700. The choice among these interpre-

tations was left to the discretion of the performer—a "discretion," however, that was not haphazard but was governed by rules (based upon the conduct of the melody and other parts, the tempo and phrasing of the passage in question, and the expression of the accompanying text) that were formulated in textbooks (e.g., B. Bacilly, *Remarques curieuses sur l'art de bien chanter*, 1668) and taught to every student of performance. With the exception of a and b [Ex. 1B], which are exclusively French, these interpretations were taken over by musicians of all nationalities, and they are valid for the per-

formance of music by J. S. Bach, Handel, Purcell, D. Scarlatti, etc. Ex. 2 illustrates the application of these principles to the music of J. S. Bach (a: Little C-minor Fugue; b: Goldberg Variations, aria; c: St. Matthew Passion, bass aria no. 66; d: Sinfonia no. 3). See also *Appuy*; *Port de voix*.

II. After 1750 the performance of the appoggiatura was systematized by the German teachers and writers K. P. E. Bach, Leopold Mozart, F. W. Marpurg, and D. G. Türk. The ornament was then divided into two types: the long, or variable, appoggiatura (*veränderlicher Vorschlag*), and the short appoggiatura (*kurzer Vorschlag*), both to be performed upon the beat. The duration of the long appoggiatura was proportionate to that of the main note with which it was connected, according to the following rules: (a) if the main note can be divided into two equal parts the appoggiatura takes half its value; (b) an appoggiatura to a dotted note takes

two-thirds of its value; (c) in 6/8 or 6/4 meter an appoggiatura to a dotted note tied to another note takes the whole value of the dotted note; (d) if the main note is followed by a rest, the appoggiatura takes the whole value of the main note, the latter is played in the time of the rest, and the rest ceases to exist. In Ex. 3 these four rules are illustrated by quotations from the works of Mozart and Beethoven (a: Mozart, Piano Sonata K. 311; Beethoven, Piano Sonata op. 2, no. 1, Minuet; b: Mozart, Piano Sonata K. 332; c: Mozart, Piano Sonata K. 332; d: Beethoven, "Adelaide").

The short appoggiatura was to be performed as a short note, regardless of the duration of the main note. It was to be used only in the following circumstances: (a) when the main note is itself an appoggiatura (i.e., a nonharmonic note occurring on the beat); (b) when the main note accompanies a suspension or syncopation; (c) when the appoggiatura fills up the intervals in a series of descending thirds; (d) when the main note is a short note that is followed by more notes of the same value; (e) when the main note is one of a series of reiterated notes (see Ex. 4—a: K. P. E. Bach; Beethoven, Piano Sonata op. 2, no. 3; b: K. P. E. Bach; c: Mozart, Rondo in D, K. 485; d: Beethoven, Piano Sonata op. 22, Minuet; e: Mozart, Piano Sonata K. 547a).

The notation of the appoggiatura in this period had no definite relationship to its performance. A few composers wrote the long appoggiatura as a small note of the exact value in which it should be performed and distinguished the short appoggiatura from it by means of a single stroke across the stem (for a 16th note) or a double stroke (for a 32nd note), but this practice was by no means consistently carried out. In music by K. P. E. Bach, Gluck, Haydn, Mozart, and Beethoven, the rules given above constitute a far surer guide to performance than does the physical appearance of the ornament, even in the most reliable editions. For an 18th-century practice of improvised appoggiatura, see Ornamentation I.

III. The 19th century brought still further changes in the treatment of the appoggiatura. The long appoggiatura became absorbed in the ordinary notation, and the short appoggiatura was invariably indicated by a small note with a single stroke across its stem, called a grace note or (erroneously) an *\*acciaccatura*. The question then arises whether this grace note should be performed on the beat or in anticipation of the beat. The latter possibility had already been admitted

by some late 18th-century authorities (who referred to it as a *durchgehender Vorschlag*, distinct from both the *langer* and the *kurzer Vorschlag*) for certain exceptional circumstances. After 1800 this execution became decidedly more popular; it seems to be indicated for most of the grace notes in the works of Chopin, Schumann, Brahms, etc. (Schumann often prescribes it by placing the grace note before the bar line), but lack of material evidence leaves the matter open to controversy in many cases. In modern music it is customary to snap the grace note sharply onto the following note, so that it slightly anticipates the beat and imparts a decided accent to the main note. See Ornamentation. P.A.

**Appoggiatura, double.** The term "double appoggiatura" has been applied to each of the three distinct ways in which two appoggiaturas can be used: first, two appoggiaturas performed simultaneously, at the interval of a third or sixth; second, two conjunct appoggiaturas approaching the main note from the interval of a third above

or below it; and third, two disjunct appoggiaturas, one being placed below the main note, the other above it.

I. Little need be said of the simultaneous double appoggiatura save that each of its components is performed as though the other were not present, as in Ex. 1 (Bach, Suite in E<sup>b</sup>, Sarabande; BG xxxvi, 10).

II. The conjunct double appoggiatura, or slide, was a common *\*agrément* in the 17th and 18th centuries. The 17th-century English lutenists and viol players referred to the ascending slide as an elevation or whole fall and called the descending slide a double backfall. The signs and execution of these ornaments are illustrated in Ex. 2 and 3. Their German equivalent is the *Schleifer*, which is indicated in the music of the baroque period by either a *\*direct* (*custos*) or two grace notes [Ex. 4]. It should always be played on the beat.

The *punctierte Schleifer*, or dotted slide, is a complicated ornament very popular with rococo composers between 1750 and 1780. Its performance is shown in Ex. 5 (by K. P. E. Bach). Another special form of slide, peculiar to keyboard music, is that in which the first note is held throughout. Introduced by the French clavecinists, who called it *coulé sur une tierce* or *tierce coulée*, this *agrément* is indicated and performed as shown in Ex. 6. It was adopted by Purcell and other English composers, who used the same notation but called it a slur. In romantic and modern music this execution of the slide is indicated with a tie, as in Ex. 7 (Schubert, *Moments musicaux* op. 94, no. 3). The performance of the slide in general has changed very little since the 18th century; it is still begun on the beat, as in Ex. 8 (Beethoven, *Bagatellen* op. 119, no. 5).

III. The disjunct double appoggiatura was written in ordinary notes until the last half of the 18th century, when K. P. E. Bach gave it the name *Anschlag* and introduced the two tiny grace notes that have since been used to represent it [Ex. 9]. The first of the two notes that make up the *Anschlag* may be at any distance from the main note, but the second is only one degree removed from it. The ornament should always begin on the beat, as in Ex. 10 (Chopin, *Rondo* op. 16) and Ex. 11 (Chopin, *Polonaise* op. 44).

P.A.

**Appreciation of music.** See Music appreciation.

**Apprenti sorcier, L'** [F., The Sorcerer's Apprentice]. Symphonic poem by Paul Dukas, composed 1897, based on Goethe's ballad, "Der Zauberlehrling."

**Appuy** [F.]. An 18th-century term for a note having the quality of an appoggiatura. It usually refers to the appoggiatura that constitutes the first note of the *tremblement* or *cadence* [see Trill].

P.A.

**Appuyé** [F.]. With emphasis.

**Après-midi d'un faune, L'** [F., The Afternoon of a Faun]. Symphonic poem by Debussy, composed 1894, a musical interpretation of a poem by Mallarmé. It portrays a faun dozing in the warm sunshine of the Apennines, his dreams interrupted by a vision of fleeing nymphs. The complete title, *Prélude à l'après-midi d'un faune*, has given rise to the theory that Debussy planned additional sections. The work, in which the sensuous atmosphere of the poem is captured with consummate skill, is one of the first and

most convincing realizations of musical \*impressionism.

**Apsidenchöre** [G.]. The two choirs of a *coro spezzato*, so called because they were placed in the two apses of the church [see *Cori spezzati*].

**Aquitanian neumes.** The neumatic script from southern France (Aquitaine). See Neumes II (table, col. III).

**Arabella.** Opera in three acts by Richard Strauss (libretto by H. von Hofmannsthal, after his short novel *Lucidor*), produced in Dresden, 1933. Setting: Vienna, 1860.

**Arabesque** [F.; G. *Arabeske*]. A fanciful title used by Schumann, Debussy, and others for pieces of a more or less casual nature. The term is also used in the sense of figuration, ornamentation of a melody.

**Arab music.** The music of the Arab nations and tribes of Arabia, North Africa, and the Near East.

Our knowledge of the history of this music is derived chiefly from theoretical treatises since there are very few examples of notated compositions, and none prior to the 13th century. Among the most important treatises are those of Al-Kindī (c. 796–c. 873), Al-Fārābī (872–950), Ibn Sīnā (Avicenna, 980–1037), Šafī al-Dīn (d. 1294), and 'Abd al-Qādir (d. 1435). The *Kitāb al-mūsīqā al-kabīr* of Al-Fārābī in particular [trans. D'Erlanger, *La Musique arabe* i and ii] contains a detailed presentation of theory (going beyond its Greek models), information on practice, and an exemplary account of the main instruments. Material on musicians and the social background may be found in works of a more general nature, notably the *Kitāb al-aḡhānī*. There is also a considerable literature on the legal status of music, much of it hostile.

Most theorists discuss intervals and tetrachord species at great length, often presenting them through various frettings on the *'ūd*, a short-necked lute with four (later five) strings, which is the ancestor of the European lute. In the 8th and 9th centuries, according to Ibn al-Munajjim, its fretting was:

open string	g (0)	c'	f'	b <sup>b</sup> '
first finger	a (204)	d' (702)	g' (1200=0)	c'' (498)
second finger	b <sup>b</sup> ' (294)	e <sup>b</sup> ' (792)	a <sup>b</sup> ' (90)	d <sup>b</sup> '' (588)
third finger		e' (906)	a' (204)	d'' (702)
fourth finger	c' (498)	f' (996)	b <sup>b</sup> ' (294)	e <sup>b</sup> '' (792)
				e'' (906)

The notes f'-e'' formed a normative series from which eight diatonic modes were derived, the second and third finger notes being mutually exclusive. Al-Fārābī also gives a quite different fretting on another instrument (the *ṭunbūr baghdādī*, a long-necked lute with 2 strings) producing a series of approximate quarter tones within a range of little more than a minor third. He attributes this problematical fretting to the pre-Islamic period (6th and early 7th centuries), but it can hardly have represented the dominant tradition of that time.

During the 9th and 10th centuries Persian influence again made itself felt. There arose rival schools of musicians, those led by Ibrāhīm ibn al-Mahdī welcoming change and artistic freedom, while Ishāq al-Mawṣilī (d. 850) and his followers adhered to the classical style. The most far-reaching innovation was the introduction into court music of a neutral third (perhaps of indigenous origin), which led to the disruption of the diatonic modal system. By the 11th century the notes found within the tetrachord (i.e., on any one string of the 'ūd) were g a<sup>b</sup> a<sup>♯</sup> a b<sup>b</sup> b<sup>♯</sup> b c' (♯ is halfway between <sup>b</sup> and <sup>♯</sup>). Various empirical formulas were given for locating frets for the neutral intervals. In the 13th century these were, however, integrated into the Pythagorean system by Ṣafī al-Dīn, being placed one comma below the diatonic intervals so that the tetrachord becomes in theory g (0), a<sup>b</sup> (90), a<sup>-c</sup> (180), a (204), b<sup>b</sup> (294), b<sup>-c</sup> (384), b (408), c' (498). In practice the neutral intervals of course remained, and Ṣafī al-Dīn's notation of the twelve main modes (*shudūd*, later *maqāmāt*, sing. *maqām*) may be amended to (f<sup>♯</sup> is halfway between ♭ and ♯):

g a b c' d' e' f' g'  
 g a b<sup>b</sup> c' d' e<sup>b</sup> f' g'  
 g a<sup>b</sup> b<sup>b</sup> c' d<sup>b</sup> e<sup>b</sup> f' g'  
 g a b<sup>b</sup> c' d' e<sup>b</sup> f' g'  
 g a<sup>b</sup> b<sup>b</sup> c' d<sup>b</sup> e<sup>b</sup> f' f<sup>♯</sup> g'  
 g a b<sup>b</sup> c' d' e<sup>b</sup> f' f<sup>♯</sup> g'  
 g a<sup>b</sup> b<sup>b</sup> c' d<sup>b</sup> e<sup>b</sup> e<sup>b</sup> f<sup>♯</sup> g'  
 g a<sup>b</sup> b c' c<sup>♯</sup> d' e' f<sup>♯</sup> g'  
 g a b<sup>b</sup> c' d<sup>b</sup> e' f' g'  
 g a<sup>b</sup> b c' d<sup>b</sup> e<sup>b</sup> f' g'  
 g a<sup>b</sup> b<sup>b</sup> c' d<sup>b</sup> e<sup>b</sup> f' g'  
 g a<sup>b</sup> b<sup>b</sup> c' d<sup>b</sup> e' f' g'

The b in *Buzurg* and *Rāhawī*, and e' in *Zangūla* and *Hījāzī*, are notated as b<sup>-c</sup> and e'<sup>-c</sup> respectively.

These octave scales are to a certain extent artificial since the melody was articulated essentially in terms of tetrachords and/or pentachords, one being developed after another. By the beginning of the 16th century about forty modes were in use, and many were in fact notated in the form of melodic matrices [see D'Erlanger, iv, 429-52]. The rhythmic modes, characterized by the distribution of strong and weak beats as well as by the number of time units within the cycle, had also evolved throughout this period, increasing in number from eight (9th century) to more than twenty (16th century). From our sources it would appear that from the 13th to the 16th centuries most of these melodic and rhythmic modes were common to Persia and the eastern Arab world [see Persia].

The 16th to 19th centuries were a time of cultural stagnation and political decline for the Arabs, and the few extant treatises of this period are somewhat uninformative. They attach especial importance to the doctrine of *ta'thīr* (ethos) first mentioned by Al-Kindī, whereby music is integrated through complex series of associations (e.g., the twelve *maqāmāt* with the zodiac, the four strings of the 'ūd with the humors, elements, etc.) into the macrocosmic scheme [see Farmer, *The Influence of Music: from Arabian Sources*]. A similar attitude is evident in Sufi writings on music.

Arab music has not remained static since the 16th century; nevertheless the remarks above on the structure of the melodic and rhythmic modes are also valid for the present-day classical idiom (although not necessarily for folk music).

1. The beginning of a composition notated c. 1300 and ascribed to Ṣafī al-Dīn (d. 1294). The mode is Muḥayyir ḥusaynī, the rhythm Khafif. 2. The beginning of an improvisation in the mode Bayātī (recorded c. 1930?).

Ex. 1 and 2 develop just one pentachord and tetrachord respectively. The modern *maqām* may be made up of a considerable number of these, arranged in a fixed sequence, and may in addition be characterized by the position of prominent notes and by certain melodic features. In the eastern Arab world solo improvisation is generally unmeasured (*taqsim*), but may be in a rhythmic cycle of 8 units (*taqsim 'alā al-wahda*). A rondo form, *bashraf*, is also important. In North Africa the most characteristic form is the *nawba*, comparable in the set order of its movements to the 18th-century suites of European classical music.

The most important instruments today are the 'ūd and the *qānūn* (\*kanun), followed by: the *rabāb*, a boat-shaped fiddle (but a spike fiddle in the eastern regions); the *nāy*, a vertical flute; the *kamānja*, a violin or viola; the *darbukka*, a vase-shaped drum; and the *duff* (or *riqq*), a tambourine.

Translations of treatises are: (French) Al-Fārābī, Ibn Sīnā (Avicenna), Ṣafī al-Dīn, and others in R. d'Erlanger, *La Musique arabe*, 6 vols. (1930–59); (German) Al-Kindī in R. Lachmann and Mahmud el-Hefni, *Ja'qūb ibn Ishāq al-Kindī* (1931); (English) Al-Fārābī in H. G. Farmer, *Al-Fārābī's Arabic-Latin Writings on Music*.

**Archlute** [F. *archiluth*; G. *Erzlaute*; It. *arciliuto*; Sp. *archilaut*]. A lute with two pegboxes, one for the fingered strings, the other for the bass courses (theorbo, chitarrone). See Lute III.

**Arcicembalo, arciorghano** [It.]. Microtonic instruments of the 16th century, described by N. Vicentino in his *L'Antica Musica* (1555) and *Descrizione dell' arciorghano* (1561). Each had six manuals containing 31 keys to the octave, and these gave all the tones of the diatonic, chromatic, and enharmonic genera of ancient Greek theory. A simplified instrument of greater practical importance was built by the Belgian Charles Luython (1556–1620); it had 18 keys in each octave, namely—in addition to the diatonic

tones—c $\sharp$  and d $\flat$ , d $\sharp$  and e $\flat$ , f $\sharp$  and g $\flat$ , g $\sharp$  and a $\flat$ , b $\flat$ , e $\sharp$ , and b $\sharp$ . This instrument, called “clavicymbalum universale” (M. Praetorius, in his *Syntagma musicum*, vol. ii [1618], praises it as “instrumentum perfectum, si non perfectissimum”), permitted enharmonic change and modulation in all the keys, without the compromise of equal temperament. Compositions such as John Bull’s fantasia on the hexachord “Ut, re, mi, fa, sol, la” (*Fitzwilliam Virginal Book*, i, 183; see Hexachord IV) are evidently written for this instrument. In the preface to his *Correnti, Gagliarde e Balletti . . . libro quarto* (1645), Martino Pesenti mentions two other instruments, one built by Domenico de Pesaro in 1548, the other by Vido Trasentino in 1601, the former with 24, the latter with 28 keys in the octave.

Lit.: A. Koczirz, in *SIM* ix; Shohé Tanaka, in *VMW* vi, 66ff; W. Dupont, *Geschichte der musikalischen Temperatur* (1935), pp. 51ff.

**Arco** [It.]. Bow (of violins, etc.). See *Col arco*.

**Arditamente** [It.]. Boldly.

**Ardore, con** [It.]. With warmth.

**A re, are.** See under Hexachord III.

**Areito.** A dance of the West Indies. The music consists of alternating solo and group singing accompanied by percussion instruments. It is also known as *batoco*, and in Mexico as *mitote*.

J.O.S.

**Argentina.** The beginnings of musical activity in Argentina are associated with a number of *ministriles* (Martin Nino, Juan Andrés Mendoza, Juan Jara, Rodrigo Melgarejo, and others) who joined Spanish expeditions to the New World. The *ministriles* were servants trained in the art of singing and playing certain instruments, such as the vihuela, lute, organ, and clavichord. Most of them lived in Asunción but were sent for short periods to Buenos Aires, then a small village.

Argentine musical life first began to have some continuity with the establishment of Jesuit missions in the Paraná River region and the arrival of trained musicians who joined these missions at the time Father Pedro Comental (1595–1665) founded the first school of music in this area. Accordingly, the earliest accomplishments in professional music education are linked with the names of Belgian-born Father Juan Vasseau (Vaseo or Vaiseau, 1584–1623) and to that of the French Father Luis Berger (1588–1639). Berger’s activities extended throughout Argentina and Paraguay, and even to Chile. In

1691, the Austrian-born Father Antonio Sepp (1655–1733), who had participated for many years in the imperial court choir in Vienna, arrived in Buenos Aires. He was assigned to the Mission of Yapeyú, which he made one of the most important music centers by the end of the 17th century. The most distinguished musician to be assigned to the missions was the Italian composer and organist Domenico Zipoli (1688–1726), who arrived in Buenos Aires in 1717. He was stationed in Córdoba and became the organist of the Jesuit chapel there. References to “30 motets by Brother Zipoli” have been found in the National Archives, but so far only the manuscript of a Mass for four voices and continuo has been discovered. During the remainder of the 18th century Jesuit priests such as Martin Schmid (1694–1773), Juan Mesner (1703–68) and Florián Paucke (1719–80) played a role in Argentina’s musical development.

In the 19th century a number of native composers were strongly influenced by Italian opera, especially by Bellini and Rossini. Among these were Amancio Alcorta (1805–62), Juan Pedro Esnaola (1808–78), and Juan Bautista Alberdi (1810–84). Alcorta, an economist and politician, became active as a composer after 1822, writing largely songs, piano pieces, chamber and church music. Esnaola, a native of Buenos Aires, founded the Academia de Música y Canto and composed a number of piano pieces, songs, hymns, church music, and two symphonies. Alberdi was a prominent writer who composed a number of songs and piano pieces on the side. He also wrote an essay, “The Spirit of Music,” and in 1832 published a piano method for amateurs.

Between 1850 and 1880 a considerable number of composers of semiprofessional status, most of them living in Buenos Aires, produced salon music and a few orchestral and stage works. The most representative members of this group were Saturnino F. Berón (1847–98), author of a *Treatise of Modern Music* (1859); Luis José Bernasconi (1845–85); Juan Gutiérrez (1840–1906), founder and first director of the Conservatorio Nacional de Música (1880); Francisco A. Hargreaves (1849–1900), the first native Argentine composer of operas (*La Gatta Bianca*, 1875; *Los Estudiantes de Bologna*, 1897; *L’Assedio* and *Psyche*, unpub.); and Zenón Rolón (1856–1902), who also wrote operas (*Solané*, *Le Prove*, *Fides*) as well as a number of operettas and *zarzuelas*.

By 1880 a new generation of composers had emerged in Argentina, most of them professional and winning recognition abroad. All of them

cultivated the major symphonic forms as well as chamber music and opera. Herman Bemberg (1861–1931) composed an opera, *Elaine*, that was performed in London (1892) and New York (1894); Justin Clérice's (1863–1908) opera *Figarillo* was introduced with great success in Paris (1889), Antonio Restano's (1860–1928) *Un millioncino* in Turin (1885), and Eduardo García Mansilla's (1866–1930) *Ivan* was staged in Russia (1905). The most important composer of this generation was Alberto Williams (1862–1952), closely followed in prestige by Arturo Berutti (1862–1938), Ettore Panizza (b. 1875), and Constantino Gaito (1878–1945). Williams, a grandson of Alcorta, studied in Paris for seven years. In 1889 he returned to Buenos Aires, where he devoted his time to teaching, giving piano concerts, conducting, and writing some 136 compositions, including nine symphonies, several symphonic poems, orchestral suites, chamber music, choral and piano works, and songs.

Julián Aguirre (1868–1924) is the most important of the immediate followers of Williams' early nationalist trends. The desire to create styles relatively free from European influences was shared by a group of composers active at the turn of the century, among them Carlos López-Buchardo (1881–1948), Gilardo Gilardi (1889–1963), and Athos Palma (1891–1951).

The development of opera in Argentina was particularly stimulated by the Teatro Colón (founded 1908) in Buenos Aires. Pascual de Rogatis (b. 1881), Raul H. Espolle (b. 1888), Enrique M. Casella (1891–1948) and Felipe Boero (b. 1884), the last-named the composer of *El Matrero*, which describes life in the Argentine pampas, are some of the outstanding figures of 1900–30 who produced operas strongly influenced by Italian verismo.

Nationalism remained an active force in Argentine symphonic and chamber music throughout the first half of the 20th century. It influenced not only those composers who still support the use of folk material in art music but also a number of those who, after 1950, gradually withdrew. Juan Carlos Paz (b. 1897) was among the first to lose interest in nationalism. By 1930 he was a strong supporter of serial techniques. As founder of the *Grupo Renovación*, he attracted many younger followers and his influence remains strong in Argentina.

Juan José Castro (1895–1968) and his brothers José María Castro (1892–1964) and Washington Castro (b. 1909) represent a stream of composition that moved from the nationalism of the

early 20th century toward greater universalism. This group also includes Floro M. Ugarte (b. 1884), Jacobo Ficher (b. 1896), Honorio M. Siccardi (b. 1897), Luis Gianneo (b. 1897), Carlos Suffern (b. 1905), Roberto García Morillo (b. 1911), Carlos Guastavino (b. 1914), Guillermo Graetzer (b. 1914), the Spanish-born Julian Bautista (1901–60), and Alberto Ginastera (b. 1916), the last-named becoming one of the leading creative forces in Latin American music. From Ginastera's earliest nationalist compositions, such as his ballets *Panambi* (1937) and *Estancia* (1941), to the neoclassical approach of his Sonata for Piano (1952), *Variaciones Concertantes* (1953), and his two String Quartets (1948, '58), and thence to his more recent interest in atonal and serial techniques (*Cantata para América Mágica*, 1960; Concerto for piano, 1961; Concerto for violin, 1963; the opera *Don Rodrigo*, 1964), his work showed a considerable and important evolution. As head of the Center for Advanced Musical Studies established in Buenos Aires in 1962, Ginastera has helped train many of Latin America's most talented young composers.

Today a large group of outstanding musicians is continuing Argentina's musical development through the paths of the most advanced compositional techniques. Representative of this group are Roberto Casamaño (b. 1923); Antonio Tauriello (b. 1928); Mario Davidowsky (b. 1934), a composer of electronic music; Alcides Lanza (b. 1929); Mauricio Kagel (b. 1931), a native of Argentina and developer of electronic and aleatory techniques who has worked in Germany since 1960; Carlos Tuxen-Bang (b. 1932); Gerardo Gandini (b. 1936); and Armando Krieger (b. 1925).

The folksongs and dances of Argentina are linked to three chief traditions: the indigenous music of Andean origin, exemplified by the *\*huaiño* and *\*carnavalito* from the province of Jujuy and the *\*baguala* and *\*vidala* of the northeast; the Creole tradition, which developed mainly in the north, exemplified by such types as the *\*triste*, *\*gato*, *\*zamba*, and *\*estilo*; and the European tradition, exemplified by the *alabanza*, [see Aguinaldo], *\*villancico*, *polca* (polka), and *vals* (waltz). The modern *\*tango*, which took on its present form at the turn of the century, is more an expression of popular music from urban Buenos Aires than of folk music.

**Aria.** I. An elaborate composition for solo voice (occasionally for two solo voices; see Duet) with instrumental accompaniment. The aria figures prominently in the cantatas and oratorios of the 17th and 18th centuries and in opera up to the end of the 19th century except for the Wagnerian type. It is distinguished from the air, song, or lied by (a) generally greater length; (b) nonstrophic form (except for its earliest development; see II); and (c) emphasis on purely musical design and expression, often at the expense of the text. In fact, the small regard that many aria composers have shown for the text has evoked serious criticism of the form and, in some instances, has led writers of operas to banish the aria from the stage. By and large such criticism cannot be justified. Although at certain periods the aria style has been characterized by conventionalism and exaggeration, the great majority of arias represent a treasure of great musical value. Moreover, in opera the aria has a definite and important function, in representing lyric episodes that temporarily relieve the dramatic tension of the action.

II. The word "aria" is derived from Gr.-L. *aer* (air), a term that came to mean mode or manner, scheme, model, etc. [see Ayre (3)]. In O. Petrucci's *Strambotti, ode, frottole, sonetti . . . libro quarto* (1505) a composition is called "Aer de versi latini," and one in his *Frottole libro nono* (1508) is marked "Aer de capitoli." Each represents a model melody to be used for a variety of texts having the same poetic structure. M. A. Ingegneri's *Il Secondo Libro de' madrigali . . . a quattro voci* (1579) includes two "Arie di canzon francese per sonare" (for four instruments); M. Facoli's *Il Secondo Libro d'intavolatura di balli* (1588) has twelve *arie* for harpsichord, among them one "da cantar terza rima"; and G. M. Nanino's *Il Primo Libro delle canzonette* (1593) has an "Aria di cantar sonetti" and an "Aria da cantar in ottava rima." Designations such as "Aria di Ruggiero" and "Aria di Firenze" probably refer to strophic songs, in which the same melody was used for the different stanzas of the poem. This meaning is clearly present in G. Caccini's *Le Nuove Musiche* (1601), where the term "aria" is used for short mo-

nodic melodies to be repeated with a number of stanzas [see K. Jeppesen, *La Flora*, vols. i, iii], whereas the longer, more elaborate, and through-composed monodies are called madrigals. Caccini's type of aria was cultivated by such German composers as Johann Staden (1581–1634; see *DTB* 12 and 14), Heinrich Albert (1604–51; see *DdT* 12/13; *HAM*, no. 205; *SchGMB*, no. 193), Adam Krieger (1634–66; see *DdT* 19; *HAM*, no. 228; *SchGMB*, no. 209), and J. Philipp Krieger (1649–1725; see *DdT* 53/54). Those of A. Krieger [see Ritornello (2)] especially are important forerunners of the German strophic lied of the 18th and 19th centuries [see *RiHM* ii.2, 331ff].

III. One of Caccini's arias, "Ard' il mio petto," consists of three stanzas having the same bass but varied melodies [*SchGMB*, no. 172]. This is the earliest known example of the \*strophic-bass aria, which became the most important type in the period up to c. 1630. The strophic-bass aria occurs in: Jacopo Peri, *Le Varie Musiche* (1609); Alessandro Grandi, *Cantate et arie a voce sola* (1620; see *RiHM* ii.2, 39f); Stefano Landi, *Arie a una voce* (1620); Girolamo Frescobaldi, *Primo Libro d'arie musicali* (1630; see Jeppesen, *La Flora*, vol. iii, no. 35); and other collections of arias. To the same type belongs the Prologue of Monteverdi's *Orfeo* (1609; *La Flora*, vol. ii, no. 1), in which each varied stanza is followed by an instrumental ritornello.

Shortly after 1630 a new type appeared in the *ostinato* aria, which is through-composed over a short *basso ostinato*, usually in descending motion. Among the earliest examples is an aria, "Io son pur giovinetta," in Benedetto Ferrari's *Musiche varie* of 1633, based entirely on an *ostinato* that descends through an octave. Many other examples are found in his *Musiche [e poesie] varie* (1637, 1641; see *RiHM* ii.2, 55ff, 64ff). Monteverdi employed this type in the final duet of *L'Incoronazione di Poppea* (1642; see *SchGMB*, no. 178), which at the same time is an early example of a tripartite *da capo* aria. The *ostinato* type, actually a "vocal passacaglia" [see Chaconne and passacaglia], continued to be used frequently by Italian, English, and French composers of the second half of the 17th century, among them Carissimi, Stradella, Provenzale [*HAM*, no. 222], Purcell, and F. Couperin [see also the Crucifixus of Bach's B-minor Mass].

IV. The next stage (c. 1650–1750) is characterized by the establishment of the *da capo* aria as the preferred form. It consists of two sections followed by a repetition of the first, resulting in

a tripartite structure A B A. An early example is the above-mentioned duet from Monteverdi's *L'Incoronazione*. Numerous others occur in the cantatas of Luigi Rossi (1598–1653; see *HAM*, no. 203), Giacomo Carissimi (1605–74; see Jeppesen, *La Flora*, vol. i), or in the operas of Pietro Francesco Cavalli (1602–76), Marc' Antonio Cesti (1623–69), Agostino Steffani (1653–1728; see *HAM*, no. 244), and others. These arias are usually of small dimension (brief *da capo* aria) and in triple meter, sometimes suggestive of dance rhythms. A special feature, introduced c. 1660 by Cesti and Legrenzi, was the use of a so-called motto [*G. Devise*], that is, two introductory announcements of the beginning of the melody, first by the singer (a'), then by the instruments (a''), after which the full melody (a) is sung [see Motto (b)]. The early 18th century saw the rise of the grand *da capo*, characterized by considerably larger dimensions, virtuoso style of singing, and the use of a three-part modulatory scheme in the over-all form (B usually in the relative key, R) as well as in each section. The material of B is generally different from that of A but not of a strongly contrasting character. This type was developed by Alessandro Scarlatti (1660–1725; see *HAM*, no. 258) and universally adopted by other late baroque composers, including Bach and Handel.

The grand *da capo* aria became the basic ingredient of the so-called Neapolitan opera [see Opera VIII], which usually consisted of some twenty arias of a highly virtuoso character, connected by *secco* recitatives. In keeping with the strict conventions of 18th-century Italian opera, the arias were codified and classified according to typical situations of the plot, e.g.: *aria di bravura* (quick, deliberately difficult, sung to express passion, vengeance, rejoicing, triumph); *aria di mezzo carattere* (moderate tempo, expression of gentle feelings); *aria cantabile* (slow, expression of grief or longing); *aria parlante* (emphasis on the text, often with only one note to the syllable). The desire of great singers to show their ability in various musical styles led, about 1750, to the double aria, a form consisting of two separate arias of contrasting character, the first usually dramatic, the second lyrical.

V. After 1750 the conventionalized *da capo* aria was gradually replaced by arias written in

a variety of forms and showing more individual expression. This tendency probably received its first impulse from the *opera buffa*, which by its very nature had no use for the aria types of the *opera seria*. An early example of the new kind of aria is the *\*cavatina* "Godi l'amabile" from K. H. Graun's *Montezuma* (1755). Many others are found in the operas of Jommelli, Traetta, and, of course, Gluck and Mozart. The aria remained in favor with operatic composers throughout the first half of the 19th century (Beethoven, Auber, Rossini). While Wagner discarded it (except in his earliest operas, *Rienzi*, *Der fliegende Holländer*, *Tannhäuser*, which still contain a few well-defined arias), Verdi continued to make full use of it except in his last two operas (*Otello*, 1886; *Falstaff*, 1893).

The term "aria" was also used for short instrumental pieces of a songlike character, e.g., movements of a suite [Muffat, Handel; see Air (3)] or a theme for variations (*aria con variazioni*; see Bach's "Goldberg" Variations, Pachelbel's *Aria Sebalдина*).

Zanon, ‡*Venti Arie... di Fr. Cavalli* [n.d.]; L. Walther, *Die Ostinatotechnik in den Chaconne- und Arienformen des 17. und 18. Jahrhunderts* (1940); I. Schreiber, *Dichtung und Musik der deutschen Opernarien, 1680–1700* (1934); B. Hjelmberg, in *CP Jeppesen*; B. Flögel, "Studien zur Arienteknik... Händels" (*Händel-Jahrbuch*, 1929); L. Torchi, "Canzoni ed arie... nel secolo xvii" (*RMI* i, 581); J. Godefroy, "Some Aspects of the Aria" (*ML* xvii, 200). See also under Cantata; Opera.

**Ariadne auf Naxos.** Opera in one act and a prologue by R. Strauss (libretto by H. von Hofmannsthal), originally produced in Stuttgart in 1912 as an entr'acte for Molière's play *Le Bourgeois Gentilhomme*, for which Strauss also wrote the incidental music. Setting: Vienna, 18th century, and Naxos, ancient Greece. In 1916 it was produced in Vienna as an independent work, with the addition of an introductory scene representing the stage rehearsal of the work.

**Aribú.** An Afro-Brazilian dance song of rural origin, performed during harvest celebrations to the accompaniment of guitars and castanets. It is also called *lundú*. See bibl. under Brazil. J.O-S.

**Arietta** [It.], **ariette** [F.]. (1) A small aria, usually in binary form and lacking the musical elaboration of the aria; thus rather a song or a *\*cavatina*. (2) In French operas before 1750, an aria to Italian words, usually in brilliant coloratura style. (3) In the *opéra comique* of the second half of the 18th century, a solo song (aria) in French, preceded and followed by spoken dialogue, the work being known as a *comédie mêlée d'ariettes*. D.J.G.

**Arioso** [It.]. Properly, *recitativo arioso*, that is, a recitative of a lyrical and expressive quality, not, as usual, narrative and speechlike. The arioso style, therefore, is midway between that of a recitative and an aria. A good example showing the difference among these three styles is a can-

tata by Marc'Antonio Cesti (c. 1650), reproduced in *AdHM*, pp. 439ff. Historically, the arioso came earlier than the speechlike recitative. All the composers of the Florentine opera (Peri, Caccini, Monteverdi) employed the *recitativo arioso*, the expressive and quasimelodic recitative. Bach often uses the arioso for the concluding section of a recitative in order to give it a particular expression of assurance or confidence [see *Cavata*]. The accompanying example is taken from his cantata *Ein' feste Burg*. Beethoven, in the final movement of his Piano Sonata op. 110, uses the term for an accompanied recitative played on the piano.

**Arithmetic and harmonic mean.** The arithmetic mean  $a$  of two numbers  $m$  and  $n$  is determined by the equation  $m - a = a - n$ , and the harmonic mean  $h$  by the same relationship between the reciprocals:  $\frac{1}{m} - \frac{1}{h} = \frac{1}{h} - \frac{1}{n}$ . Hence,  $a =$

$\frac{1}{2}(m + n)$ , and  $h = \frac{2mn}{m + n}$ . The musical significance of these two means was recognized by Boethius, who pointed out that the arithmetic mean (L. *medietas*) of the octave (frequencies 1 and 2) is the fifth:  $\frac{1+2}{2} = \frac{3}{2}$ , while its har-

monic mean is the fourth:  $\frac{2 \times 1 \times 2}{1 + 2} = \frac{4}{3}$ . Of even greater importance was the discovery, made by Zarlino, that the two corresponding divisions of the fifth ( $m = 1$ ;  $n = \frac{3}{2}$ ) lead respectively to

the major and minor thirds:  $a = \frac{(1 + \frac{3}{2})}{2} = \frac{5}{4}$ ;

$h = \frac{(2 \times 1 \times \frac{3}{2})}{(1 + \frac{3}{2})} = \frac{6}{5}$ . The major triad is represented by the arithmetic progression  $1 : \frac{5}{4} :$

$\frac{3}{2} = 40 : 50 : 60$ ; the minor triad by the harmonic progression  $1 : \frac{6}{5} : \frac{3}{2} = 40 : 48 : 60$ . It

may be noted that the above measurements are in frequencies (octave = 2), and that the opposite correspondences are correct if the tones are determined by lengths of strings. Therefore Zarlino (who, of course, knew nothing about frequencies) quite properly calls the major triad c-e-g *harmonica* and the minor triad d-f-a *arithmetica*.

**Arlésienne, L'** [F., The Woman of Arles]. Incidental music by Georges Bizet (1838–75) to Alphonse Daudet's play *L'Arlésienne*. It is usually played in the form of two orchestral suites [see Suite V], the first arranged by Bizet in 1872 and the second by E. Guirand after Bizet's death.

**Armenia.** Since Armenia was the first country officially to adopt the Christian faith (A.D. 303), the history of Armenian sacred literature and music has attracted much attention. The Armenian liturgy, like that of Byzantium, consists chiefly of hymns. The oldest of the hymns were in prose. Later, versified hymns became prominent, especially through the activity of the great poet Nerses Schnorhali (11th cent.). The official book of hymns, called *sharakan*, contains 1,166 songs. The earliest preserved liturgical manuscripts containing musical signs date from the 14th century. The notation is a highly developed system of neumes (Armenian neumes), which certainly was the result of a long evolution [examples in *LavE* i.1, 552; J. Thibaut, *Origine byzantine de la notation neumatique de l'église latine*, 1907, pl. 4], but the lack of treatises explaining this notation renders the Armenian neumes undecipherable. In the early 19th century a new system of musical notation, similar to that of present-day Greek church music, was introduced, and it is still in use. Whether the present-day melodies are identical or similar to those of the early books cannot be ascertained, but the fact that the modern chants are grouped according to an *oktoechos* [see *Echos*] suggests an ancient origin for the melodies. The continuity of tradition is more doubtful so far as the rhythmic interpretation of Armenian chant is concerned. The melodies of the present liturgy are based upon strict time, with the temporal unit (*kèt*, i.e., beat) divided into an elaborate system of rhythmic formations of smaller values, including 32nd and 64th notes. Whereas scholars such as R. P. Dechevrens and J. C. Jeannin have considered this rhythm of great antiquity and have used it as an argument in favor of strictly rhythmical interpretation of Gregorian chant, P. Aubry considers it a fairly recent innovation due to Turkish influence (15th century). The purest source of Armenian church music is undoubtedly the music in use at Echmiadzin, which is also used at Tiflis and Erivan. The collections issued by European and American communities differ widely from the traditional forms, chiefly owing to the use of cheap modern harmonizations.

**Armonica.** See Glass harmonica.

**Armure** [F.]. Key signature.

**Arpa** [It., Sp.]. Harp. See also under Psaltery.

**Arpègement** [F.]. Older term for *arpège* (arpeggio). For *arpègement figuré*, see *Acciaccatura*; *Arpeggio*.

**Arpeggio** [It.; F. *arpège*; Sp. *arpeggio*]. The notes of a chord played one after another instead of simultaneously. In modern music the arpeggio is indicated by one of the signs given in Ex. 1. Its execution always starts with the lowest note, and as a rule it should begin at the moment when the chord is due (i.e., on the beat), whether indicated by sign or by tiny notes [Ex. 2, Mozart, Sonata in C major, K. 309 (K. Einstein 284b); Ex. 3, Chopin, Nocturne op. 62, no. 1]. There are cases, however, in which the melody carried by the top note of the arpeggio will not bear the delay caused by this execution, so that the last note of the arpeggio must then be made to coincide with the beat [Ex. 4, Mendelssohn, *Songs without Words*, no. 30]. The latter performance is generally to be recommended in piano music whenever the arpeggio occurs in the left hand alone, as in Ex. 5 (Chopin, Mazurka op. 7, no. 3). A distinction should be made between an arpeggio played simultaneously with both hands. [Ex. 6] and a long arpeggio in which the right hand succeeds the left [Ex. 7]. The latter is (or should be) indicated by a long arpeggio sign, joining

the two staves. For the violin arpeggio, see Bowing (i).

In the music of the 17th and 18th centuries the execution of the arpeggio varied considerably (often at the discretion of the individual performer) in respect to direction and number of notes. The French clavecinists used the signs shown in Ex. 8 to indicate the *arpègement en montant* (ascending arpeggio) and those in Ex. 9 for the *arpègement en descendant* (descending arpeggio). Other special signs were used to indicate various kinds of *arpègement figuré*, or arpeggios in which unwritten notes are introduced [see Ex. 10, 11, 12]. In performance of these *arpègements figurés* all the notes are held except those that are foreign to the chord, which are immediately released [see *Acciaccatura*]. An appoggiatura to an arpeggio chord is incorporated in the arpeggio, occasioning a delay of the particular note to which it belongs, as in Ex. 13. A combination of *arpègements figurés* and an appoggiatura is shown in Ex. 14, from Bach's Partita in E minor.

In music of the time of Bach and Handel the word "arpeggio" is sometimes found written at

the beginning of a sequence of chords. In this case, the player is at liberty to break the chords up and down several times, to extend them, and to interpolate extraneous notes as he sees fit [see Handel's own notation of the last four bars of the Prelude to his keyboard Suite in D minor]. The note values, and even the tempo of such passages, are left entirely to the player's discretion. These chords (e.g., those in Bach's Chromatic Fantasia) are written in measured time only to facilitate reading, the style of performance being derived from the unmeasured preludes of the lutenists and early French clavecinists (Louis Couperin, D'Anglebert, etc.; see Prelude II).

P.A.

**Arpeggione** (also called guitar violoncello, *guitare d'amour*). A stringed instrument the size of a cello but with a guitarlike body and six strings tuned E, A, d, g, b, e', invented in 1823 by G. Stauffer. It is played with a bow. Franz Schubert wrote the only existing composition for it, a sonata for arpeggione and piano (1824; see *Franz Schuberts Werke*, 1888–97, ser. viii).

**Arpicordo**. Italian 16th-century name for a harpsichord that differed in some unknown detail from the clavicembalo [see Harpsichord II]. Note the title of a publication of 1551: *Intabolutura nova di varie sorte de balli da sonare per*

*arpichordi, clavicembali, spinette et manachordi*; also G. Picchi, *Intavolatura di balli d'arpicordo* (1620; \*Editions V, 2). See "Arpichordum" in *SaRM*. Perhaps it is identical to the *Arpichordum* as described by M. Praetorius (*Syntagma musicum*, 1619, ii, ch. 43), "a jack-action instrument or virginal on which a harplike sound is produced by means of a special stop which governs brass hooks under the strings." S. Virdung in his discussion of the *Claviciterium* in *Musica getutscht* (1511), J. Adlung (*Anleitung zu der musikalischen Gelahrtheit*, 1758, note r to Par. 246), and P. N. Sprengel (*Handwerk und Künste in Tabellen*, Berlin, 1773, xi, 265) all mention versions of the device. It seems to have produced a buzzing tone sometimes considered to be harplike and sometimes compared to the reed stops of the organ (*Schnarrwerk*). Metal pins or hooks were moved close to the strings so as to jar against them. add. by F.H.

**Arpitarrone.** Name given by Adriano Banchieri to an instrument (made for him by Michel de Hodes) with the form of a harpsichord and the sound of a \*chitarrone. See his *L'Organo suonarino* (1611), p. 57.

**Arraché** [F.]. Forceful pizzicato.

**Arrangement.** The adaptation of a composition for a medium different from that for which it was originally written, so made that the musical substance remains essentially unchanged. From the early 14th to the end of the 16th century, we have evidence of an ever increasing practice of arranging vocal music (motets, Mass items, madrigals, chansons, etc.) for a keyboard instrument or for lute in order to make such compositions available for domestic performance and enjoyment [see *Intabulation*]. In the baroque era this practice largely disappeared, no doubt because of the greatly reduced importance of vocal music. It is interesting to note that the greatest creative genius of this period, Bach, was almost the only one to take considerable interest in the recreative activity of arranging compositions of his own or others. Well-known examples are his arrangements for the harpsichord and organ of violin concertos by Vivaldi and others, and his transcription of the Fugue from his solo Violin Sonata in G minor for the organ (D minor; *BG* xv, 148). This last is of interest as being one of the earliest instances of an arrangement from a limited medium to one of ampler resources. To this category also belong Rameau's arrangements of his harpsichord pieces for an instru-

mental ensemble (*Pièces de clavecin en concerts*, 1741, for harpsichord, flute, and viol). Other noteworthy examples are Haydn's *Die Sieben Letzten Worte . . . am Kreuze* [see *Seven (Last) Words*], Liszt's concert arrangements of operatic scenes and of Schubert's songs, Brahms' transcription for two pianos of his orchestral *Variations on a Theme by Haydn*, etc.

In a different category are the customary piano arrangements of operas, symphonies, string quartets, etc., which are primarily designed for study purposes. The first such arrangements of symphonies by Haydn, Mozart, and Beethoven were made by F. Mockwitz (1785–1849).

Since about 1910 there has been an extraordinary amount of activity in transcribing Bach's organ works for the piano and the orchestra. Although this must be welcomed as a token of the ever growing interest in the work of the great master, the development has taken on forms that have recently led to a sharp reaction against the "business of arrangement." This opposition, however, is justifiable only with regard to certain methods of transcription. Several transcribers (e.g., Respighi), impelled by the richness of modern orchestration or piano technique, have tried—and certainly with success—to give Bach's organ pieces an impressionist lushness or a romantic emotionalism that is inconsistent with the intrinsic clarity of his style.

**Arrescu** [Sp.]. See *Aurresku*.

**Ars antiqua** [L.]. I. The term *ars antiqua* (*ars veterum*) was used by writers of the early 14th century (e.g., "Speculum musicae" c. 1325; see *CS* ii, 429) to distinguish the late 13th-century school (Franco, c. 1260; Petrus de Cruce, c. 1290) from that of their own day, which was called \**ars nova* (or *ars modernorum*). Today, both terms are usually employed in a wider sense, denoting music of the 13th and 14th centuries respectively. The *ars antiqua*, then, includes the school of \*Notre Dame with its two masters, Leoninus (second half of 12th cent.) and Perotinus (c. 1160–1220), and the ensuing period, which, for want of other names, may be divided into the period of Franco (middle 13th cent.) and

that of Petrus de Cruce (late 13th cent.). The school of Notre Dame was preceded by the school of \*St. Martial (c. 1100–50).

Leoninus, called “optimus organista” by the English Anon. IV [CS i, 342]—i.e., “greatest composer of organa,” not, as some modern writers believe, “very able organist”—was the creator of the “Magnus liber organi,” which in its final form represents a complete cycle of two-part organa (*organa dupla*) for the ecclesiastical year, about 90 in all.

Perotinus, “optimus discantor” (i.e., greatest composer of \*discantus), enlarged this repertory by composing organa in three and occasionally four parts (*organum triplum* and *organum quadruplum*; see *AdHM* i, 226, 228–32). He and his collaborators also added a large number of short compositions, mostly in two parts, the so-called clausulae, which were designed to be used as substitutes for corresponding sections in Leoninus’ organa. These clausulae constitute the link with the following period, since they were frequently transformed into motets. The motet is the representative form of the middle and second half of the 13th century, when it was cultivated almost to the exclusion of any other type of music. The propensity of the 13th-century musicians (practically all anonymous) for this form would be difficult to understand were it not for the fact that the motet, which originally was a strictly liturgical form (a clausula provided with a full text in the upper part), soon underwent secular influence, partly from the tradition of the troubadours, which brought with it fresh impulses and even various heterogeneous elements (mixture of Latin and French, of liturgical tenors and love lyrics). The repertory of the school of Notre Dame also includes a large number of \*conductus, i.e., Latin songs in one to four parts, mostly to devotional texts, but without plainsong *cantus firmus*, such as occurs with all the organa, clausulae, and motets.

II. The 13th-century technique of composition may be described as “successive counterpoint.” The composer starts out with one complete voice, the tenor, which is either a pre-existent plainsong melody (this is the case with organa, clausulae, and practically all motets) or one written by the composer himself (this is the case with conductus). To this fundamental part the others are added successively, first the *duplum* (called *motetus* in a motet), then the *triplum*. [Regarding the principles of consonance and dissonance, see Harmony II A.]

The most important contribution of the *ars*

*antiqua* lies in the field of rhythm. While the organa of the school of St. Martial employ for their upper part melismas in free, unmeasured rhythm, the period around 1180 marks the establishment of strict rhythm, based on the rhythmic modes [see Rhythm III (b), (c)]. This new rhythm presents itself clearly in the discant sections of Leoninus’ organa, whereas the organum sections are written in a transitional style whose rhythmic interpretation is still a matter of controversy [see Organum]. With Perotinus, modal rhythm (usually reproduced in modern editions as  $2 \times 3/8 = 6/8$  meter) was universally adopted for the entire organa and their derivative types. For the most important sources of 13th-century polyphony, see Sources, nos. 3–7. For more complete lists see F. Ludwig, in *AMW* v; also *ApNPM*, p. 201f, sections II, III.

**Arsis and thesis** [Gr.]. Arsis means “lifting” [G. *Hebung*] and thesis means “lowering” [G.

*Senkung*]. In Greek poetry, these terms were used in the sense of bodily movement, such as the lifting and lowering of the foot (as in dancing) or the hand (in conducting). Consequently, thesis meant the long syllable, or upbeat, of a simple metrical foot (e.g., dactyl: - ~ ~), while the remainder of the foot was regarded as the arsis. Unfortunately, Roman and medieval writers reversed the meaning of the terms, interpreting them as referring to the raising and lowering of the voice, not the foot. Since with a pair of tones the higher one is usually accented more than the lower, the term arsis (high) was identified with accent, and thesis (low) with lack of accent:

a t a t a t  
- ~ - ~ - ~

It is in this sense that the terms are usually employed in French writings on meter and metrical music. The usage also persists in German terminology, in which *Hebung* (arsis) means strong beat, *Senkung* (thesis), weak beat [see *Vierhebigkeit*]. Modern English writers have returned to the original and proper meaning of arsis and thesis [see, e.g., *Webster's Collegiate Dictionary*]. This usage is observed in this book. See Poetic meter.

To 16th- and 17th-century theorists (G. Zarlino, C. Butler, T. Morley), the phrase *per arsin et thesin* meant "by contrary motion," i.e., by inversion. The same phrase was used later by F. W. Marpurg (*Abhandlung von der Fuge*, 1753–54) to designate a fugue in which the answer is in contrary rhythm, i.e., what had been on a strong beat in the subject was now on a weak beat.

**Ars nova** [L.]. I. *General*. Generic name for the music of the 14th century, in contradistinction to the *\*ars antiqua*, i.e., music of the 13th century. Properly, the name should be restricted, as it originally was, to French music of the first half of the 14th century, represented by the most recent compositions in the "Roman de Fauvel" [see Sources, no. 8] and by the works of Philippe de Vitry (1291–1361). Indeed, compositions of the late 14th century, especially French ones, show features of intellectual refinement, affectation, and even decadence that are scarcely compatible with the term [L., new art]. In the early 14th century, however, the *ars nova* began as a novel movement whose chief champion was Philippe de Vitry. About 1325, he employed the term *ars nova* as the title of a treatise, which unfortunately deals primarily with the notational

rather than the musical innovations of the period [CS iii, 13; trans. by P. Bohn, in *MFM* xxii]. More illuminating from a general point of view are the discussions in the "Speculum musicae," whose author, Jacques de Liège [see Theory B, no. 13], gives extremely interesting information regarding the stylistic contrast between the *ars antiqua* and the *ars nova*, although he speaks from a decidedly antimodernist point of view, always extolling the *ars veterum* (Franco of Cologne and Petrus de Cruce) over the "unnatural" innovations of the *moderni* [Book VII, ch. 43–46: "Collatio veteris artis . . . ad novam"; see CS ii, 383, 427–32]. On the other hand, Johannes de Muris, who was formerly thought to have written the "Speculum musicae," actually was another leader of the new movement, as was the contemporary Italian writer Marchetto da Padua, who in his "Pomerium in arte musicae mensuratae" contrasts the Italian and the French notation of the 14th century and decides in favor of the latter. In the field of musical composition the 14th century saw continued activity in France and the rise of a new school of polyphonic music in Italy. There are also a limited number of English compositions of the 14th century whose main interest lies in their extended use of \*voice exchange and in their early employment of \*sixth-chord style [see England III; Worcester, school of].

II. *The French ars nova*. The main achievement of the *ars nova* (and at the same time the point of attack by its adversaries) was the conquest of new territory in the field of rhythm and meter. While the music of the late 13th century was dominated by the principle of triple division (*modus perfectus* and *tempus perfectum*; modern equivalent 3/4 time with eighth-note triplets), the binary divisions were now admitted, so that the composer could choose from a variety of meters—2/4, 3/4, 6/8, and 9/8. Another important difference is the replacement of the rhythmic formula ♩ by its inversion, ♪. Jacobus strongly defended the former, saying that it "conforms

Typical rhythms of (a) *ars antiqua*; (b) *ars nova*.

with nature, which is always stronger at the end than at the beginning," but it is the latter that prevails in the motets of Vitry and of the greatest French composer of the 14th century, Guillaume de Machaut (c. 1300–77). Still another important aspect of the motets of this period is the use of isorhythm, regularly in the tenor and occasionally in the upper parts as well. Even more radically new is the style of Machaut's secular works, the polyphonic *ballades*, *rondeaux*, and *virelais*, most of which are probably of a later date than his motets. These secular pieces show free contrapuntal texture, supple rhythms, and expressive melodies, and generally bear the stamp of high refinement, delicacy, individuality, spontaneous creation, and even personal feeling, so that one is almost tempted to speak of a "14th-century romanticism." Toward the end of the 14th century there flourished in southern France (papal court of Avignon; secular courts of Orléans, Navarre, Berry) and also in northern Spain (court of Aragon) a group of French and Italian composers (Solage, Senleches or Selesses, Grimace, Cordier, Matteo da Perugia, Antonello da Caserta, and others) who constitute the "mannerist school," so called because of its tendency toward exaggeration and overrefinement. They cultivated a style characterized by almost unbelievable rhythmic complexities (cross rhythms, extended syncopations, written-out rubatos), equally complex methods of notation [see ch. ix, "Mannered Notation," in *ApNPM*], extravagant harmonies, bold dissonances, etc., resulting in "a musical texture . . . as disintegrated as . . . Webern's" [*GDB*, s.v. "Ars nova"]. An entirely different segment of French music of the late 14th century is represented by the Codex Apt [see Sources, no. 19], which includes liturgical compositions written in a simple style, among them historically important settings of hymns.

The harmonic style of the *ars nova* shows some advance over that of the *ars antiqua* insofar as thirds are introduced more frequently. Of special interest is the treatment of dissonances, which frequently reminds one of the dissonant counterpoint of modern composers (e.g., Hindemith). The polyphonic texture stands, as it were, under the influence of "points of magnetic attraction," at which the parts start and converge in perfect consonances, mainly octaves, fourths, and fifths, while in between the lines move with a remarkable degree of individuality and independence from harmonic considerations.

III. *The Italian ars nova*. In the tradition of

Italian 14th-century music two schools can be distinguished, the earlier of which is represented by Magister Piero, Giovanni da Cascia (or Johannes de Florentia), and Jacopo da Bologna, and the later by Francesco Landini (1325–97), Paolo Tenorista, Ghirardello da Firenze, and others. Musical as well as notational features indicate that Italian polyphonic music branched off from the French tradition of the late 13th century, particularly from the style of Petrus de Cruce. However, in the half-century 1275–1325 it developed special traits that led to a decidedly national repertory and style. The forms of the earlier school are the madrigal and the *caccia*, while in the later school the *ballata* (the French *virelai*) prevails. The style of the earlier compositions may be described as an "ornamented conductus style." The voices, usually two and having the same text, move simultaneously, the lower part in longer note values, the upper frequently in quick figurations that remind one of the coloraturas of the 17th and 18th centuries. With Landini much of the elaborate texture and rhythmic refinement of French music (Machaut) appears in Italy. He largely abandoned the madrigal in favor of the *ballata* and often added an instrumental contratenor to the vocal duet formed by the discant and the tenor. Combining French subtlety and spirituality with Italian fullness and warmth, he created works that foreshadow the transparent beauty of early 15th-century music (Dunstable, Dufay). Paolo Tenorista is noteworthy for his fairly extensive use of imitation. At the end of the 14th century there appeared in Italy a Flemish composer, Johannes Ciconia (c. 1335–1411), who figures prominently in the development leading to the 15th century. In general, Italian music of the 14th century is much simpler than the French. Syncopations are rare or, if present, take place within the confines of a measure. Dissonances are much less pronounced and the feeling for tonality is considerably more developed, particularly through the frequent use of well-defined cadences.

**Art ballad.** See *Ballade* [G.].

**Arte musicale in Italia, L'.** See Editions III.

**Articulation.** A term used to denote (or demand) clarity and distinct rendition in musical performance, whether vocal or instrumental. Correct breathing, phrasing, attack, legato, and staccato are some of the aspects involved. See Phrasing and articulation.

**Art of Fugue, The** [G. *Die Kunst der Fuge*]. The last work of J. S. Bach, written in 1749 and published posthumously, in a rather careless manner, by his sons in 1750. It contains some 20 fugues and canons, called *contrapuncti*, all based on the same theme [Ex. 1], in which the various devices of imitative counterpoint, such as inversion, stretto, augmentation, diminution, canon, double fugue, triple fugue, etc. are exploited in the most elaborate and ingenious manner. The number of pieces varies in the different editions, some of which combine two related pieces under one number. Formerly *The Art of Fugue* was considered chiefly a magnificent manual of advanced counterpoint, but it is now universally recognized as one of the greatest musical creations. The turning point was the first public

performance, promoted by W. Graeser (1906–28) in Leipzig in 1927. This event was the beginning of a sensational revival that has since spread over the entire musical world.

The inaccuracy of the first printed edition has given rise to a century or so of controversy concerning the proper order of the *contrapuncti*, a controversy in which historical, paleographic, and artistic arguments as well as metaphysical speculations and mathematical abstractions have been advanced without yielding a final answer [see Lit., Hauptmann, Rust, Graeser,

David, Tovey, Apel]. A special problem is presented by the last (unfinished) fugue, which has frequently been considered extraneous to the work, since none of its three subjects (the last of which is \*B-A-C-H) is the principal subject of *The Art of Fugue* [see A. Schweitzer, *J. S. Bach*, 2 vols. (1911), i, 424]. G. Nottebohm (1817-82), however, showed that this subject can be contrapuntally combined with those of the last fugue [Ex. 2]. This is sufficient reason for assuming that the unfinished "triple fugue" was planned as a gigantic quadruple fugue, a fitting climax to the whole work. The chorale "Wenn wir in höchsten Nöten sein," which was added by the editors "as a recompense for the incomplete fugue," does not belong to the work; yet, if played after the abrupt breaking off of the preceding fugue, it takes on a symbolic significance that may outweigh historical scruples. According to Mizler (1754), Bach planned to write still another quadruple fugue that could be reversed (crab motion) in all its parts [see *GD*, Sup. Vol., p. 10].

Another problem of *The Art of Fugue* is that of medium and performance—the question as to whether it is keyboard, orchestral, or chamber music. The lack of instrumental specifications in either the autograph or the first edition, together with the use of the scholarly *contrapunctus* as a designation for the various pieces, characterizes *The Art of Fugue* as a work that is not dependent upon specified medium or sound. Therefore any kind of performance that conforms to the austere spirit of the composition must be considered justifiable. On the other hand, it should not be overlooked that all the pieces, with the exception of the mirror fugues (nos. XII and XIII of the Peters ed.), are within reach of the hands of a keyboard player. Evidently, in composing the work, Bach was thinking of keyboard performance, if only for instructive purposes. F. Busoni, in his *Fantasia contrappuntistica* (1910), has offered a congenial modern version, fantastically expanded, of Bach's last fugue.

Lit.: *BG* xxv; other editions by Czerny, W. Graeser, H. T. David, D. F. Tovey (with completion of the unfinished fugue), Roy Harris (for string quartet), E. Schwebsch (for 2 pianos); M. Hauptmann, *Erläuterungen zu Joh. Sebastian Bachs Kunst der Fuge* (1841); D. F. Tovey, *A Companion to "The Art of Fugue"* (1931); B. Martin, *Untersuchungen zur Struktur der 'Kunst der Fuge'* (1941); G. M. Leonhardt, *The Art of Fugue, Bach's Last Harpsichord Work* (1952); C. S. Terry, in *MQ* xix; H. David, in *JMP* xxxiv; W. Apel, in *DM* xxii.4; H. Husmann, in *BJ* xxxv;

J. A. Burns, "L'Impiego della partitura e l'Arte della Fuga di J. S. Bach" (*L'Organo* ii, 163ff.).

**Art song.** A song of serious artistic intent written by a trained composer, as distinct from a folk-song. See Song; Song cycle.

**As, ases** [G.]. A-flat, a-double-flat; see Pitch names.

**ASCAP.** American Society of Composers, Authors, and Publishers, a society founded in 1914 by Victor Herbert mainly to protect copyrights and performing rights. About 10,000 composers, authors and publishing firms belong to it.

**Asia.** See Mesopotamia; China; Japan; etc. See R. A. Waterman, *et.al.*, "Bibliography of Asiatic Musics" (*Notes* v-viii; 15 installments).

**Aspiration** [F.]. See under Nachschlag.

**Assai** [It.]. Much, e.g., *allegro assai*, quite fast.

**Assassinio nella Cattedrale** [It., Murder in the Cathedral]. Opera in two acts and an intermezzo by I. Pizzetti (libretto by A. Castelli after T. S. Eliot's play), produced in Milan, 1958. Setting: Canterbury Cathedral.

**Assez** [F.]. Enough, e.g., *assez vite*, fairly quick.

**Assyria.** See under Mesopotamia.

**Atabal.** Name for a set of three single-headed drums found in rural districts of the Dominican Republic. Also known as *palos*, the set consists of a *palo mayor* (large drum) about 48 inches high and 22 inches in diameter, a *palo segundo* (middle-sized drum) 42 inches high and 16 inches in diameter, and a *palo auxiliar* (small drum) 36 inches high and 12 inches in diameter. The drums are placed upright, the larger two being beaten with the palms and fingers and the smallest with a pair of *palitos* (drumsticks).

J.O-S.

**Atabaqués.** Set of three single-headed upright barrel drums used mainly in the *candomble* ritual dances in Bahia, Brazil. All three are beaten with the palm and fingers. They also are known as *tabaques*.

J.O-S.

**Atem** [G.]. Breath. *Atempause* (breathing pause), a very short rest used in instrumental performance for the sake of articulation or phrasing. It is sometimes indicated by an apostrophe: '.

**A tempo** [It.]. Indicates return to normal tempo after deviations such as *ritenuto*, *più lento*, *ad libitum*, etc.

**Atonality.** Literally, absence of tonality. Tonality is a particular expression of the general principle of relaxation of tension, tension being a particular state that implies its "resolution," i.e., a return to relaxation, a stable state. Harmonically, the fundamental expression of tonality is the dominant-tonic relationship. When the harmonic relationships of a composition can be considered to derive from this fundamental relationship—remotely or closely, for a long or a short time—the music is said to be tonal.

In the history of Western music, tonality dominates a period of about two centuries, from the end of the 17th to the end of the 19th century. More precise limits cannot be set, since the development is a continuous one. The works of J. S. Bach represent a peak of this development. It is in the works of Wagner, Debussy, and many of their contemporaries that a progressive breakdown of tonality begins to appear: constant modulations denying, in the long run, any possible reference to a tonal center; harmonic structures that are less and less reducible to a cadential scheme; piling up of chords without polarity, i.e., without definite tension toward a resolution, like the chords of a diminished seventh, ninth, etc. Tonality was used less and less by Wagner's successors, notably Schoenberg, and thereafter the evolution from tonality to atonality continued. It might be said that the harmonic framework of *Tristan*—a fortiori that of Schoenberg's *Verklärte Nacht*—is already atonal, insofar as the tonal centers are no longer clearly evident to the listener. Nevertheless, the term *atonal* is generally (and preferably) confined to music that totally banishes tonality. Thus atonality, both as a concept and as a descriptive term, although at first challenged by Schoenberg himself, begins with the works he composed after 1909 (*Pierrot lunaire*, etc.).

The conscious suspension of tonality did not, however, at once bring a single substitute for it. It was only years later that Schoenberg proposed a new principle of organization [see under Serial music]. It is significant that c. 1900 the American composer Charles Ives, working quite independently of Schoenberg, wrote sections in certain chamber compositions in which tonality is practically suspended.

L. Rognoni, *La Scuola musicale di Vienna* [1966]; T. W. Adorno, *Philosophie der neuen Musik* (1949); P. Boulez, *Relevés d'apprenti* (1965); *id.*, *Penser la musique aujourd'hui* [1964]; *Incontri musicali*, nos. 1–4 (1956–60), *passim*; *Die Reihe* (German ed., 1955—, English ed., 1958—), *passim*; *Perspectives of New Music* [1962—], *passim*; D. Milhaud, "Polytonalité et atonalité" (*RM* 1923, no. 4); A. Machabey, "Dissonance, polytonalité, atonalité" (*RM* 1931, no. 116). See also under Tonality; Serial music. A.B.

**Attacca, attacca subito** [It.]. Attack suddenly, an indication at the end of a movement that the next movement should follow without break.

**Attacco.** See under *Soggetto*.

**Attack** [F. *attaque*]. Promptness and decision in beginning a phrase, especially in forte passages. In orchestral parlance, attack means precise entry of the instruments. In French orchestras, the concertmaster is called *chef d'attaque*.

**Aubade** [F.; Sp. *alborada*]. Morning music, as distinct from \*serenade, evening music. In the 17th and 18th centuries *aubades* were played in honor of royal or princely personages, at levees. The term has been used by various composers (e.g., Bizet, Rimsky-Korsakov) to denote a sort of idyllic overture. The beginning of Beethoven's "Pastoral" Symphony and Wagner's *Siegfried Idyll* may be considered idealized *aubades*. See *Alba*.

**Auctoralis** [L.]. Same as authentic (\*church modes).

**Audition.** (1) A hearing given to a performer; a performance (particularly by students). (2) Faculty of hearing.

**Aufforderung zum Tanz** [G., Invitation to the Dance]. Piano composition by C. M. von Weber, op. 65 (1819), in the form of a waltz, preceded by an introduction (the "invitation") and concluded with an epilogue. It is the first example of a true waltz in art music.

**Aufführungspraxis** [G.]. See Performance practice.

**Aufgeregt** [G.]. Excited.

**Auflösung** [G.]. (1) Resolution (of a dissonance). (2) Cancellation (of an accidental). *Auflösungszeichen*, the natural sign, ♮.

**Aufsatz** [G.]. Tube of an organ reed pipe.

**Aufschnitt** [G.]. The mouth of an organ pipe.

**Aufstrich** [G.]. Up-bow.

**Auftakt** [G.]. Upbeat. For *Auftaktigkeit*, see under Phrasing and articulation.

**Auftritt** [G.]. Scene of an opera.

**Aufzug** [G.]. Act of an opera.

**Augenmusik** [G.]. See Eye music.

**Augmentation and diminution.** The presentation of a subject in doubled values (augmentation) or in halved values (diminution), so that, e.g., the quarter note becomes a half note (augmentation) or an eighth note (diminution). The note values may also be augmented (or diminished) in higher ratios, such as 1 : 3 (triple augmentation) or 1 : 4 (quadruple augmentation). These devices provide an important element of variety in fugal writing. They are usually introduced toward the end of the fugue; thus used, diminution bestows a character of *\*stretto*, augmentation one of grandeur. Examples are: Bach, *The Well-Tempered Clavier* i, no. 8 (augmentation), *The Well-Tempered Clavier* ii, no. 9 (diminution), *The Art of Fugue*, nos. 6 and 7 (simultaneous appearance of the normal form, diminution, augmentation, and double augmentation); Beethoven, Piano Sonata op. 110, last movement (similar combinations; see Ex.). Augmentation and diminution are also used in the development sections of symphonies, particularly by Brahms and Bruckner.

Diminution (or augmentation) occurs first in a number of two-voice clausulae of the Perotinus period, in which a plainsong melody is used twice in succession, first in *duplex longae* (dotted half notes in modern transcription), then in plain *longae* (dotted quarter notes) [see *ApNPM*, p. 246]. In the 14th century, diminution is explained

in detail by theoretical writers (J. de Muris, Prosdocius de Beldemandis) and is used almost regularly in the motets of G. de Machaut, the tenor having the *cantus firmus* twice, the second time in halved values [see *Isorhythmic*]. With the beginning of the 15th century, augmentation and diminution become notational devices, since the change of note values is no longer indicated by longer or shorter notes but by proportional signs [see *Proportions*] or by verbal instructions, such as *per augmentationem* or *per medium*. A last example of this method appears in Bach's *\*Musikalisches Opfer*. Many 16th-century *ricercars* use augmentation or diminution, e.g., A. Gabrieli's *Ricercare del primo tono* for organ [repr. in *\*Editions III*, 3], in which each voice states the subject once in quadruple augmentation—exactly as in the *contrapunctus* 7 of Bach's *The Art of Fugue*. Augmentation and diminution are of basic importance in the fantasias of Sweelinck, which usually consist of three sections, with the theme (1) in normal values, (2) in augmentation, (3) in diminution.

**Augmented intervals.** See Interval. Augmented sixth chord, triad, see Sixth chord, Triad.

**Aulos.** The most important wind instrument of the ancient Greeks. It is not a flute (as has frequently been stated) but an oboe with double reed and a number of holes, ranging from four in the oldest instruments to fifteen in later specimens. The numerous pictures of aulos players show that the aulos usually consisted of two pipes; probably the larger pipe provided a drone or a few tones that were missing on the other. Many pictures show the player wearing a leather band over his mouth and tied at the back of his head. This probably served to increase the resistance of the cheeks, which acted as bellows, and enabled the player to build up considerable air pressure, thus producing a sound that occasionally must have been as shrill as that of a modern bagpipe.

The aulos originally was an Oriental instrument. According to legend, it was introduced into Greece about 900 B.C. by Olympos, who was later glorified as the "inventor of music." Throughout the history of Greek music the aulos has retained its Asiatic character. It was adopted for the orgiastic music symbolized by Dionysus, whereas the *\*kithara* represented the restrained character of autochthonous Greek music, symbolized by Apollo. Aulos music was rapid, rhythmic, exciting. The slight modifications of pitch that could be obtained by half covering the holes

of the aulos probably led to the enharmonic genus of Greek music. See also *Chroai*. See ill. under Oboe family.

Lit.: K. Schlesinger, *The Greek Aulos* (1939); *SAHMI*, pp. 138ff; A. Howard, "The [Aulos] or Tibia" (*Harvard Studies in Classical Philology*, iv); *id.*, "The Mouth-piece of the [Aulos]" (*ibid.*, x).

**Aurresku, arrescu, auresca.** An ancient ceremonial dance of the Basque regions (northern Spain), executed with a large variety of vigorous steps and gestures symbolizing courtship and other customs. It consists of several sections in varying meters (triple, quadruple, quintuple) and in different speeds. In its most complete modern form the *aurresku* consists of eight sections: *entra*, *atzescu*, \**zortziko*, *pasamano*, *desafio*, \**fandango*, *arin-arin*, *galop*. It is danced to the accompaniment of the *chistu* (a type of flute) and *tamboril* [see Pipe]. See V. Alford, in *MQ* xviii; F. Gascue, in *BSIM* 1912, viii, 41; *LavE* i.4, 2355ff.

**Ausdrucksvoll, mit Ausdruck** [G.]. With expression.

**Aushalten** [G.]. To sustain a note.

**Aus Italien.** See under Symphonic poem III.

**Auslösung** [G.]. The repeating mechanism (escapement) of the piano.

**Australia and New Zealand.** I. Organized musical activity in Australia may be said to begin with William Vincent Wallace (1812–65) and Isaac Nathan (1792–1864). Wallace, an Irish composer and violinist, visited Australia and New Zealand, giving a concert in Sydney in 1836. Nathan, an English singer and composer, settled permanently in Australia, arriving in Melbourne in 1841 and moving to Sydney, where he organized concerts and music societies, activities that later (1886) led to the establishment of the Philharmonic Society, and in 1890 to the building of a large organ in Sydney Town Hall. A conservatory of music was founded in 1916, and a symphony orchestra somewhat later. Melbourne has a University Conservatorium, established in 1894. Today each state capital has a symphony orchestra. Of great importance for the musical life of Australia was the establishment, in 1932, of the Australian Broadcasting Commission (A.B.C.). Chamber music has thrived under the auspices of the Musica Viva Society, and opera under the Australian Elizabethan Theatre Trust.

Composers of Australian (or New Zealand) descent include Alfred Hill (1870–1961), Percy

Grainger (1882–1961; became a U.S. citizen), Frank Hutchens (b. 1892), Roy Agnew (1893–1944), Margaret Sutherland (b. 1897), Clive Douglas (b. 1903), John Antill (b. 1904), Dorian Le Gallienne (b. 1915), Donald Banks (b. 1923), and Malcolm Williamson (b. 1931). The Australian opera singers Nellie Melba (1859–1931) and Joan Sutherland (b. 1926) won world-wide recognition.

One of Australia's most outstanding contributions to music was made by Louise B. M. Dyer through the foundation of the Lyrebird Press (Les Éditions de l'Oiseau-Lyre). The magnificent publications of this press include, among others, the complete edition of the Montpellier Codex [see Sources, no. 4], the series *Polyphonic Music of the Fourteenth Century* (ed. L. Schrade), the 13-volume set of Attaignant's motets (ed. A. Smijers and A. T. Merritt), and the complete works of François Couperin.

II. The early settlers of New Zealand found a Polynesian people, the Maoris, who themselves had settled there much earlier. The resulting impact of Western culture on Maori music was virtually annihilating.

In the early decades of New Zealand's colonization (from c. 1840) the new immigrants retained their English musical heritage, mainly Anglican church music, a strong choral tradition, and an emphasis on brass-band playing. In Christchurch particularly the Anglican pattern survived, and a choir school established there in 1881 still provides treble voices for the all-male cathedral choir. Christchurch secular choirs have sung in Adelaide, the United States, and England in recent years. While amateur orchestral societies maintained high standards, it was not until 1946 that the New Zealand Broadcasting Corporation established a fully professional orchestra. There is a flourishing National Youth Orchestra, and a strong Federation of Chamber Music Societies that encourages distinguished groups from abroad to visit New Zealand. Music education in the schools is under the direction of a national music adviser assisted by regional supervisors. The universities award degrees toward a Mus. B. according to the English system and recently have introduced courses in performance at the four main centers, Auckland, Wellington, Christchurch, and Dunedin. Courses in musicology are offered at the University of Otago, Dunedin. The first New Zealand-born composer to become outstanding is Douglas Lilburn (b. 1915; three symphonies, chamber music, songs).

Andersen, *Maori Music, with Its Polynesian Background* (1934); M. Levine, in *Pierre Key's Music Year Book 1926-27*, p. 178 (Australia and New Zealand); T. Waters, *ibid.* (1928), p. 185; Dai-keong Lee, in *MM* xxii, no. 4; C. Carey, in *The Sackbut* ix, no. 1; V. A. Rucroft, "A Survey of Music in New Zealand" (*PMA* 1943, p. 56); C. H. Grattan, "The Australian Bush Songs" (*MQ* xv). There are numerous studies of the music of the Australian indigenes; s.v. "Australien und Austro-nisien," in *MGG*. See also the record and accompanying 19-page pamphlet (background, pictures, musical notations), *Songs of Aboriginal Australia and Torres Strait* (Ethnic Folkways Library), ed. G. List (Indiana Univ. Archives of Folk and Primitive Music). II by T.J.Y.

**Austria.** The development of music in Austria is included under Germany, as is customary and almost inevitable because of the close bonds—political, cultural, and musical—between the two countries. Not a few of the most outstanding "Austrian" composers were born in Germany (e.g., T. Stoltzer, Froberger, Beethoven, Brahms), while on the other hand many of the great "German" masters were actually Austrian by birth. Following is a survey of the development of music in Austria, excluding the numerous Flemish and Italian composers who were active in Vienna and other cities (composers born in Germany are marked G.).

The first Austrian composers known to us are the minnesingers Walther von der Vogelweide (c. 1170–c. 1230) and Neidhardt von Reuenthal (G.? 12th and 13th centuries). The development of "German" polyphony started in Austria with Hermann von Salzburg (14th century) and Oswald von Wolkenstein (1377–1445). The polyphonic lied was cultivated by Heinrich Finck (G., 1444–1527), P. Hofhaimer (1459–1537), T. Stoltzer (G., c. 1475–1526), and Arnold von Bruck (b. in Bruges, c. 1470–1554), and lute music by H. Judenkünig (G., c. 1450–1526).

In the 17th century, P. Puerl (c. 1570–c. 1624), J. H. Schmelzer (c. 1623–80), Heinrich Biber (1644–1704), and Georg Muffat (b. in France, 1653–1704) made important contributions in the field of instrumental music, while keyboard music was cultivated by W. Ebner (G., 1612–65), J. J. Froberger (G., 1616–67), F. M. Techelmann (c. 1649–1714), Georg Muffat, and G. von

Reutter (1656–1738). J. J. Fux (1660–1741), famous for his treatise *Gradus ad Parnassum* (1725), wrote orchestral suites, Masses, and motets, as well as operas, thereby interrupting the Italian domination of opera in Austria that had begun with Cesti and ended only with Mozart.

In the 18th century, G. C. Wagenseil (1715–77) and G. M. Monn (1717–50) contributed to the early development of the symphony [see Mannheim school] and helped lay the foundation for the work of the "Viennese classics," Haydn (1732–1809), Mozart (1756–91), Beethoven (G., 1770–1827), and Schubert (1797–1828), who were followed by Bruckner (1824–96), Brahms (G., 1833–97), and Mahler (1860–1911). F. Schubert, the great master of the romantic lied, found a worthy successor in H. Wolf (1860–1903). J. Bittner (1874–1939) and E. W. Korn-gold (1897–1957) composed in a late romantic idiom.

The revolutionary trends of 20th-century music started in Vienna with A. Schoenberg (1874–1951) and J. M. Hauer (1883–1959), to be continued by Schoenberg's disciples A. Berg (1885–1935) and A. von Webern (1883–1945). Among the next generation of Austrian composers are E. Wellesz (b. 1885), also famous for his studies of Byzantine music, J. N. David (b. 1895), E. Krenek (b. 1900), H. E. Apostel (G., b. 1901), and H. Jelinek (b. 1901).

Lit.: E. Schenk, *950 Jahre Musik in Österreich* [n.d., 1946?]; H. J. Moser, *Die Musik im früh-evangelischen Österreich* [1954]; R. F. Brauner, *Osterreichs neue Musik* [1948]; R. Klein, "Contemporary Music in Austria" (*LBCM*; also *MQ* li); G. Adler, "Musik in Österreich" (*StM* xvi); \*Editions XV.

**Ausweichung** [G.]. Modulation, especially passing modulation.

**Auszug** [G.]. Arrangement, usually for piano [*Klavier-auszug*] of an opera, oratorio, etc.

**Authentic cadence.** See under Cadence I.

**Authentic modes.** See under Church modes I.

**Auto** [Sp.]. Spanish and Portuguese dramatic play of a religious or contemplative character, frequently with incidental music [see Liturgical drama]. Such plays were written by Juan del Encina (fl. 1500), Gil Vicente (1492–1557), Lope de Vega (1562–1635), Calderón (1600–81), and others. See G. Chase, in *MQ* xxv; A. Salazar, in *PAMS* 1938.

These religious plays were introduced into Latin America by missionaries as early as the 16th century and soon became very popular throughout the Spanish and Portuguese colonies. In 1672, *El Arca de Noé*, a sacred play in *música recitativa*, was presented in Lima, and the same year Tomás de Torrejón y Velasco (1644–1728) is mentioned as the composer of music for the productions of a *breve coloquio de música recitativa* and a *coloquio en forma de Auto Sacramental*. Reports on the productions of these plays in Brazil, starting in the late 16th century, occur in the Jesuits' chronicles. An *auto hierático* entitled *O Misterio de Jesus* was produced about 1583. Later, two others, an *Auto do Misterio das Onze Mil Virgens* and an *auto* of the *Martirio de São Sebastião*, were produced. All these *autos* were complemented by vocal and instrumental episodes in the manner of the 16th- and 17th-century mystery plays and moralities in Europe.

add. by J.O.S.

**Autographs, musical.** The oldest extant autographs of compositions are by Heinrich Isaac (St. Bibl. Berlin Mus. MS. 40021; fac. in J. Wolf, *Musikalische Schrifttafeln*, no. 49). From the 16th century we have a few autograph pages by Senfl and Lassus. From the 17th century Monteverdi's *L'Incoronazione di Poppea* as well as the keyboard works of Tomkins, Froberger, and Pasquini have survived in autographs. For the autographs of Handel, Bach, Mozart, Beethoven, Chopin, and others, the reader is referred to special studies [see Lit.]. Autographs of a number of famous compositions, by Bach, Beethoven, Mozart, and others, have been published in facsimile editions. Anthony van Hoboken founded in 1927 an *Archiv für Photogramme musikalischer Meisterhandschriften* (archive for photographic reproductions of master autographs), a most valuable collection (Vienna, Nationalbibliothek) that includes a number of items whose originals were lost during World War II.

Lit.: E. Winternitz, *Musical Autographs from Monteverdi to Hindemith*, 2 vols. (1955); W. Gerstenberg, *Musikerhandschriften von Palestrina bis Beethoven* [1960]; *id.*, *Musikerhandschriften von Schubert bis Strawinsky* [1961]; W. Schmieder, *Musikerhandschriften in drei Jahrhunderten* (1939); G. Schünemann, *Musikerhandschriften von Bach bis Schumann* (1936); L. M. Vauzanges, *L'Écriture des musiciens célèbres* (1913); G. Schünemann, *Ludwig van Beethovens Konversationshefte*, 3 vols. (1941–43); O. E. Albrecht, *A Census of Autograph Music Manuscripts of*

*European Composers in American Libraries* (1953).

**Autoharp.** Trademark for an instrument of the \*zither family, on which simple chords are produced by strumming the strings (with fingers, pick, or plectrum), while button-controlled damper bars damp all the strings except those required for the chord. It is intended chiefly as an accompanying instrument (for folk singers, etc.).

**Automelon** [Gr.]. See under *Idiomelon*.

**Auxiliary tone.** See under Nonharmonic tones I.

**Ave Maria** [L., Hail, Mary]. (1) A prayer of the Roman Catholic Church; see text and plainsong in *LU*, p. 1861. In a shortened form it is used as an \*antiphon for the Feast of the Annunciation [*LU*, p. 1416]. There are polyphonic settings, most of them based on the plainsong melody, by Ockeghem, Josquin, Willaert, Victoria, and others; also a *Missa Ave Maria*, by Pierre de La Rue, Morales, Palestrina, and others. (2) The same title was used for a lachrymose piece by Schubert (based on a song from Sir Walter Scott's *Lady of the Lake*), and a lamentable piece by Gounod in which Bach's C-major Prelude from *The Well-Tempered Clavier* (vol. i) is misused as a harmonic background for a highly sentimental melody.

**Ave maris stella** [L.]. A hymn of the Roman Catholic Church, sung to various melodies in different modes [see *LU*, pp. 1259ff]. There are polyphonic settings (anon. in Codex Apt; Dufay), Masses (Josquin, Morales, Victoria), and organ compositions (Girolamo Cavazzoni, Cabezón, Titelouze), most of them based on the first melody in *LU*.

**Ave Regina caelorum** [L.]. One of the four Marian antiphons; see Antiphon (2). Particularly famous is a setting by Dufay [repr. in H. Besseler, *Capella*, vol. i], which is mentioned in his will and was probably performed at his funeral. Dufay also wrote a *Missa Ave Regina caelorum* (others by Arcadelt, Palestrina, Victoria).

**Ayre.** (1) A late 16th- and early 17th-century type of English song, which is derived from the French *air de cour* and, like it, was primarily a solo song accompanied by the lute (or pharion, theorbo, occasionally also virginal), often with the lowest part doubled by a bass viol (viola da gamba; see *HAM*, no. 162). In many cases the

composers provided for an alternative (or additional?) vocal accompaniment, printed separately on the opposite page so that the parts could be read simultaneously by three singers seated, for example, north, south, and east at a table. The ayres range from serious songs, often through-composed, to light and gay tunes, usually strophic. The earliest publication was Dowland's *The first Booke of Songs or Ayres* of 1597 [see Editions XVII, which includes reprints of many collections]. Later publications are *Select Musically Ayres and Dialogues* (1652) and *New Ayres and Dialogues* (1678), which include songs with the accompaniment of lute, theorbo, bass viol, by H. Lawes, W. Webb, Blow, Purcell, and others. See *ReMR*, pp. 835–41; A. Dolmetsch, *Select English Songs and Dialogues of the 16th and 17th Centuries*, 2 vols. (1898, 1912); P. Warlock, *The English Ayre* (1926); U. Olshausen, *Das lautenbegleitete Sololied in England um 1600*

(1963); P. Warlock and P. Wilson, ‡*English Ayres, Elizabethan and Jacobean*, 6 vols. (1927–31); H. J. Sleeper, ‡*John Jenkins, Fancies and Ayres* (1950).

(2) In the 17th century, a movement of a suite [see Air (3)]. For instance, each of the suites in M. Locke's *Consort of Ffour Parts* consists of a fantasia, courante, ayre, and saraband [see *HAM*, no. 230, Commentary].

(3) English writers of the 17th century use the term ayre (aire) in the sense of key or mode, e.g., T. Morley: "these aires (which the antiquity termed *Modi*)," in *A Plaine and Easie Introduction to Practicall Musicke* (1597), p. 147; or T. Mace: "Every Shake, is to be made in the *Aire*," in *Musick's Monument* (1676), p. 104; also C. Butler, *The Principles of Musik* (1636), pp. 72, 80, 82; C. Simpson, *A Compendium of Practical Musick*, 5th ed. (1714), p. 36. See also under *Fancy*.

## B

**B.** See (1) Pitch names; Letter notation; Hexachord; also Accidentals II. In German, *b* stands for *b-flat*. (2) In partbooks of the 16th century, *B* stands for *bassus* (bass).

**Babacué.** See *Macumba*.

**Baborak.** A Bohemian national dance, which has alternating sections in duple and in triple time.

**Babylonia.** See *Mesopotamia*.

**Bacchetta** [It.]. Drumstick; *b. di legno*, wooden; *b. di spugna*, spongeheaded.

**B-A-C-H.** The letters forming Bach's name, each of which denotes a tone (if the German terminology is used, in which *h* is *b natural* while *b* is *b-flat*; see Pitch names). The resulting theme, *b<sup>b</sup> a c b*, has been repeatedly used in compositions, first by Bach himself in his *\*Art of Fugue* (in the last, unfinished fugue). Another fugue on the same subject that is often ascribed to him [see Peters ed. xv, 42] is definitely spurious. Various later composers have used the famous motif in fugues or fantasias, e.g., J. G. Albrechtsberger [see \*Editions XV, 33]; Schumann (*Sechs*

*Fugen über den Namen Bach*, op. 60); Liszt (*Fantasia and Fugue on . . . B A C H* for piano and *Prelude and Fugue on B A C H* for organ); M. Reger (op. 46); W. Piston (*Chromatic Study on the Name of Bach*); A. Casella (*Due Ricercari sul nome Bach*). It also plays an important role in Busoni's *Fantasia contrappuntistica* [see under *Art of Fugue*].

**Bach-Gesellschaft.** See *Societies*, II 2.

**Bachiana** [Port.]. Title employed by Heitor Villa-Lobos [see Brazil] for some of his compositions, which he claimed were the product of applying Bach's contrapuntal techniques to Brazilian folk music. He wrote nine such works, for solo piano, full orchestra, or voice and smaller ensembles, following the general plan of a suite. J.O.S.

**Bach trumpet.** See *Clarino* (2).

**Backfall, forefall.** English 17th-century names for an *\*appoggiatura*, the former from above, the latter from below. It is indicated and performed as follows:

**Badinage, badinerie** [F.]. A dancelike piece of jocose character that occurs as a movement in the optional group of 18th-century suites, e.g., in Bach's Suite for orchestra in B minor.

**Bagatelle** [F.]. A short piece, usually for piano. The name was used by F. Couperin ("Les Bagatelles"; see his *Pièces de Clavecin*, ordre 10) and, in particular, by Beethoven, whose *Bagatellen* (op. 33, op. 119, op. 126) mark the beginning of the extensive literature of 19th-century \*character pieces.

**Bagpipe** [F. *musette*; G. *Dudelsack*, *Sackpfeife*; It. *piva*, *zampogna*; Sp. *gaita*]. Generic name for a number of instruments having one or (usually) several reed pipes (single or double reeds) attached to a windbag that provides the air for the pipes; also, specifically, the name for the Irish and Scottish varieties of this family. [See ill. under Wind instruments.] One or two of the pipes, called "chanter" (chaunter), are provided with sound holes and are used for the melody, while the others, called "drones," produce only one tone each and are used for the accompaniment.

In the earlier, Eastern specimens, both chanter and drones are clarinets (i.e., have single reeds), while in the modern types either they are both oboes (i.e., with double reeds), as in Italy and some parts of France, or the drones are clarinets while the chanter is an oboe, as in Scotland, Ireland, and Brittany. In some bagpipes the wind in the bag is supplied from the mouth through an additional blowing pipe, while in others it is provided by a small pair of bellows placed under and operated by the arm. To the former type belong the *Old Irish bagpipe*, *Highland bagpipe* (Scotland), *biniou* (Brittany), *cornemuse* (France), *Dudelsack* or *Sackpfeife* (Germany), and *zampogna* and *piva* (Italy); to the latter, the *Northumbrian bagpipe* (England), modern *Irish bagpipe*, *gaita* (Galicia), and *musette* (France). A more primitive instrument was the *bladder pipe*, a single or double clarinet with a bladder used as a bag [illustrated in *GD*, pl. LX; *GDB*, pl. II].

Nothing certain is known about the origin of the bagpipe, although there is virtually no doubt that it developed in the Orient [see *Sumponyah*]. It is first attested in Rome under the name *tibia utricularis* (Suetonius). Nero is reported to have played on it. In the Middle Ages it is frequently mentioned under different names (*musa*, *chorus*, *symphonia*, *chevrette*). The famous illuminations of the 13th-century Spanish MS *Escorial j b 2* [see

*Cantiga*] show players of bagpipes [see *GD* iv, 184; *ReMMA*, p. 222]. In the British Isles the bagpipes have been prominent for many centuries in folk and military music. Their Continental history is less interesting, except for a late 17th-century movement in France that for a short time raised the instrument's standing in society and in art music [see *Musette*]. See also *Pibroch*.

Lit.: W. H. Grattan Flood, *The Story of the Bagpipe* (1911); W. L. Manson, *The Highland Bagpipe* (1901); A. Baines, *Bagpipes* (1960); G. Askew, *A Bibliography of the Bag-pipe* (1932).

**Baguala**. Argentine folksong with a melody of triadic design and a rhythmic pattern of a quarter note followed by two eighth notes. These songs are usually accompanied by a *caja* (drum). Most ethnomusicologists consider the *baguala* indigenous to the Andean regions. J.O-S.

**Baguette** [F.]. Drumstick; *b. de bois*, wooden drumstick; *b. d'éponge*, spongeheaded drumstick. Also, the baton of the conductor and the stick of the violin bow.

**Bailecito** [Sp.]. Argentine folk dance-song in 6/8 meter, consisting of two contrasting sections. The first section is in lively tempo and is sung to the first four lines of the lyrics; the second is slower and sung to the remaining four lines of the text. There follows a repetition of the first section, but now sung to nonsense syllables. Owing to its northern Argentine origin the form is also known as *boliviana*. J.O-S.

**Baile de palos**. Elaborate ritual dance performed in the rural districts of the Dominican Republic, in which the set of indigenous drums known as *palos* or \**atabal* is used with amazing rhythmical virtuosity. Also called *baile de atabales*. J.O-S.

**Baisser** [F.]. To lower a string.

**Balalaika**. A popular Russian instrument of the guitar family, characterized by a triangular body, long fretted neck, and (usually) three gut strings tuned in fourths. It is played with a plectrum and is made in six sizes that together constitute a balalaika band. [See ill. under Guitar family.] The forerunner of the balalaika was the \**domra*. See A. S. Rose, in *PMA* xxvii; W. von Kwetznisky, in *DM* xxii.12.

**Balancement** [F.]. An 18th-century name for tremolo. Sometimes used synonymously with \**Bebung*.

**Balg** [G.]. Bellows of an organ.

**Bali.** I. *History* [also see Java]. The first important though short-lived cultural contacts between Java and Bali occurred in the reign of Airlangga in the first half of the 11th century. In the 14th century, under the rule of Gadjah Mada, the establishment of a permanent Javanese colony in Bali assured a continuous influence from East Java until late in the 18th century. The rich treasury of poetic literature that developed from the 10th to 16th centuries in East Java would have been lost but for the keen interest of the Javanese colonists and the Balinese aristocracy, who adopted this literature as the language and models for the literati. It is probably safe to assume that some of the musical forms associated with the literature of this period have also survived. For example, in contemporary Bali, one can hear 15th-century Javanese spoken in the course of the dance dramas known as *wajang wong* accompanied by the ancient seven-tone pélog *gamelan gambuh*. A number of musical instruments depicted in the bas-reliefs of early Hindu-Javanese monuments have survived in Bali but are no longer known in Java. Today Balinese Hinduism is practiced as a way of life by a communal society in which the former royal patronage of the arts has been largely replaced by that of the village community. Endless temple festivals and rites of passage demand the fullest participation by musicians, dancers, sculptors, and those responsible for decorative festoons, beautifully arranged offerings of food, flowers, etc. In the context of this form of religious worship, cultivation of the arts is as important as the cultivation of rice.

II. *Tunings and orchestras*. Like the ensembles of Java, no two Balinese gamelan are tuned precisely the same. More than a dozen different genres, some active survivors of ancient ensembles, can be related to either the sléndro or pélog system, better known in Bali as *saih lima* (series of five) and *saih pitu* (series of seven) respectively. The tunings of different ensembles include: four-tone sléndro and deviants of this type, five-tone sléndro, four-tone pélog, five-tone pélog and deviants of this type, six-tone pélog, and seven-tone pélog [see Lit., C. McPhee, *Music in Bali*, ch. vii]. As in Java, there is a tendency to stretch and compress octaves; the question of "tuning pattern" is yet to be studied [see under Java]. In Bali, throughout the compass of the orchestra the bronze instruments are tuned in pairs, designated as *pengumbang* (low) and *pengisep* (high), with a difference of several cycles per second between corresponding keys of the

two instruments. The number of musical beats produced by this method of paired tuning varies with taste from one gamelan to another [see M. Hood, "Sléndro and Pélog Redefined," *Selected Reports* (Institute of Ethnomusicology, Univ. of California at Los Angeles, 1966)].

The five-tone pélog tuning of the large ensemble known as *gamelan gong*, as well as its modern counterpart, *gong kebyar*, is derived from one of several possible scales found on the seven-tone pélog *gambuh*. Four of these large end-blown flutes are combined with the rebab (a spike fiddle), several gongs, a pair of *kemanak*, cymbals, and a pair of drums to form the ensemble known as *gamelan gambuh* mentioned above. The melodies of this ancient repertory are also performed by a five-, six-, or seven-tone pélog ensemble of metallophones known as *gamelan semar pegulingan*, formerly found in the royal courts. Although this ensemble has practically disappeared, the derivative five-tone *gamelan légong*, having an enlarged instrumentation that permits greater flexibility, is a popular orchestra that transforms the same music into a dramatic sound of suddenly shifting dynamics and tempo and sparkling ornamental figuration in the high register of the gamelan. It includes two small end-blown flutes and a rebab and is used to accompany a large repertory of dance dramas taken from the *gambuh* theater and Hindu mythology. A smaller ensemble, modeled after *gamelan légong* but made up entirely of bamboo instruments, is known as *gamelan jogèd* and provides an animated staccato accompaniment for the popular village dance called *jogèd*. Four-tone pélog is known only in the *gamelan bonang*, a group of individual gongs of different size played in processions. Five-tone sléndro is reserved for a special quartet of metallophones known as *gendèr wajang*, used to accompany the shadow plays, an indispensable part of cremation festivities, weddings, and other rites of passage. Four-tone sléndro is the tuning of *gamelan angklung*, a small group of bronze instruments that formerly included the *angklung*, a bamboo instrument now rarely used. This ensemble, heard in connection with temple anniversaries and village festivals, in smaller villages often replaces the heavier sound of the *gamelan gong* on ceremonial occasions. It is always used in connection with village cremation rites. [For a complete description of these and other ensembles, see Lit., C. McPhee, *Music in Bali*.]

III. *Musical practice*. Three elements are common to most of the various ensembles found in

Bali: a melody; a colotomy, or punctuating strata; and animated drumming. Melodies vary in character from long lyrical lines to short, rapid ostinato figures, and the music is usually marked by sudden contrasts in tempo and dynamics. Singing is almost unknown in gamelan performance and is largely reserved for certain forms of plays (e.g., *Ardja*) and temple rituals (e.g., *kekawin* for solo voice). The full *gamelan gong kebyar*, requiring about thirty instrumentalists, has the following musical organization: (1) a nuclear melody in relatively long note values, played by a pair of the single-octave *tjalon*, a low-pitched member of the *gangsa* family of metallophones resonated by bamboo; (2) an abstraction of the nuclear melody (usually every fourth tone), played by a pair of *djublaga* tuned an octave lower than the *tjalon*; (3) the expansion of the nuclear melody to a full melody, performed by a pair of multi-octave *gendèr*; (4) doubling or paraphrasing or ornamentation of the melody, played by two quartets of instruments having the same range as the *gendèr* but voiced one octave higher in the *panjatjah* and two octaves higher in the *kantilan*; (5) further ornamentation (*kotekan*) of the melody, supplied by the *rèjong*, an instrument consisting of twelve inverted bronze kettles played by four musicians; (6) the colotomy that determines musical form, played by the large gong, the *kempur* (a medium-sized gong), the *klèntong* (a small gong), the *kempli* or *kadjar* (an inverted kettle); (7) the interlocking rhythms of a pair of drums or *kendang*, underscored by one or two pairs of hand cymbals or *tjèngtjèng*. Except for a slight freedom in solo passages there is no improvisation in Balinese gamelan. Two pairs of players in each of the paraphrasing or ornamenting quartets (*panjatjah*, *kantilan*, *rèjong*) execute extremely rapid interlocking or "shared" parts that permit no deviation and demand meticulous rehearsal.

**Ballabile.** A name given occasionally to dance-like pieces (ballets) in 19th-century operas.

**Ballad.** The term derives from medieval words such as \**chanson balladée*, \**ballade* [F.], \**ballata*, all of which originally denoted dancing songs [L. *ballare*, to dance] but lost their dance connotation as early as the 14th century and became stylized forms of solo song. In England this process of change went still further, and eventually (16th century) "ballad" came to mean a simple tale told in simple verse. There may have been a transitional period during which the recitation of the poems was still accompanied by some sort of dancing. Most ballads are narrative, and many deal with fabulous, miraculous, or gruesome deeds. Ballad singers made a living by singing their newest productions in the streets and at country fairs, and by selling the printed sheets, which usually gave a direction: "to be sung to the tune of . . .," e.g., "Greensleeves." In its more recent (19th-century) meaning, a ballad is a popular song usually combining narrative and romantic elements, frequently with an admixture of the gruesome. These ballads are mostly written in common meter (8.6.8.6; see Poetic meter II). Today the term "ballad" is loosely applied to any kind of popular song. For art ballad, see *Ballade* [G.].

The word "ballad" is also used as an anglicized form of \**ballade* [F.], \**ballata* [It.], or \**Ballade* [G.]. Such usage, however, is misleading in view of the fact that these terms denote entirely different things.

**Ballade** [F.]. One of the three *\*formes fixes* of 14th-century French poetry and music. (Note the separate article on the German *Ballade* below.) The poem usually has three stanzas, each of seven or eight lines, the last one or two of which are identical in all the stanzas, thus forming a *\*refrain*. The form of the stanza is: a b a b c d E or a b a b c d E F (capital letters indicate the refrain), a scheme that, so far as the music is concerned, can be simplified as follows: A A B (A = ab; B = the remaining lines). Some *ballades* are in the form A A B B, the music for lines 5 and 6 being used also for lines 7 and 8.

The *ballade* plays a prominent role in the work of Machaut, who treated it as a polyphonic composition of great refinement and subtlety. His example was followed by the French and Italian composers of the late 14th century (mannerist school: Solage, Trébor, Selesses, Matteo da Perugia, and others; see *Ars nova*), with whom the polyphonic *ballade* became the most representative type of music, treated with great elaboration and affectation. The form continued to be cultivated, though much more sparingly, during the first half of the 15th century, by Cordier, Césarís, Arnold de Lantins, Dufay, and Binchois. An exceptionally late example is Josquin's "Bergerette savoyene" (*Harmonice Musices Odhecaton A*, 1501, no. 10).

Monophonic songs with the form A A B are common in the repertory of the *\*troubadours* and even more so in that of the *\*trouvères*. Although most of these differ from the *forme fixe* in some details of versification (absence of refrain, more than three stanzas, etc.), they may well be regarded as early *ballades*. The troubadour *ballades* have, without good reason, been designated as *\*canzo*. The *ballade* form, without refrain, was adopted by the minnesingers under the name *Bar* [see *Bar* form].

Several scholars have used the term *ballade* for the Italian 14th-century *\*ballata*, a usage bound to lead to confusion since the *ballata* is an en-

tirely different form. For example, the piece by Enrique reproduced in *RiMB*, no. 12, is a *ballata* (or *\*villancico*), not a *ballade*.

Lit.: F. Brosch, "Die Balladen im Kodex von Turin" (diss. Vienna, 1931). See also under *Formes fixes*.

**Ballade** [G.]. In German usage *Ballade* denotes a type of poem derived from the English ballads but having greater artistic elaboration and poetic refinement. (Note the separate article on the French *ballade* above.) They usually deal with medieval subjects, either historical or legendary (e.g., Goethe's "Ballade vom vertriebenen und zurückkehrenden Grafen"), or with romantic tales (e.g., Goethe's "Erlkönig"). Such *Balladen* were frequently set to music, usually as through-composed songs of great length. Probably the earliest examples are the interesting settings of Gellert's moralizing and dry *Fabeln* by A. B. V. Herbing (1759; *DdT* 42), written in a continuous recitative with a highly dramatic accompaniment. Later examples are in the form of cantatas, i.e., in various movements of contrasting character (J. André, 1741–99; J. Zumsteeg, 1766–1802). A *Fantasie* op. 109 by Beethoven's pupil Ferdinand Ries (1784–1838) for piano alone, written to Schiller's poem "Resignation," is an interesting example of what might be called a "Ballade ohne Worte" [repr. in *TaAM* xiv]. The classical master of the vocal *Ballade* (sometimes referred to as "art ballad") is Karl Loewe (1796–1869), whose seventeen volumes of *Balladen* [compl. ed. by M. Runze] include a number of truly great songs ("Archibald Douglas," "Erlkönig," "Der Pilgrim vor St. Just," etc.). Loewe's form is a free combination of the strophic and through-composed types. Schubert's songs include a number of *Balladen*, e.g., "Erlkönig." In the late 19th century *Balladen* were composed for solo or chorus with orchestral accompaniment, e.g., H. Wolf's "Der Feuerreiter." Chopin and Brahms used the term for piano pieces written in the ternary A B A form frequently found in the 19th-century *\*character* piece. Here the highly dramatic character of A and the lyrical character of B would seem to portray heroic deeds and knightly love, thus justifying the title *Ballade*.

Lit.: A. B. Bach, *The Art Ballad* (1890); P. Spitta, "Ballade" (*Musikgeschichtliche Aufsätze*, 1894); H. J. Moser, ‡*Die Ballade* (H. Martens, ‡*Musikalische Formen in historischen Reihen* iii [1930]); R. Batka, *Martin Plüddemann und seine Balladen* (1896); A. König, *Die Ballade*

in *der Musik* (1904, no. 9 in *Musikalisches Magazin*); S. Northcote, *The Ballad in Music* (1942).

**Ballade style.** A term referring to the typical texture of the 14th-century French \*ballade (Machaut), that is, in three parts, the top part vocal and the two lower parts (tenor, contratenor) instrumental. It is a somewhat misleading designation, since the same style was used for rondeaux and virelais as well. This style was occasionally employed for Mass compositions of the late 14th century, which have been (rather incongruously) termed *Balladenmesse*. The terms \*cantilena style and treble-dominated style have been suggested as substitutes for *ballade* style.

**Ballad meter.** The most usual poetic meter of English and American ballads, also known as common meter [see Ballad; Poetic meter II].

**Ballad of Baby Doe, The.** Opera in two acts by D. Moore (libretto by J. Latouche), produced in Central City, Colo., 1956. Setting: Colorado and Washington, D.C., 1880–99.

**Ballad opera.** A popular form of 18th-century stage entertainment in England, consisting of spoken dialogue alternating with musical numbers taken from ballad tunes, folksongs, or famous melodies by earlier or contemporary composers. The ballad opera, though it developed quite independently, resembled the contemporary French *opéra comique en vaudevilles* in its use of popular melodies and its occasional satire or parody of serious opera. It flourished in London from 1728 to after the middle of the century, when it was gradually replaced by a somewhat similar form of entertainment, with romantic or sentimental plots and mainly using original music (e.g., T. A. Arne's *Love in a Village*, 1762). *The Beggar's Opera* (1728) by John Gay, with music arranged by J. Pepusch (1667–1752), the first important example of this type, was also the most successful. Two ballad operas (or farces) by Charles Coffey, *The Devil to Pay* (1731) and *The Merry Cobbler* (1735), played a decisive role in the development of the German \*Singspiel. The music of the ballad operas included songs and arias by Locke, Purcell, Handel, Geminiani, Corelli, Scarlatti, and others; Playford's *The (English) Dancing Master* (numerous editions from 1650 to 1738) and similar collections of vocal and instrumental melodies were the chief sources for popular tunes. The style of the ballad opera has been imitated in Vaughan Williams' *Hugh the Drover* (1924) and in Kurt Weill's *Die Dreigroschenoper* (1928; *The Three-*

*penny Opera*, 1933), the latter a highly successful imitation of Gay's *Beggar's Opera*.

Lit.: E. M. Gagey, *Ballad Opera* (1937); F. Kidson, *The Beggar's Opera: Its Predecessors and Successors* (1922); W. E. Schultz, *Gay's "Beggar's Opera"* (1923); [Hinrichsen's] *Ninth Music Book containing John Gay and the Ballad Opera* [1959]; G. Calmus, "Die Beggar's Opera von Gay und Pepusch" (*SIM* viii, 286); W. Barclay Squire, "An Index of Tunes in the Ballad-Operas" (*MA* ii); G. Tufts, "Ballad Operas" (*MA* iv); W. J. Lawrence, "Early Irish Ballad Opera" (*MQ* viii); A. Berger, "The Beggar's Opera, the Burlesque, and Italian Opera" (*ML* xvii); W. H. Rubsamen, "The Ballad Burlesques and Extravaganzas" (*MQ* xxxvi); *id.*, "Mr. Seedo, Ballad Opera, and the Singspiel" (*CP Anglés* ii).

**Ballata** [It.]. The chief form of Italian 14th-century music [see *Ars nova*]. It is not related to the French *ballade* but is practically identical with the \*virelai, which was also called *chanson balladée*. As a poem, the *ballata* consists of a refrain (called *ripresa*) and, normally, three stanzas that alternate with the refrain: R S<sub>1</sub> R S<sub>2</sub> R S<sub>3</sub> R. The shorter form R S<sub>1</sub> S<sub>2</sub> S<sub>3</sub> R may also have been used. The stanza consists of two so-called *piedi* (feet) of identical versification and a *volta* (turn) having the same structure as the *ripresa*. In some cases the *ripresa* and (one) *piede* consist of two lines each, in others the *ripresa* of three and the *piede* of two, etc. Music is composed only for the *ripresa* and the first *piede*, and is repeated for the rest of the poem as follows:

<i>ripresa</i>	<i>stanza</i>		<i>ripresa</i> etc.
	<i>piedi</i>	<i>volta</i>	
A	bb	a	A etc.

In modern transcriptions the resulting form, A b b a A, is usually represented in the following manner:

:A	:B	
1. 5.	2.	
4.	3.	

with the text for 1. 5. printed in italics. In the original sources only the texts for 1. and 2. are given with the music, those of 3., 4., and 5. being written separately. In contrast to the virelai, *ballate* rarely have an \**ouvert* and *clos* (for section B).

Because of its name [L. *ballare*, to dance], it is generally assumed that the *ballata* originally was a song accompanying round dances, although no definite evidence for this conclusion has been found. Anyhow, none of the surviving examples shows any traces of dancelike rhythm or style. Monophonic songs with the *ballata* structure are found in the religious *laude* [see *Lauda*] of the thirteenth century. In the fourteenth century the form was treated polyphonically, especially by F. Landini; in all, 91 two-voice and 49 three-voice *ballate* by Landini survive (mostly with only one stanza). The form of the *ballata* recurs, with modifications, in the *\*frottole* of the early 16th century. See also the general remarks under Virelai II. See W. T. Marrocco, "The Ballata—A Metamorphic Form" (*AM* xxxi).

**Ballet.** I. Ballet is a theatrical performance by a dancing group, usually with costumes and scenery, to the accompaniment of music but customarily without singing or spoken words. The origins of modern ballet date from the 15th century, when dance performances were introduced at the French, Burgundian, and Italian courts for weddings, receptions of foreign sovereigns, and similar festive occasions. In their early stages these performances consisted of loose sequences of dances, based on the steps of the conventional courtly repertory but performed in sumptuous costumes and oriented toward representing the over-all theme of the occasion (e.g., dances of the European nations paying homage to a visiting prince, dances of the Four Continents in honor of a newborn royal baby, etc.). In the course of time elaborate decorations were added, a story or plot provided dramatic interest and unity, and the music, originally played by small instrumental ensembles specializing in dance accompaniment, began to be performed by the full court orchestra (or even orchestras), often together with vocal soloists and ensembles.

When, in the early 16th century, the traditions of the Italian *intermedii* and *trionfi* on the one hand and the "horse ballets" (*balletti a cavallo*, *carrousels*, *danses equestres*) on the other merged with the art of ballroom dancing, the *ballet de cour* was born. Of Italian origin, this multifaceted form of courtly entertainment was brought to France in 1533 at the marriage of Catherine de' Medici and King Henry II. After a period of adjustment, the first short *mascarades* and *boutades* with dances, verse, and music grew into full-scale dramatic entertainments. One of

the most sumptuous of these was the *Balet comique de la Royne*, a choreographic invention of the ballet master Baldassare de Belgioioso (de Beaujoyeux), performed for the marriage of Margaret of Lorraine-Vaudémont to the Duke of Joyeuse in the Salle du Bourbon in the fall of 1581 [fac. ed. by G. A. Caula, Turin, 1962]. It is the earliest *ballet de cour* for which the music has been preserved and is especially noteworthy for its inclusion of two monodic songs [see Editions VII; also *AdHM* ii, 642ff; L. Celler, *Les Origines de l'Opéra et le ballet de la Reine*, 1868]. Throughout the 17th century the *ballet de cour*, which was the French counterpart of the English court "masque," remained the undisputed favorite at the royal court and in the palaces of the French nobility. Among the first composers who contributed (often collectively) to these entertainments were Pierre Guéron (1565–1621), Antoine Boësset (c. 1585–1643), and Étienne Moulinié (d. after 1669), but little of the music that accompanied these presentations has been preserved (although some of it may survive in the *\*Philidor* Collection).

The golden age of ballet came under Louis XIV (reigned 1643–1715), who himself liked to dance and was fond of appearing in ballets. With the ballet master C. L. Beauchamps and the musicians Cambefort (1605–61) and Lully (1632–87), the French ballet attained great cultural importance as well as musical significance. It became the origin of a large number of new courtly dances, such as the gavotte, passepied, bourrée, and rigaudon, which were later used in the optional movements of suites. Of particular importance among these was the minuet. Lully's activity in the ballet of the French court (*ballet de cour*) began in 1653 with the *Ballet de la Nuit* (together with Cambefort). In subsequent years he wrote about 28 ballets, the last being *Le Temple de la paix* (1685). In 1664 he and Molière jointly created the *comédie-ballet*, a unification of stage play and ballet. The first work of this type was *Le Mariage forcé* (1664), and the most famous *L'Impromptu de Versailles* (1663). [See *Entr'acte*.] Lully also introduced the ballet into French opera. His successors, Campra and Rameau, went further in this direction by establishing the *opéra ballet*, in which dramatic content was reduced to a minimum in favor of dancing [see Ballet in opera]. In the second half of the 17th century Vienna was a center of elaborate presentations, especially of equestrian ballets (*Rossballett*), among them *La Contesa dell'aria e dell'acqua* (1667), for which F. Sbarra

wrote the libretto and J. H. Schmelzer and A. Bertali the music. [See *DTO* 56; *StM* viii, 47.]

Soon after 1700 the imperial court of Vienna, always in stiff competition with Versailles, became one of the foremost centers of professional ballet in Europe. During the reigns of Charles VI and Maria Theresa, almost all the leading dancers and choreographers of the time came to Vienna, either as dancing masters at the court or as guests or permanent members of the two main theaters in the city. Among them was Alexandre Pillebois, who early in the 18th century was named court ballet master (*Hofballetmeister*). One of his 13 *ballerini di corte* was Franz Hilverding van Weven (1710–68), who in 1742 became first ballet master at the Kärntnertor-Theater. Under his inspired guidance Viennese ballet began to turn from the merely spectacular to the dramatic; many of Hilverding's pantomimic ballets were based on plots from the works of Racine, Voltaire, Crebillon, and other renowned writers [see S. Arteaga, *Le Rivoluzioni del Teatro musicale italiano*, 3 vols., 1783–88].

II. From 1750 to 1850 the history of the ballet includes a galaxy of famous dancers, such as Marie Camargo (1710–70), J.-G. Noverre (1727–1810), the brothers Angiolo Maria Vestris (1730–1809) and Gaetano Apollino Vestris (1729–1808), Maria Taglioni (1804–84), Fanny Elssler (1810–51), and others. Unfortunately, little of the music used in their presentations has survived. Noverre, the great reformer of the ballet, found musical collaborators in Stuttgart (Florian Deller, 1729–73; Jean J. Rudolphe, 1730–1812; see *DdT* 43/44) as well as in Vienna (Ignaz Holzbauer, 1711–83; Gluck, 1714–87; Josef Starzer, 1726–87; and Mozart, 1756–91). Gluck's *Don Juan* (1761), Mozart's *Les Petits Riens* (1778), and Beethoven's *Die Geschöpfe des Prometheus* (1801) are the best-known ballets from this period. All three were produced in Vienna, the last-named for the Italian dancer Salvatore Vigano (1769–1821). Hilverding (from Vienna), following an invitation from Empress Elizabeth of Russia, completely reorganized the Russian ballet at St. Petersburg from 1758 to 1764. He worked with many of the leading dancers of his day, to the music of such composers as Holzbauer, J. A. Hasse, Starzer, and Gluck. During Hilverding's stay in Russia, the ballet productions at Vienna's Burgtheater were capably guided by Gasparo Angiolini (1723–96 or 1731–1803), while Bernardi reigned at the Kärntnertor. Angiolini became particularly

famous through his association with Gluck and the composer's operatic reform, as well as his ballet controversy with Jean-Georges Noverre (1727–1810), who succeeded Hilverding in 1768.

Public interest in ballet was so strong that as many as three new ballets were staged each month and no opera or drama could be performed without at least one major divertissement or pantomime. Ballet in Vienna remained on a high level until the death of Maria Theresa in 1780, after which the theaters were closed for a long time. When they reopened, after the French Revolution, the emphasis in ballet had shifted from feudal elegance to patriotic fervor, drama, and frank burlesque, which in turn were followed by the advent of romanticism and the emergence of its great representatives, Maria Taglioni (1804–84), Fanny Elssler (1810–51), and others. Some outstanding roles in the romantic ballet, with its emphasis on idyllic or supernatural rather than heroic or tragic subjects, were created by Taglioni (*La Sylphide*), Carlotta Grisi, and Elssler (*\*cachucha*). Of the numerous ballets of this period one has survived to the present day, *Giselle*, produced in Paris in 1841 with Grisi as *prima ballerina*, choreography by Jean Coralli, and music by Adolphe-Charles Adam.

III. In the second half of the 19th century ballet was cultivated particularly in Denmark and Russia. Danish ballets based on Nordic myths were written by J. P. E. Hartmann (*Valkyrien*, 1861; *Thrymskviden*, 1868) and his son, E. Hartmann (*Fjeldstuen*, 1859). These are still very popular in Denmark. The Russian center of greatest vitality was St. Petersburg (Leningrad), where Marius Petipa (1822–1910) paved the way for the modern ballet. Tchaikovsky's *Swan Lake* (1876; perf. 1877), *The Sleeping Beauty* (1889; perf. 1890), and *The Nutcracker* (1891; perf. 1892) represent the culmination of this activity. Two other important ballets of this period are *Coppélia* (1870) and *Sylvia* (1876) with music by Delibes.

The great flowering of modern ballet began in 1909 when a touring company of Russian dancers under director Sergei P. Diaghilev and dancer-choreographer Michel Fokine began to perform in Paris. Diaghilev not only changed the Russian troupe to conform to his ideals of ballet but also succeeded in transplanting the Russian tradition, particularly to France, England, and America. Diaghilev's Ballet Russe attracted composers, artists, and writers to create music, posters and scenery, and plots for their performances. Léon Bakst and Picasso created decora-

tive and exotic backdrops. Debussy, Ravel, Stravinsky, Milhaud, Satie, and Honegger were among those commissioned to compose new works and make arrangements from other forms.

The 1909 Ballet Russe performance presented *Dances from Prince Igor* to the "Polovetsian Dances" from Borodin's opera *Prince Igor*. The group's outstanding musical collaborator was Igor Stravinsky, who wrote the scores for *L'Oiseau de feu* (*The Firebird*, 1910), *Petrushka* (1911), *Le Sacre du printemps* (*The Rite of Spring*, 1913), and others. Ravel contributed the music for *Daphnis et Chloé* (1912), Richard Strauss for *Josephslegende* (1914), De Falla for *Le Tricorne* (*The Three-Cornered Hat*, 1919, with décor by Picasso), and Milhaud for *La Création du monde* (1923). Debussy's ballet *Jeux* (1913), choreographed by Vaslav Nijinsky, leading male dancer of the troupe, was not well received. Other outstanding works of this period were Stravinsky's *Les Noces* (1914–19; perf. 1923); Prokofiev's *Chout* (*The Buffoon*, 1915; perf. 1921); Satie's three ballets, *Parade* (1917), *Mercure* (1924, with Picasso décor), and *Relâche* (1924); and Poulenc's *Les Biches* (1923, perf. 1924). With Diaghilev's death in 1929 the company disbanded, and the dancers and choreographers either joined other companies or formed their own. Also performed in the 1920's were Hindemith's *Der Dämon* (1924) and Bartók's *The Wooden Prince* (1914–16, perf. 1917 and 1922) and *The Miraculous Mandarin* (1919, perf. 1926 in an altered version). Ida Rubinstein, a choreographer with the Diaghilev Ballet Russe, left the company in 1925 to form her own, for which she choreographed Ravel's *Boléro* (1928) and a new version of his *La Valse* (1929). In England Ninette de Valois, who had also left the Diaghilev company in 1925, founded a small company of dancers that became the Sadler's Wells Ballet, later the Royal Ballet. Notable works performed by this company were R. Vaughan Williams' *Job* (1931) and William Walton's *Façade* (1931) with choreography by F. Ashton.

Since 1920 ballet has become increasingly popular in the United States. About 1933 a distinctly national flavor and style developed that depart markedly from traditional positions, movements, and techniques. Stravinsky's *Perséphone* of 1934 (with text by A. Gide) was still in the European tradition. The Russian George Balanchine, who came to the United States in 1933, was the first choreographer with revolutionary ideas. Balanchine created *Jeu de cartes* (1937) to Stravinsky's music, and 20 years later

the two men collaborated to create *Agon*. Among the best-known American works are Copland's *Billy the Kid* (1938), *Rodeo* (1942), and *Appalachian Spring* (1944), and Bernstein's *Fancy Free* (1944). British choreographer Anthony Tudor, a pupil of Diaghilev, came to the United States in 1940. He created *Undertow* (the case history of a psychopathic murderer) to music by William Schuman; it was performed in New York in 1945.

There is much disagreement about the quality of the ballet in the Soviet Union. Unlike the rest of Europe, Russia escaped Diaghilev's influence, for his innovations were created in France. Although the traditional full-length ballet that lasts a whole evening is still popular, shorter modern ballets such as Shostakovich's *The Golden Age* (1930) are also being produced there. Other Soviet composers, notably Boris Asafiev (*The Flames of Paris*, 1932, and *The Fountain of Bakhchisarai*, 1934), Aram Khatchaturian (*Gayne*, 1942), and Prokofiev (*Romeo and Juliet*, 1940, and *Cinderella*, 1945), have also produced ballet scores.

Ballet in France was continued after Diaghilev's death by ballet director Serge Lifar. Albert Roussel (*Bacchus et Ariane*, 1931), J. Ibert (*Les Amours de Jupiter*, 1946), and G. Auric (*La Chambre*, 1955) are among the better-known composers of ballets. \**Musique concrète* has also been used for ballets, e.g., Pierre Henry's *Orphée 53* (1953) as well as his *Arcane* (1955) and *Haut Voltage* (1957). In other countries ballet has been less popular. In Italy L. Dallapiccola and L. Nono, in Germany Werner Egk and Hans W. Henze, in Denmark Knudåge Riisager, in Sweden Karl-Birger Blomdahl, in Yugoslavia Fran Lhotka, and in Hungary Ferenc Farkas and László Lajtha have written ballet music, each in his own idiom.

Much of the music originally written for ballet has been arranged as orchestral or solo music, e.g., Ravel's *Boléro* and Stravinsky's *Firebird Suite*.

**Ballet in opera.** Ballets appear in opera usually as interludes unessential to the plot, although connected with it by some more or less specious pretext. Thus their function is to offer a diversion from the purely vocal and dramatic portions, and they frequently involve large choral groups and spectacular stage effects as well as dancing. They are therefore most appropriate in large-scale, serious, formal opera, and historically they are found chiefly in operas of the French school or works written under the influence of French taste. Ballets in comic opera are simpler and less formal than those in serious works, as, for example, the dances in the finale of the first act of Mozart’s *Don Giovanni*.

Although Lully is commonly credited with having introduced the ballet into opera, it was not unknown in operas before his time. Aside from the choral dances of Greek tragedy, the general dances that frequently took place at the end of the medieval mystery plays [see Liturgical drama], or the ballet portions of the 16th-century \*intermezzi, there are closing dances in Peri’s and Caccini’s *Euridice* (both 1600), a *ballo* at the end of Gagliano’s *Dafne* (1608), and a \*moresca danced by the shepherds in the finale of Monteverdi’s *Orfeo* (1607). There are also ballets, though on a relatively small scale, in other Italian operas of the early 17th century (e.g., Landi’s *Il Sant’Alessio*, 1632; M. Rossi’s *Erminia sul Giordano*, 1633). Later Italian operas made some use of the ballet, together with spectacular stage effects, especially in works designed for festival occasions, like Cesti’s *Il Pomo d’oro* (Vienna, 1667), which has several ballets in each act and a grand triple ballet in the finale.

The importance of ballet in French opera is due to the long previous tradition of the *ballet de cour* in France and to the fact that Lully, in establishing the national operatic form, practically incorporated the entire apparatus of the ballet in this new type of entertainment. The very name of the opera company, “Académie royale de musique et de danse,” shows the intimate connection that was thought to exist between opera and ballet, a connection that has been maintained throughout subsequent French opera. So strong was the French fondness for ballet that before the end of the 17th century a

new form, the *opéra ballet*, was created (Campra, *L’Europe galante*, 1697), in which the dramatic content was reduced to a minimum in order to make room for practically continuous dancing, choral, and scenic elements (Rameau, *Les Indes galantes*, 1735). The dances of Lully’s and Rameau’s operas and *opéras ballet* furnish some of the finest examples of French instrumental music of their period.

English opera likewise introduced ballet, partly from the native tradition of the \*masque and partly under French influence. There are ballets in Blow’s *Venus and Adonis* (c. 1684–85) and Purcell’s *Dido and Aeneas* (1689), as well as in Purcell’s other dramatic music (e.g., the chaconne in *King Arthur*, 1691).

In Germany ballet in opera was introduced by foreign composers (C. Pallavicino’s *La Gerusalemme liberata*, Dresden, 1687) and, under French influence, by native composers as well (J. S. Kusser’s *Erindo*, Hamburg, 1694). The ballets in the original version of Keiser’s *Croesus* (first perf. date unknown; MS score 1710, libretto 1711) were omitted in the revival of 1730.

In early 18th-century Italian opera the ballet was of minor importance, with rare exceptions in festival works such as Fux’s *Costanza e fortezza* (Prague, 1723). Toward the middle of the century, however, with the first movements toward reform of the older model, ballet scenes began to be revived. This is especially evident in the works that Jommelli wrote from 1753 to 1769 at Stuttgart, where the celebrated ballet master Jean-Georges Noverre was also in residence, and in the operas of Traetta at Parma (1758–65) and St. Petersburg (1768–74), which show the influence of Rameau. Gluck’s “reform” operas are filled with ballet scenes, like their French prototypes, and the ballet remained a constant and important feature in the works of Gluck’s disciples as well as in the “grand opera” of the 19th century (Auber’s *La Muette de Portici*, 1828; Rossini’s *Guillaume Tell*, 1829; Meyerbeer’s *Robert le Diable*, 1831; Halévy’s *La Juive*, 1835; Wagner’s *Rienzi*, 1842; Berlioz’s *Les Troyens*, composed 1856–58; Gounod’s *Faust*, 1859, recitatives added 1860, ballet music 1869). All the above-named works except *Rienzi* were first performed (or intended to be performed) at Paris, where a ballet was still considered an indispensable part of any large operatic work. Wagner’s addition of the “bacchanal” music for the Paris performance of *Tannhäuser* (1861) is striking evidence of the power of this French tradition. In his later works Wagner occasionally

had recourse to the ballet (*Die Meistersinger, Parsifal*) as did Verdi in *Aida* (1871). There are also important ballet scenes in Borodin's *Prince Igor* (comp. 1871–87, perf. 1890). The relative decline of “grand opera” in the late 19th and early 20th centuries led to the decreasing importance of ballet in opera, accompanied by a steady rise of interest in ballet as a separate form [see Ballet]. Incidental dance scenes closely connected with the action are found in R. Strauss's *Salome* (1905) and Berg's *Wozzeck* (1925). Many operas since 1925 have reintroduced the earlier custom of incorporating large dance and choral scenes, notably Milhaud's *Christophe Colomb* (1930) and *David* (1954), Schoenberg's unfinished *Moses und Aron* (comp. Acts 1 and 2, sketches only for Act 3, 1932), and Hindemith's *Die Harmonie der Welt* (1957), which closes with an elaborate allegorical ballet quite in the tradition of Lully and Rameau. D.J.G.

**Ballet suite.** Modern designation for baroque suites consisting entirely of dance types derived from the French ballet of the 17th century. See Suite V.

**Ballett.** German spelling for \*ballet. Also, 16th- and 17th-century English or German for \*balletto or for \*ballo.

**Balletto** [It.]. (1) A vocal composition of c. 1600, dancelike in character, written in a simplified madrigal style and frequently provided with a \*fa-la burden, which may occasionally have been danced. The first publication in this field was G. Gastoldi's *Balletti a cinque voci . . . per cantare, sonare, & ballare* (1591; see HAM, no. 158). His example was imitated by T. Morley in *The First Books of Balletts to Five Voices* (1595; see HAM, no. 159), by H. L. Hassler in *Lustgarten neuer teutscher Gesäng, Balletti* (1601), and in similar publications until c. 1620. (2) A dance of the 17th century, usually in 4/4 meter, bipartite form, and in a simple, near-homophonic style (somewhat similar to the early allemande), mostly for ensembles. Such *balletti* appear frequently in the German suites of the early 17th century, e.g., J. H. Schein, *Banchetto musicale* (1617; comp. ed. by A. Prüfer, vol. i), Paul Peurl, Melchior Franck, and Valentin Haussmann, as well as in Italian publications, e.g., Maurizio Cazzati, *Correnti Balletti Galiarde* (1659), Andrea Grossi, *Balletti, Correnti, Sarabande, e Gighe* (1679), etc. Frescobaldi's *Il Secondo Libro di Toccate* (1627) contains an “Aria del balletto” for keyboard (8 variations). (3) A dramatic choreography de-

scribed in Cornazano's “Libro dell'Arte da Danzare” (c. 1450), fol. 8/9. It used the conventional step repertory as found in the contemporary *ballo* and *bassadanza* but added mimic gestures and facial expressions to tell the story. See also *Ballo*.

**Ballo** [It.]. A term used in various ways since the 15th century: (1) as a generic designation for dances (e.g., F. Bendusi, *Opera nova de balli*, 1553); (2) for scenic representations, more or less in the character of a ballet (as in Monteverdi's *Il Ballo delle ingrate*, 1608), and also for operatic ballets (as in M. Gagliano's *Dafne*, 1608); (3) in the meaning of \*balletto (2) and (3), as a rare substitute for this term.

**Ballo in maschera, Un** [It., A Masked Ball]. Opera in three acts by Verdi (libretto by A. Somma, based on Scribe's *Gustave III, ou Le Bal masqué*), produced in Rome, 1859. The original play was based on historical fact; Gustavus III of Sweden was shot in the back at a masked ball in Stockholm in 1792. To avoid inciting violence against royalty during a period of political unrest, Verdi was forced by the authorities to change the scene of the opera from Sweden to colonial Boston. Some modern performances revert to the original Swedish setting, while others set the scene in Naples.

**Balsa.** Name used in Mexico as early as 1810 for a ballroom type of dance strongly reflecting the traditions of the European waltz and especially those of its French models. During the second half of the 19th century it became increasingly popular, and its influences are reflected in most of the art music produced by the composers of this period, such as Felipe Villanueva, Melesio Morales, Ricardo Castro, and others [see Mexico]. J.O-S.

**Bamberg, Codex.** See Sources, no. 5.

**Bambuco** [Sp.]. One of the most representative of Colombian traditional dance-songs, using alternation of 6/8 and 3/4 meter in moderately quick tempo. Small guitars (*tiples*) and lutes (*bandolas*) provide accompaniment for the voice. J.O-S.

**Band** [It., Sp. *banda*]. An instrumental group composed principally of woodwind, brass, and percussion instruments. In earlier periods the name was used for any group of instruments, and particularly for highly distinguished groups, e.g., the “24 violons du roy” under Lully (*La Grande Bande*), or the 24 fiddlers of Charles II (The King's Private Band). Today, the term is

also used for groups of unusual instrumental combinations, e.g., marimba band, accordion band, etc. Different types of wind band include the brass band, military band, symphonic band, wind ensemble, jazz or dance band, etc. The Italian word *banda* means the brass and percussion combination in the orchestra, a meaning carried over from the earlier cavalry bands, consisting of brass and percussion. Also see Brass band; Military music; Symphonic band.

J.W.

**Bandola** [Sp.]. Small guitar typical of Colombia, with a set of fifteen strings tuned three to each of the following notes: G-d-a-e'-b'. It is usually used together with a smaller twelve-string guitar known as *requinto*.

J.O-S.

**Bandoneon** [Sp.]. See under Accordion.

**Bandora, pandora, pandore.** A 16th-century stringed instrument of bass size [see ill. under Lute], with a characteristic scalloped body. It had seven (originally six) pairs of metal strings tuned G<sub>1</sub>-C-D-G-c-e-a and as many as 15 frets. Pieces for bandora in the Cambridge University Library [Ms. Dd.2.11] as well as some pieces by Barley call for the additional bass course which was tuned to G<sub>1</sub>. It was supposedly invented by John Rose of London in 1562 and was in use for about a hundred years. There are close to 100 compositions for the bandora. A smaller instrument of the same type was the \*orphanion. See W. W. Newcomb, *Lute Music of Shakespeare's Time* (1966; new ed. of W. Barley's *A new Booke of Tabliture* of 1596); T. Dart, "Le Pandore" (in *Le Luth et sa musique*, 1958, ed. J. Jaquot); D. Gill, "The Orphanion and Bandora" (GSJ xiii).

**Bandura.** Instruments referred to by this or a similar name can only be identified with reference to specific countries of origin, e.g., the bandura being Russian, the \*bandurria Spanish.

**Bandurria.** A Spanish instrument of the guitar family, still widely used in southern Spain. In its present-day form it has six double strings tuned in fourths from g<sup>#</sup> to a<sup>2</sup> and is played with a plectrum. See ill. under Guitar family. In Latin America the name is used for a twelve-string guitar similar to the \*bandola but smaller, used mainly in Colombia. It is also known as *pandura*.

**Banjo.** A stringed instrument with a long neck and a body in the form of a shallow, one-headed drum spanned with parchment. Sometimes fretted, it may have four to nine strings. Often

it has five, the highest of which, called the thumb-string, is placed next to the lowest, in the following arrangement: d', b, g, c, g'. It is plucked with either the fingers or a plectrum. The banjo was the typical instrument of the American Negro and has been frequently used in jazz. It was imported by slaves from West Africa (Senegambia), where it existed under the name "bania." In all probability it is not an aboriginal African instrument but a modification of the Arabian or European guitar [see ill. under Guitar family].

**Bar.** (1) In English, bar line or, more usually, measure (included between two bar lines). (2) In German, see *Bar* form.

**Barber of Seville, The.** See *Barbiere di Siviglia*.

**Barbershop harmony.** Colloquial term for a type of banal harmony used in popular American part singing such as was formerly practiced in barbershops [see Ex.]. Diminished seventh chords, dominant seventh chords, augmented

sixth chords, and triads with added sixths prevail, usually in close position. See S. Spaeth, *Barber Shop Ballads* (1940).

**Barbiere di Siviglia, Il** [It., The Barber of Seville].

(1) Opera in two acts by Rossini (libretto by C. Sterbini, originally entitled *Almaviva o sia L'Inutile Precauzione*, based on Beaumarchais' *Le Barbier de Seville*), produced in Rome, 1816. Setting: Seville, 18th century. It is one of the last examples of 18th-century Italian comic opera and, in particular, the last to use the *secco* \*recitative. Figaro's aria "Largo al factotum" is one of the outstanding examples of *buffo* aria in rapid declamation. The plot of Mozart's *Nozze di Figaro* is based on Beaumarchais' sequel to *Le Barbier de Seville*. (2) Opera in two acts (4 parts) by G. Paisiello (libretto by G. Petrosellini, based on Beaumarchais). Produced in St. Petersburg, 1782. Setting: Seville, 18th century.

**Barbitos.** An instrument mentioned by various Greek and Latin writers, from the 6th century B.C. (Anacreon) to the 3rd century A.D. (Athe-

naeus). Anacreon likens it to the lyre and Theocritus says that it had many strings.

**Barcarole** [F. *barcarolle*; It. *barcarola*]. A boat song of the Venetian gondoliers [It. *barca*, boat], or an instrumental or vocal composition in imitation thereof. Well-known examples for the piano are found in Mendelssohn's "Songs without Words" (op. 19, no. 6; op. 30, no. 6; op. 62, no. 5); others were written by Chopin (op. 60) and Fauré. Vocal barcaroles occur in various operas with Italian settings, e.g., in Hérold's *Zampa* (1831), Auber's *Fra Diavolo* (1830), Offenbach's *Tales of Hoffmann* (1881); see also Schubert's song, "Auf dem Wasser zu singen." Barcaroles are always in moderate 6/8 or 12/8 time and use a monotonous accompaniment suggestive of the movement of the waves and the boat.

**Bard.** The pre-Christian and medieval poet-musician (minstrel) of the Celts, especially the Irish and the Welsh. In the early Middle Ages bards exercised great political power, serving as historians, heralds, ambassadors, officers of the king's household, and, in brief, constituting the highest intellectual class. Their activities are documented as early as the pre-Christian era by Greek writers such as Diodorus Siculus (1st cent. B.C.), who refers to the \*crwth, the traditional instrument of the bards. Privileges of the Welsh bards were fixed by King Howel Dha in 940 and revised by Gryffyd ap Cynan in 1040. Their earliest persecutions (on political grounds) occurred after the conquest of Wales by Edward I in 1284. The bards continued to be active, (though at a level far below their former high station) in Ireland until 1690 (battle of the Boyne) and in Scotland until 1748. Annual congregations of the Welsh bards, called *Eisteddfod*, were revived as a regular practice in the early 19th century after an interruption of about 150 years. Their standards, extremely low, have recently been raised considerably. [Also see Pennillion.]

The music of the Welsh bards has been the subject of much discussion and controversy. Many exaggerated claims have been made, chiefly on the basis of certain music manuscripts, one of which, called *Musica neu Bero-riaeth* (Penllyn MS; fac. ed. *Musica, Brit. Mus. Add. MS 14905*, University of Wales, Cardiff, 1936), bears the inscription, made by an 18th-century owner: "The following manuscript is the Music of Britains as settled by a Congress, or Meeting of Masters of Music, by order of

Gryffydd ap Cynan, Prince of Wales, about A.D. 1100, with some of the most antient pieces of the Britains supposed to have been handed down to us from the British Druids." Actually, this manuscript dates from the 17th century and does not substantiate this supposition or support other extravagant claims voiced by modern advocates of the "medieval bardic music" movement (e.g., A. Dolmetsch). The notation is but a modification of the German organ tablature of the late 16th century [see *WoHN* ii, 294]. The transcriptions given by Dolmetsch (who succeeded in clarifying certain peculiarities of this notation) still further discredit the fantastic legends so frequently told. The style of these pieces seems to indicate that they may be end-products of "debasement through seepage," a process frequently noticeable in folk traditions [see *Folk music* II]. It is scarcely tenable, therefore, to state that "from internal evidence such music could not have been made later than the sixth century, and was probably much earlier" (A. Dolmetsch, in *The Consort*, no. 4, p. 14). The accompanying example, transcribed from

*WoHN* ii, 298, shows written out figurations in the style of the 17th-century *arpègement figuré* [see *Arpeggio*]. Only the beginning and the end of the piece are given here, but the intermediate measures can easily be found from the formula 111100001010111100001011 given in the original, which indicates the scheme of alternation for the two chords used in this piece, each being indicated by the figure 1 or 0, a method commonly used in 17th-century guitar tablatures [see *WoHN* ii, 171ff].

Crossley-Holland, "Secular Homophonic Music in Wales in the Middle Ages" (*ML* xxiii, 135).

**Bar form** [G.]. I. A term used frequently in modern studies for an old, very important musical form, schematically designated a a b. The name is derived from the medieval German term *Bar*, a poem consisting of three or more *Gesätze* (i.e., stanzas), each of which is divided into two *Stollen* (section a) and an *Abgesang* (section b). See the accurate description in Wagner's *Die Meistersinger*, Act I, 3, where Kothner says: "Ein jedes Meistersinges Bar" consists of "unterschiedlichen Gesätzen" (different stanzas); "ein Gesätz" consists of "zweenen [two] Stollen" and "Abgesang." It appears that the form a a b should properly be called *Gesätz* form (form of the stanza), but the term *Bar* form has been generally accepted.

The aesthetic principle of the *Bar* form is adumbrated in the ancient Greek ode, which consists of *strophe* (a), *antistrophe* (a), and *epode* (b). In Gregorian chant, repeat structures of the a a b type occur particularly in the jubili and verse melismas of the Alleluias [e.g., "Timebunt gentes," *LU*, p. 1056], as well as in the verse melismas of the Offertories [see *ApGC*, p. 368f]. It is also clearly recognizable in some of the long Alleluia melismas of Mozarabic chant [e.g., *Antifonario . . . de Leon*, fac. ed. 1953, f. 187]. The *Bar* form also occurs in a few hymn melodies [e.g., "Iste confessor," *LU*, p. 1178] that have identical music for the first and second lines of the stanza (a a b c). From here it found its way into the repertory of the troubadours and particularly of the trouvères, where it is known as *\*ballade*, and ultimately into that of the minnesingers and Meistersinger, who called it *Bar* and used it for nearly all their lyrical songs [Ex. in *EiBM*, no. 8; *HAM*, nos. 20, 24; *SchGMB*, nos. 12, 21]. It is equally common in the German polyphonic songs of the 15th and 16th centuries (Locheimer Liederbuch, Glogauer Liederbuch, Hofhaimer, Stoltzer, etc.), as well as in the Lutheran chorales and the various compositions based on them (organ chorales, chorale cantatas, etc.).

An interesting modification found in the French and, particularly, in the German songs is the use of identical endings for the *Stollen*

and the *Abgesang*, resulting in the form ||: a + x :|| b + x, as, e.g., in W. von der Vogelweide's "Palestine Song" [see Ex. 1], in Hans Sachs' "Silberweise" [*SchGMB*, no. 78], and in many chorales of the 16th century, e.g., "Wachet auf, ruft uns die Stimme" [cf. Bach's chorale prelude and the first movement of the cantata]. It could

1. Al - ler - erst le-be ich mir werde  
3. Daz hêre lant und ouch die er - de

2. Sit min sün - dic ou - ge siht  
4. Dem man vil der ê - ren giht.  
7. Da got men - nisch - li - chen trat.

5. Mirst ge - schehn des ich ie bat:

6. Ich bin kom - men an die stat (7, see above).

1. A - les di - e - i nun - ti - us  
2. Lu - cem pro - pin - quam prae - ci - net.  
4. Jam Chri - stus ad vi - tam vo - cat.

3. Nos ex - ci - ta - tor men - ti - um (4, see above).

be designated as rhymed *Bar* form. Another subspecies is the "doubled *Bar*" ||: a :|| b :|| c, which occurs in the melismas of some Alleluias (e.g., "Oportebat," *LU*, p. 822) and forms a connecting link with the *\*sequence*; yet another the "superposed *Bar*" (*G. potenziert Bar*), in which the *Stollen* itself is a complete *Bar* [Ex. in F. L. Saran, *et al.*, ed., *Die Jenaer Liederhandschrift*, 2 vols. (1901), ii, 53, 57].

II. Of particular importance is the type of *Bar* in which the *Stollen* recurs complete at the end of the *Abgesang*, thus leading to the form a a b a or ||: a :|| b a. An appropriate designation

for this is rounded *Bar* form (G. *Reprisenbar*, also *Rundkanzone*). Several hymn melodies show this form, e.g., "Jam sol" [LU, p. 312], "Lucis creator" [LU, p. 257], "Ales diei nuntius" [Ex. 2; see AR, p. 109]. Minnesinger songs showing this structure are quite numerous [see Neidhardt von Reuenthal, in *DTO* 71, p. 31; Saran (*op. cit.*), ii, 29; HAM, no. 20d; ReMMA, p. 235]. The special interest of the rounded *Bar* form lies in the fact that its scheme is identical with *\*sonata* form, whose exposition (repeated), development, and recapitulation correspond to the *Stollen* (repeated), *Abgesang*, and restated *Stollen* of the rounded *Bar*. There is, of course, no historical relationship between the medieval *Bar* form and classical sonata form, which actually developed from the rounded binary form  $\parallel: a : \parallel: b a : \parallel$  in which both sections are repeated [see Binary and ternary form II]. However, the similarity is all the more noteworthy since the *Abgesang* of the medieval songs frequently takes on the function of a real development (higher range, motif continuation, greater intensity of the melodic line, etc.), e.g., in the "Palestine Song" and in Hans Sachs' "Morgenweise" [EiBM, no. 8]. The *a a b a* form is also the most common scheme of present-day popular songs (*b* is called the "bridge").

A. Lorenz has tried to show (with questionable success) that the *Bar* form is the main structural principle of Wagner's operas, particularly of *Die Meistersinger*. He interpreted them as consisting of numerous layers of superposed *Bars* (*Kleinbar*, *Mittelbar*, *Grossbar*), beginning with the smallest units of the musical line and culminating with the "gigantic" *Bar* of the three acts.

Lit.: A. Lorenz, *Das Geheimnis der Form bei Richard Wagner*, 4 vols. (1924–33); *id.*, "Das Relativitätsprinzip in den musikalischen Formen" (CP Adler); *id.*, "Homophone Grossrhythmik in Bachs Polyphonie" (DM xxii.4); H. A. Grunsky, in *ZMW* xvi.

**Baricanor** [L.]. See Baritonans.

**Bariolage** [F.]. A special effect in violin playing, obtained by quickly shifting back and forth between two or more strings, the lower strings being used to produce relatively higher tones. This technique may be employed for broken-chord passages [Ex. 1, Bach, Solo Partita in E major], for a "coloristic" tremolo [Ex. 2, Brahms, Symphony no. 4, last movt.], or for similar formations.

**Baritonans, baricanor.** Terms employed occasionally in the late 15th century (Busnois, La Rue) for bass parts.

**Baritone** or (rarely) **barytone**. (1) The male voice between the bass and the tenor; see Voices, range of. (2) Applied to instruments (oboe, horn, saxophone), any size above the bass size. (3) Abbr. for baritone horn; see Brass instruments III (c).

**Baritone clef.** See under Clef.

**Baritone horn.** See under Brass instruments III (c).

**Bar line** [F. *barre de mesure*; G. *Taktstrich*; It. *stanghetta*; Sp. *linea divisoria*]. A vertical line drawn through the staff to mark off measures. The general use of the bar line is relatively recent (17th century). Until 1600 bar lines were used only for keyboard and lute (*vihuela*) music, the earliest known being from the late 14th century (Codex Faenza). The use of bar lines in 16th-century compositions frequently differs from present-day practice, since they served primarily as a means of orientation, without implying a regular recurrent main beat. They are drawn at the distance of either a *brevi*s or a *semibrevis* (two or one whole note), the choice depending to a certain extent on the absence or presence of small note values. In some compositions, mostly Spanish, the bar lines completely fail to indicate the musical meter because they mark off beats, three of which must be combined in order to produce a measure in the modern sense of the term (3/1, reduced to 3/2; see Narvaez's "Diferencias sobre O gloriosa Domina," HAM, no. 122). Particularly noteworthy is the fact that the marking-off began with the first note, even if it was an upbeat. See Ex. 1 (Pisador, "Pavana muy llana," *Libro de música de vihuela*, 1552), in which the original barring is given on the staff, the modern below the staff. The same usage occurs in Frescobaldi's *Partite sopra l'aria della Romanesca* [see HAM, no. 192].

In ensemble (vocal) music the bar line was not introduced until the latter part of the 16th century, when the notation in single parts gave way to notation in score arrangement. The arias of the 17th century frequently show the anomalous use of the bar line referred to above, i.e., the disregard of upbeat or of triple time [see the explanations and examples in *RiHM* ii.2, 12f].

Modern editors of polyphonic music of the 15th and 16th centuries have increasingly resented the "tyranny" of the bar line and have tried to make this indispensable device of modern notation less conspicuous by replacing it with apostrophes: ', punctuated lines: ::, or with the *Mensurstrich*, i.e., a line drawn between, not through, the staves [Ex. 2, from Josquin, *Ave Christe, immolate*]. However, the *Mensurstrich* is impracticable if different meters (mensurations) are used in different parts, e.g., 2/4 against 3/4, a practice not uncommon in the period of Obrecht and Josquin and still more common in the compositions of the late 14th century.

**Baroque music.** The music of the period c. 1600–1750, following that of the Renaissance. It is also referred to as the "thoroughbass period." The term *baroque* (probably from Port. *barrôco*, irregularly shaped pearl; or from the painter F. Barocci, or Baroccio, d. 1612) was used formerly in a decidedly pejorative sense, to mean "grotesque," "in corrupt taste," overladen with scrollwork," etc. Its application to the fine arts was based on the opinion (Jacob Burckhardt) that 17th-century architecture and painting represented a debased Renaissance style. This opinion, however, was thoroughly revised about 1900 by Heinrich Wölfflin, who was the first to

point out the positive contributions and great artistic qualities of baroque art and to vindicate the term "baroque" from any implication of inferiority.

Both the beginning and the end of the baroque period in music are rather clearly defined. Baroque music began about 1600, with the rise of monody, opera, oratorio, cantata, and recitative, and ended 150 years later, with the death of Bach and Handel. Preparatory phenomena were, on the one hand, the *\*balletto* and *\*villanella*, with their reaction against Flemish polyphony, and on the other hand, the style of the *\*Venetian school* (G. Gabrieli), whose pomp and splendor exceed the limitations of true Renaissance art and foreshadow the aesthetic basis of baroque style. It may be noted that throughout the 17th century the tradition of Renaissance music persisted to some extent in the *\*Roman school*, and that, on the other hand, a new period, the *\*rococo*, had already begun when Bach and Handel were writing their greatest masterpieces, which represent the acme of baroque music.

Generally speaking, the baroque period is an era of ecstasy and exuberance, of dynamic tensions and sweeping gestures, an era of longing and self-denial, much in contrast to the assuredness and self-reliance of the Renaissance. It is a period when men liked to consider this life the "vale of tears," when the statues of the saints look rapturously toward heaven, when the clouds and the infinite landscape were discovered. Much of this attitude is reflected in the expressive melodies of the 17th century, in the long coloraturas, the pathetic recitative, the frequent use of chromaticism, the capricious rhythms. Early baroque music (prior to 1650) in particular shows, in its *\*canzonas* and *\*toccatas*, striking traits of capriciousness, exuberance, and irregularity, whereas later composers such as Carissimi and Corelli represent a trend toward greater restraint and regularity of style. On the other hand, the structural, or, as one might call it, the architectural element in baroque music must not be overlooked. More than any other period, the 17th century contributed toward the development and establishment of clearly defined types and forms, such as the *ostinato* forms, the variations, the suite, the sonata, the *da capo* aria, the rondo, the concerto, the opera, the oratorio, the cantata.

Stylistically, baroque music is characterized chiefly by the thoroughbass technique, leading to a texture of two principal contours, melody and bass, with the intervening space filled by improvised harmony. In Germany, however, the

contrasting style of true polyphony not only persisted but reached, in Bach, the very acme of perfection. A third principle of baroque style is the *stile concertante*, that is, contrasting effects, a principle expressed in the abrupt changes of the early canzona as well as in the solo-tutti alternation of the *\*concerto grosso* and in the *\*echo* effects of vocal and organ music. Other basic concepts of baroque music are *\*improvisation* and *\*ornamentation*. Finally, there is the definitive establishment of tonic and dominant as the principal chords of harmony and, c. 1650 (Carissimi), of four-measure phrases [see *Vierhebigkeit*].

At the beginning of the 17th century stand three great figures still rooted in the tradition of the Renaissance but inaugurating the novel trends of baroque music: Monteverdi, G. Gabrieli, and Sweelinck. They may be considered the sources of three mainstreams of baroque music, that is, vocal, instrumental, and organ music, with which, in turn, the three styles mentioned above can be roughly associated, namely, accompanied melody, concerto style, and contrapuntal style.

The first of these streams, starting in Florence (Caccini, Peri, later Monteverdi), produced the monodic style [see *Monody*] with the *\*recitative* and *\*aria*, and with the composite forms of the *\*cantata*, *\*opera*, and *\*oratorio* (Passion). The second, "Venetian" stream found its realization in the instrumental canzona, the violin *\*sonata*, the trio sonata in its two varieties, sonata da chiesa and *\*sonata da camera*, and in the orchestral forms of the *\*concerto grosso* [see also *Concerto III*], the French *\*overture*, and the *\*sinfonia*. The last stream, starting with Sweelinck and Frescobaldi but continuing chiefly in Germany (Scheidt, Froberger, Buxtehude, Pachelbel, Kuhnau, Muffat, Fischer, Bach), led to the *\*fugue*, *\*organ chorale* (chorale prelude), *\*toccata*, and *\*suite* (the latter also in France).

Wellesz, *Der Beginn des musikalischen Barock und der Anfang der Oper in Wien* (1922); J. H. Mueller, "Baroque—Is it Datum, Hypothesis, or Tautology?" (*Journal of Aesthetics and Art Criticism* xii, 421ff); C. J. Friedrich, M. F. Bukofzer, H. Hatzfeld, J. R. Martin, W. Stechow (*ibid.* xiv, 143ff); "Le 'Baroque' musical" (*Les Congrès et Colloques de*

*l'Université de Liège*, xxvii, 1964); E. Schenk, in ZMW xvii; E. Wellesz, in ZIM xi; C. Sachs, in JMP xxvi; A. Della Corte, in LRM vi, no. 5; *id.*, in CP Laurencie; G. Barblan, in CP Anglès i.

**Baroque organ.** See Organ XII.

**Barpyknon.** Same as *barypyknon*. See Pyknon.

**Barré** [F.]. In lute and guitar playing, term calling for the simultaneous shortening of the vibratory length of several or all strings by holding the forefinger across them. An artificial substitute is the *\*capotasto*.

**Barre de mesure** [F.]. *\*Bar line*.

**Barrel organ.** See under Mechanical instruments II.

**Bartered Bride, The** [Cz. *Prodaná Nevěsta*]. Opera in three acts by Bedřich Smetana (libretto by Karel Sabina), produced in Prague, 1866. Setting: A Bohemian village, 1850. It has been widely sung outside Czechoslovakia in the German translation (1893) as *Die verkaufte Braut*. Describing an episode from 19th-century Bohemian peasant life, *The Bartered Bride* is one of the first and most successful examples of national opera.

**Baryton.** (1) French and German spelling for *\*baritone* (voice, size of instruments). (2) An instrument of the viol family. See Viol IV, 5. For ill. see Violin. See E. Fruchtmann, "The Baryton: Its History and Its Music Re-examined" (*AM* xxxiv). *Barytonhorn*, i.e., euphonium [see Brass instruments III(d)].

**Barytonans, barycanor.** See Baritonans.

**Barzelletta** [It.]. A type of Italian poetry of about 1500, generally in the form of the *\*ballata* (*ripresa* - *piedi* [or *mutazione*] - *volta* - *ripresa*) or *\*bergerette* (*ballata* or *\*virelai* with one stanza). More than half of the *frottole* are *barzellette*. Indeed, the specific poetic-musical type generally known as *frottola* should perhaps be designated *barzelletta*, the term *frottola* being more a collective name for various types.

**Base viol.** Same as bass viol. See Viola da gamba.

**Basilica.** See under Diaphonia (3).

**Basis** [Gr.]. Humanist name for "bass" used by 15th- and 16th-century composers.

**Bass.** (1) The lowest of men's voices [see *Voices*, range of]. (2) German name (abbr. of *Kontrabass*) for the double bass. (3) Applied to instruments,

the term indicates the lowest and consequently largest type of the family, e.g., bass clarinet. (4) In musical composition, the lowest of the parts. In the styles of the 18th and 19th centuries the bass has special significance as the determining factor of the harmonic structure [see Harmonic analysis]. The special role of the bass is particularly conspicuous in the practice and theory of \*thoroughbass. For the origin of the bass, see Contratenor.

**Bassa** [It.]. Low. *Ottava bassa* (abbr. *8va bassa*), the lower octave of the written notes. *Con 8va bassa*, doubling of the written notes in the lower octave.

**Bassadanza** [It.]. See *Basse danse*.

**Bass-bar**. In violins, etc., a strip of wood glued inside the table, about 11 in. long and narrowing at both ends. Its function is to support the left foot of the bridge and to spread over the table the vibrations of the bridge produced by those strings.

**Bass clef**. See under Clef.

**Bass-course**. See Course.

**Bass drum**. See under Percussion instruments B 3.

**Basse** [F.]. *Basse chiffré* or *b. continue*, thoroughbass; *basse contrainte*, ground (basso ostinato); *basse profonde*, *chantante*, *taille*, see Voices, range of; *basse fondamentale*, fundamental bass; *basse-à-piston*, euphonium.

**Basse danse** [F.], **bassadanza** [It.]. One type of a "family of related dances" (*ReMR*, p. 37) of unknown origin cultivated at the courts of western Europe during the 15th century and, in a somewhat debased form, cultivated more generally during the early 16th century. The name (*bas*, low) probably refers to the gliding or walking movements of the feet, in contrast to the livelier steps of the *pas de Brabant* (It. *saltarello*, Sp. *alta* or *altadanza*), which often followed the *basse danse* proper. The earliest sources of information about the *bassadanza* include nine Italian MSS, of which the so-called "Trattato dell'arte del ballo di Guglielmo Ebreo" (c. 1463) and the "Libro dell'arte del danzare" of Antonio Cornazano (c. 1455) are the best known; three French sources, including the late 15th-century MS Brussels 9085, written (for Marie of Burgundy?) with gold and silver on black paper [see Lit., Closson], and *L'Art et instruction de bien dancier*, printed before 1496; and a single Spanish

source. The Italian treatises give prose descriptions of the choreographies and very little of the music; the French sources record the steps of each dance in a simple tablature notation (*s* = *simple*, *d* = *double*, *r* = *reprise*, *b* = *branle*, etc.) and give a monophonic tenor for each dance. Most of the dances have names such as "La crudele," "Triste plaisir," "Sans faire de vous departie," "La baixa de Castilla," etc. [see Ex. 1].

A few of the *basse danse* melodies have been identified as tenors of Burgundian chansons ("Triste plaisir" by Binchois; "Sans faire" by Fontaine). The three *bassadanza* tenors in Cornazano's treatise are written almost exclusively in white semibreves, whereas the 56 *basse danse* tenors included in the two French sources mentioned above are written almost exclusively in black breves. In both cases one note of the tenor corresponds to one step unit of the dance. However, the written notes do not constitute the dance melody but a tenor (in \*cantus planus style) above which one or two parts of a livelier character were improvised. (A typical *basse danse* band consisted of, e.g., two shawms and a slide-trumpet.) An instructive example of the use of a tenor is the *saltarello* in Perugia MS. 431 [M. Bukofzer, *Studies in Medieval and Renaissance Music* (1950), p. 199]; another, with the two upper parts moving in parallel fourths, is the *Spaniol Kochersperg* [W. Merian, *Der Tanz in den deutschen Tabulaturbüchern* (1927), p. 46]. According to Cornazano, the same tenor could be used for all dances of the *bassadanza* type—the *saltarello*, *quaternaria* (or *saltarello tedesco*, used by the Germans), \**piva* (*cacciata*), and the *bassadanza* proper—the difference being in the number of beats allowed to each of the (tenor) written notes, 3 for the *saltarello*, 4 for the *quaternaria*, 2 (four half-beats) for the *piva*, and 6 for the *bassadanza*. A particularly interesting *basse danse* tenor is the \**Spagna*.

In the 16th century the *basse danse* became a simpler, more stereotyped dance, its music no longer based on equal-note tenor melodies but on discant melodies, like the melody of Willaert's "Jouyssance vous donneray," the example given

by Arbeau (*Orchésographie*, 1589) in his description of the *basse danse*; other examples are included in several of Attaingnant's publications, e.g., *Dixhuit Basses dances garnies de recoupes et tordions* (1530). The great majority of the *basses danses* are in slow triple meter (3/2), which, however, is sometimes obscured in modern editions by the use of bar lines separating beats rather than measures [see Bar line]. (Arbeau says that "it is always necessary to reduce into ternary meter the *basses danses* given by Attaingnant in binary meter.") The basic rhythm and a typical example of the later *basse danse* (*Beurre frais*) are shown in Ex. 2 and 3. However, Attaingnant's

publications also contain a few *basses dances* in duple meter. Sometimes the 16th-century *basse danse* is followed by a *recoupe* and a *tordion*, thus forming an early example of a suite.

**Bass horn.** See under Cornett. For ill. see under Brass instruments.

**Bassist** [G.], **bassista** [It.]. A bass singer.

**Bass lute** [G. *Basslaute*]. The chitarrone, or the theorbo. See Lute III.

**Basso** [It.]. Bass. *B. profondo, cantante*, see Voices, range of. *B. continuo*, see Thoroughbass.

**Basson** [F.]. Bassoon. *B. quinte*, a smaller bassoon, also called tenoroon. *B. russe*, \*Russian bassoon.

**Bassoon.** See under Oboe family I, C.

**Basso ostinato.** See Ground; also under Ostinato.

**Basso ripieno** [It.]. In 18th-century orchestral works, a bass part for the tutti (\*ripieno) passages only, i.e., not for the solo sections.

**Basso seguente.** An early type of thoroughbass, which merely duplicated (usually on the organ) whatever part of a vocal composition was the lowest at any given time. Thus, in a composition beginning with a downward imitation it would start with the soprano, then pick up the alto, tenor, and finally continue with the bass. The practice of adding such a part began in the late 16th century (G. Croce, *Motetti a otto voci*, 1594). After 1600 optional organ basses of the *seguinte* type were added to madrigals, etc., in order to bring them in line with contemporary trends. An example is Monteverdi's fourth book of madrigals (1603), which was reprinted in 1615 with the addition of an organ part. See M. Schneider, *Die Anfänge des Basso continuo und seiner Bezeichnung* (1918); *BuMBE*, pp. 26, 35.

**Bassschlüssel [G.].** The F-clef.

**Bass viol.** Properly (17th century), the \*viola da gamba [see also Viol II]. For ill. see Violin. Today, name for the double bass, a descendant of the old double-bass viol [see Viol IV, 1].

**BathypHONE.** See under Clarinet family III.

**Battaglia** [It.]. Name for a composition in which the fanfares, cries, drum rolls, and general commotion of a battle [It. *battaglia*] are imitated. This was a favorite subject of \*program music from the 16th through the 18th centuries. Late 14th-century compositions such as Grimace's *Alarme, alarme* [W. Apel, *French Secular Music of the Late Fourteenth Century*, p. 122\*] represent this genre in an incipient form. It appears fully developed in a 3-voice "Alla bataglia" (c. 1470?) in the Chansonier Pixérécourt. Isaac's instrumental "A la bataglia" [DFO 32, p. 221] is probably an arrangement of a vocal composition. Particularly famous was Janequin's "La Guerre" (1529?), a highly realistic description of the battle of Marignano of 1515 [see Editions XXV, 7]. Hans Newsidler arranged it for the lute in 1544 [see DFO 37]. H. M. Werrekoren (Mathias Fiamengo) wrote "Die Schlacht vor Pavia" (1544; repr. 1549 as "La Bataglia taliana"), which portrays this important battle of 1525. The artistic culmination of the vocal *battaglia* is represented by Monteverdi's "Canti guerrieri" from his *Madrigali guerrieri et amorosi* (1638). Instrumental battle pieces were written by Byrd [*My Ladye Nevells Booke*, ed. H. Andrews, 1926], Banchieri [see *ApMZ* i], J. K. Kerll [DFO 3; also *TaAM* vii], J. Cabanilles [*Johannes Cabanilles... Opera omnia*, ed. H. Anglés, 4 vols., 1927-56, i, 130, 170; ii, 102, 109; one of these is almost identical with that of Kerll], and others. These pieces have rather limited artistic value, but even poorer are the numerous battle pieces (mostly English) of the 18th century, some of which prescribe actual gunfire at certain moments. Franz Kotzwara's *Battle of Prague* (1788?) is still known today. Beethoven contributed to the repertory with his "battle symphony," *Wellingtons Sieg oder die Schlacht bei Vittoria* (op. 91, 1813, pub. 1816). See R. Gläsel, "Zur Geschichte der Battaglia" (diss. Leipzig, 1931); E. Bienenfeld, in *ZIM* viii; K. G. Fellerer, in *DM* xxxii, no. 7.

**Battement** [F.]. French 17th-century term for any ornament consisting of an alternation of two adjacent tones, e.g., mordent, trill, vibrato. In modern parlance, *battements* are the acoustical beats.

**Batterie** [F.]. (1) The percussion group of the orchestra. (2) A drum roll. (3) An 18th-century name for arpeggio, broken-chord figures, Alberti basses, etc. (4) A manner of playing the guitar by striking the strings.

**Battery.** Old term for arpeggio; see *Batterie* (3).

**Battle of the Huns, The.** See *Hunnenschlacht, Die*.

**Battle of Victoria.** See *Wellingtons Sieg*.

**Battle pieces.** See *Battaglia*.

**Battuta** [It.]. Beat. A *battuta* indicates a return to strict time after some deviation (*ad libitum*, *a piacere*, etc.). In particular, *battuta* means the strong beat at the beginning of a measure; hence, Beethoven's indication "ritmo di tre [quattro] battute" (*Scherzo*, Ninth Symphony) means that three (or four) measures are to be grouped together, the tempo being so fast that there is only one beat to the measure.

**Batuque** [Port.]. Term for Brazilian dances of African origin, using marked syncopation and with the percussion standing out above the other instruments. The dancers usually form wide circles and clap their hands or strike together pieces of glass, wood, or iron. The *batuque* is also known as *batucada*. It is the ancestor of the \*samba and \*maxixe, which represent its modern versions, modified by urban influences.

J.O-S.

**Bauernkantate** [G., Peasant Cantata]. A secular cantata by Bach, written to a text by Picander in Saxon dialect ("Mer hahn en neue Oberkeet," We Have a New Magistrate) and performed in 1742 to celebrate the installation of a new magistrate in a rural district of Saxony. The music includes several popular tunes of the day.

**Baxa** [Sp.]. A 16th-century term for \*basse danse.

**Bay Psalm Book.** A book of psalms, *The Whole Booke of Psalms Faithfully Translated into English Metre*, published in Cambridge, Mass., in 1640 (the first book printed in North America). It had numerous subsequent editions over more than a century. In 1698 music (in two parts) was added for thirteen tunes. See Psalter; United States I; I. Lowens, in *JAMS* viii, 22, and in his *Music and Musicians in Early America* (1964).

**Bayreuth Festival.** Annual festival held in the opera house of Bayreuth (Bavaria) for the per-

formance of Wagner's operas. It originated in 1876 with the first complete performance of the \**Ring des Nibelungen*.

**Bayreuth tuba.** Same as Wagner tuba; see under Tuba.

**BB<sup>b</sup> bass.** See under Tuba (2).

**B. c.** Abbr. for *basso continuo*.

**Be [G.].** The sign *b*.

**Beak flute.** \*Recorder.

**Bearbeitung [G.].** Arrangement, transcription.

**Beat [F. *temps*; G. *Zählzeit*, *Schlag*; It. *battuta*; Sp. *tiempo*].** (1) The temporal unit of a composition, as indicated by the up-and-down movements, real or imagined, of a conductor's hand (upbeat, downbeat). In modern practice, the duration of such a beat varies from M.M. 50 to M.M. 140, with M.M. 80 being a middle speed. In moderate tempo, the 4/4 measure includes four beats, the first and third of which are strong, the others weak, while the 3/4 measure has three beats, only the first of which is strong. In quick tempo, there are only two beats, or even one, to the measure. In very slow tempo, the beats may be subdivided into two's or three's. In music prior to 1600, the beat was of much less variable duration [see *Tactus*; *Tempus*].

(2) A 17th-century English ornament that may be performed in two ways, depending on whether it is a *plain beat* (indicated by an ascending oblique line placed before or over the written note) or a *shaked beat* (indicated by a wavy line resembling the French sign for the trill). The plain beat is an inferior \**appoggiatura* performed on the beat and of flexible duration. The shaked beat consists of several rapid repetitions of the *appoggiatura* and its resolution, beginning with the former, so that it resembles an inverted trill. In the 18th century the term beat is often applied to the ornament commonly known as \**mordent*.

(3) See Beats,

(2) by P.A.

**Béatitudes, Les [F., The Beatitudes].** Oratorio by Franck for solo voices, chorus, and orchestra, set to the well-known text from the Scriptures [Sermon on the Mount, *Matt.* 5: 3–12]. It was completed in 1879.

**Beats [F. *battements*; G. *Schwebungen*; It. *battimenti*; Sp. *batimientos*].** An acoustical phenomenon resulting from the interference [see Acoustics VI] of two sound waves of slightly

different frequencies. It is heard as minute yet clearly audible intensifications of the sound at regular intervals. The number per second of these intensifications, or beats, is equal to the difference in frequency of the two tones. Thus, a tone of 440 cycles per second will make four beats per second with a tone of 444; three with a tone of 443; two with 442; one with 441; and the beats will disappear if the two strings are in perfect unison [see ill. of interference under Acoustics]. This phenomenon is therefore of fundamental importance in \**tuning*. Slow beats such as two to four to the second are not unpleasant to the ear. In certain organ stops (voix céleste, unda maris) beats are deliberately introduced, by using two pipes slightly out of tune, in order to give the combined tone an undulating quality. Beats of 5 or 6 per second produce a distinctly less agreeable result, and the unpleasantness of the effect increases until the number of beats is *c.* 30. From there on the unpleasantness diminishes because the beats rapidly become too quick to be distinguished. This phenomenon is the basis of Helmholtz's theory of \**consonance* and *dissonance*. See also *Combination tone*.

**Bebization.** See Solmization.

**Be bop.** See Bop.

**Bebung [G.; F. *balancement*].** A \**vibrato* effect peculiar to the clavichord, whose action allows for a repeated pressure of the finger without releasing the key, a motion causing the tangent momentarily to increase the tension of the string and thus producing slight variations in pitch. K. P. E. Bach, in his *Versuch über die wahre Art das Clavier zu spielen*, 2 vols. (1753, '62), considers *Bebung* a great advantage of the clavichord over the harpsichord and piano, which both lack this effect. It is indicated by the sign shown:

[see various editions of K. P. E. Bach's 18 *Probestücke*]. *Bebung* is mentioned in the theoretical writings of W. K. Printz (1668), J. Mattheson (1735), F. W. Marpurg (1750), K. P. E. Bach, and many later authors. The sign, however, does not occur in the literature for the clavichord before Bach.

The reference in many music books to certain passages in Beethoven and Chopin as calling for *Bebung* is misleading. *Bebung* is a fluctuation of

pitch, which cannot be produced on the piano. It is possible, however, that Beethoven, in writing such passages, tried to imitate on the piano the *Bebung* of the clavichord [see Tremolo, Ex. d].

**Bec** [F.]. The mouthpiece of the clarinet or recorder; see Mouthpiece (b), (d).

**Bécarre** [F.]. The natural sign [see Accidentals]. In the 17th century it also served to indicate the major mode, e.g., *mi bécarre*, E major.

**Becken** [G.]. Cymbals.

**Bedächtig** [G.]. Unhurried, deliberate.

**Be fa, befa**. See under Hexachord III.

**Beggar's Opera, The**. Ballad opera with music arranged by J. Pepusch (libretto by John Gay), produced in London, 1728. The plot is a satirical presentation of life among the lower classes in early 18th-century London, the characters being highwaymen, pickpockets, and harlots. The most successful of all \*ballad operas, it has been revived several times (F. Austin, 1920; B. Britten, 1948), with fuller harmonization and orchestration. Another revival, with much the same plot but with new music, is Weill's *\*Dreigroschenoper*.

**Begleitung** [G.]. Accompaniment.

**Behaglich** [G.]. Comfortably, with ease.

**Behende** [G.]. Nimbly, quickly.

**Beisser** [G.]. An 18th-century name for the \*mordent.

**Bel**. A unit for measuring changes in the intensity of sound, i.e., loudness, named for Alexander Graham Bell. One bel is equal to an interval of intensity corresponding to a tenfold increase in sound energy. Thus, if the quietest sound audible to the human ear is generated by sound energy equal to  $E_0$  and if  $E_1/E_0 = 10$ , the intensity corresponding to the energy  $E_1$  (10 times greater than  $E_0$ ) is 1 bel above zero. (Zero does not mean absence of sound but is an arbitrary point of reference; in this case it means the lowest audible sound.) Because 1 bel represents a considerable change in loudness, the more commonly used unit of measure is the decibel (db), equal to one-tenth of a bel. One db represents the smallest change in loudness that the average normal ear can detect, about 26 per cent. The ear's range between audibility and pain is about 12 bels. The intensity of sounds

used in practical music varies from c. 25 db (softest violin tone) to 100 db (fortissimo of full orchestra). See J. Mills, *A Fugue in Cycles and Bels* [1935]; S. S. Stevens and H. Davis, *Hearing: Its Psychology and Physiology* (1938), pp. 450ff.

**Bel canto** [It.]. The Italian vocal technique of the 18th century, with its emphasis on beauty of sound and brilliance of performance rather than dramatic expression or romantic emotion. In spite of repeated reactions against *bel canto* (or its abuses, such as display for its own sake; Gluck, Wagner) and the frequent exaggeration of its virtuoso element (*coloratura*), it must be considered a highly artistic technique and the only proper one for Italian opera and Mozart. Its early development is closely bound up with that of the Italian *opera seria* (A. Scarlatti, N. A. Porpora, N. Jommelli, J. A. Hasse, N. Piccinni). More recently the term *bel canto* has been associated with a mid-17th-century development represented by L. Rossi (1597–1653) and G. Carissimi (1605–74), who cultivated a simple, melodious vocal style of songlike quality, without virtuoso *coloraturas* [see *BuMBE*, esp. pp. 118ff].

Lit.: C. L. Reid, *Bel Canto. Principles and Practices* (1950); H. Klein, *The Bel Canto* (1923); A. Machabey, *Le Bel Canto* (1948); B. Ulrich, *Die altitalienische Gesangsmethode* (1933); L. Landshoff, *†Alte Meister des Bel Canto*, 5 vols. [1912–27]; G. Silva, "The Beginnings of the Art of 'Bel Canto'" (*MQ* viii).

**Belebend, belebt** [G.]. Brisk, animated.

**Belgium**. This article deals with the musical history of the southern portion of the Low Countries (Dutch, French, and mostly Roman Catholic), as distinguished from the northern part, the Netherlands (Dutch and mostly Protestant). The highly important role that Belgium played in the earlier history of music is obscured by the name "Netherlands school," widely used for a long line of 15th- and 16th-century composers, most of whom came from Belgium [see Flemish school]. This great period, during which Belgian musicians held leading positions everywhere in Europe, was followed, after 1600, by a long period of stagnation and decline. Only in the field of organ and harpsichord music did Belgium produce composers of some historical significance, e.g., Charles Luython (c. 1556–1620), Pieter Cornet (fl. 1600–25), Giovanni Macque (c. 1550–1614; see Neapolitan school II), Charles Guillet (d. 1654), Abraham van den

Kerckhoven (c. 1627– after 1673), Jean-Baptiste Loeillet (1680–1730), and Joseph-Hector Fiocco (1703–41) [see Editions XXVIII; the last two followed the trends of the French rococo (F. Couperin)]. At the Brussels court, Henri-Jacques de Croes (1705–86) and Pierre van Maldere (1729–68) were prominent choral and orchestral composers; Van Maldere contributed to the introduction of bithematism in the allegro of the early symphony. The next Belgian composer to be mentioned, François Gossec (1734–1829), was influenced by the \*Mannheim group, and the slightly younger André Modeste Grétry (1741–1813) plays an important role in the history of French opera (*Richard Cœur de Lion*, 1784; see Leitmotiv). It should be noted that Belgium has an ancestral claim to one of the greatest composers, Beethoven, whose grandfather lived in Mecheln [see P. Bergmans, *Les Origines belges de Beethoven* (1927); E. Closson, *The Fleming in Beethoven* (1936)].

In the 19th-century music of Belgium, Henri Vieuxtemps (1820–81) is notable, though César Franck (1822–90) is by far the most important personality. Like Tchaikovsky, Franck adhered to the concept of music as an international language, whereas Peter Benoit (1834–1901) played a role comparable to that of Smetana, namely, that of the initiator of Flemish national music, freed from German as well as French influence. He is particularly noted for his oratorios and cantatas. Among his successors, Jan Blockx (1851–1912) and Edgar Tinel (1854–1912) deserve special mention. Paul Gilson (1865–1942) adopted some elements of Russian music and is particularly known for his symphonic poem *La Mer* (1892); Lodewijk Mortelmans (1868–1952) distinguished himself as a master of the late romantic lied. A composer who during his short life wrote several works of great promise was Guillaume Lekeu (1870–94). Joseph Jongen (1873–1953) is known mainly for symphonic and chamber music, and Paul de Maleingreau (1887–1956) wrote compositions in the neoclassical style. Among more recent composers, Jean Absil (b. 1893), Marcel Poot (b. 1901), and H. Pousseur (b. 1929) are worthy of mention.

**Bell.** (1) The bell-shaped opening of wind instruments such as the horn or trumpet.

(2) A metal percussion instrument in the shape of a hollow vessel and sounded by a clapper, usually placed inside the bell. The best alloy for bells is 76 per cent pure copper and 24 per cent pure tin. Sometimes small amounts of zinc or lead are added. The tone of a well-tuned bell is characterized by a great number of partials, which in old bells (chiefly those of the Continent) are slightly out of tune; owing to the efforts of English bell-founders (especially Taylor of Loughborough), modern English bells have five prominent partials (including the minor, not the major, third) tuned with absolute accuracy. The pitch of a bell varies inversely with the cube root of its weight. Therefore, if a bell weighing 100 pounds sounds  $c'''$  (the actual tone is nearer  $b''$ ), a bell of 800 pounds ( $\sqrt[3]{8} = 2$ ) will be needed for the tone of the half frequency,  $c''$ , one of 6,400 pounds for  $c'$ , 51,200 pounds for  $c$ , and 409,600 pounds for  $C$ . The largest bell ever founded was the Tsarina Kolokol (*kolokol* means "bell") of Moscow's Kremlin (cast in 1733, damaged by fire in 1737, excavated in 1836, and now displayed in the Kremlin), which according to the best estimate weighed c. 432,000 pounds and measured more than 22 feet in diameter. The largest bell in existence is the Troitzkoi, also in Moscow, weighing c. 383,000 pounds. Old French and German bells weigh from 20,000 to 40,000 pounds. Large modern bells usually weigh from 5,000 to 15,000 pounds.

The use of bells in churches can be traced back to the 6th century (Gregory of Tours, c. 560); the earliest record of large bells in England dates from the 10th century (Turketyl, Abbot of Croyland); the earliest preserved bells are to be found in Italy and in Germany (11th century).

There are three chief ways of sounding church bells: (a) chiming, in which a rope moves the bell just enough for the clapper to strike it; (b) ringing, in which the bell is swung round full circle, thus giving a more vigorous sound; (c) clocking, in which the clapper is moved instead of the bell—a method that should not be used since it is likely to cause the bell to crack. Whereas in Continental Europe church bells are

sounded so as to produce a confused musical noise, in England bells are rung in succession according to certain elaborate systems so that a "melody" is produced. The latter method is known as \*change ringing. See also Carillon; Campana.

Bells made of bronze, silver, or gold and dating from as early as 1000 B.C. have been found in China and Egypt. In many parts of the world bells were—and still are—used to accompany ritual dances, for religious ceremonies, and for numerous other purposes. It has long been customary to hang them around the necks of domestic animals such as camels (in Arabia) or cows (Europe, etc.).

The bell effect is frequently required in compositions, early examples being the "Anthonius motet" by Busnois (d. 1492) and Bach's solo cantata *Schlage doch, gewünschte Stunde* (two bells, probably an organ stop). In the modern orchestra real bells are not used (because of their lack of definite pitch), being replaced by "tubular bells" (\*chimes; see also Bells), i.e., a number (7 to 10) of cylindrical metal tubes of different lengths, hung in a frame and struck with a hammer. Debussy's "La Cathédrale engloutie" and Busoni's *Sonatina in diem nativitatis Christi MCMXVII* contain bell effects produced on the piano. See Cymbalum.

Coleman, *Bells* [1928], condensed as *The Book of Bells* [1938], bibl.; G. Morrison, ed., *Bells: Their History and Romance* (1932); T. Ingram, *Bells in England* (1955); J. Smits van Waesberghe, *Cymbala (Bells in the Middle Ages)* (1951); A. Weissenböck and J. Pfundner, *Tönendes Erz: Die abendländische Glocke als Toninstrument und die historischen Glocken in Österreich* (1916); W. W. Starmer, "Bells and Bell Tones" (*PMA* xxviii); H. Bewerunge, "On the Tuning of Bells" (*ZIM* vii); J. Biehle, "Die Analyse des Glockenklanges" (*AMWi*).

**Belle Hélène, La** [F., The Beautiful Helen]. Satirical comedy in three acts by Offenbach (libretto by H. Meilhac and L. Halévy), produced in Paris, 1864. Setting: ancient Greece.

**Bell harp.** A sort of psaltery invented c. 1700 by John Simcock. The name comes from the bell-shaped form of its frame. See *SaRM*, p. 44.

**Bell-lyra.** See under Glockenspiel.

**Bell ringing.** See Change ringing.

**Bells.** Recent name for the orchestral glockenspiel or the chimes [see Percussion instruments A, 2].

**Belly.** The upper plate of the resonant box of violins, lutes, etc. Also, the soundboard of the piano.

**Be mi, bem.** See under Hexachord III.

**Bémol** [F.], **bemolle** [It.]. The flat sign [see Accidentals; also Pitch names]. In the 17th century it served also to indicate the minor mode, e.g., *mi bémol*, E minor.

**Benedicamus Domino** [L.]. A salutation of the Roman liturgy, with the response "Deo gratias." It is used, instead of the "Ite missa est," in Masses lacking the Gloria (e.g., during Lent; cf. *LU*, pp. 22, 28, etc., with pp. 62–63). It is also sung at the end of all Offices, for which purpose various melodies (*toni*) are provided [*LU*, p. 124]. It was frequently troped, in the form of long poems, often rhyming on -o or closing with words such as "Benedicamus socii Domino" [see Trope]. The "Benedicamus Domino" of the Office (especially Vespers) plays a very important role in the history of early polyphony (schools of St. Martial and Notre Dame) since its melodies, especially the first one given in the Antiphonarium, have been very frequently used as the tenor of organa in two or three parts as well as of clausulae and motets [see *HAM*, nos. 28a–i]. See H. Schmidt, *†Drei Benedicamus-Domino-Organa* (1933); \*Editions XLVI, 11; *ReMMA*, p. 266; *ApNPM*, p. 247 (fac.); *AdHM*, p. 179; *BeMMR*, p. 97f.

**Benediction.** An extraliturgical popular service of the Roman Catholic Church, usually following Vespers and including the blessing of the congregation with the Host. See *LU*, pp. 93ff.

**Benedictus Dominus Deus Israel** [L.]. The \*canticle of Zachary (Blessed be the Lord; Luke 1: 68–79), sung at Lauds, in the monastic Offices, and in the Anglican Morning Prayer. Not to be confused with "Benedictus es, Domine Deus Israel," the canticle of David (I Chronicles 29: 10–13). The term Benedictus alone nearly always refers to \*"Benedictus qui venit."

**Benedictus qui venit** [L.]. The second part of the Sanctus of the Mass. In polyphonic compositions it is usually treated as a separate movement [see Mass III].

**Beneventan neumes.** The neumatic script from Benevento (southern Italy) [see Neumes II].

**Bequadro** [It.]. The natural sign. See Accidentals.

**Berceuse** [F.]. Lullaby. Usually the name refers to instrumental pieces (piano, orchestra) in moderate 6/8 time and with an accompaniment reminiscent of the rocking of a cradle. A famous example is Chopin's op. 57.

**Bergamasca.** (1) A generic term for dances, dance-songs, and popular poetry from the district of Bergamo in northern Italy. Early musical examples occur in G. Gorzanis' *Il Terzo Libro de intabolutura di liuto*, 1564 (no. 12, "Saltarello dito il Bergamasco") and in F. Azzaiolo's *Il Terzo Libro delle villotte del fiore alla padoana con alcune napolitane e bergamaschi*, 1569 (nos. 3 and 7, "Bergamasca"). Gorzanis' title suggests it is music for a Bergamascan dance; Azzaiolo's refer to the texts written in the Bergamascan dialect. The music is different in each of the three examples, and none is related to the harmonic pattern described below. Many compositions—even sophisticated ones—written in the 17th, 18th, and 19th centuries bear the title because of real or fancied relationship to Bergamo [see *MGG*, 1685–87]. Debussy wrote a *Suite bergamasque*, an example of a free composition based on impressions of the peasant life of Bergamo.

(2) Late in the 16th century, the term was attached to pieces composed on repetitions of a specific harmonic pattern: I–IV–V–I [cf. G. C. Barbeta, *Intavolatura de liuto*, 1585, p. 14, "Moresca quarta deta la Bergamasca" and J. Abondante, *Il Quinto Libro de tabolutura da liuto*, 1587, p. 58, "Bergamasca"]. In the 17th century, hundreds of compositions, largely for the guitar, were written on that pattern. Early in the 17th century a single discant began to be associated with it and in some cases supplanted the pattern itself [see Frescobaldi's "Bergamasca" in the *Fiori Musicali*, 1635]. It is worth noting that the melody "Kraut und Rüben" used by Bach in the final *quodlibet* of his Goldberg Variations is the same discant.

himself contributed actively to the musical life of his court. The most important members of the group were: J. J. Quantz (1697–1773; flute sonatas, etc.); J. G. Graun (1703–71; symphonies, trio sonatas); K. H. Graun (1704–59; opera *Montezuma*, text by Frederick the Great [DdT 15], and oratorio *Der Tod Jesu*); F. Benda (1709–86; violin sonatas, concertos); K. P. E. Bach (1714–88); C. Nichelmann (1717–62; songs, harpsichord sonatas); F. W. Marpurg (1718–95; songs; editor of *Berlinische Oden und Lieder*, 3 vols. [1756–63]; numerous theoretical books); J. P. Kirnberger (1721–83; songs, harpsichord pieces, theoretical books); and J. F. Agricola (1720–74; operas, songs).

While these men, particularly K. P. E. Bach, made significant contributions in instrumental music, their activity in the field of the lied (*Berliner Liederschule*) was largely frustrated by the spirit of rationalism and the Enlightenment to which Frederick the Great, a close friend of Voltaire's, had given ready admittance. The situation changed when a younger generation, known as the *Zweite* (Second) *Berliner Liederschule*, turned from the dry moralism of Gellert to the inspiring poems of Klopstock and the young Goethe. J. A. P. Schulz (1747–1800), J. F. Reichardt (1752–1814), and C. F. Zelter (1758–1832) are the most important members of this group. See Lied IV; also Singspiel. The name *Berliner Schule* is sometimes restricted to this latter group.

Lit.: *AdHM* ii, 699ff; M. Friedländer, *Das deutsche Lied im 18. Jahrhundert*, 2 vols. (1902); M. Flueller, "Die norddeutsche Sinfonie" (diss. Berlin, 1908); H. Hoffmann, "Die norddeutsche Triosonate" (diss. Kiel, 1924); E. Stiltz, "Die Berliner Klaviersonate zur Zeit Friedrichs des Grossen" (diss. Berlin, 1930); A. Mayer-Reinach, "Carl Heinrich Graun als Opernkomponist" (*SIM* i).

**Bersag horn.** See under Brass instruments IV.

**Beruhigt, beruhigend** [G.]. Calm, quieting.

**Bes** [G.]. B-double-flat.

**Beschleunigt** [G.]. Accelerando.

**Besetzung** [G.]. A term denoting the instruments and/or voices employed in a composition, e.g., *Besetzung für Chor und kleines Orchester* (for chorus and small orchestra). There is no exact English equivalent for this, although "scored" and "setting" come close to it.

**Bestimmt** [G.]. With decision.

**Betont** [G.]. Stressed, emphasized.

**Bewegt** [G.]. Animated, with motion.

**Bezifferter Bass** [G.]. Figured bass, i.e., \*thoroughbass.

**B fa.** See under Hexachord III.

**BG.** Abbr. for *Bach-Gesellschaft* [see under Societies II, 2].

**B. & H.** Abbr. for Breitkopf & Härtel, publishers of numerous complete editions.

**Biann.** Same as \**pian*.

**Bible regal** [G. *Bibelregal*]. See Regal.

**Bibliography of music.** Following is a list of the most important publications in the field of music bibliography, divided into three sections: I. Bibliographies of music (compositions); II. Bibliographies of books on music; III. History (bibliographies before 1850). For a very comprehensive bibliography, now in process of publication, see *RISM*.

I. *Bibliographies of music.* O. E. Albrecht, *A Census of Autograph Music Manuscripts of European Composers in American Libraries* (1953); American Society of Composers, Authors and Publishers, *ASCAP Symphonic Catalog* (1959); F. P. Berkowitz, *Popular Titles and Subtitles of Musical Compositions* (1962); A. Boll, *Répertoire analytique de la musique française des origines à nos jours* [1948]; H. Brown, *Instrumental Music Printed before 1600* (1965); A. Davidsson, *Catalogue critique et descriptif des imprimés de musique des XVI<sup>e</sup> et XVII<sup>e</sup> siècles, conservés dans les bibliothèques suédoises, excepté la Bibliothèque de l'Université Royale d'Upsala* (1952); R. Eitner, *Biographisch-bibliographisches Quellen-Lexikon der Musiker und Musikgelehrten der christlichen Zeitrechnung bis zur Mitte des 19. Jahrhunderts*, 10 vols. (1900–04; rev. ed., 11 vols. in 6, 1959); *id.*, *Verzeichnis neuer Ausgaben alter Musikwerke aus der frühesten Zeit bis zum Jahre 1800* (1871); *id.* and F. X. Haberl, *et al.*, *Bibliographie der Musik-Sammelwerke des XVI. und XVII. Jahrhunderts* (1877; repr. 1963); W. H. Frere, *Bibliotheca Musico-Liturgica*, 2 vols. (1901–32); F. Gennrich, *Bibliographie der ältesten französischen und lateinischen Motetten* (1957); A. Hofmeister, ed., *C. F. Whistlings Handbuch der musikalischen Literatur oder allgemeines systematisch-geordnetes Verzeichnis . . . bis zum Anfang des Jahres 1844 ergänzte Auflage* (1845; 3 parts,

bibl. to 1844 [1845]; vols. iv–vi, covering 1844–51 [1852–68]; vols. vii–xviii, ed. F. Hofmeister [1876–1934]; W. Lott, *Verzeichnis der Neudrucke alter Musik*, 7 vols. (1937–43); *Universal-Handbuch der Musikliteratur aller Zeiten und Völker*, 14 vols. (1904–10?); A. Taylor and F. H. Ellis, *A Bibliography of Meistergesang* (Indiana Univ. Studies, no. 113, 1936); E. Vogel, *Bibliothek der gedruckten weltlichen Vocalmusik Italiens aus den Jahren 1500–1700*, 2 vols. (1892).

See also the authors mentioned in the following articles: *Ars antiqua* (Ludwig); *Ars nova* (Von Fischer); Autographs (Winternitz); Cello (Nogué, Weigl); Chamber music (Altmann, Richter); Chorale (Wackernagel, Zahn); Church music (Bäumker, Schreiber); Clarinet family (Foster, Opperman); Conductus (Gröninger); Double bass (Grodner); Editions (Heyer); Flute (Girard, Pellerite); Hymn (Chevalier); Instrumental music (Altmann, Sartori); Lied (Friedländer); Meistersinger (Linker); Minnesinger (Linker); Motet (Gennrich, Ludwig); Opera (Altmann, Loewenberg); Organ (Weigel); Organum (Geering, Ludwig); Piano duet (Moldenhauer, Rowley); Piano music (Prosniz, Friskin, Parent, Teichmüller, Ruthardt); Quartet (Altmann); Quintet (Altmann); Recorder (Winterfeld); String quartet (Altmann); Trio (Altmann); Troubadour (Gennrich, Pillet); Trouvère (Raynaud); United States (Sonneck); Violin (Tottman); Violin music (Baudet-Maget); Vocal music (Kagen, Knapp); Wind instruments (Helm); Woodwinds (Houser).

II. *Bibliographies of books on music* (arr. alphabetically by author): A. Aber, *Handbuch der Musikliteratur in systematisch-chronologischer Anordnung* (1922); H. Alker, *Blockflöten-bibliographie* (1960); H. W. Azhderian, *Reference Works in Music and Music Literature in Five Libraries of Los Angeles County* (1953); A. P. Basart, *Serial Music, A Classified Bibliography of Writings on Twelve-Tone and Electronic Music* (1961); C. W. Beaumont, *A Bibliography of Dancing* (1929); *Bibliographie des Musikschriftums* (1936–64); *A Bibliography of Periodical Literature in Musicology*, 2 vols. (1940, '43); A. Davidsson, *Bibliographie der musiktheoretischen Drucke des 16. Jahrhunderts* (1962); *Deutsche Musikbibliographie* (Jahrgang 1 [1829–], supersedes *Handbuch der musikalischen Literatur* [1817–29]; Jahrgang 1–79: *Musikalisch-literarische Monatsbericht über neue Musikalien, musikalische Schriften und Abbildung*; Jahrgang 79–114: *Hofmeisters musikalisch-literarischer Monatsbericht*); R. Eitner, *Bücherverzeichnis der Musik-literatur aus*

*den Jahren 1839 bis 1846 im Anschluss an Becker und Büchting* (1885); H. M. Hewitt, *Doctoral Dissertations in Musicology*, rev. ed. (1960; new ed., 1965; additions appear in *JAMS*); *JMP* [see Abbreviations]; W. Kahl and W.-M. Luther, *Repertorium der Musikwissenschaft* (1953); E. C. Krohn, *The History of Music; An Index to the Literature Available in a Selected Group of Musicological Publications* (1952); E. B. Long and M. McKee, *A Bibliography of Music for the Dance* (1936); P. D. Magriel, *A Bibliography of Dancing* (1936); A. P. Merriam, *A Bibliography of Jazz* (1954); *The Music Index; The Key to Current Music Periodical Literature* (1949–); Music Teachers National Association, *Volume of Proceedings* (1906–50); R. G. Reisner, *The Literature of Jazz; A Selective Bibliography*, rev. ed. (1959); R. Schaal, *Verzeichnis deutschsprachiger musikwissenschaftlicher Dissertationen, 1861–1960* (1963; add. in *MF* xvii, 421ff).

See also the authors mentioned in the following articles: Africa (Thieme); Arab music (Farmer); Asia (Waterman); Brazil (Correia); Congresses (Briquet); Dictionaries of music (Coover); Ethnomusicology (Herzog); Flute (Miller); Folk music (Haywood, Henry, Lomax); Jazz (Merriam, Reisner); Jewish music (Sendrey); Latin America (Chase); Periodicals (Freystätter, Rohlf); Printing of music (Steele); Publishing (Lesure and Thibault, Sartori, Smith, Stellfeld); Serial music (Basart); Sweden (Davidsson); Theory (Davidsson, Smits); Violin (Heron-Allen).

Additional bibliographical information is available in library catalogs [see Libraries], in current book lists of periodicals (*AM*, *MD*, *MQ*, *Notes*, *ZIM*, *ZMW*), and in the bibliographies of nearly all books on music history. For lists of records, see Phonograph (Lit.) and the current lists in *Notes*. For microfilm material, see *Union List of Microfilms* (Ann Arbor, 1951–; entries on music are marked M or ML) and *Deutsches Musikgeschichtliches Archiv Kassel, Katalog der Filmsammlung*, nos. 1–7 (1955–65; continued).

III. *History*. The earliest bibliographical material of interest consists of dealers' catalogs (*Messkataloge*) published for the annual book fairs (G. Buchmesse) at Frankfurt (c. 1560 and later) and Leipzig (c. 1600 and later). An important bibliographical publication of early date is Georg Draudius, *Bibliotheca librorum germanicorum classica* (1611, 1625), which includes a separate chapter of "Teutsche musicalische Bücher" in alphabetical arrangement: *Allmand, Balletten, Bergreyhen*, etc. (fac. ed. by K. Ameln,

1957). Sébastien de Brossard, author of the *Dictionnaire de musique* (1703), worked for many years on a bibliographical work that he could not complete. L. Mizler, with his *Musikalische Bibliothek* (1735–54), J. Adlung, with his *Anleitung zu der musikalischen Gelahrtheit* (1758), and J. G. Walther, with his *Musicalisches Lexikon oder musicalische Bibliothek* (1732), paved the way for J. N. Forkel's monumental *Allgemeine Literatur der Musik* (1792), which has retained considerable value to the present day (it includes about 3,000 titles). The last two volumes of P. Lichtenthal's *Dizionario e bibliografia della musica*, 4 vols. (1826), are an abridged translation of Forkel's work brought up to date. Somewhat later K. F. Becker published his *Systematisch-chronologische Darstellung der musikalischen Literatur*, 2 vols. (1836, '39). There followed, in 1870 and later, Eitner's work, which marks the beginning of modern musical bibliography.

Lit.: L. B. Spiess, *Historical Musicology* [1963]; V. Duckles, *Music Reference and Research Materials*, rev. ed. (1967); K. E. Mixter, *General Bibliography for Music Research* (1962); *id.*, *An Introduction to Library Resources for Music Research* (1963); A. H. King, *Recent Work in Music Bibliography* (1945); O. E. Deutsch, *Music Bibliography and Catalogues* (1943); A. Göhler, *Verzeichnis der in den Frankfurter und Leipziger Messkatalogen der Jahre 1564 bis 1759 angezeigten Musikalien* (1902); L. R. McColvin and H. Reeves, *Music Libraries . . . with a Bibliography of Music and Musical Literature*, 2 vols. (1937, '38); M. Brenet, "Bibliographie des bibliographies musicales" (*L'Année musicale* iii, 1913); K. Meyer, in *CP Wolf*; G. Schulz, in *CP Sandberger*; H. Springer, in *CP 1925*. See under II, above, Kahl and Luther, *Repertorium*, pp. 2–8.

**Biblioteca di rarità musicali.** See Editions V.

**Bicinium.** A 16th-century name, used chiefly in Italy and Germany, for a composition (vocal or instrumental) in two parts. In contrast to the \*duet, *bicinia* are without accompaniment. The Greek synonym *diphona* also has been used.

The *bicinia*, which form a delightful contrast to the rich texture of the late 16th-century motet, madrigal, etc., represent a little-known treasure of great artistic value and educational significance. The earliest known publication of this type is the *Musica di Eustachio Romano* of 1521 [see K. Jeppesen, *Die italienische Orgelmusik am Anfang des Cinquecento* (1943), p. 18]. A number of French and Italian compositions of a slightly

later date are reproduced in Editions XIX, 8. The most important German publications are: Georg Rhaw, *Bicinia Gallica Latina Germanica* (1545; partly repr. by K. Ameln, ed., 1950; H. Reichenbach, ed., 1961); Kaspar Othmayr, *Bicinia sacra* (1547; partly repr. by W. Lipphardt, ed., 1957); Erasmus Rotenbacher, *Diphona amoena et florida* (1549; repr., D. Degen, ed., 1951, as vol. lxxiv of *Hortus musicus*); Seth Calvisius, *Bicinia septuaginta ad sententias Evangeliorum* (1599), *Biciniorum libri duo* (1612); Erhard Bodenschatz, *Bicinia XC. selectissima* (1615; see *SchGMB*, no. 163). Outstanding examples are found among the works of Ludwig Senfl (*DTB* 5, pp. 79ff) and Michael Praetorius (comp. ed., vol. ix and *passim*; see *HAM*, no. 167a). Italian publications of *bicinia* are Antonio Gardano, *Il primo libro a due voci de diversi autori* (1543, '53) and Pietro Vinci, *Il primo libro della musica a due voci* (1560). Vincenzo Galilei's *Contrapunti a due voci* of 1584 (see Editions XLVIII, 8) and about half the duets of Lasso (*Sämtliche Werke*, 1894–1926, vol. i) are without text, as are the numerous pieces in two parts that were published in Italy during the 17th century under the name *ricercare* [see *Ricercar* II (d); also *Invention*]. Such pieces were primarily instructive in purpose; see A. Einstein, "Vincenzo Galilei and the Instructive Duo" (*ML* xviii, 360; in *It.*, *LRM* xi) and D. Kämper, "Das Lehr- und Instrumentalduo um 1500 in Italien" (*MF* xviii). S. Scheidt, in his *Tabulatura nova* (1624), uses the term *bicinium* for organ verses and variations in two voice-parts. Also see *Tricinium*.

**Bien nourri.** See *Nourri*.

**Billy Budd.** Opera in four acts by Benjamin Britten (libretto by E. M. Forster and E. Crozier, after the short novel by H. Melville), produced in London, 1951. Setting: aboard *H.M.S. Indomitable*, 1797. The music is somber, providing an effective background for the tragic events of the plot.

**Bina.** Same as *vīṇa* [see *India* VIII; *Inst.* IV].

**Binary and ternary form.** I. Two basic musical forms consisting of two and three main sections respectively. The binary form follows the scheme A B, with each section repeated; the ternary form (also called \*song form) follows the scheme A B A. Examples of the former abound in the allemandes, gavottes, etc., of Bach's suites, while the latter is frequently found in the slow movements of sonatas (e.g., Beethoven, Piano Sonata op. 7; op. 10, no. 3), in the minuet or

scherzo with trio, and in numerous \*character pieces of the romantic composers, such as Schumann's novelettes, Chopin's nocturnes, Brahms' fantasias, etc.

The binary and ternary forms are not so similar as the nomenclature might suggest. In fact, to consider them analogous forms is quite misleading. The binary form is essentially a stylistic and structural entity, a unified whole that, like many phrases in music, falls into two parts, the second of which forms the logical and necessary completion of the first. The ternary form, on the other hand, is usually the sum of three single units, each complete in itself. This difference is clearly reflected in the harmonic scheme normally found in these forms: in the binary form each section is harmonically "open," the first leading from T to D, the second back from D to T; in the ternary form each section is harmonically "closed," beginning and ending in the same key but with a different key (dominant, relative key, parallel key) often used for the middle section. Stylistic considerations corroborate this fundamental difference: the binary form uses the same or similar material throughout, whereas the ternary form uses different, often contrasting material for the middle section. In brief, the binary form is a continuous form, the ternary a sectional form. The minuet (scherzo) with trio of the sonata combines the two forms, since the whole movement is in ternary form and each section is usually in binary form.

II. The historical development of the binary form is of particular interest, since it includes one of the most important developments of music history, namely, that leading to the sonata form of the classical sonata, symphony, etc. Owing to the fact that this form includes three main sections—the exposition, the development, and the recapitulation (= exposition)—it is frequently considered a ternary form. Such an interpretation, although perhaps admissible in program notes, is too much of an oversimplification for serious studies. Its main drawback is that it does not take into account the repetition of the exposition that is almost invariably prescribed in the works of the Viennese classical composers, including Brahms—an oversight for which the blame must be put on conductors and pianists who in performance consistently disregard a feature whose aesthetic importance was clearly recognized by the great masters of the sonata. Another objection is that in sonata form the middle section (development) is based on the thematic material of the first section (exposi-

tion), whereas in true ternary form it has different, contrasting material. Finally, the historical development of sonata form clearly shows its derivation from binary schemes, such as were used in the dance movements of the suite [see Sonata form II]. Three such schemes can be distinguished: (1) the *symmetrical binary form*, in which both sections are of equal length; (2) the *asymmetrical binary form*, in which the second section is longer than the first, owing to a "bulging-out" process at its beginning; (3) the *rounded binary form*, where the first section is repeated, in whole or in part, at the end of the second [see Ex. 1–3]. The last is structurally

identical with the earlier type of sonata form (Haydn, Mozart) in which both sections are repeated. The same scheme is used in some dance movements and other pieces by J. S. Bach (e.g., in the Anglaise from his French Suite no. 3, in the C-minor Fantasy, and in the Prelude in D of *The Well-Tempered Clavier*, vol. ii, as well as in practically all the minuets (scherzos) and trios of the classical period. In fact, any of these pieces may well serve as a rudimentary example of sonata form. For a medieval type of binary form in which the first section only is repeated (as in the later examples of sonata form), see Bar form II.

III. The principle of ternary structure is present in various types of Gregorian chant, e.g., in the responsories and graduals, in which the respond is repeated after the verse: R V R [see Psalmody, Gregorian II]. Also tripartite are the \*Agnus and \*Kyrie. The ternary form of \*"L'Homme armé" probably accounts to a large extent for its popularity as the basis of Mass compositions. Many of the chansons of the early 16th century are in the form A B A, e.g., Josquin's "Faulx d'argent" [HAM, no. 91]. The idea of a contrasting middle section is quite clearly expressed in the shepherd's solo of Monteverdi's *Orfeo*, 1607 [see also his famous duet "Pur ti miro" from *L'Incoronazione di Poppea*, 1642; SchGMB, no. 178]. Ternary form with a continuing rather than contrasting middle section became established in the *da capo* aria, c. 1700. Another manifestation of the ternary principle is the alternation of two dances, the first being repeated after the second [see *Alternativo*]. In 19th-century music, the ternary form was frequently broadened into a five-part scheme: A B A B A or A B A C A, particularly in slow movements of symphonies, e.g., in Bruckner's Symphony no. 7. See Forms, musical; Rondo. See E. J. Dent, "Binary and Ternary Form" (ML xvii, 309).

**Bind.** Same as \*tie.

**Biniou.** See under Bagpipe.

**Bird song.** The song of birds, being practically the only case of "music in nature," has been the subject of numerous studies. Interesting facts are that only small birds sing, that the best singers (nightingale, lark, thrush, blackbird, finches) are unobtrusively colored, that they prefer to sing in solitude rather than in flocks, that only male birds have loud musical voices, and that good singers are found mainly in moderate climates.

Much attention has been given to the relationship between bird song and man-made music. Certainly no biological relationship exists, since most animals do not sing. Whether or not man's music developed in imitation of bird song, as has been frequently maintained, is a matter of speculation. Although bird song does have many features in common with some primitive folksong (irregularity, wavering of pitch, microtonic deviations from the Western scale, improvisation), this type of folksong exists chiefly in the non-Western countries (Africa, Asia) where there are few singing birds. Concerning

the imitation of bird song in art music, see Program music III.

Lit.: S. P. Cheney, *Wood Notes Wild* (1892); F. S. Mathews, *Fieldbook of Wild Birds and Their Music* (1904); W. Garstang, *Songs of the Birds* (1922); A. R. Brand, *More Songs of Wild Birds* (1936; with records); E. M. Nicholson and L. Koch, *Songs of Wild Birds* (1936; with records); A. A. Saunders, *A Guide to Bird Songs ... of Northwestern United States* (1935); W. B. Hoffmann, *Kunst und Vogelgesang* (1908); H. Tiessen, *Musik der Natur* [1953]; J. Graf, *Vogelstimmen in Natur und Kunst* [1962]; W. B. Olds, in MQ viii.

**Bis** [L.]. (1) In French and Italian, request for \*encore. (2) Indication that notes or passages should be repeated.

**Bisbigliando** [It.]. A special effect of harp playing, obtained by a quickly reiterated motion of the finger and resulting in a soft tremolo.

**Biscroma** [It.]. Thirty-second-note. See Notes.

**Bisdiapason** [L.]. The interval or range of two octaves.

**Bistropa**. Same as *distropa*. See Neumes I (table).

**Bitonality, polytonality.** The simultaneous use of two (occasionally three or four) different keys in different parts of the musical fabric, e.g., B-flat minor in the left hand against F-sharp minor in the right hand of a piano piece [Ex. 1, from Prokofiev's *Sarcasmes*, op. 17, no. 3, 1912-14]. This device has been used considerably by 20th-century composers seeking new effects within the general framework of tonality. The combination of C against F-sharp or, in terms of the piano

keyboard, of "white against black," has become known as the "Petrushka chord" because it occurs in Stravinsky's *Petrushka*, composed in 1911 [Ex. 2]. This device has been exploited, somewhat facetiously, by numerous other composers, often in pieces they consider suitable for children (A. Casella, *11 Pezzi infantili*, 1920). The main champion of bitonal music has been Darius Milhaud, who also occasionally used three or four keys simultaneously.

Prior to c. 1900 bitonality was occasionally used for satirical purposes, e.g., by Hans Newsidler in his lute piece *Der Juden Tantz* (The Jew's Dance) of 1544 [see *HAM*, no. 105b] and by Mozart in his *Ein musikalischer Spass* (A Musical Joke), composed in 1787 (K. 522). Bitonality was generally accepted about 1910, but earlier examples occur in Ravel's *Jeux d'eau* (1901; C and F major) and in the works of Charles Ives, whose *Variations on "America"* for organ (1891) has two Interludes (added before 1894), the second written in F major against A-flat major. It is interesting to note that Ives, as if afraid of his boldness, marks one of the conflicting keys *ppp*, the other, *ff*.

Lit.: J. Deroux, "La Musique polytonale" (*RM* 1921, no. 11; 1923, no. 4); A. Machabey, "Dissonance, polytonalité, atonalité" (*RM* 1931, no. 116).

**Biwa.** The Japanese lute. See Pyiba. For ill. see Lute.

**Bkl.** [G.]. Abbr. for *Bassklarinette*, bass clarinet.

**Blackening.** Same as coloration [see Mensural notation V].

**Bladder pipe** [G. *Platerspiel*]. See under Bagpipe.

**Blanche** [F.]. Half note. See Notes.

**Blasinstrument** [G.]. Wind instrument. *Blasmusik*, music for wind instruments.

**Blasquinte** [G.]. See Blown fifth.

**Blatt** [G.]. Sheet; also, reed (\**Rohrblatt*). *Blattspiel*, sight reading.

**Blech** [G.]. Brass, used as a collective designation for *Blechinstrumente*, i.e., brass instruments. *Blechmusik*, music for brass bands.

**Blind musicians.** Many blind persons are musically gifted and have become expert performers, particularly on the organ. Some of them have achieved great fame as composers or theorists,

e.g., Francesco Landini, Conrad Paumann, Arnolt Schlick (perhaps blind only late in life, like Bach), Antonio de Cabezón, Francisco de Salinas, Antonio Valente (?), Martino Pesenti (*cieco a nativitate*), Pablo Bruna (*Ciego de Daroca*), and Pablo Nassarre. Also see Braille music notation. See H. J. Moser, *Blinde Musiker aus Sieben Jahrhunderten* [1956].

**Blind octaves.** A trick device of piano virtuosity. Both hands alternate rapidly with octaves, the passage (usually a trill or a scale) being played with the thumbs and doubled by the little fingers alternately in the higher and lower octave.

**Blockflöte** [G.]. Block flute, i.e., recorder. See also under Whistle flute.

**Block harmony.** Term for a succession of identical or similar chords, e.g., parallel triads or seventh chords, a characteristic trait of Debussy's piano style. See Parallel chords.

**Blown fifth** [G. *Blasquinte*]. A term introduced by E. von Hornbostel for a fifth of 678 cents, i.e.,  $\frac{1}{8}$  of a whole tone lower than the Pythagorean (pure) and tempered fifth (of 702 and 700 cents respectively). From this interval, which results if a stopped pipe (bamboo) is overblown, Hornbostel derived a circle of blown fifths (*Blasquintenzirkel*) similar to that of the ordinary \*circle of fifths and based on the absolute pitch of the Chinese *hwangjong* (*huang chung*) [see China II]. He was able to show that these tones recur in many musical cultures of the Far East and South America, most clearly in the Javanese *pélog* scale [see Java]. Recent studies have shown, however, that the blown fifth is without physical foundation. Hornbostel's theory has been attacked by Bukofzer and Lloyd, and defended by Kunst.

Lit.: E. M. von Hornbostel, "Die Massnorm als kulturgeschichtliches Forschungsmittel" (*Festschrift . . . P. W. Schmidt*, 1928); *id.*, "Musikalische Tonsysteme," in H. Geiger and K. Scheel, *Handbuch der Physik*, vol. viii (1927); M. F. Bukofzer, in *Zeitschrift für Physik*, vol. 99

(1936); *id.*, in *Anthropos* xxxii (1937); *id.*, in *CP* 1939; L. Lloyd, in *Monthly Musical Record* lxxvi; J. Kunst, "Around von Hornbostel's Theory of the Cycle of Blown Fifths (*Mededeling* no. 81, *Afdeeling volkenkunde* no. 30, Koninklijk Vereeniging Indisch Instituut, 1948). Also s.v. "Blasquinte" in *MGG*.

**Bluebeard's Castle** [Hung. *A Kékszakállú Herceg Vára*]. Opera in one act by Bartók (libretto by B. Balázs after Maeterlinck), produced in Budapest, 1918. Setting: hall in Bluebeard's castle.

**Blue notes.** See Blues.

**Blues.** A type of American popular music, both vocal and instrumental, introduced in the first decade of the 20th century. Despite evidence of earlier examples ("Mamie's Blues," c. 1900), its traceable history begins with the "Jelly Roll Blues," written by Jelly Roll Morton in 1905 (© 1915) and W. C. Handy (pub. "Memphis Blues" in 1912). The principal sources of the blues appear to be Negro work songs and spirituals. Although the blues evolved in part from spirituals, there are numerous differences between the two genres. The spirituals are sung by groups of worshipers, whereas the blues are solo utterances. Prior to 1920, spirituals were sung without instrumental accompaniment, whereas the accompaniment is a vital part of a blues performance. The tempo of many spirituals is fast and the dynamic level is usually very high, whereas the blues are generally in slow tempo and sung on a medium dynamic level.

The blues are distinguished from the earlier \*ragtime by several features: (1) groups of 12 measures rather than of 8 or 16; (2) more frequent harmonization with seventh chords, especially with those on the subdominant side of the key ( $I^{b7}$ ,  $IV^{b7}$ ), as well as with those in rapid succession, producing \*barbershop harmonies; (3) a melody in the tradition of the work songs and spirituals, making the early blues more singable than ragtime; (4) usually the presence of special melodic features (also found in spirituals) such as (a) certain "blue" notes, i.e., notes (in particular the III and VII degrees, later also the V) whose intonation is unstable and lies between the normal major and minor pitches, (b) the use of portamento, and (c) cadential formulas that avoid the VII degree in favor of II or VI as penultimate tone of the melody; (5) a trend toward declamatory style with a steady pulsating accompaniment, and a smoother, less percussive, and less staccato rhythm as well as a slower

tempo in the blues of New Orleans and St. Louis (as contrasted with the fast blues of Texas); (6) frequent use of habanera and tango rhythms; (7) use of the "break," a brief improvised instrumental cadenza (usually about two measures) characterized by many syncopations. See W. C. Handy, ed., *A Treasury of the Blues* (1949); Carl Gregor Herzog zu Mecklenburg and W. Scheck, *Die Theorie des Blues in modernen Jazz* (1963); O. Gombosi, "The Pedigree of the Blues" (*Proceedings of the Music Teachers National Association*, 1946, p. 382). Also see Jazz I.

L.H.; rev. J.W.W.

**Blumen** [G.]. Name for the coloraturas of the Meistersinger.

**B mi.** See under Hexachord III.

**B-minor Mass.** A great Mass by Bach, for soloists, chorus, and orchestra, composed 1733–38 to the (Latin) text of the Roman Catholic \*Mass. The five items of the Mass are subdivided into many sections treated as choruses, arias, duets, etc. Several of these are rewritten from earlier cantatas, among them the famous *Crucifixus* (from Cantata no. 12, *Weinen, Klagen*). The fact that the foremost Protestant composer wrote a Catholic Mass has long been a matter of special interest and controversy. Undoubtedly some opportunism was involved when, in 1733, Bach sent the Kyrie and Gloria to the Catholic King of Saxony, requesting the title of court composer. Whatever the motives, we can only be grateful that denominational considerations are set aside in this magnificent work.

**B moll** [G.]. B-flat minor.

**B. M. V.** See under Antiphon (2).

**Bobization.** See under Solmization III.

**Bocal** [F.]. Mouthpiece of a brass instrument.

**Bocca chiusa** [It.]. Same as \**bouche fermée*. *Boccaridente* (laughing mouth) indicates, in singing, a smiling position of the lips.

**Bocedization.** See under Solmization III.

**Bockstriller** [G.]. See Goat's trill.

**Boehm.** See Böhm system.

**Boethian notation.** See under Letter notation.

**Bogen** [G.]. (1) The bow of a violin, etc. (2) The \**tie*. *Bogenform*, see Forms, musical (after I, A). *Bogenführung*, bowing. *Bogenklavier*, *Bogenflügel*, see *Sostenente piano*.

**Bohème, La.** Opera in four acts by Puccini (libretto by G. Giacosa and L. Illica, based on H. Mürger's novel *Scènes de la vie de Bohème*), produced in Turin, 1896. Setting: Latin Quarter, Paris, 1830. One of the best-known examples of *\*verismo*, the opera is, with its light texture, orchestral clarity, and lyricism, closer to the French than to the typically Italian (Verdi) opera. Interesting are the *\*parallel chords* in the opening to the second act. Leoncavallo wrote an unsuccessful opera on the same subject (produced in Venice, 1897), without knowledge of Puccini's score.

**Bohemian music.** See Czechoslovakia.

**Böhm clarinet** (flute). See Böhm system; Clarinet family I; Flute I.

**Böhm system.** A system of keying a woodwind instrument that allows the holes to be cut in the proper acoustical position and size and yet be within the spread of the average hand. It was invented about 1830 by the flutist Theobald Böhm (1794–1881) of Munich to supersede earlier methods of keying, in which the holes were not placed exactly from the acoustical point of view but in a sort of compromise position, with greater regard for the hand than for the ear. In spite of its complicated mechanism and the fact that it detracts slightly from the tonal quality of the instrument, it has been universally adopted in the manufacture of flutes, and has also been applied to oboes, clarinets, and (to a lesser extent) bassoons. Duplicate fingerings are used that facilitate passages previously impossible, and the system has the advantage of keeping different keys on more or less the same level of difficulty. The pre-Böhm types of flute and oboe are now obsolete, but clarinets with the older system are still used.

Lit.: T. Böhm, *An Essay on the Construction of Flutes* (1882); H. C. Wysham, *The Evolution of the Boehm Flute* [1898]; C. Welch, *History of the Boehm Flute*, rev. ed. (1896). W.D.D.

**Bois** [F.]. The woodwinds.

**Boite à musique** [F.]. Music box; see Mechanical instruments III. Also, title of pieces imitating the high notes and mechanical motion of a music box.

**Bolero.** A Spanish dance said to have been invented by Sebastián Cerezo, a celebrated dancer of Cádiz, about 1780. Danced by one dancer or a couple, it includes many brilliant and intricate steps, quick movements such as the *entrechat* of

classical ballet, and a sudden stop in a characteristic position with one arm held arched over the head (*bien parado*). The music is in moderate triple time, with accompaniment of the castanets and rhythms such as those in the accompanying figure. Probably the earliest extant example is a "Bolero a solo" by Beethoven [see W. Hess, in *DM* xxx.12]. Operatic boleros occur in Auber's *La Muette de Portici* and *Le Domino noir* and Weber's *Preciosa*. Particularly famous are Chopin's *Boléro* op. 19 for piano and Ravel's *Boléro* for orchestra (1927).

The Cuban bolero is in 2/4 meter. It consists of a short introduction followed by two highly syncopated *allegretto* sections of sixteen to thirty-two measures each. The most characteristic rhythmic pattern of the *Cuban bolero* is:

Today the bolero is also very popular in Puerto Rico, where it tends to have a more sentimental character. add. by J.O.S.

**Bolivia.** Three main streams can be traced in Bolivia's traditional music: that of the Indian tribes of the Amazon region, which preserves its primitive quality; a second, centered in the Andean highlands (Altiplano), a development of Aymara and Quechua origins; and a third developed in the lowlands and valleys, where Spanish influence prevails.

In the Altiplano, a pentatonic scale or a mixture of the pentatonic and European diatonic scales prevails. The music is melancholy. Typical examples are all of the songs generically known as *Aire Indio*, such as the *llaquiaru*, very similar to the *Yaraví*, sung in Bolivia as well as in Peru and Ecuador. Music from the valleys is gayer, more rhythmic and sensual, and closely related to that of Argentina and Chile. The *bailecito* and *\*cueca* are good examples of this group. Other Bolivian traditional and regional songs and dances are the *\*huaiño*, *\*cacharpaya*, *\*pasacalle*, *\*triste*, and *\*zamba*.

Art music in Bolivia dates from the time of the Viceroyalty of Peru, which included present-day Bolivia. In 1568 two musicians, Hernan García

and Juan de la Peña, opened a school in the capital city of La Plata (today Sucre) to teach the Indians singing, dancing, and various instruments. In 1597 Gutierre Fernandez Hidalgo (c. 1553–1618) was appointed musical director of the Cathedral of La Plata. Previously he had been active in \*Colombia.

The most distinguished of the 17th-century La Plata composers was Juan de Araujo (1646–1714), a native of Spain who came to America at an early age and became the musical director of the Cathedral in 1680. Approximately two hundred of his compositions, including Latin psalms, *villancicos*, and part songs, are preserved in the (Sucre) Cathedral archives, and a few others are stored in Cuzco. The most prolific musician of the 18th century was Manuel Mesa y Carrizo, a noted psalmodist and also composer of *jácaras* and *juguetes*, gay secular songs for voice and instruments.

After the colonial period art music in Bolivia developed rather slowly. Not until 1940 was the first symphonic organization established, the National Orchestra under the leadership of the composer and conductor José María Velasco Maidana (b. 1899). He is the foremost Bolivian composer of his day, author of a ballet *Amerindia* (1938) and several other programmatic works for orchestra. His contemporaries and most of the composers belonging to the immediately succeeding generation share a strong nationalist stand. This is true of Eduardo Caba (b. 1890), author of a ballet, *Kollana*, based on Indian motifs; Antonio González Bravo (b. 1885), also a prominent educator; and Humberto Viscarra Monje (b. 1898).

Jaime Mendoza-Navas (b. 1925) has worked with the pentatonic native music of the Altiplano, exploring its tonal possibilities and using its characteristic rhythms. He has written piano pieces, three symphonic poems (*Don Alvaro*, *Antawara*, *Pachamama*), a concerto for piano and orchestra, and *Estampas y Estampillas* for an orchestra of cellos. Also noteworthy is Alberto Villalando, whose works include *Estructuras*, for piano and percussion, a composition free from nationalist implications.

J.O.-S.

**Bologna school.** A group of 17th-century instrumental composers who were active in Bologna. Among its members are M. Cazzati (1620–77),

G. B. Vitali (1644?–92), P. degli Antonii (1648–1720), G. B. Bassani (c. 1657–1716), D. Gabrielli (c. 1650–90), G. B. Borri (?), G. Torelli (1658–1709), T. A. Vitali (1665–1747), and G. Aldrovandini (1665–1707). See History of music V.

The Bologna school was important in the formal development of the trio sonata (Cazzati, Bassani, G. B. Vitali), solo violin sonata (degli Antonii, Aldrovandini), solo cello sonata (Gabrielli), concerto grosso (Torelli, Gabrielli), and violin concerto (Torelli). The stylistic contributions of these men were in the direction of balanced structure, elegance of expression, and a pervasive lyricism. These characteristics, combined with deliberate avoidance of virtuosity, are in contrast to the technical exuberance of the string composers of the early baroque, Biagio Marini, Carlo Farina, Marco Uccellini (and their German successors Rosenmüller, Walther, and Biber), who early developed such special idioms of violin playing as *col legno*, *scordatura*, *sul ponticello*, double and triple stops, and higher positions (5th and 6th). The Bologna school thus constitutes an interlude between the virtuoso experimentation of the early baroque and the bravura style of the later baroque (Vivaldi, Tartini, Handel).

The most illustrious proponent of the Bologna style was Arcangelo Corelli (1653–1713), who studied and worked at Bologna from 1666 until 1671, becoming a member of the famous *Accademia Filarmonica* [see Academy] in 1670. His identification with the Bologna school is evident from the restrained classicism of his style, as well as from the designation "detto il bolognese" that appears in his op. 1 (1681) and op. 2 (1685).

Much of the activity of the Bologna school centered around the chapel of San Petronio, which was organized by Cazzati in 1657. The reorganization of this institution in 1701 to conform with the new Neapolitan taste and retrenchments owing to financial strictures were factors in the decline of the Bologna school.

**Bombarde** [F.], **bombarda** [It.]. (1) Names for the shawm, particularly the bass size of this instrument. In Germany, such corruptions as *Bomhart*, *Pomhart*, *Pumhart*, and *Pommer* were used. See Oboe family III. (2) Same as bombardon [see Brass instruments III (e)]. (3) An organ stop of the solo-reed type [see Organ X].

**Bombardon**. See under Brass instruments III (e).

**Bombo** [It.]. See under Tremolo I.

**Bomhart** [G.]. See Bombarde (1).

**Bonang**. See under Java.

**Bonne chanson, La** [F., The Good Song]. Song cycle by Fauré (1892), based on eight poems from Verlaine's collection of the same title.

**Boogie-woogie**. Originally, a special type of piano \*blues, first heard in Chicago in the early 1920's. It was revived about 1935, becoming very popular for a number of years. This type of playing is characterized by an ostinato bass figure, usually sharply rhythmic, against which the right hand rhapsodizes freely, the sections usually comprising twelve measures and the treatment often being contrapuntal (sometimes in only two widely spaced parts), with repeated tones, broken-octave tremolos, and short figures reiterated in great rhythmic variety (*riff* technique).

**Bop** (also rebop, bebop). A term coined about 1945 to describe jazz characterized by improvised solo performances in a dissonant idiom with complex rhythmic patterns and continuous, highly florid melodic lines. Sometimes nonsense syllables are sung, a practice from which the name is thought to have originated. It became popular after World War II under the leadership of trumpeters Dizzy Gillespie and Miles Davis and alto saxophonist Charlie ("Bird") Parker. Its later development is characterized by the adoption of Latin American or Afro-Cuban rhythms. Bop evolved into "modern" jazz, the latter softening the harmonic and rhythmic innovations of the "boppers." See Jazz IV.

J.W.W.

**Bordun** [G.], **bordone** [It.]. See Bourdon.

**Borea** [L., It.], **boree**, **borre**, **borry** [O. Eng.]. See Bourrée.

**Boris Godunov**. Opera in four acts by Mussorgsky (libretto by Mussorgsky after Pushkin's play and Karamzin's *History of the Russian State*), rev. produced in St. Petersburg, 1874; rev. by Rimsky-Korsakov, 1896, 1908. Setting: Russia and Poland, 1598–1605. *Boris Godunov* is the masterpiece of Russian national opera. Its musical style is remarkably advanced for its time, and although its bold unconventionality aroused resentment, many innovations of a more recent date have been traced to this work, e.g., the use of \*parallel chords and \*modality. Striking is the prominence of the chorus, standing for the Russian people, who, it has been said, represent the real hero of the opera rather than Boris himself.

**Boston, valse Boston**. A term hardly known in America but widely used in Europe (particularly Germany) during the period after World War I for the hesitation waltz, a slow waltz with a sophisticated rhythm, characterized by the frequent suppression of single beats or entire measures in the accompaniment. In postwar Germany it acquired a prominent position as an American importation and was imbued with jazzlike elements. Numerous composers of note have written Bostons, e.g., Hindemith (1st String Quartet; 1922 *Suite für Klavier*); Erwin Schulhoff (*Esquisses de Jazz*, 1927; *Partita*, 1925); Louis Gruenberg (*Jazzberries*, 1925); Conrad Beck (*Zwei Tanzstücke*, 1929).

**Bouché** [F.]. See under Horn I.

**Bouche fermée** [F.], **bocca chiusa** [It.]. Singing without words and with closed mouth or, at least, closed teeth. This is a special effect used occasionally in choral music in order to obtain variety of color. Examples occur in Verdi's *Rigoletto*, last act, and Debussy's *Sirènes*.

**Bouffons** [F.]. In the 15th and 16th centuries, costumed dancers performing the \**moresca* or \**matasin*. For *Querelle (Guerre) des bouffons*, see War of the Buffoons.

**Boulevard Solitude**. Opera in seven acts by H. W. Henze (libretto by G. Weil), produced in Hanover, 1952. Setting: Paris, 1950.

**Bourdon** [F.]. Generally, a low note of long duration, i.e., a drone or pedal point. As early as c. 1280 the medieval Latin term *burdo* was used for the sustained tenor tones of the organum duplum [see H. Sowa, *Ein anonymes glossierter Mensuraltraktat 1279* (1930), p. 53]. The term was also applied to instrumental devices produc-

ing such tones, e.g., to the low-pitched bass-courses of the \*vielle and \*hurdy-gurdy, which could be sounded continuously against a melody played on the higher strings [see Petrus Picardus, CS i, 153], to the large pipes of the organ, or to the drones of the bagpipe. In French 17th-century music, the name "*bourdon*" is given to uniform bass accompaniments similar to that of the drones of a bagpipe, e.g., C-g-c-g C-g-c-g [see F. Couperin's "*Les Viéleux et les gueux*" in his *Pièces de Clavecin*, Book 2, ed. Augener, ii, 209].

H. Bessler has advanced the theory (in *Bourdon und Fauxbourdon*, 1950) that sometime about 1400 the term *bourdon* was used for a low instrumental contratenor, in a wide range and with the function of a harmonic bass, as occurs in some motets by Ciconia. This surmise (for which there is no documentary evidence) represents one of various attempts to explain the term \*fauxbourdon (replacement of the hypothetical bourdon by a pseudobass of an entirely different character, namely a middle part in parallel motion with the discant).

The often alleged relationship between *bourdon* and \*burden is very doubtful.

**Bourrée** [F.]. A French 17th-century dance, probably from Auvergne, usually in quick duple meter with a single upbeat [Ex. from Bach's French Suite, no. 6]. The dance is mentioned by M. Praetorius (*Syntagma musicum*, 1615) but does not appear in musical composition before c. 1660 [see J. Écorcheville, ed., ‡*Vingt Suites d'orchestre*, 2 vols. (1906), nos. 1, 5, 6, 7, 14, 16].

Lully used it in his ballets (*Les Amours déguisés*, 1664) and operas, whence it was transferred to the suites of the late 17th and early 18th centuries (Pachelbel, J. K. F. Fischer, J. S. Bach). In Italy the *borea* appears in the suites of Tomaso Motta (*Armonia capricciosa di suonate musicali da camera*, 1681). See Dance music III.

**Boutade** [F.]. A dance or ballet in a capricious style. The name is also used for 18th-century instrumental pieces of a similar nature.

**Bow** [F. *archet*; G. *Bogen*; It. *archetto*; Sp. *arco*]. This implement of violin playing takes its name (in all languages) from the fact that it originally was shaped like the bow used in archery. Chinese

and Arabian fiddles are still played with almost semicircular bows, as were stringed instruments in Europe until about the 15th century. During the 16th and 17th centuries various shapes of bow were used, some of which are reproduced here. Ex. 3 shows Corelli's bow, which was short

1. Mersenne (1620). 2. Bassani (1680).  
3. Corelli (1700). 4. Tartini (1740). 5. Tourte (c. 1820).

and of hard inelastic wood, while Tartini's bow [Ex. 4] was longer and more elastic. In Germany players used bows with a slightly outward curving stick, which may have facilitated the playing of the polyphonic violin music cultivated there (Biber, Bach). It has been frequently stated that on these bows it was possible to loosen the tension of the hair by releasing the pressure of the thumb and thus play chords without arpeggio. Although there is no evidence for this supposition, the greater distance between stick and hair was of some advantage.

The nut (frog) originally was a small piece of wood fastened to the stick, around which the hair was tightly wrapped. The horn-shaped nut shown in Ex. 1 is reminiscent of this early shape. Ex. 2 shows a device that was used temporarily before 1700 in order to allow for an adjustment of the tension of the bow, namely, a wire loop that could hook into a series of teeth (dentated bow). About 1700 this device was replaced by a

screw mechanism like the one still used today [Ex. 3–5].

The bow was given its classical and final form by François Tourte (1747–1835). The most important characteristics of his bow [Ex. 5] are the long, tapering, and slightly inward curving stick, the use of metal or ivory plates for the tip, of Pernambuco wood for the stick, the exact measurements for perfect balance, and probably also the metal ferrule of the frog through which the hair passes evenly spread (this last invention has also been attributed to Tourte's contemporary, John Dodd).

The bows used for the viola, cello, and double bass are designed like the violin bow but are successively heavier and, for the two last-named instruments, shorter.

Saint-George, *The Bow*, rev. ed. (1922); F. Wunderlich, *Der Geigenbogen* (1936); LavE ii.3, 1744ff; H.-H. Dräger, "Die Entwicklung des Streichbogens" (diss. Berlin, 1937). See also the literature under Violin. For the 18th-century bow (and bowing) see S. Babitz, "Differences between 18th Century and Modern Violin Bowing" (*The Score*, 1957); D. Boyden, in *MQ* xxxvi; C. Dolmetsch, in *The Consort*, no. 12 (July 1955); A. Schering, in *BJ* 1904; K. Gerhartz, in *ZMW* vii.

**Bowed harp.** Modern name for the \*crwth and similar instruments of northern Europe. See O. Andersson, *The Bowed-Harp* (1930).

**Bowing.** The technique of using the bow on stringed instruments (violins, etc.). The mastery of the bow includes a considerable number of different manners of bowing, the most important of which are briefly described below. It should be noted that these terms, except for the most common ones, like *détaché*, *sautillé*, *spiccato*, *staccato*, are not much used by players, and that the various effects frequently are not indicated exactly with the proper notation although they are clearly suggested to the player by the character of the music.

(a) *Plain bowing* (*legato*). This consists of two basic strokes: down-bow [F. *tiré*; G. *Abstrich*, *Herabstrich*, *Herstrich*, *Herunterstrich*, *Niederstrich*; It. *arcata in giù*; Sp. *arco abajo*] and up-bow [F. *poussé*; G. *Aufstrich*, *Heraufstrich*, *Hinstrich*; It. *arcata in su*; Sp. *arco arriba*]. In

down-bow, indicated by a sign [Ex. 1], the arm is moved away from the body, and in up-bow [Ex. 2] the arm moves toward the body. The slur [Ex. 3] indicates the number of notes to be taken in a single stroke.

(b) *Détaché* [F.]. A broad, vigorous stroke in which the notes of equal time value are bowed singly with a slight articulation owing to the rapid change of bow. This stroke is much used for loud passages of not very great speed. Sometimes it is indicated by lines under (or above)

the notes [Ex. 4]. An exceptionally long stroke is called *le grand détaché*.

(c) *Martelé* [F.; It. *martellato*]. Literally, a "hammered" stroke, an effect obtained by releasing each stroke forcefully and suddenly. It can be played in any section of the bow and is indicated by an arrowhead [Ex. 5].

(d) *Sautillé* [F.; It. *saltando*; G. *Springbogen*; Sp. *saltillo*]. A short stroke played in rapid tempo in the middle of the bow so that the bow bounces slightly off the string. It is a most brilliant effect and can be done from very soft to quite loud. It is indicated by dots [Ex. 6]. The same indication is used for the *spiccato* [It., detached], in which the bow is dropped on the string and is lifted again after each note.

(e) *Jeté* [F.; also known as *ricochet*]. This is done by "throwing" the bow on the string in the upper third of the bow so that it will bounce a series of rapid notes on the down-bow. Notation as in Ex. 7. Usually from two to six notes are taken in one stroke, but up to ten or eleven can be played.

(f) *Louré* [F.] or *portato* [It.]. A stroke useful in slow tempo to separate slightly each of several notes taken in a slur. It is indicated as in Ex. 8. It is used in passages of a *cantabile* character.

(g) *Staccato* [It.]. This is a solo effect and theoretically consists of a number of *martelé* notes taken in the same stroke. It can be executed with dazzling brilliance either up-bow or down-bow, but the latter is more difficult. When the bow is allowed to spring slightly from the string it is known as *staccato volante* (flying staccato). Notation as in Ex. 9.

(h) *Viotti-stroke*. This is attributed to Giovanni Battista Viotti (1755–1824) and consists of two detached and strongly marked notes, the first of which is unaccented and given very little bow, while the second comes on the accent and takes much more bow. Its use is practically limited to the works of Viotti, Kreutzer, and Rohde. Notation as in Ex. 10.

(i) *Arpeggio, arpeggiando* [It.]. A bouncing stroke played on broken chords so that each bounce is on a different string. Indicated as in Ex. 11.

(j) *Tremolo* [It.]. This is primarily an orchestral effect and is produced by moving the bow back and forth, in short and extremely rapid strokes, on one note [Ex. 12]. See Tremolo.

(k) *Sul ponticello* [It.; F. *au chevalet*; G. *am Steg*; Sp. *sobre el puenteillo*]. A nasal, brittle effect produced by bowing very close to the bridge.

(l) *Sul tasto, sulla tastiera* [It.; F. *sur la touche*; G. *am Griffbrett*]. A flutelike effect (also called *flautando*), produced by bowing very slightly over the fingerboard.

(m) *Col legno* [It.]. This is done by striking the string with the stick instead of the hair. A purely orchestral effect.

(n) *Ondulé* [F.; It. *ondeggiando*]. An obsolete form of tremolo ("undulating tremolo") in which several notes are taken in the same bow [see Tremolo I].

Recent investigations have shown that 18th-century bowing was quite different from that of the present day. See the studies mentioned at the end of the article on Bow. H.N.

**Brabançonne, La.** See under National anthems.

**Braccio** [It.] In the baroque period, the members of the violin family (*viola da braccio*) that were held at arm level [*braccio*, arm], as distinguished from the viols (simply called *viola*), which were held downward, resting on the knees, or from the larger *viola da gamba* [*gamba*, leg], which was held resting between the player's legs. Later, after the name "violin" had become established, only the second smallest size of the family retained the name *viola da braccio*. The first half

of the name survives in the English term "viola" and the second in the German *Bratsche*.

**Brace** [F. *accolade*]. The bracket connecting two or more staves of a score; also, the group of staves thus connected.

**Braille music notation.** The method of writing music according to the principles of the Braille system for the blind. In this system, raised dots are used in various configurations, all of which are derived from an elementary configuration of six dots: ⠠. Following are the signs for the C-major scale and a few other symbols.

The rhythmic value of the note signs is an eighth note, unless a dot is added underneath to the right or to the left. In the former case, the

**Example of Braille notation.**

value is  $\frac{1}{4}$  or  $\frac{1}{64}$ , in the latter  $\frac{1}{2}$  or  $\frac{1}{32}$ . If both dots are added, the value is  $\frac{1}{4}$  or  $\frac{1}{16}$ . [See Ex.] The octave position is indicated by special signs that normally appear at the beginning of each measure. Other signs indicate rests, time signatures, etc. For more details, see A. Reuss, *Development and Problems of Musical Notation for the Blind* (1935); *WoHN* ii, 449ff; *LavE* ii.6, 3836ff.

**Brande** [Old G.]. \*Branle.

**Brandenburg Concertos.** Six concertos written 1718–21 by J. S. Bach (who called them *Concerts a plusieurs instruments*) and dedicated to Christian Ludwig, Margrave of Brandenburg. They represent the artistic peak of the baroque concerto. Each consists of three movements, fast–slow–fast, except for the first, which has a Minuet and a Polonaise added at the end. Three of them, nos. 2, 4, and 5, are *concerti grossi*, employing a group of solo instruments against the string orchestra. See N. Carrell, *Bach's Brandenburg Concertos* (1963).

**Brando** [It.], **brangill** [Old E.]. \*Branle.

**Branle** [F.]. In the 15th century, one of the various dancing steps of the \**basse danse*, indicated in the dance notation by the letter *b*. In the 16th century, the branle was an independent popular dance. There were a large number of local varieties (Arbeau's \**Orchésographie* enumerates more than 20), many of which were of the follow-the-leader type, similar to the farandole, the hay, and the cotillon. It was accompanied by singing and apparently included some swaying movements of the body or hands. The *branle double* and *branle simple* were in duple meter (the former with phrases of four, the latter, of three measures), whereas the *branle gay* was in triple meter. The *branle à mener* survived in the \**amener* of the 17th century and, very likely, in the \*minuet. In England the dance was known as "brangill" or "brawl" [see Shakespeare, *Love's Labour's Lost*, Act III, Sc. II]. An early example of the Italian branle (*brand*) is found in Carlo Farina's *Libro delle pavanne* (1626). See Dance music II.

**Brass band.** A group of brass instruments. Today, the term "brass band" refers to a fairly standardized combination of 24 or 25 players, consisting of 1 E<sup>b</sup> soprano cornet, 8 B<sup>b</sup> cornets, 1 B<sup>b</sup> *Flügelhorn*, 3 E<sup>b</sup> tenor horns, 2 B<sup>b</sup> baritone horns, 2 B<sup>b</sup> euphoniums, 2 B<sup>b</sup> tenor trombones, 1 B<sup>b</sup> bass trombone, 2 E<sup>b</sup> basses, and 2 BB<sup>b</sup> basses.

The brass band dates from the time when valves began to be used in brass instruments in the reorganization of Prussian cavalry bands, beginning about 1830 [see Brass instruments]. The increased versatility of these brass groups prompted the creation of civilian brass bands, the first being founded in 1833. Such bands were vastly popular. In fact, until "Gilmore's Grand Boston Band" was formed in 1859, most bands in America were brass bands. Since then, their popularity in America has declined. In England, however, they continued to flourish, becoming an integral part of recreational and educational programs offered by industry, religious groups, and schools. Regularly scheduled "festivals" and "contests," plus a standard instrumentation, has led some outstanding French and English composers to contribute to the repertory.

**Brass instruments** [F. *instruments de cuivre*; G. *Blechinstrumente*; It. *stromenti d'ottone*; Sp. *instrumentos de metal*].

I. *General.* The section of the orchestra consisting of the instruments made of brass or other metal, such as trumpets, horns, trombones, tubas, as distinguished from those made of wood [see Wind instruments; also Orchestra]. This feature, however, has only superficial significance, since the material from which a wind instrument is made has almost no effect on its tone quality and other properties. Moreover, various instruments of the "brass family" were formerly made of wood [see V], while the "woodwind family" includes instruments made of metal, e.g., the flute and saxophone. A more characteristic feature of the brasses is their mouthpiece, which is nearly always cup-shaped; hence the name "cupped-mouthpiece family" might be a more accurate designation. If this definition is rejected—on the ground that in certain obsolete or Oriental instruments the mouthpiece is not cup-shaped—the instruments in question must be defined as lip-vibrated aerophones, i.e., wind instruments in which the player's lips serve as a reed.

The so-called "brass instruments" form an extremely large group, including not only numerous ancient instruments but also many later ones that were invented in the 18th and 19th centuries for military purposes, for bands, and as improvements on older orchestral types. The subsequent grouping is intended to place the various instruments in certain general categories that show their historical or other position, a grouping that, needless to say, involves some overlapping. [For the general acoustical properties of the brass instruments, see under Wind instruments.]

II. *Orchestral instruments.* The brass section of the modern orchestra consists mainly of the French \*horn, \*trumpet, \*trombone, and \*tuba. The tuba is related to the horn, both having a pipe whose diameter increases throughout the greater part of its length (conical pipe), whereas in the trumpet and trombone the pipe is to a great extent (about two-thirds) cylindrical and widens only at the end into a relatively small bell. The mouthpieces also are different, being more cup-shaped in the trumpet and trombone than in the horn and tuba, which have funnel-shaped mouthpieces. For more details on these instruments, see the separate entries. Other instruments that have occasionally been used in the modern orchestra are the Wagner tubas [see

Tuba (2)], cornet, and several types discussed below under III.

III. *Band instruments.* In this category are all the brass instruments that are used chiefly in the brass band and in other bands, primarily for open-air performance of marches and other popular music. Some of them, however, have occasionally been called for in orchestral scores, particularly the cornet. Most of these instruments can be considered hybrid horns or trumpets since they combine features of the horn (e.g., conical bore) with features of the trumpet (e.g., cup-shaped mouthpiece). A methodical survey of these instruments is extremely difficult, owing to the large variety of types and sizes as well as the utterly confusing terminology. The subsequent survey of the most important types follows in principle the description given in N. Bes-saraboff, *Ancient European Musical Instruments* (1941), pp. 150ff.

(a) Cornet [F. *cornet à pistons*; G. *Kornett*; It. *cornetta*; Sp. *cornetín*]. An instrument similar in shape to the trumpet but shorter and with a relatively longer conical portion and cupped mouthpiece. It is pitched in B<sup>b</sup> (sometimes in A), and has a written range from f<sup>♯</sup> to c<sup>'''</sup>, sounding a whole tone (or three semitones) lower. The cornet's timbre is similar to that of the trumpet. Owing to its shorter tube it has considerably more agility. It has been used a good deal by French and Italian composers (Berlioz, Bizet, Rossini). Its tone has been described as coarse and vulgar and has been compared unfavorably with the brilliant tone of the trumpet. This difference, however, is largely due to an inferior style of playing and to the music commonly associated with the instrument.

(b) Flügelhorn [G.; F. *bugle*; It. *flicorno*; Sp. *fiscorno*]. An instrument similar in design and size to the cornet (sometimes to a tuba or helicon) but with a wider conical bore, usually with three valves. It is usually built in B<sup>b</sup>, more rarely in C. Its sound is somewhat similar to that of the horn but lacks the latter's mellowness. The instruments named below are larger sizes constructed on the principles of the Flügelhorn. They might be regarded as forming a family for which the generic name "bugles" is often used. The largest members of the family are the \*tubas, which are the only ones used in the orchestra. See also below, under (f).

(c) Baritone [F. *bugle ténor*; G. *Tenorhorn*; It. *flicorno tenore*; Sp. *fiscorno tenor*]. This is a larger instrument in C or B<sup>b</sup> and built in one of two shapes, either in the oblong shape of the trum-

pets, with the bell pointing directly upward, or oval, with the bell at an angle. The range is from E to b<sup>b</sup>.

(d) Euphonium [F. *basse à pistons*; G. *Baryton*; Sp. *eufonio*]. Its shape, pitch, and range are the same as those of the baritone. A larger bore, however, gives it a broader, mellower timbre and favors the lower notes. French and other composers have used it in place of the tuba, e.g., Stravinsky in *Petrushka*.

(e) Helicon. This name is used for bass and contrabass tubas in a circular shape (similar to that of the horn) instead of the upright shape of the tubas. The circle is wide enough to allow the player to carry the instrument over his shoulder. An American variety, characterized by a specially designed bell, is the *sousaphone* (named after John Philip Sousa, who suggested it). In Germany a similar instrument is called *Bombardon*.

(f) Saxhorn. A family of instruments invented by Adolphe Sax and designed on a uniform model. Their bore is somewhat narrower than that of the instruments described above, resulting in a more brilliant timbre. They all are upright, with the pipe starting horizontally from the funnel-shaped mouthpiece (as in the tubas, etc.) and the pistons on top of the upper horizontal part of the tube. It should be noted that the saxhorns made today frequently differ in details (width of bore, etc.) from Sax's original design and therefore are closer to the Flügelhorn. Indeed, most authorities maintain that it is practically impossible to make a clear distinction between the saxhorns and Flügelhorns. Usually, the latter term is restricted to the one size described under (b). All agree that there is a hopeless confusion of nomenclature in this group. For example: (1) in E<sup>b</sup> or F (sopranino saxhorn, soprano saxhorn, Soprano Flügelhorn, etc.); (2) in B<sup>b</sup> or C (soprano saxhorn, alto saxhorn, Alt Flügelhorn); (3) in low E<sup>b</sup> or F (alto saxhorn, saxhorn, Althorn, tenor saxhorn, etc.); (4) in low B<sup>b</sup> or C (baritone saxhorn, Althorn, tenor horn, etc.); (5) in EE<sup>b</sup> or FF (saxtuba).

The *saxtromba* is a modification of the saxhorn that has a less conical bore, approaching that of the trumpet (tromba). It is little used today.

IV. *Military instruments.* Under this heading brief mention may be made of instruments used for signaling. They all are natural instruments, restricted to the tones 2 to 6 of the harmonic series, e.g., g d' g' b' d'' for an instrument built in G. The most common of them is the *bugle*

# BRASS INSTRUMENTS

Brass instruments: 1. Trumpet. 2. Cornet. 3. Bugle. 4. Trombone. 5. Wagner tuba. 6. Double B-flat baritone. 7. French horn. 8. B-flat euphonium. 9. Double B-flat tuba. 10. Sousaphone.

# BRASS INSTRUMENTS

Old brass instruments: 1. Lur. 2. Buisine. 3. Alphorn. 4. Slide trumpet. 5. Lituus. 6. Buccina.

Old brass instruments: 7. Ophicleide. 8. Key bugle. 9. Natural horn. 10. Hand horn. 11. Bass horn.

[F. *clairon*; G. *Signalhorn*; It. *cornetta segnale*; Sp. *cuerno de caza*, *bocina*, *clarín*, *corneta*], built in G or B<sup>♭</sup> and occasionally in F. Bugles that have been furnished with a single valve lowering the pitch a fourth are known as *Bersag horn*.

V. *History*. (a) Trumpets and horns, though used in many ancient cultures, were very late in acquiring properties that made them useful as proper musical instruments. Only a few tones of the harmonic series were available on the primitive instruments (made from animal horns, seashells or snails, bark, etc.), a fact that restricted their use to the purpose of signaling, either in religious ceremonies or in military service. Moreover, the trumpets and horns of the Greeks, Romans, Jews, etc., possessed a sound that was far from agreeable but was rather startling, as are to the present day the trumpets of China, Tibet, and India. Plutarch likens the sound of the Egyptian trumpet to the bray of an ass, and the Jewish ceremonial horn, the \*shofar, even today fills the congregation with awe. The Jews also had a long straight trumpet made of silver, the *hasosra* [see Jewish music]. The Greek straight trumpet, called *salpinx*, was taken over from the Orient. The same shape occurs in the Roman *tuba*, a straight instrument made of bronze, about four feet in length. The Romans

also had a trumpet that curved up at the end in the shape of a J, called *lituus*, whereas their \**buccina* was entirely curved, in the shape of a G, and had a wooden crossbar by which it was carried over the shoulder. Among the most interesting examples of ancient trumpets is the Nordic \**lur* type, which shows a high degree of perfection in bronze founding.

Horns were originally made from animals' horns as, e.g., the alphon, the shofar or the Roman *cornu*, made from a ram's-horn or ox-horn, which, we are informed, was covered with gold and studded with precious stones. Metal horns, S-shaped and widening like the animal's horn, are much rarer in ancient cultures than the more cylindrical trumpets, probably owing to the greater difficulty of founding them. They are also relatively rare among the Oriental nations.

(b) In Europe the \*oliphant, a signaling horn made from an elephant's tusk, appeared in the 10th century, imported from Byzantium. The Roman armies brought their trumpets all over Europe. After A.D. 1000 the straight *tuba* acquired the shape of a long slim pipe with a rather large, funnel-shaped bell. This instrument was called *buisine* (from L. *buccina*, which, however, was circular), while smaller sizes were called *trombetta*. From the early part of the 15th cen-

tury comes the first evidence of a folded trumpet. The same principle was also applied to the larger *buisine*, which by the 15th century had acquired the distinguishing feature of the modern trombone, i.e., the slides [see Trombone II; for slide trumpet, see Trumpet]. In the 15th and 16th centuries trumpets became associated with heraldry [see Trumpet II], and the wooden \*cornett [G. *Zink*] acquired a prominent place in 16th-century chamber music. Its bass size had an odd, serpentine shape and therefore was called *serpent*. All these instruments had side-holes covered by the fingers [see Wind instruments IV (d)]. Later a few keys were added in order to facilitate playing, particularly in the large serpent, which in an improved form doubled up on itself like the bassoon and became known as the *Russian bassoon* or its metal counterpart, the *bass horn* [see under Cornett].

(c) About 1650 began the development of the modern horn and trumpet, which is briefly described under Horn II and Trumpet II. [For hand horn and natural horn, see under Horn.] Here it will suffice to mention a group of instruments that were developed about 1800 and are characterized by the use of side-holes (as in the much older cornetts) operated by keys. This principle was applied not only to horns and trumpets but also to bugles [see IV above], in which it proved more successful (Joseph Halliday, 1810). The *key bugle* or *Kent bugle* (*Kent horn*), named in honor of the Duke of Kent [F. *bugle à clés*, G. *Klappenhorn*], remained in use until the second half of the 19th century. Later a larger size was constructed; called *ophicleide*, it had the doubled-up shape of the Russian bassoon. Spontini prescribed it in his opera *Olympie* (1819) and Mendelssohn in his overture to *A Midsummer Night's Dream* (1826). Although soon replaced by the tuba in the orchestra, the ophicleide was used in Italian, French, Spanish, and South American bands up to this century.

See also under Woodwinds; Turmsonaten.

**Bratsche** [G.]. \*Viola. *Bratschist*, viola player.

**Brautlied** [G.]. Bridal song.

**Brawl**. English term for \*branle.

**Brazil**. Primitive Indian music in its original form had relatively little influence on the development of Brazilian music. Most of the Indians living in the coastal areas at the time of the European conquest moved inland to the jungles of western Brazil. Consequently, the only important sources in the development of native Brazilian music are African and Iberian. African immigration to the country had begun by the middle of the 16th century. From that period dates a continuous development of Afro-Brazilian styles of music, which today represent a powerful force of folk expression bearing only slight resemblance to their original African models. The Portuguese contribution has been at least as important. Art music in Brazil dates from the early 17th century, when the Jesuits established large plantations in Santa Cruz, near Rio de Janeiro, and set up a small organization for the musical instruction of their slaves, later called *Conservatorio dos Negros*. Among the first composers whose names are known (though their works are not) are Father Manoel de Silva Reis, Friar de Santa Eulalia, and Friar Santa Clara.

The earliest composers whose works have been traced—and some of them even published—emerged during the last decades of the 18th century. One of them, Father José Mauricio Nuñez Garcia (1767–1830), born in Rio de Janeiro, became choir director of the cathedral of his native city (1798) and director of music of the Royal Chapel (1808–21) during the reign of King John VI in Brazil. He wrote several Masses, among them a *Missa de Requiem* that was sung at the funeral service of Queen Dona Maria I (1811). Other church composers of the same period were José Joaquim Emérico Lobo de Mesquita, Marcos Coelho Netto (c. 1763), Francisco Gomes da Rocha, Ignacio Parreira Neves (c. 1790), and Jerónimo José Ferreira.

During the first half of the 19th century, Rio de Janeiro became one of the most brilliant music centers in South America. The Portuguese-born composer Marcos Antonio da Fonseca Portugal (1762–1830), whose operas were well received in Europe, came to this city in 1811 to become general director of music and helped found the Teatro São João, which from 1813

until the end of the Empire (1889) produced grand opera on a large scale. An important composer of this period was Francesco Manoel da Silva (1795–1865), composer of the Brazilian national anthem (1834), sacred compositions, and \**modinhas*. In 1841 he founded the Conservatory of Rio de Janeiro, today the National School of Music of the University of Brazil. Da Silva's immediate successor was Henrique Alves de Mesquita (1830–1906), composer of operas and operettas (*La Nuit au chateau*, *O Vagabundo*, *Ali Babá*) with French, Portuguese, and Italian librettos. His contemporary, Antonio Carlos Gomes (1836–96), became Latin America's foremost composer of operas modeled on Italian styles. He was trained in Italy and several of his works, including *Il Guarani* (1870), were acclaimed at La Scala in Milan. In 1861 his first opera with a Portuguese libretto, *A Noite do Castelo*, was presented. Other operas by Gomes are *Salvador Rosa* (1874), *O Escravo* (1889), and *Condor* (1891); he also wrote an oratorio, *Colombo* (1892), for the World's Columbian Exposition in Chicago.

In opposition to the facile Italian style of Carlos Gomes and his followers, Leopoldo Américo Miguez (1850–1902) composed symphonic music and operas (*Os Saldunes*, 1896) in a Wagnerian idiom, while Henrique Oswald (1852–1931), wrote orchestral and chamber music in the French manner. Alberto Nepomuceno (1864–1920), took the first steps toward the development of a national style. With techniques borrowed from Wagner, Puccini, and Debussy, he wrote songs, piano pieces, and a *Serie Brasileira* for orchestra of a definite Brazilian spirit. Alexandre Lévy (1864–92) also followed the stream of romantic nationalism, exemplified in his *Suite Brasileira* and a symphonic poem, *Comala*. Francisco Braga (1868–1945) was less concerned with nationalism, instead being attracted to French impressionism. He wrote two operas, *Jupira* and *Anita Garibaldi*, as well as several symphonic poems, songs, and church music.

During the first decades of the 20th century Brazilian music won international recognition through an outstanding group of composers sharing a keen perception of both the national spirit and the latest trends of European composition. The most prominent in this group was Heitor Villa-Lobos (1887–1959), one of the most powerful creative forces that Latin America has produced. He was an amazingly prolific composer (more than 1,000 works) for every con-

ceivable medium, sometimes weak from the viewpoint of musical form or overexuberant in his musical textures but always original and imaginative. Especially notable are his 14 *Choros*, single-movement compositions ranging from instrumental solos to large orchestral works; his piano music (*Guia Prático*, numerous suites and cycles); and his nine *Bachianas Brasileiras*, works in several movements for various instrumental and vocal media. Villa-Lobos also wrote twelve symphonies; a number of symphonic poems and suites; ten concertos; a considerable amount of chamber music, including sixteen string quartets; a large number of songs; choral compositions, including the *Canto Orfônico*; five operas; etc.

Among Villa-Lobos' contemporaries, the most important are Luciano Gallet (1893–1931); Oscar Lorenzo Fernandez (1897–1948), composer of a successful opera, *Malazarte* (1941), and a number of symphonic and chamber works and songs; and Francisco Mignone (b. 1897), conductor, pianist, and also a prolific composer whose works reflect the restless spirit of an experimenter always seeking new modes of expression. The next generation includes Radamés Gnattali (b. 1906), Luiz Cosme (b. 1908), and Camargo Guarnieri (b. 1907). The last-named, considered the foremost successor of Villa-Lobos in Brazil, is an extremely prolific composer of orchestral and chamber music, songs, piano compositions, and choral works. In general Guarnieri no longer draws his materials from folk music, yet his works sound utterly Brazilian and at the same time show a discipline of form and an economy of means that has led many critics to classify him as a neoclassicist.

The young generation is headed by C. Guerra Peixe (b. 1914); Claudio Santoro (b. 1919), a strong supporter of nationalism in his early works who turned next to atonal music; and German-born Hans Joachim Koellreutter (b. 1915), who moved to Brazil in 1937. Still younger composers are Edino Krieger (b. 1928), Marlos Nobre (b. 1939), and Osvaldo Lacerda (b. 1927). Another group of recent composers associated with the newer experimental streams and represented by the New Music Group established in São Paulo are Damiano Cozzella (b. 1929), Roger Duprat (b. 1932), Gilberto Mendes (b. 1922), Olivier Toni, Willy Correa de Oliveira, Luis Carlos Vinholes, and José Luiz Paes Nunes.

Present-day Brazilian folk music stems from two main sources: one of African origin, which

developed into the so-called *Negra* music from Bahia, the second the *Nortista* or *Cabocla*, product of the ethnic stratification combining Iberian and native traditions. The most characteristic features of the former are its rigorous highly syncopated rhythm and its melodic formulas, originating in Portuguese song, found in such forms as the *\*batuque*, *congada* [see *Congo*], *\*maxixe*, and *\*samba*. The *Nortista* (*Cabocla*) is dominantly melodic. Traces of the old modes are seen in its preference for the minor keys. Rhythmically, this music follows the movements of the text rather than conforming to dance patterns. The *modinha*, *toada*, *chula*, and *cantilena* are among the many forms belonging to this group.

Andrade, *Ensaio sobre a música brasileira* (1962); *id.*, *Música do Brasil* (1941); Oneida Alvarenga, *A Influência negra na música brasileira* (1946); *id.*, *Música popular brasileira* (1947); F. Curt Lange, *La Música en Minas Gerais* (1946); L. H. Correa de Azevedo, *Bibliografia musical brasileira, 1820-1950* (1952); V. Mariz, *A canção brasileira* (1959). Also see under Latin America. J.O.S.

**Breit** [G.]. Broad, largo. *Breit gestrichen*, broadly bowed.

**Breve, brevis** [L.]. An old note value that, as implied by the name [L. *brevis*, short], originally (early 13th century) was the shortest value then in use; see Notation III. Because of the subsequent introduction of six or more degrees of smaller value (*semibrevis*, *minima*, etc.; see Notation IV; also Mensural notation I), it became, in the late 16th century, the longest value. Today it is occasionally used as the equivalent of two whole notes, written  $\equiv$  or  $\equiv$ . See also *Alla breve*.

**Breviary** [L. *breviarium*]. See under Liturgical books I (2).

**Bridge** [F. *chevalet*; G. *Steg*; It. *ponticello*; Sp. *punte*]. (1) In stringed instruments, the wooden support resting on the table over which the strings are stretched. Its shape and size vary in the different instruments. The bridge of the double bass has "legs." Although they appear symmetrical, the two halves of the bridge serve somewhat different purposes. The right (treble) foot rests firmly on the table, very nearly above the sound post, while the other, having no such support, transmits the vibrations of the string

to the body of the instrument. The present-day shape of the violin bridge was developed in the time of Antonio and Girolamo Amati (c. 1550-1630).

(2) Short for *\*bridge passage*.

**Bridge passage**. In musical compositions, a passage of subordinate importance serving to connect two themes. It consists of figurations, sequences, or other subsidiary material. Frequently it effects a modulation of key, e.g., from the first to the second theme in *\*sonata form*.

**Brillenbass** [G.]. Derogatory nickname for stereotyped accompanying figures in the manner of the *\*Alberti bass*, whose abbreviated writing [see Abbreviations, Ex. h] suggests a pair of spectacles [G. *Brille*].

**Brindisi** [It.]. Drinking song, particularly in operas, e.g., in Verdi's *La Traviata* ("Libiamo"), Mascagni's *Cavalleria rusticana* ("Viva il vino").

**Brio, con; brioso** [It.]. With vigor and spirit.

**Brisé** [F.]. An 18th-century name for the turn. In modern terminology, indication for arpeggio playing, or for detached bowing. See also *Style brisé*.

**Broadcasting**. See Radio and television broadcasting.

**Broderie** [F.]. (1) French term for coloratura. Also used in German writings, more in the sense of "delicately embroidered melody," as in 15th-century music. (2) Same as auxiliary tone [see Nonharmonic tones I (5)].

**Broken consort**. See Consort.

**Broken cord**. Term for figurations consisting of the notes of a chord (triad, seventh chord, etc.), e.g., those of the C-major Prelude of *The Well-Tempered Clavier*, vol. i, or the stereotyped patterns known as *\*Alberti bass*. The earliest examples are found in the works of the virginists. Chopin's works contain many ingeniously devised broken-chord formations. The term "arpeggio" is often used as a synonym.

**Broken octave**. See under Short octave.

**Browning**. Designation for a body of 16th- and 17th-century English compositions based on the tune "The leaves be greene, the nuts be browne." Thomas Ravenscroft's *Deuteromelia* (1609) contains a vocal canon on the tune, with the text "Browning Madame." [See J. A. Fuller Maitland and W. Barclay Squire, ed., *The Fitzwilliam*

*Virginal Book*, 2 vols. (1899), ii, 381; W. Chappell, ed., *Old English Popular Music*, 2 vols. (1893), i, 154; *ReMR*, p. 845.] Most brownings are intricate variations for instrumental ensembles, e.g., Byrd's "Browning" in five parts [E. H. Fellowes, ed., *The Collected Works of William Byrd*, 20 vols. (1937–50), xvii, 30]. Other composers of brownings were E. Bevin, C. Woodcocke, R. Parsons, H. Stoninge, and J. Jenkins (?). See E. H. Meyer, *Die mehrstimmige Spielmusik des 17. Jahrhunderts in Nord- und Mitteleuropa* (1934); *id.*, *English Chamber Music* (1946).

**Brumeux** [F.]. "Misty," veiled.

**Brummeisen** [G.]. \*Jew's-harp.

**Brummscheit** [G.]. Corruption of *Trumscheit* [see *Tromba marina*].

**Brummstimmen** [G.]. See under *Bouche fermée*.

**Brunette** [F.]. A 17th- and 18th-century type of French popular song, with or without accompaniment, with idyllic, pastoral, or amorous subjects. It replaced the earlier *bergerette* and *vaudeville*. The name is probably derived from one famous example, "Le beau berger Tirsis," which has the refrain "Ah petite brunette, ah tu me fais mourir" [see *SchGMB*, no. 217]. C. Ballard published three collections of *Brunetes ou petits airs tendres* (1703, '04, '11). Some of these songs occur in the harpsichord pieces by Chambonnières and D'Anglebert, e.g., the *Sarabande Jeunes Zéphirs*, and the *Gavotte Où estes vous allées*. Others were used later in comic opera. See P.-M. Masson, in *SIM* xii; G. Cammaert, in *RBM* xi.

**Brusque** [F.]. A 17th-century dance known only through two examples, by Chambonnières, which have some characteristics of the gigue.

**Bruststimme** [G.]. Chest voice.

**Brustwerk, Brustpositiv** [G.]. A special group of smaller organ pipes placed in the middle of the front of the organ, between the large pedal pipes. The group has softer intonation than the *Hauptwerk* (great organ) and is usually played on the second manual.

**Buccina** [L.]. An ancient Roman brass instrument [see Brass instruments V (a)]. The name reappears in the medieval term \**buysine*, in the German word *Posaune* (i.e., trombone), and in the French *buccin* (or *buccine*). The last was a pseudoantique variety of trombone with a bell

shaped like a dragon's head, which was used during the French Revolution for festive occasions. See *LavE* ii.3, 1449.

**Buchstabenschrift** [G.]. \*Letter notation.

**Buckwheat note**. See under *Fasola*.

**Buffet** [F.]. Organ case.

**Buffo** [It.]. In Italian 18th-century opera, a comic character, usually a *basso buffo* (e.g., Leporello in Mozart's *Don Giovanni*). Hence, a singer for comic roles. See *Comic opera*.

**Buffonistenstreit** [G.]. \*War of the Buffoons.

**Bügelhorn** [G.]. German term for the entire family sometimes referred to as \*bugles. See *SaRM*, p. 62.

**Bugle**. A military instrument [see Brass instruments IV]. The term is also used generically for the entire group of brass instruments described under Brass instruments III (b)–(e). For the key bugle (Kent bugle), see Brass instruments V (c).

**Bühne** [G.]. Stage. *Bühnenfestspiel* (stage festival play) and *Bühnenweihfestspiel* (stage-consecrating festival play) are names used by Wagner, the former for his *Ring* cycle, the latter for *Parsifal*. *Bühnenmusik* means \*incidental music for plays, or, in operas, music played on the stage itself, as in the final scene of Mozart's *Don Giovanni*.

**Buisine**. See *Buysine*. For ill. see under Brass instruments.

**Bulgaria**. Bulgarian folk music combines possibly Thracian folksongs and Byzantine and Near Eastern elements with its indigenous traditions. Its most distinct feature is the prominent use of asymmetrical rhythmic patterns (five, seven, and nine beats within one measure), which permeate both songs and dances. Although some such patterns also appear in Greek and Yugoslav folk music, it has become customary to refer to them as "Bulgarian rhythm." Folksongs are usually short but intensely melismatic, and they use both diatonic and chromatic modes. In some parts of Bulgaria one still finds examples of "primitive" polyphony (parallel fourths and fifths or parallel seconds). Folk dances are usually accompanied by singing, which is almost invariably accompanied by an instrument. The chief instruments are the *gaida* (bagpipe), *caval* (fife, related to flute), *gadulka* (two-stringed [or more] instrument played with a primitive bow, occasionally called *gusla*), and the \**gusle* (a primitive bowed instrument with

one string, sometimes two). The main publications of folk music are by Wassil Stoin (1880–1938) and Dobri Christov.

The liturgical music of the Bulgarian church developed from Byzantine chant and was strongly influenced by Russian church music from the 16th to 18th centuries. This influence is still evident despite the addition of folk elements and the acceptance, in more recent times, of certain forms of the Greek rite.

Art music, influenced at first by Russia, began to develop toward the end of the 19th century. The first composers to use Bulgarian folksong as the basis of composition were Emanuel Manolov (1860–1902), Dobri Christov (1875–1941), and Georgi Atanasov (1881–1931). Of all the Bulgarian composers, only Pantcho Vladigerov (b. 1899) has become internationally known. His contemporaries include Lubomir Pipkov (b. 1904), Wesselin Stojanov (b. 1902), and Marin Goleminov (b. 1908). Among the younger generation of Bulgarian composers is Constantin Iliev (b. 1924).

M.V.

**Bund** [G.; pl. *Bünde*]. Fret. *Bundfrei*, see under Clavichord.

**Burden**. Same as \*refrain. The term is used particularly in connection with the 15th-century \*carol.

**Burdo** [L.]. See Bourdon.

**Burgundian cadence**. See under Landini cadence.

**Burgundian school**. The leading Continental school of composers of the early 15th century, represented chiefly by Guillaume Dufay (c. 1400–74), and Gilles Binchois (c. 1400–60).

It forms the link between the *ars nova* (14th century) and the Flemish schools (1450–1600) [see History of music]. In older writings, the Burgundian school is called First Netherlands school [see Netherlands schools]. Today, the term "Burgundian school" is preferred because the musical activity of this period centered in the cultural sphere of the duchy of Burgundy, which, under Philip the Good (1419–67) and Charles the Bold (1467–77), included the whole of eastern France as well as Belgium and the Netherlands. Its court at Dijon was the leading center of culture for western Europe, a culture that manifested itself in the paintings of the brothers Van Eyck as well as in the fantastic fashion of peaked shoes, long cone-shaped hats, and extravagant colors that has survived in the "once-upon-a-time" setting of our fairy tales. Another important musical center of the period was Cambrai. Occasionally the term "Burgundian" has been challenged [see *ReMR*, p. 8] on the ground that none of the composers was born in Burgundy, but such reasoning is hardly valid.

The Burgundian school includes a number of composers who were connected with the Burgundian court. In approximately chronological order, they are: Jacques Vite (fl. 1423–33), Nicolas Grenon (fl. 1385–1449), Pierre Fontaine (fl. 1404–47), Gilles Binchois (c. 1400–60), Guillaume Dufay (c. 1400–74), Hayne van Ghizeghem (fl. 1457–72), and Robert Morton (c. 1440–75). Dufay was only temporarily connected with the Burgundian court, probably in the 1440's, but nevertheless held the title of *cantor illustrissimi ducis burgundie*. Ghizeghem was Flemish by birth and Morton English. Certain other composers whose musical production is closely related to that of the "Burgundians" may well be added to the group, notably Arnold and Hugo de Lantins.

The musical style of the Burgundian school stands in marked contrast to the complexity and mannerism of the late 14th century (Seleses, Solage, Matteo da Perugia) and the severe rigidity of the "early Parisians" (Tapissier, Carmen, and César). Strongly influenced by the English school of Dunstable and his contemporaries, and possibly also by Italian models, Dufay and Binchois developed a musical language of translucent beauty and tenderness that has as much immediate appeal today as it must have had 500 years ago. Perhaps their most important contribution (probably derived from English tradition) was the establishment of the

third as a principal melodic interval. Many of their melodies could well be considered "ornamented triads" [see Ex., Dufay, "Craindre vous vueil"]. No less important is the establishment

of a strongly consonant idiom based on triadic harmonies that often occur in dominant-tonic relationship. The major mode prevails to a much larger extent than in the subsequent period of Ockeghem and Josquin. An important innovation was *\*fauxbourdon*. Except for Dufay, who wrote also Masses [see Mass II] and motets [see Motet IV], Burgundian composers concentrated on secular forms, especially the *\*rondeau*. These, which are often referred to as polyphonic *\*formes fixes*, are usually in three parts, in a high range, and in 3/4 meter (*tempus perfectum*). Not without justification has the music of this period been called a "celestial symphony," symbolized in contemporary paintings that show the various instruments of the period—viols, shawms, recorders, trombones, tromba marina—in the hands of angels. Examples in *HAM*, nos. 65–72. See also *Basse danse*.

Marix, *†Les Musiciens de la cour de Bourgogne au XV<sup>e</sup> siècle (1420–1467)* [1937]. See also under Chansonier.

**Burla, burlesca** [It.]. A composition of a playful character. Bach's A-minor Partita includes a *burlesca*, Schumann's *Albumblätter* a *burla*. A modern example is R. Strauss's *Burleske* for piano and orchestra.

**Burlesque, burletta**. An English (and later, American) type of stage entertainment of the late 18th and 19th centuries, which may be considered the successor of the ballad opera. Like the latter, it was a "low-brow" entertainment consisting of comic dialogue and songs sung to borrowed melodies. Its beginning is indicated by Kane O'Hara's *Midas*, a "burlesque burletta" produced in Dublin in 1762. See W. Rubsamen, in *MQ* xxxvi.

**Burrasca** [It.]. A composition descriptive of a tempest or thunderstorm, e.g., the overture of Rossini's *Guillaume Tell*.

**Butterfly**. See *Madama Butterfly*.

**Buxheimer Orgelbuch** [G., *Buxheim Organ Book*]. A manuscript (formerly in the possession of the monastery of Buxheim near Munich; now Munich, Staatsbibl., Cim. 352b; *olim mus. ms.* 3725), written c. 1460–70 (in Munich?), that contains more than 250 organ compositions, notated in the so-called old German organ tablature system. Among these are c. 110 settings (or *\*intabulations*) of German songs, more than 30 intabulations of French chansons (some by Dunstable, Dufay, Binchois), c. 40 liturgical compositions (Kyries, Introits, Marian antiphons, hymns), c. 20 preludes, a number of *\*basses danses*, and 4 (5?) collections similar to Conrad Paumann's *\*Fundamentum organisandi*, although much more extensive. A facsimile edition (by B. A. Wallner) was published in 1954. Transcription in *\*Editions XVIII*, 37–39. See R. Eitner, "Das Buxheimer Orgelbuch" (*Beilage of MfM* xix/xx); E. Southern, *The Buxheim Organ Book* [1963]; R. Zöbeley, *Die Musik des Buxheimer Orgelbuchs* (1964); A. Schering, *Studien zur Geschichte der Frührenaissance* (1914); H. Schnoor, in *ZMW* iv; L. Schrade, "Die Messe in der Orgelmusik des 15. Jahrhunderts" (*AMF* i); E. Southern, "An Index to 'Das Buxheimer Orgelbuch'" (*Notes* xix); W. Schrammek, "Zur Numerierung im Buxheimer Orgelbuch" (*MF* ix).

**Buysine, buzine, busine, buisine, buzanne** [L. *buccina*]. A medieval straight trumpet. See *Buccina*; Brass instruments V; also Trombone II.

**B.V.M.** See under Antiphon (2).

**BWV**. Abbr. for *Thematisch-Systematisches Verzeichnis der musikalischen Werke von Johann Sebastian Bach* (1950), i.e., the thematic catalog of the works of J. S. Bach, edited by W. Schmieder. The initials stand for *Bach-Werke-Verzeichnis*.

**Byzantine chant.** I. The ecclesiastical chant of the Byzantine Empire (founded A.D. 330 by Constantine the Great; destroyed 1453, with the fall of Constantinople). With the exception of a few ceremonial songs, the \*acclamations, no music other than liturgical chants has been preserved. Although the language of the Byzantine Church was Greek, it has become more and more apparent that Byzantine music was not a continuation of ancient Greek music (as long was assumed) but constituted a new tradition based to some extent on Oriental (Jewish, Syrian) models. The Byzantine system of modes (\**echos*, pl. *echoi*), for example, differs sharply from that of the so-called Greek modes (*tonoi*) but is quite similar to that of the Western Church [see Church modes].

II. Byzantine chant has many features in common with Gregorian chant, being monophonic, unaccompanied, chiefly diatonic, and devoid of strict meter. A fundamental difference between the two bodies of chant, however, is their textual basis. Whereas psalmodic and other scriptural texts prevail in Gregorian chant, the texts of Byzantine chant are mostly nonscriptural, although often modeled after psalms or the canticles. Most of them are hymns, written in metrical arrangements that often employ the isosyllabic principle. Another difference is that in the Eastern tradition the Offices are much more elaborate than the Mass.

The earliest hymns, the *troparia* (4th, 5th centuries), were intercalations sung originally between the verses of the psalms. The 6th century marks the beginning of a new era, that of the *kontakion*, with Romanos (c. 500) and Sergios (c. 600) the leading figures. A *kontakion* is a poem consisting of a short *proœmium* (introduction) and a number (20–30) of stanzas of uniform structure that end with a refrain (either a single word such as "... time" or a complete line) and whose initial letters form an acrostic. The most famous example of this kind is the \**akathistos*. *Troparia* and *kontakia* were superseded about 700 by the *kanon* (Andrew of Crete, c. 650–720; John of Damascus; and Kosmas of Jerusalem, c. 750). The *kanons* are extremely long poems consisting of nine parts (called hymns, odes), each of which was supposed to contain allusions to one of the nine canticles (as a rule, the second ode was omitted on account of the somber nature of the second canticle; all the others are chants of praise and joy). The poetic activity came to an end in the 11th century.

III. The earliest Byzantine sources containing

musical signs date from the 9th century and are written in \*ecphonetic notation. According to recent interpretation [see C. Høeg, *La Notation ekphonétique* (1935)] these signs, which always occur in pairs (one at the beginning, the other at the end of a sentence), represent certain stereotyped formulas that were employed for frequently used phrases, such as: "And Jesus said." Beginning with the 10th century, sources show a more fully developed type of musical notation, indicating a continuous melody. As is the case in the notation of Gregorian chant, the early Byzantine "neumes" (c. 950–1200) cannot be deciphered. Only a few melodies from some of the latest MSS of this period, written in the so-called *Coislin system*, have been transcribed with the help of parallel versions existing in later sources that use the later *middle* (or *round*) notation. The latter system, which was in use c. 1100–1450, has been deciphered in all essential details, including the rhythmic significance of the neumatic signs, on the basis of information contained in certain theoretical manuals called *papadike*. The principal feature of this notation is that its signs do not indicate pitches (as do, more or less exactly, the Western neumes), but intervals to be taken from the tone reached previously. The starting note was indicated by a special sign (the *martyrion*), which signified the *echos* of the melody. Thus, in Byzantine notation, the melody d e g g a f g d would be notated as a succession of intervals according to the following scheme: (d) s t u s t s f– (s = second, u = unison, t = third, f = fourth; descending intervals with a minus sign) [ex. in *GD* i, 520; *GDB* i, 1075].

IV. After about 1100 the traditional chant, which was largely syllabic, was enriched by the introduction of coloraturas that, owing to abuse and individual license, eventually led to the decadence of Byzantine chant. Kukuzeles, who flourished about 1300, seems to have been the first to codify these florid, "kalophonic" chants. In the 14th century the chants were occasionally provided with long coloraturas sung to syllables such as *te-re-rem*, a practice known as *teretism* [see Anenai]. At the beginning of the 19th century the Greek archimandrite Chrysanthos developed a notation that utilizes the principles and some of the details of the Byzantine notation and is still used today for the chants of the Greek Church.

So far as we know, the MSS of the 12th and 13th centuries represent the classical tradition of Byzantine chant. The following example [see

Τμ-νοῦ-μεν τὸν σω-τῆ-ρα, τὸν ἐκ τῆς παρ-θε-  
 σαρ-κω - θέν-τα, ——— δι' ἣ - μᾶς γὰρ ἔ - σταν -  
 ρω - θη καὶ τῇ τρί-τῃ ἡ - με-ρα ἂν ——— ἔσ - τη,  
 δω-ρὸν - με - νος ἡ-μῶν τὸ μέ - γα ἔ - λε - ος.

First ode of a canon for Saturday in Holy Week.

*MQ* xxiii, 208] illustrates the syllabic or somewhat neumatic style that prevails in the chants of this period [see also *HAM*, no. 8]. However, there are Alleluias in a highly melismatic style.

In 1935 C. Høeg, H. J. W. Tillyard, and E. Wellesz began a scholarly edition of medieval Byzantine musical MSS entitled *Monumenta Musicae Byzantinae* [see Editions XXIX]. Also

see Acclamation; Akathistos; Akoluthia; *Echos*, Ecphonetic notation; *Idiomelon*; *Sticheron*.

## C

**C.** (1) See Letter notation; Pitch names; Hexachord. (2) As an abbreviation, *C* may stand for: *con* (*colla, coll'*), i.e., with [*\*c.a.*; *\*c.b.*, *\*C.O.*; *\*c.s.*]; *cantus* [*\*c.f.*]; *capo* [*\*D.C.*]. In modern part songs *C* means *contralto*; in 16th-century part-books, *cantus*. (3) *C* clef, see *Clef*.

**C.a.** [It.]. Abbr. for *col arco* (with the bow).

**Cabaletta** [It.]. A short operatic song in popular style, characterized by a rather uniform rhythm in the vocal line and accompaniment. There are many *cabalette* in Rossini's operas. One of the earliest examples is "Le belle immagini" in Gluck's *Paride ed Elena* (1770). In later Italian opera (Verdi) the term was applied to the final stretto close of arias or duets, in which elaborate

treatment usually gives way to quick, uniform rhythm.

**Cabocla.** An archetype of Brazilian folk music. See under *Brazil*.

**Caça** [Sp.]. See *Chace*.

**Caccia** [It.]. A form of 14th-century Italian poetry and music. The text often deals with hunting and fishing scenes or with similar realistic subjects (a fire, cries of street vendors, etc.). The musical form is a strict canon in two parts, the second usually beginning six or more measures after the first, which is followed by a *ritornello* that sometimes is also canonic. The two "chasing" voices are usually supported by a

tenor line in longer note values that does not imitate the canon melody. The importance of the *caccia* in the history of imitation has been somewhat exaggerated [see Imitation]. Of greater historical significance is the fact that the *caccia* marks the earliest appearance of a supporting lower part, obviously an addition to the duet of the upper parts [see Successive counterpoint]. Some 26 *cacce* survive, by Magister Piero, Giovanni da Cascia, Jacopo da Bologna, Landini, and others.

Although both of the above-mentioned characteristics—realistic text and canonic treatment—are usually present, in some cases a realistic text is composed as a madrigal and in others a madrigal text is composed as a *caccia*. The latter have occasionally been termed “canonic madrigals.” It would seem, however, that the term *caccia* referred primarily not to the subject of hunting but to the musical “hunt,” i.e., to canonic treatment. Thus, the canonic madrigals would also belong to the category of *caccia*. For a similar type of French music, see *Chace*.

Lit.: G. Carducci, *Cacce in rima* (1896; texts only); W. T. Marrocco, *Fourteenth-Century Italian Cacce*, rev. ed. (1961); R. Fosse, *Fourteenth-Century Canonic Madrigals* (1954); N. Pirrotta, in *RMI* xlviii, 305; A. Einstein, “Eine Caccia im Cinquecento” (*CP Liliencron*, p. 72); *WoGM* ii, iii, nos. 42, 56; *HAM*, no. 52; J. Wolf, *Sing- und Spielmusik aus älterer Zeit* (1926), no. 7; A. Main, “Lorenzo Masini’s ‘Deer Hunt’” (*CP Sachs*).

**Caccia Mass, motet.** Modern terms for Mass compositions (mainly Glorias) and motets from the period c. 1320–1420 that make use of canonic imitation, either at the beginning or throughout. The term “*caccia* style” is used in the same sense. In all such cases, the designation “canonic” is preferable, being more to the point. Examples of such motets are De Vitry’s *Lugentium-Petre*, Ciconia’s *O felix templum*, and Dufay’s *O sancte Sebastiane*; examples of the Mass are Glorias by Arnold and Hugo de Lantins [see C. van den Borren, *Polyphonia Sacra* (1932), pp. 10ff, 118ff], Dufay’s *Gloria ad modum tubae*, and several Glorias by English composers [see M. Bukofzer, *Studies in Medieval and Renaissance Music* (1950), pp. 53ff, 80ff]. See also W. Apel, “Imitation in the Thirteenth and Fourteenth Centuries” (*CP Davison*).

**Cacharpaya.** Name given either to a fast round of the Andean countries or to a dance performed at the end of carnival festivities. In the Quechuan

language the word corresponds to the English “good-bye.”

J.O-S.

**Cachua.** Term (also *cachina*, *kashwa*, *kjaswa*, etc.) in the Quechuan language meaning “round dance.” Chronicles of the early 17th century indicate that the *cachua* was popular before the Spanish conquest and describe it as a dance in which men and women formed a circle “while around them wove the dancers.” A report sent to Charles IV of Spain between 1788 and 1790 includes a collection of melodies from northern Peru, which is headed by two Christmas songs subtitled *cachua*. The present-day *cachua* is also a circle dance, performed by betrothed couples. The men tap their shoes while the women spin around. Various kinds of native flute and the *caja* (small drum) are used to accompany the song, which is in quick 2/4 meter and usually based on the following pattern:

J.O-S.

**Cachucha.** An Andalusian dance in triple time, similar to the bolero. It was introduced by the dancer Fanny Elssler in the ballet *Le Diable boiteux* (1836).

**Cachullapi.** Indian song from Ecuador consisting of a single theme in fast 6/8 meter, which is used in the vocal section as well as in the interludes played on a guitar. The melody is usually based on a descending pentatonic scale (c'-a-g-f-d).

J.O-S.

**Cacophony.** Harsh, discordant sound; dissonance. Richard Strauss' tone poems were derided as cacophony when they were first performed.

**Cadence** [G. *Kadenz*; F. *cadence*; It. *cadenza*; Sp. *cadencia*]. I. A melodic or harmonic formula that occurs at the end of a composition, a section, or a phrase, conveying the impression of a momentary or permanent conclusion. Each period of music history has a rather limited number of such formulas or, at least, a limited number of models of which all closing passages are but variations or modifications. The cadences in use during the 18th and 19th centuries have been studied in great detail. Unfortunately, the classification and terminology in this area lack uniformity and frequently also clarity. The following discussion is not intended to present a complete list of terms but to clarify the essential points [see the chapter on “Cadences” in W. Piston, *Harmony*, rev. ed. (1962)].

A cadence is called *perfect* (*final*, *full*) if it can

be satisfactorily and normally used as the close of a composition. According to the standards of classical harmony, the last chord must be the tonic triad (I) and must have the tonic note in the soprano. For the penultimate chord, there is

1 2 3 4

V I IV I IV V I IV I<sup>6</sup> V I

5 6 7 8 9

V I V<sup>6</sup> I V/V V IV/V V V/IV IV  
(I V) (I IV)

10 11 12 13 14

IV/IV IV V VI V VI<sup>b</sup> V III V I<sup>7</sup>

a choice between the dominant (V) and the subdominant (IV), both in root position. The combination V-I is called *authentic* cadence [Ex. 1], the progression IV-I, *plagal* cadence [Ex. 2]. The authentic cadence usually occurs in the fuller form IV-V-I (II<sup>6</sup>-V-I) [Ex. 3] or, still more complete, IV-I<sup>6</sup>-V-I (II<sup>6</sup>-I<sup>6</sup>-V-I) [Ex. 4]. The last four are sometimes called *mixed* cadences.

The remaining cadences fall into two classes, *imperfect* cadences and *deceptive* (or *interrupted*) cadences. The imperfect cadences are the same as the two elementary perfect cadences except that they have the tonic chord in another arrangement, e.g., with the third or fifth in the soprano [Ex. 5]; or they have the penultimate chord in inversion [Ex. 6]—these are called *inverted* or *medial* cadences, as opposed to a *radical* [L. *radix*, root] cadence—or occur in transposition to the dominant (or more rarely, the subdominant) [Ex. 7-10]. These “transposed” cadences occur almost regularly at the end of the first half of a musical phrase and are therefore termed *half-cadence* (authentic or plagal).

The deceptive cadence [F. *cadence rompue*, c. *évitée*; G. *Trugschluss*; It. *inganno*; Sp. *cadencia interrumpia*] is an authentic (or, sometimes, plagal) cadence whose tonic chord (I) is—deceptively—replaced by some other chord, most frequently by VI [Ex. 11]. Some other possibilities are indicated in Ex. 12-14. See also Masculine, feminine cadence.

II. The cadences of early music differ sharply from those described above, particularly prior to 1500, when progressions such as V-I and IV-I were very seldom used [see Harmony]. The history of these cadences is interesting, since the various formulas are characteristic of their period and may well serve as identifying marks. In Gregorian chant, by far the most frequent cadential motion is that of the descending second, II-I, with III-I being next in importance. Ascending motion is much rarer and is practically limited to the ascending second (VII-I). It appears more often in later chants, such as hymns of sequences, but almost never as a leading tone (e-f). Prior to 1450, practically all cadences of polyphonic music are based on the progression II-I in the lowest part (tenor). This cadence appears with various modifications [Ex. 15-19], among which that with two “leading tones,” one before the octave and the other before the fifth, is particularly common before and after 1400 [Ex. 16-18; see Lydian; also Landini cadence]. After 1400 another modification of the II-I cadence appears, in which the contratenor jumps up an octave from the fourth below to the fifth above the tonic [Ex. 20]. This cadence is interesting because it foreshadows the authentic cadence, with its V-I movement in the lowest part [Ex. 21]. This, as well as the plagal cadence, was introduced about 1450 as a result of the addition of a true bass to musical texture (Ockeghem, Obrecht; see Flemish school). The earlier type (II-I) survived only in the so-called Phrygian cadence [Ex. 22; see Phrygian]. It should be noted that until 1500 the third is almost always omitted in the final chord of the authentic as well as the plagal cadence [see

Triad; Picardy third]. In the 16th century the "suspension" formula [Ex. 21] was universally accepted, while in the 17th century the "anticipation" formula [Ex. 23] is very common. Composers of the 17th century frequently used both formulas simultaneously in two parts (violins) in a strikingly dissonant combination known as *Corelli clash* [Ex. 24; for an early instance, in Stefano Landi's *Il Sant' Alessio* (1634), see H. Goldschmidt, *Studien zur Geschichte der italienischen Oper*, 2 vols. (1901, '04), i, 212].

III. The cadences of the classical and romantic periods are of little historical interest since they usually conform to the standard types outlined in I. Toward the end of the 19th century, however, the amplification of the harmonic vocabulary brought with it numerous novelties in the writing of cadences, such as the use of modal cadences [Ex. 25; Mussorgsky, *Boris Godunov*, 1869], the use of a dissonant final chord [Ex. 26; Ravel, *Les Grands Vents*, 1906], polytonal formations [Ex. 27; Busoni, *Sonatina Seconda*, 1912], and, later, the return to a "contrapuntal" type of cadence reminiscent of medieval cadences in the steplike motion of the bass and in their "plagal" feeling [Ex. 28; Hindemith, *Sonate für Klavier*, 1936].

**Cadence** [F.] A 17th-century name for the trill.

**Cadent.** See under Nachschlag.

**Cadenza.** A passage or section of varying length in a style of brilliant improvisation, usually inserted near the end of a composition, where it serves as a retarding element, giving the performer a chance to exhibit his technical mastery. Its traditional place is in the concerto, between the six-four chord (marked with a *fermata*) and the dominant chord of the final cadence [see Ex.]. Such cadenzas make ample use of highly virtuoso passage work but also draw from the thematic substance of the movement, presenting its subjects in artfully devised modifications or combinations. They usually close with an extended trill on the dominant chord.

In most of the earlier concertos (Haydn; Mozart; Beethoven, Piano Concertos nos. 1-4) the cadenzas are not included in the composition but were supposed to be provided by the performer. In the 19th century, cadenzas to the famous concertos were written by the outstanding virtuosos (Hummel, Thalberg, Moscheles, Reinecke, Joachim), frequently without proper

regard to style, so that it is not unusual to hear a Mozart concerto with a cadenza full of the lush harmonies and heavy texture of late romanticism. Beethoven was the first to write his own cadenzas as an integral part of the work, in his last Piano Concerto, op. 73 (Emperor Concerto). This precedent was followed by most of his successors (Schumann, Brahms), who wanted to guard their works against the poor taste and stylistic incongruities of the "pianist-composers." There exist authentic cadenzas (written by the composers themselves) for all of Beethoven's concertos and for a number of Mozart's concertos. Although not entirely satisfactory, they should be consulted by anyone confronted with the necessity of choosing (or writing) a cadenza. Judicious artists will probably find them preferable to any of those in current use, with the sole exception of the excellent cadenzas to Mozart's piano concertos written by Busoni. In the piano compositions of Chopin and Liszt, ample use is made of another type of cadenza, consisting of relatively short portions of glittering passage work, written in small notes and inserted where a momentary retardation or a display of pianistic brilliancy was desired.

Cadenzas in the form of running passages following (rather than preceding) the final chord of a cadence occur in early keyboard and guitar music ("Praeludium super D," in \*Editions XVIII, 39, p. 318f; Milán, *Libro de musica de vihuela da mano*, 1535). Early examples of the modern cadenza, on  $I_4^6$ , are found in Corelli and Vivaldi (c. 1700). Throughout the 18th century improvised cadenzas of a highly virtuoso type were an established feature of the solo arias in the Neapolitan operas and provided the inspiration for the cadenzas written into contemporary concertos (Mozart).

**Cadenzato** [It.]. Rhythmical.

**Caecilianismus** [G.]. See Cecilian movement.

**Caisse** [F.]. Drum. See Percussion instruments B, 1-3.

**Calando** [It.]. Gradually diminishing.

**Calascione** [It.]. Same as *colascione* [see Lute II].

**Calata** [It.]. An Italian dance of the early 16th century known only (?) through thirteen examples in Petrucci's *Intavolatura de lauto Libro quarto* (1508). Ten of them—including one for two lutes—are in  $3/2$  time (notated in three measures of  $2/4$ ), thus resembling the *bassadanza* [see *Basse danse*]. The others are in  $6/8$  time, similar to the \**pivas* of the same publication. See J. W. Wasielewski, *Geschichte der Instrumentalmusik im xvi. Jahrhundert* (1878), Suppl.

**Calenda** [Sp.]. An early dance form, very popular in Santo Domingo, that supposedly originated on Africa's Guinea coast and then spread throughout South America. It is the precursor of the Chilean *zamacueca*. During the 16th century it was so popular that it was performed in religious processions and even inside churches on Christmas Eve. J.O-S.

**Callino casturame**. Title of a piece in the Fitzwilliam Virginal Book. It is probably a corruption of the Irish "Cailinog a stuir me" (Young girl, my treasure).

**Calliope**. An instrument invented in America in the 1880's and named after the Muse of Eloquence, probably because its inventor expected it to have divine powers of persuasion. It consists of a number of steam-blown whistles played from a keyboard. It can be heard at a great distance and is still occasionally used at fairs and circuses.

**Callithump**. Same as \*charivari.

**Calmando, calmato** [It.]. Quieting, quieted.

**Calm Sea and Prosperous Voyage**. See *Meeresstille und glückliche Fahrt*.

**Calore, con; caloroso** [It.]. With warmth.

**Calypso**. A regional type of ballad sung in Trinidad that employs a peculiar mixture of French, English, and even African words. Its origin has been traced to the late 18th century when, on the island's plantations, popular singers known as *shatwel* sang satirical songs about unpopular members of the community. Later these songs were mingled with the *kalinda* (Sp. *calenda*) and became part of carnival festivities. From the *kalenda* derive most of the devices of calypso musical accompaniments, the drum rhythms, and also the use of the *shakshak* (maraca) and the bottle-and-spoon.

In Trinidad today there is a community of professional calypso singers who usually com-

pose both the words and music of their songs or rework a popular calypso melody of the past. Special emphasis is put on the invention of new words, on stressing of local events, and on use of a colloquial idiom full of slang and artificially accented words. The music, however, continues to use a limited number of melodic patterns. Always strident, it is based on breathless tunes, highly syncopated and repetitious. J.O-S.

**Cambia, cambiano** [It.]. Direction in orchestral scores to change instruments or tuning [see under Muta].

**Cambiata** [It., Sp.; F. *note de rechange*; G. *Wechselnote*]. A term used, rather confusingly, for a variety of formations that belong to the general category of nonharmonic notes. All the various interpretations of the term go back to the *Gradus ad Parnassum* (1725) of J. J. Fux, who explains the *cambiata* as the formation shown in Ex. a. This presents an exception from the general rule that a dissonant note (the second of the four quarter notes) should be resolved in conjunct motion. K. Jeppesen [*The Style of Palestrina and the Dissonance*, rev. ed. (1946), p. 213; *Counterpoint* (1939), p. 125] has broadened the meaning of the term, applying it to somewhat similar but shorter formations that occur in 15th- and 16th-century music, one (Ex. b) consisting of three notes, the other (Ex. c, common in Palestrina) of four. The term has also been used for formations such as shown in Ex. d and e. All these have in common a dissonant note followed by the inter-

val of a third, not, as the strict rules would require, a (descending) second. For yet another meaning of the term, see Nonharmonic tones. See C. Dahlhaus, "Die 'Nota Cambiata'" (*KJ* xlvii).

**Cambodia**. See under Thailand.

**Camera** [It.]. In baroque music (1600–1750), *da camera* indicates music for use outside the church, as distinguished from *da chiesa*, music to be performed in the church [see *Chiesa*]. This dichotomy was applied to sonatas, cantatas,

duettos, etc. In the first case especially it entailed a distinct difference of form that is discussed under *Sonata da camera, da chiesa*. In modern Italian usage, *musica da camera* means chamber music.

**Camerata** [It.]. In the 16th century, a name for small academies. Specifically, a group of literary men, musicians, and amateurs who, about 1580, began to gather in the palace of Count Giovanni Bardi at Florence to discuss the possibilities of a new musical style in imitation of the music of the ancient Greek drama [see *Nuove musiche*; *Opera*]. Members of this "charmed circle" were the poet Ottavio Rinuccini and the musicians Vincenzo Galilei, Giulio Caccini, and Jacopo Peri. In 1592, when Bardi went to Rome, Jacopo Corsi became the leader of the group.

Lit.: C. Palisca, *Letters on Ancient and Modern Music to Vincenzo Galilei and Giovanni Bardi* (1960); *id.*, "The Beginnings of Baroque Music" (diss. Harvard Univ., 1954); H. Martin, "La 'Camerata' du Comte Bardi et la musique florentine du xvie siècle" (*RdM* 1932, pp. 63, 152, 227; 1933, pp. 92, 141); G. Gilli, *Una Corte alla fine del '500* (1928); R. Paoli, "Difesa del primo melodramma" (*LRM* 1950, p. 93).

**Camminando** [It.]. "Walking," pushing on.

**Campana** [It.]. Bell. Campanology is the art of bell-founding and bell-ringing. *Campanella* (little bell) is the \*glockenspiel; also, the title of a violin piece by Paganini and an etude by F. Liszt (a piano adaptation of the former) in which the sound of small bells is imitated.

**Campanello di Notte, Il** [It., The Night Bell]. Opera in one act by Donizetti (to his own libretto), produced in Naples, 1836. Setting: a suburb of Naples, early 19th century.

**Can.** Abbr. for *cantoris*; see *Decani* and *cantoris*.

**Canada**. For the music of the original inhabitants of Canada, see American Indian music and Eskimo music.

In the earliest time of permanent French settlement (Quebec, 1608) music was employed in attempts to convert Indians to the Roman Catholic faith. Although plainsong was taught to French boys as early as 1635 and an organ is mentioned in Quebec in 1661 (the first in North America), church music, unlike religious art, did not receive systematic encouragement. A liturgical composition by Abbé Charles Amador Martin (1648–1711) has been preserved. Secular art music seems to have been restricted to the

parties and balls of a few members of the ruling classes. Far more widespread was French folksong, much of which has been preserved through oral tradition and which, together with variants and new songs, such as those of the *voyageurs*, forms a literature of many thousands of items. A similar process took place with the English and Gaelic songs of the Atlantic provinces.

The establishment of British rule (1760) and the growth of urban centers encouraged theater, opera, and subscription concerts. Chamber and orchestral music by Gyrowetz, Haydn, Mozart, and Pleyel was imported and performed. The Frenchman Joseph Quesnel (1749–1809; arrived 1779) became a pioneer of the theater in Montreal and wrote plays, poetry, and music, including a tuneful *comédie mêlée d'ariettes* entitled *Colas et Colinette* (Montreal, 1790). Church music was aided by the importation of organs, printing of music (1800), and, in Protestant communities, "singing schools."

In the second half of the 19th century the apparatus of modern musical life was established, with its societies (usually choirs with *ad hoc* orchestras), visits by virtuoso performers, private, conservatory and elementary-school teaching, piano and organ manufacturing, and sheet-music publishing. But most enterprises were short-lived. Taste was shallow; concerts were dominated by vocal renditions or instrumental fantasias of operatic and national airs and bravura pieces. Nevertheless, individual musicians did succeed in introducing the great oratorios (*Messiah*, Toronto, 1857) and orchestral works (Beethoven, Ninth Symphony, Montreal, 1897) and in raising the level of church music. By the beginning of the 20th century Canada excelled in choral singing. German immigrants were active in teaching and in the music trade, whereas British organist-choirmasters wielded the dominant influence in music education and church music from Confederation (1867) until World War II.

French-speaking Canada was the first region to depend largely on its own musicians. Outstanding among them were Calixa Lavallée (1842–91), composer of the national song "O Canada" (1880) and also of operettas and band music; the Montreal organist-teacher-composers Romain Octave Pelletier (1844–1927), Guillaume Couture (1851–1915), and Alexis Contant (1858–1918); and the Quebec folksong collector Ernest Gagnon (1834–1915) and bandmaster Joseph Vézina (1849–1924). The soprano Emma Lajeunesse (1847–1930)

achieved world fame as Mme. Albani. The earliest Anglo-Canadian composers included Wesley Octavius Forsyth (1859–1937), Clarence Lucas (1866–1947), and British-born Charles A. E. Harriss (1862–1929; arrived 1882). By World War I a fair number of respectable choral-orchestral works (cantatas, oratorios, Masses), light operas, and piano pieces had been produced, but almost nothing in the larger instrumental forms. About 1925 folksong collectors, led by Marius Barbeau (b. 1885), began to publish material that was seized upon by composers like Alfred Laliberté (1882–1952), Claude Champagne (1891–1965), and Ernest MacMillan (b. 1893; knighted 1935), the last-named Canada's leading conductor and musical statesman. Paris-trained musicians such as Léo-Pol Morin (1892–1941) and Rodolphe Mathieu (1896–1962) brought impressionist and other contemporary techniques to Canada. But it was a younger generation whose determination and talent made a place in Canada for the professional composer. These composers include Barbara Pentland (b. 1912), John Weinzwieg (b. 1913), Alexander Brott (b. 1915), Jean Vallérand (b. 1915), Jean Papineau-Couture (b. 1916) and Godfrey Ridout (b. 1918). Aided by the Canadian Broadcasting Corporation, these composers employ various media of composition. Those born in the 1920's and later became the first to receive training in contemporary techniques at home as well as abroad. Harry Somers (b. 1925) and Pierre Mercure (1927–1966) are typical of this generation. A wide range from conservative to avant-garde is also apparent among the immigrants, including Healey Willan (1880–1968), known for his organ and choral music, Arnold Walter (b. 1902), Otto Joachim (b. 1910), Oskar Morawetz (b. 1917), Istvan Anhalt (b. 1919), and Udo Kasemets (b. 1919).

**Canarie, canario.** A French dance of the 17th century, obviously designed as an imitation of the "sauvages des îles Canaries," the natives of the Canary Islands, who represented an exotic element in the European culture of the 16th and 17th centuries. Arbeau, in his \**Orchésographie* (1589), says that it originated in the *mascarade* (masked dance) and gives a melody in the rhythmic pattern | J J J |. The known examples, dating from the 17th century, are all (?) in quick 3/8 or 6/8 time, usually with a dotted note on each strong beat. The earliest *canario* occurs in a "Balletto con gagliarda, saltarello e canario" in M. F. Caroso's *Nobiltà di Dame* (1600), where it forms a short conclusion of eight measures. More fully developed examples are found in the harpsichord suites of Chambonnières (c. 1602–72) and Louis Couperin (c. 1626–61). Others occur in the operas of Lully, Purcell (*Dioclesian*, 1690), in J. K. F. Fischer's *Les Pièces de Clavessin* (1696), in G. Muffat's *Florilegium primum* (1695), etc. Examples in *TaAM* vii, 43. See P. Nettl, in *StM* viii. Also see Dance music III.

**Cancan.** A French dance of the late 19th century that developed from the quadrille and became world famous for its vulgarity and lasciviousness. J. Offenbach introduced it into his *Orphée aux enfers* (1874).

**Cancel.** Same as natural (sign).

**Canción** [Sp.]. Song. Specifically, a 15th-century type of poetry, differing from the contemporary *villancico* through its association with the aristocracy, its regularity of verse structure, and complete agreement between the metrical and musical schemes. See under *Virelai*. See I. Pope, in *AnnM* ii, 198.

**Cancionero** [Sp.]. (1) Collection of Spanish folksongs. Publications of this type have been issued by F. Pedrell and by E. M. Torner. (2) Collections of Spanish (Portuguese) polyphonic art songs of the 15th and 16th centuries, identical in scope with the French \**chansonnières*. The earliest and most important ones are the *Cancionero of Seville* (bibl. Colombina MS 7-1-28; see R. C. Lawes, "The Seville Cancionero: Transcription and Commentary" [diss. North Texas College, 1960]) and the *Cancionero de Palacio* [see Editions XXXII, 5, 10; Sources,

no. 27], which together contain more than 500 secular songs (*canciones, villancicos*, etc.) of the 15th and early 16th centuries. Other collections are: *Cancionero de Juan del Encina, 1496* (fac. ed. by Real Academia Española, 1928); *Cancioneiro of Elvas* (Portuguese; pub. in M. Joaquim, *O Cancioneiro... da Biblioteca Pública Hortênsia*, 1940); *Cancionero de Upsala* (Venice, 1556; new ed. R. Mitjana, J. Bal y Gay, and I. Pope, Mexico, 1944); *Cancionero musical de la Casa de Medinaceli* [see Editions XXXII, 8, 9]; *Cancionero de Sablonara* (Munich, Staatsbibl. Mus. E 200; pub. in D. J. Aroca, *Cancionero... del siglo XVII recogido por Claudio de la Sablonara*, 1918). For their contents, see *ReMR*, pp. 582ff, 611ff.

**Cancrizans.** In crabwise motion; see *Retrograde*.

**Canntaireachd.** See under *Pibroch*.

**Canon.** (1) A contrapuntal device whereby an extended melody, stated in one part, is imitated strictly and in its entirety in one or more other parts. Usually the imitating part follows at a short distance (one measure), as in the accompanying example by Schubert (Piano Trio op. 100, Scherzo). Thus, in a canon the normal contrapuntal texture of horizontal (melodic) and vertical (harmonic) relationships is "reinforced" by diagonal threads that consistently connect the places of imitation [see *Texture*]. It is this added dimension that accounts for the special

artistic charm of the canon. Any phrase heard in the leading voice (*dux*, antecedent) will soon be heard in the following voice or voices (*comes*, consequent); in the meantime, however, the *dux* has proceeded to another motif that sounds against the first and that will, in turn, soon occur in the *comes*.

I. *Types*. The following types of canon are commonly distinguished. (a) According to the temporal distance between the parts: canon of one, two, etc., measures. In earlier terminology: *canon ad minimam*, *ad semibreve*, *ad brevem* (or *ad tempus*), i.e., in the distance of a minim, etc. (b) According to the interval of imitation: canon in unison, at the fifth, fourth, etc. Earlier terms are: *canon ad unisonum*, *ad subdiapente* (the *comes* begins at the lower fifth), *ad diatessaron* (the *comes* begins at the higher fourth), etc. According to special devices: (c) canon by augmentation or diminution (the *comes* has the melody in doubled or in halved values); (d) canon by inversion (the *comes* has the inverted melody; also called *per motu contrario*); (e) retrograde canon, crab canon, or *canon cancrizans* (the *comes* imitates the *dux* in retrograde motion; see Retrograde); (f) *canon al contrario verso* (the *comes* is the retrograde inversion of the *dux*; such a canon can be executed by two players reading the same melody simultaneously from opposite sides of the page); (g) *group canon* (the *dux* and, consequently, the *comes* consist of two or more parts each; a famous example of this type is Byrd's motet "Diliges Dominum"; most of the many-voiced canons of the 17th century—for 12, 16, or even 48 voices—belong to this group); (h) *circle canon* or perpetual canon (i.e., one that leads back to the beginning and that therefore may be repeated several times; most of the popular canons called \*rounds belong to this type); (i) *spiral canon* or *canon per tonos* (here the melody ends one tone higher than it started; thus the canon must be played six times, first in C, then in D, E, F-sharp, etc.; an example is found in Bach's *Musikalisches Opfer* under the title: "Ascendenteque modulatione ascendat gloria regis," i.e., "May the glory of the king rise as the modulation ascends"). A canon is called *mixed* if parts are added (usually in the bass) that do not participate in the imitation (e.g., the canons in Bach's *Goldberg Variations*). The term "canon" is also used for what is more properly called (fugal) \*stretto.

II. *History*. The technique of canonic imitation, that is, of canon in the present-day sense, was first used in the 13th century. Several motets include long passages in canonic imitation, a particularly striking example being the motet "S'on me regarde" (Codex Montpelier, no. 325). \**Sumer is icumen in* is the earliest composition consisting exclusively of a canon. Also in this category are the \**caccia* and \**chace* of the 14th century. A number of 14th- and 15th-

The image displays five musical staves, each illustrating a different type of canon. Staff 1 shows a melody in 8/8 time with a '1' above it. Staff 2 shows a melody in 8/8 time with a '2' above it. Staff 3 shows a melody in 3/4 time with a '3' above it. Staff 4 shows a melody in 4/4 time with a '4' above it. Staff 5 shows a melody in 4/4 time with a '5' above it and the word 'written' to its left. Below staff 5, the word 'played' is written, followed by a staff showing the same melody played back.

1. Canon by augmentation (Vaqueiras, Missa L'Homme armé). 2. Canon by inversion (Mouton; see SchGMB, no. 66). 3. Canon by inversion (Bach, Kanonische Veränderungen über das Weihnachtslied). 4. Retrograde canon. 5. Retrograde-inverted canon.

century motets and Mass compositions open with a section in canonic imitation [see *Caccia* Mass]. Of particular interest are the various canonic treatments of the *L'Homme armé* melody in the 15th-century Masses based on the *cantus firmus* [see Lit., Apel]. A landmark of canonic art, comparable to the canons in Bach's *Goldberg Variations*, is Ockeghem's *Missa prolationum*, each movement of which consists of a double mensuration canon [see *ReMR*, pp. 133ff]. Prominent in late 15th- and early 16th-century music (Josquin and others) is the canonic chanson, in which two voices form a canon [see *HAM*, no. 91; see Lit., Rubsamen]. Palestrina often used canons in the last Agnus Dei of his Masses. Of special interest is the technique of

writing a two-part canon to a *cantus firmus*. Introduced by Zarlino (*Le Istitutioni harmoniche*, 1558, Part 3, ch. 63), it was used by Nanino [see *HAM*, no. 152; *ReMR*, p. 482f], Titelouze, Scheidt, and Bach [*\*Musikalisches Opfer*], as well as in a collection of 16th-century English keyboard pieces by Thomas Woodson [see H. Miller, in *JAMS* viii]. A group canon in 40 ( $4 \times 10$ ) parts occurs in Venegas' *Libro de cifra nueva* (1557; see Editions XXXII, 2, p. 163), and a group canon for two lutes in V. Galilei's *Il Fronimo* (1568; see Editions XXIII, 4, p. 12). Both are called "fuga."

In the 17th century, canons were frequently devised so as to admit a number of solutions. A well-known example is a "Non nobis domine" (attributed, probably wrongly, to W. Byrd), which admits six or seven solutions depending on the number of parts, the intervals, and the distance of the imitating parts [see *GD* iii, 642; *GDB* vi, 99, 100]. Pier Francesco Valentini (c. 1570–1654) wrote a canon that boasts of more than two thousand solutions. At the same time, the English provided a great number of popular canons in their *\*catches*. It was chiefly through Bach that the canon again won an important position in music, a position it has maintained to the present day. Particularly noteworthy are Bach's *Kanonische Veränderungen über das Weihnachtslied* and the canons in his *\*Goldberg Variations*. Haydn, Mozart, and Beethoven contributed many charming examples to the popular repertory and also used canon technique in their sonatas (mostly in the minuets) and variations. A well-known later example is the last movement of Franck's Violin Sonata (1886), which, however, employs a rather facile technique, whereas Brahms made more ingenious use of the canon. e.g., in his *13 Canons* (for women's voices), op. 113.

The 20th-century development has brought with it a remarkable revival of canonic writing. Schoenberg has written canons as birthday greetings for G. B. Shaw, T. Mann, and Carl Engel. The last-named piece is a triple mensuration canon like Josquin's "Fuga trium vocum" (see under III). Bartók used canonic writing, particularly in his string quartets, and his *Music for Strings, Percussion and Celesta* has a mirror canon in the first movement. Berg's Violin Concerto has much canonic writing in the second movement, including a four-part canon for solo violin. L. Dallapiccola's *Tartiniana* has a crab canon in the third movement. Serial composers have made extensive use of canons.

III. *Early meaning of the term.* In early music, the present-day type of canon occurs under such names as *caccia*, *chace* (14th century) or *fuga* (16th century), while the term canon means any kind of inscription ("rule") giving a clue for the execution of a composition that is intentionally notated incompletely or obscurely (*riddle canon*). Such canons appear first in the works of Machaut, among them a motet "Trop plus est belle" [see F. Ludwig, *G. de Machaut, Musikalische Werke* ii, 71; J. Wolf, *Musikalische Schrift-Tafeln* (1930), p. 23], whose tenor is to be sung "ad modum rondelli" (*rondellus* here means not "round" but *\*rondeau*), i.e., as follows: a b a a b a b, although only a b is notated. Examples of much greater complexity occur in the French MSS of the late *ars nova* [see, e.g., the "Canon balade" in *WoHN* i, 375]. In the Flemish era (c. 1450–1550) the canonic inscriptions grew more and more enigmatic so that Tinctoris, in his *Diffinitorium* (c. 1475), aptly defines the canon as "a rule which shows the intention of the composer in an obscure way" [*CS* iv, 179]. Among the simpler examples of riddle canon are the various inscriptions indicating *\*inversion* and *\*retrograde motion*. More complicated is the inscription given with the Agnus Dei of Dufay's *Missa L'Homme armé*: "Cancer eat plenus et redeat medius" (the crab proceed full and return half). This means that the tenor should be read first backwards (a crab "proceeds" backwards) in the full note values, then forward from the beginning, but in halved note values [see *HAM*, no. 66c]. Even more oracular are inscriptions such as "Ne recorderis" (lit., Don't remember), which must be read "Ne re corderis," i.e., "Don't remember *re*," "Don't sing *re*," "Omit all the notes *re*," i.e., "*d*." Particularly complicated riddle canons occur in the English 15th-century *Missa O quam suavis* [new ed. by H. B. Collins (1927)]. For more details see W. Ambros, *Geschichte der Musik*, iii, 62ff; *WoHN* i, 427; *GD* ii, 713 ("Inscriptions"); *RiHM* ii.1, 83–95; *ApNPM*, pp. 179ff.

Less obscure are the so-called *mensuration canons* of the 15th and 16th centuries. Here, a single written part must be read simultaneously in different mensurations or proportions. In such a canon the voices start simultaneously but proceed differently, owing to the different value of the longer notes (*longa*, *brevis*) under the various signs of mensuration. The accompanying example shows a portion of a "Fuga trium vocum" by Josquin des Prez [see *ApNPM*, p. 181; *HAM*, no. 89].

Mies, "Der Kanon im mehrsätzigen klassischen Werk" (*ZMW* viii); O. E. Deutsch, "Haydn's Kanons" (*ZMW* xv).

(2) In ancient Greek music, canon (*kanón*) is the name of the monochord that served to demonstrate the "laws" of acoustics. See *Kanon*.

(3) In Byzantine chant, a special type of poetry, more correctly spelled *kanon*; see Byzantine chant II.

(4) In the Roman liturgy, the Canon is the central and most solemn part of the Mass, said by the officiating priest after the Sanctus. It begins with the words "Te igitur" [see LU, p. 4].

**Canonical hours.** See under Office.

**Canonic treatment, style.** Term for short passages written as a more or less free canon and forming part of a larger composition such as a sonata (frequently in the development section).

**Canso.** See *Canzo*.

**Cantabile** [It.]. Singable, singing.

**Cantata.** A composite vocal form of the baroque period, consisting usually of a number of movements, such as arias, recitatives, duets, and choruses, which are based on a continuous narrative text that is lyrical, dramatic, or religious. Owing to the activity of J. S. Bach, the church cantata, i.e., a cantata with devotional subject

matter, is particularly well known and clearly defined. However, the secular cantata was not only the earlier but also the more common type throughout the 17th century, especially in Italy.

I. The cantata appeared shortly after 1600 as an offspring of the monodic style. In its early, experimental stage (before 1630) it occurs under different names and in a great variety of forms and styles. Certain pieces in Caccini's *Nuove musiche* (1602) and in Peri's *Varie musiche* (1609), written in the form of strophic arias with the same bass used for every stanza but with different melodies for the voice [see Strophic bass], may be considered the point of departure. As a matter of fact, Alessandro Grandi's cantatas (*Cantate et arie a voce sola*, repr. 1620; first use of the name) as well as the majority of cantatas written before 1650 follow the same scheme as the "strophic-bass cantata" [see *RiHM* ii.2, 20, 31; *AdHM* i, 437; *BuMBE*, p. 32]. On the other hand, a piece such as Peri's "Se tu parti" more clearly foreshadows the later cantata, since its three stanzas (written to the same bass) contain contrasting sections, arioso and recitativo, separated by instrumental ritornellos, and thus anticipate to some extent the composite structure of the developed cantata. This structure becomes more clearly evident in the cantatas of Francesco Rasi (*Dialoghi rappresentativi*, 1620; see *RiHM*, p. 299), G. Pietro Berti (*Cantate ed arie*, 1624), G. F. Sances (*Cantate*, 4 vols., 1633–40), and Benedetto Ferrari (*Musiche varie*, 1637). The free composite cantata—in a way, the vocal counterpart of the contemporary *canzona da sonare*—reached a peak in Luigi Rossi (1597–1653; see *RiHM*, pp. 371ff), Giacomo Carissimi (1605–74; see *RiHM*, p. 383f), and Marc'Antonio Cesti (1623–69; see *AdHM* ii, 439). This form was taken over by F. Provenzale and A. Scarlatti. After 1700, the form of the cantata became standardized as a sequence of two, or sometimes three, *da capo* arias connected by a recitative. It is interesting to note that an almost identical process of standardization took place simultaneously in the instrumental field, leading from the *canzona* to the *sonata da chiesa* and *sonata da camera*. A. Stradella wrote more than 190 cantatas and A. Scarlatti more than 600, mostly of the type described above, which was almost exclusively adopted in the 18th century as a convenient and conventional scheme for virtuoso display and sentimentality (G. F. Handel, L. Leo, L. Vinci, N. Jommelli, J. A. Hasse).

II. In France the cantata was not cultivated

until the 18th century, the only exceptions being two cantatas by Marc-Antoine Charpentier (1634–1704), a pupil of Carissimi. A large number of cantatas, mostly to French secular texts, appeared between 1705 and 1730, written by A. Campra (1660–1744), N. Bernier (1664–1734), M. Montéclair (1667–1737), J.-B. Morin (1677–1745), L. N. Clérambault (1676–1749), J. J. Mouret (1682–1738), and Rameau (1683–1764). Rameau's cantatas (compl. ed., vol. iii) are mostly for one voice and usually consist of three recitatives, each followed by an aria. See *LaVE* i.3, 1557ff.

III. The development of the cantata in Germany, although strongly influenced by the Italians, was entirely different, chiefly on account of the emphasis on the church cantata (Kaspar Kittel's *Arien und Kantaten* of 1638 are practically the only German secular cantatas of the 17th century; see *RiHM*, p. 349). Schütz's *Symphoniae sacrae* (1629) contain several compositions that, although based on Latin texts, must be regarded as cantatas, being similar in form and style to those of Grandi or Rossi. However, the cantatas of F. Tunder (1614–67), M. Weckmann (1619–74; *DdT* 6), J. R. Ahle (1625–73; *DdT* 5), Buxtehude (c. 1637–1707; *DdT* 14), and J. S. Bach's uncle Johann Christoph Bach (1642–1703) already show a distinctly German character, being more serious, more genuinely dramatic, and more elaborate musically than the contemporary Italian cantata, owing chiefly to the inclusion of orchestral and choral participation. An especially interesting type is the \*chorale cantata, which was cultivated by Tunder, Johann P. Krieger (*DdT* 53/54), Kuhnau (*DdT* 58/59), and others, while most of Buxtehude's numerous cantatas are based on free poetic texts and are, in a way, more "Italian" than those of the other German composers. The changeover from the chorale to free texts (and, as a consequence, from *cantus firmus* pieces to entirely free composition) was spurred about 1700 when Pastor E. Neumeister began publishing annual sets of his own cantata texts, mostly poetic paraphrases of scriptural passages appropriate for the various feasts of the church year. Some of these sets were written expressly for particular composers, e.g., for Krieger (Set i, 1704), P. Erlebach (Set ii, 1708), and Telemann (Sets iii, iv, 1711, 1714). However, many other musicians also were eager to seize upon these extremely timely and popular texts, particularly J. S. Bach, who, through the artistic greatness and religious dignity of his music, sanctioned

Neumeister's "theatrical" poetry as well as the "operatic" form of the *da capo* aria. Bach's cantatas (195 are preserved out of a total of probably close to 300) usually open with a chorus in fugal style that sometimes assumes great proportions, continue with a number of recitatives and arias, one for each of the two or three soloists, and close with a harmonized chorale. See *Chorale cantata*.

IV. After Bach, the cantata merged with the oratorio, of which it represents a shorter and more casual type. Most such cantatas were written for special occasions, e.g., Haydn's *Birth-day Cantata* for Prince Nikolaus Eszterházy (1763), Mozart's cantata *Die Maurerfreude* (The Joy of the Masons, 1785), Beethoven's *Der gloriose Augenblick* (The Glorious Moment, op. 136, 1814). Numerous later composers (Schubert, Spohr, Weber, Schumann, Mendelssohn, Liszt, Brahms, D'Indy, Saint-Saëns, Bennett, Stanford, Parry, Sullivan, Vaughan Williams) have made contributions to the repertory, but none of lasting importance. American composers of cantatas include John K. Paine and Dudley Buck (*The Voyage of Columbus*).

In the 20th century a considerable number of cantatas were written, some designated as such, others not but nevertheless belonging to the same category. Examples are Hindemith, *Plöner Musiktag* (1923), *Ite, angeli veloces* [1955]; Milhaud, *Cantata of Peace* (1937), *Cantata of War* (1940); Bartók, *Cantata Profana* (1930); Honegger, *Cantate de Noël* (1953); Webern, 2 Cantatas, op. 29, op. 31; Stravinsky, *Cantata on Old English Texts* (1952), *Threni* (1958), *Canticum Sacrum* (1955); W. Schuman, *A Free Song* (1942); Britten, *Saint Nicholas* [1948]. Debussy's *L'Enfant prodigue* (1884) is one of the numerous cantatas written according to the stipulations of the *Prix de Rome*.

**Cantatory** [*L. cantatorium*]. See under Liturgical books I (ii); also Gradual (2).

**Cante flamenco, cante hondo, cante jondo.** See under Flamenco.

**Canti carnascialeschi** [It.]. Late 15th- and early 16th-century part songs designed for the elaborate carnival festivities that took place in Florence under the Medici, particularly Lorenzo de' Medici (ruled 1469–92), who himself wrote a number of the poems. H. Isaac composed carnival songs during his stay at Lorenzo's court (c. 1480). Unfortunately these have been lost. Numerous compositions in three and four parts, by A. Coppinus, Jacopo da Bientina, and others, exist in several Italian MSS of the early 16th century. In style as well as form, the *canti carnascialeschi* are very similar to the *frottole*. In many cases the music has the form a b b c (b b = *piedi*), repeated for a number of stanzas. Particularly interesting are the songs of the various guilds, the *Canto de' sartori* (tailors), *de' profumieri* (perfumers), *de' scrittori* (scribes; see *HAM*, no. 96), etc. The texts often contain double meanings of a satirical or obscene nature.

Lit.: F. Ghisi, *I canti carnascialeschi* (1937); *id.*, ‡*Feste musicali della Firenze Medicea* (1939); *id.*, in *MQ* xxv and in *RBM* ii; *ReMR*, pp. 167ff; P. M. Masson, ‡*Chants de carnaval florentins* (1913); K. Westphal, ‡*Karnevalslieder der Renaissance* (\*Editions VIII, 43).

**Canticle** [*L. canticum*]. In the Roman and Anglican liturgies, a scriptural text similar to a psalm but occurring elsewhere than in the Book of

Psalms. Canticles are classified as (a) *cantica majora* (greater or Gospel canticles), i.e., from the New Testament, e.g., "Magnificat anima mea Dominum" (*canticum Mariae*, *canticum B. M. V.*; see Magnificat); "Benedictus Dominus Deus Israel" (c. *Zachariae*); "Nunc dimittis" (c. *Simeonis*). In the Roman Catholic rite they form the climax of Vespers, Lauds, and Compline respectively. In Anglican churches they occur in the Morning and Evening Prayers. (b) *Cantica minora* (lesser canticles), fourteen in number, are from the Old Testament. In the Roman rite they all belong to Lauds, where they function as one of the five psalms. Two of them are assigned to each day of the week, one for normal use, the other for the period of Lent. Among them are "Cantemus Domino" (c. *Moysi I*), "Audite caeli" (c. *Moysi II*), "Audite verbum" (c. *Jeremiae*), and "Benedicite omnia opera" (c. *trium Puerorum*, or canticle of Daniel). In Anglican churches they occur in the Morning Prayer. See *ApGC*, p. 20. See also Byzantine chant II.

*Canticum canticorum* is the Song of Solomon, selections from which have been frequently used for motets (e.g., "Quam pulchra es," by Dunstable; see *SchGMB*, no. 34), most completely by Palestrina (29 motets; see comp. ed., vol. iv).

**Cantiga.** A Spanish monophonic song of the 13th century, mostly in honor of the Virgin Mary (c. *de Santa Maria*). A large number of *cantigas* (more than 400) are preserved in four MSS in the Bibl. Nacional in Madrid and in the monastery library of El Escorial. They were collected for Alfonso X (*el Sabio*, the Wise; 1221–84), King of Castile and Leon, who was a great lover of poetry and music and who probably contributed a good part of the contents. The pictorial reproductions of medieval instruments and players in the MSS are of the greatest importance [see *GD* ii, opp. 482; iii, opp. 260; iv, opp. 184; *GDB* iii, opp. 848; iv, opp. 496, 500; v, frontis.]. The chief form of the *cantiga* is that of the *virelai* [see *Virelai* II; also *Villancico*]. An earlier type of great interest is the *cantiga d'amigo* of c. 1200, the song of a girl in love [see Lit., Pope].

The *cantigas* were first published by J. Ribera, who believed they were of Arab origin and transcribed them in what he thought were "Arab rhythms," providing some of them with a 19th-century dance accompaniment. According to recent investigations (Anglés), their rhythm is part modal, part nonmodal (even meter), and part mixed. Ex. in *HAM*, no. 22.

Lit.: H. Anglés, *Las Cantigas* (1927); *id.*, ‡*La*

*Música de las cantigas de Santa Maria* [\*Editions IV, 15, 18, 19]; J. Ribera, ‡*La Música de las cantigas* (1922; superseded by Anglés); G. Sunyol, *Cantiques de Montserrat* (Publicaciones del Monasterio de Montserrat); P. Aubry, *Iter hispanicum* (1908), pp. 37ff (fac.); *ReMMA*, p. 245 (bibl. p. 450); H. Anglés, in *CP* 1949, p. 45; I. Pope, "The 13th-Century Galician Lyric" (*Speculum* ix).

**Cantilena.** (1) A vocal melody of a lyrical rather than a dramatic or virtuoso nature; also, an instrumental passage of the same kind. (2) In medieval writings the term is loosely used for the secular vocal compositions, homophonic as well as polyphonic (*ballades*, *rondeaux*, etc.; see *ReMMA*, pp. 294, 322; also *ReMR*, p. 764). The term "cantilena style" has been suggested (by Handschin) and widely adopted in place of \*"*ballade* style" (Ludwig, Besseler) to describe 14th- and 15th-century compositions with a vocal upper part and two instrumental accompanying parts. This style is found not only in the *ballades* but also in the *virelais*, *rondeaux*, and some Mass compositions and motets of the period of Machaut and Dufay. Another term is "treble-dominated style" (*ReMR*, p. 16f). (3) *Cantilena romana* means Roman (i.e., Gregorian) chant.

**Cantillation.** Religious chanting in recitative style, especially that of the Jewish service. See S. Rosowsky, *The Cantillation of the Bible* (1957); S. Corbin, "La Cantillation des rituels chrétiens" (*RdM* xlvii, 3ff); A. Machabey, "La Cantillation Manichéenne" (*RM* 1955, no. 227).

**Cantino** [It.; F. *chanterelle*]. The highest string of lutes, viols, etc. A 16th-century German equivalent is *Sangsaite*.

**Cantionale** [L.]. Title of several publications containing simple, homophonic settings of chorales, etc. for the German Protestant service, e.g., A. Raselius, *Cantionale oder Kirchengesenge* (1588); J. H. Schein, *Cantional oder Gesangbuch* (1627). In modern writings the term is used as a generic designation for publications containing such music, for instance, L. Osiannder's *Funffzig geistliche Lieder und Psalmen* (1586). Hence the designation "cantional style" [G. *Kantionalstil*], used for chorale settings in a homophonic style, with the melody in the topmost voice.

**Cantio sacra** [L.]. Motet. Many collections of motets bear the title *Cantiones Sacrae* (Tallis,

Byrd, G. Gabrieli, Schütz). An Italian synonym is *Canzoni spirituali*.

**Cantique** [F.]. Cantic. Also, a religious song. See A. Gastoué, *Le Cantique populaire en France* (1924).

**Canto** [It.]. Song; melody; soprano. *C. carnascialesco*, see *Canti carnascialeschi*; *c. fermo*, \**cantus firmus*; *c. piano* [Sp. *canto llano*], plainsong.

**Canto de órgano** [Sp.]. Spanish term for polyphony (as opposed to *canto llano*, plainsong) in the Renaissance and baroque eras. Ramos de Pareia [see under Theory, no. 18] says that *cantus figuratus* is usually called *organi cantus*, and in Juan Bermudo's *Declaración de instrumentos musicales* (1555) the chapter dealing with polyphonic music is entitled "Comiença el arte de canto de organo" (f. 48 verse).

**Cantor.** In the Roman Catholic liturgy, the soloist (usually two *cantores*) who sings the solo portions of the chants (incipits and verses), as opposed to the *schola* (chorus). In Protestant churches, the director of music (e.g., Bach in Leipzig). In the Jewish service, the solo singer, also called *chazzan*.

**Cantus** [L.]. In 12th-century polyphony, name for the original voice part, generally lower than the added one, called *discantus*. In 15th- and 16th-century polyphony, designation for the topmost part (abbr. C). The term was also used for entire vocal compositions, chiefly secular, as, in the three volumes of the \**Odhecaton*, entitled *Canti A*, *Canti B*, *Canti C*. *Cantus figuratus* (*figuralis*), *cantus fractus*, and *cantus mensuratus* all refer to the use of exactly measured (*mensuratus*) note values (*figurae*) of different lengths such as result from the breaking up (*fractus*) of a long note value into smaller parts. Hence, they designate polyphonic music as opposed to plainsong (*cantus choralis*, *cantus planus*) with its notes of (supposedly) equal duration. In the Ambrosian Mass [see Ambrosian chant] *cantus* is the name for the chant corresponding to the Tract.

**Cantus firmus** [L., pl. *cantus* (or *canti*) *firmi*; It. *canto fermo*]. An existing melody that becomes the basis of a polyphonic composition through the addition of contrapuntal voices. In terms of their origin, the *cantus firmi* can be divided into four groups: (a) plainsong melodies; (b) Protestant chorales; (c) secular melodies; (d) abstract subjects. To group (a), which is by far the largest, belong all the *organa* and *clausulae*, practically

all the motets of the 13th and 14th centuries, some motets and numerous Masses of the 15th and 16th centuries [see Mass C II a, b], the organ Magnificats, and the organ hymns of the 16th century. The latter lead to group (b), which includes the organ chorales (chorale preludes) of Buxtehude, Pachelbel, Bach, Brahms, *et al.*, as well as the chorale choruses in cantatas and Passions (e.g., the first chorus of Bach's St. Matthew Passion). Group (c) includes some motets of the 13th to 14th centuries (e.g., Machaut's motet on "Pour quoy me bat mon mari") and many Masses of the 15th century,

such as Ockeghem's Masses *\*L'Homme armé*, *Fors seulement*, and *De plus en plus*. In these the *cantus firmus* is usually taken from the tenor or *superius* of a chanson by the same or another composer (e.g., Binchois' rondeau *De plus en plus*). To the last group belong the various compositions based on the hexachord (e.g., Sweelinck, "Fantasia super ut re mi fa sol la") or those based on a *\*soggetto cavato*.

The *cantus firmus* appears most frequently in the tenor, usually in long notes that contrast with the more florid design of the other parts. In the 13th century, its rhythmic structure was determined by the system of the rhythmic *\*modes*, in the 14th by the principle of *\*isorhythm*. In the 15th century and later the *cantus firmus* often occurred in long notes of equal value [see *Cantus planus* style; see Ex. 1, Cabezón, *Ave maris*

*stella*]. In the organ chorales of the 17th and 18th centuries these often form the bass, being played on the pedal (Pachelbel, Bach). The opposite method is that of the *discant cantus firmus*, in which the *cantus firmus* appears in the topmost part, often paraphrased or ornamented. Early examples are in the Codex Apt [see Sources, no. 19] and in the hymns of Dunstable and Dufay [Ex. 2, Dufay, *Ave maris stella*], in which the plainsong is skillfully changed into a graceful melody in triple meter. Essentially the same method is employed in the melody chorales or ornamented chorales of the baroque period (Buxtehude, Bach). English composers of the 14th and 15th centuries often used a *migrant cantus firmus*, which changed its position from one part to another [see M. F. Bukofzer, in *MQ* xxxiv, 522ff]. Some scholars have maintained that seemingly free upper parts of 15th-century Masses are actually extremely complex elaborations of a *cantus firmus*; see Discant Mass.

The term *cantus firmus* was used very rarely before 1500. It occurs only in the "Discantus positio vulgaris" of c. 1225 ("Motetus est super determinatas notas firmi cantus... multiplex consonans" (A motet is a multiple consonant song based on the fixed notes of a *cantus firmus*; see CS i, 96) and in Guilelmus Monachus' "De preceptis artis musice," c. 1470, referring to the English practice ("debet assumi supranum cantum firmum" (A *cantus firmus* must be taken for the upper part; CS iii, 292b). The term is not mentioned in Tinctoris' *Diffinitorium* (c. 1475). Zarlino, in his *Istitutioni harmoniche* of 1558, speaks of "canto fermo et figurato," thus indicating that for him (as well as for the earlier writers) *cantus firmus* meant a "plain" Gregorian melody, without figuration. Bach, however, employed the term *canto fermo* for both plain and ornamented chorale melodies. See Felix namque; In nomine; In seculum; *L'Homme armé*.

Sparks, *Cantus firmus in Mass and Motet, 1420-1520* (1963); J. Mattfeld, "Cantus firmus in the Liturgical Motets of Josquin des Prez" (diss. Yale Univ., 1959); *id.*, "Some Relationships between Texts and Cantus firmi in the Liturgical Motets of Josquin des Prez" (*JAMS* xiv); F. H. Sawyer, "The Use ... of Canto Fermo by the Netherlands School" (*PMA* lxiii); A. Krings, "Die Bearbeitung der gregorianischen Melodien in der Messkomposi-

tion von Ockeghem bis Josquin" (*KJ* xxxv); G. Schmidt, "Zur Frage des Cantus firmus im 14. und beginnenden 15. Jahrhundert" (*AMW* xv).

**Cantus lateralis** [L.]. A 16th-century term for the notation in which the parts of a polyphonic composition were written "side by side" on the double page of a large choirbook, in contrast to the \*partbook.

**Cantus planus** [L.]. Plainsong, Gregorian chant. The term was not used until the 13th century, earlier names being *cantus choralis*, *cantilena Romana*, etc. The word *planus* (even, level) is usually thought to refer to the fact that in this period the original tradition of Gregorian rhythm was lost and the chant began to be interpreted in uniform values of rather long duration (a *brevis* each), an interpretation that was probably a concomitant of its adoption as a \*cantus firmus for polyphonic compositions. The original meaning of *cantus planus*, however, was a melody in a relatively low range, as opposed to *cantus acutus* (Odo of Cluny; see *ReMMA*, p. 121).

**Cantus planus style.** Term recommended (by W. Apel) for the presentation of a *cantus firmus* in long notes of equal value, usually one to the measure, in distinction from other presentations, e.g., isorhythmic, ornamented, or paraphrased. The term is the equivalent of the German \*Pfundnoten.

**Cantus prius factus** [L.]. Same as \*cantus firmus.

**Cantus visibilis** [L.]. A misleading translation by John Hothby (d. 1487) of the English term \*sight.

**Canun.** See *Kanun*.

**Canzo, canso** [Prov.; F. *chanson*]. This term (or similar ones, such as *canzone*, *Kanzone*, *chanson*, as well as the derivative *Rundkanzone*, round-chanson) has been used for a type of troubadour song characterized by initial repeat, a a b [see *Bar* form; *Ballade* (F.)], as opposed to the through-composed song, called *vers*. The use of these terms in this sense is, however, arbitrary. We know nothing about their original meaning except for some vague references to poetical content (*canzo* = love song; *vers* = more learned?), and that "what formerly was called *vers* is now called *canzo*." See W. Apel, in *JAMS* vii, 124; R. H. Perrin, in *JAMS* viii, 77, ix, 14.

**Canzona, canzone** [It., pl. *canzone, canzoni*]. (1) In Italian poetry of the 13th through 17th centuries, a serious lyrical poem, usually in four or five stanzas of eight lines each. (2) In 18th- and 19th-century music, a lyrical song (e.g., the *canzone* "Voi che sapete" in Mozart's *Le Nozze di Figaro*) or an instrumental piece of a similar character (e.g., the slow movement of Tchaikovsky's Symphony no. 4, designated "in modo di canzone"). (3) See *Canzo*.

(4) A designation of 16th-century Italian secular vocal music, including: (a) certain members of the *frottola* family, set to free poems (called *canzoni*) of Petrarch and others, which because of their high literary quality and relatively free form must be regarded as the most important predecessors of the early madrigal (examples in *Canzoni sonetti strambotti et frottole*, 1513; 1517 ed. repr. in \*Editions XLVIII, 4; see also A. Einstein, *The Italian Madrigal*, iii, no. 12); (b) later popular forms of the *villanella* type, called *canzoni villanesche* (anon. ed. of 1537; Nola, 1541; Cimello, 1545) and *canzoni alla napolitana* (Ferretti, 1568; Conversi, 1572). In the later decades of the century, the *canzonetta* became popular (Orazio Vecchi, 1580 and later; Hassler, 1590).

Lit.: A. Einstein, *The Italian Madrigal*, 3 vols. (1949); W. Rubsamen, *Literary Sources of Secular Music in Italy (c. 1500)* (1943); E. Hertzmann, *Adrian Willaert in der weltlichen Vokalmusik seiner Zeit* (1931); E. Helm, "The Beginnings of the Italian Madrigal" (diss. Harvard Univ., 1939).

(5) An important type of instrumental music of the 16th and 17th centuries that developed from the Franco-Flemish chansons of Josquin, Janequin, Crécquillon, Sermisy, and others [see *Chanson* (2)]. The immense popularity of these chansons is reflected in the numerous arrangements found in nearly all 16th-century sources of lute and keyboard music, French as well as Spanish, German, and Italian. In Italy, where the French chanson was called *canzona francese* (or *c. alla francese*), composers went even further, writing original compositions in the style and form of the French models, either for organ (*canzona d'organo*) or for instrumental ensembles (*canzona da sonar*). This procedure marks the beginning of a long and interesting development, which in the instrumental field eventually led to the sonata of the 17th century and in keyboard music paved the way for the fugue. Like their vocal models, the instrumental canzonas were characterized by clarity of texture, sectional

structure often involving repetition (in schemes such as a b a, a b b, a a b c, etc.), and variety of treatment (imitative versus homophonic style, duple versus triple meter). They differed from the contemporary *ricercar* in their tendency toward a harmonically conditioned counterpoint, in the absence of the various devices of "learned counterpoint," in their more lively rhythm, moving in quarter and eighth notes, and in their frequent use of themes starting with reiteration of the same pitch [see Ex.]. During the 17th century, however, the keyboard can-

zona showed a tendency toward stylistic unification and structural concentration, whereas in the ensemble canzonas increasing emphasis was placed on variety and contrast.

I. *Keyboard canzona*. The earliest known organ canzonas, found in Marco Antonio Cavazzoni's *Recerchari motetti canzoni, Libro I* (1523; repr. in K. Jeppesen, *Die italienische Orgelmusik am Anfang des Cinquecento*, rev. ed., 1960; also in \*Editions X, 1) are probably arrangements of vocal chansons. The first steps in the development of independent canzonas were taken by his son, Girolamo Cavazzoni (*Intavolatura cioè ricercari, canzoni*, 1542; repr. in \*Editions IX, 6), in pieces such as his "Canzone sopra Falt d'argent," which uses the thematic material of Josquin's famous chanson "Faulx d'argent" but differs from it in the contrapuntal elaboration of the themes [see *HAM*, nos. 91, 118]. Andrea Gabrieli's canzonas (two books of *Canzoni alla francese per sonar sopra istromenti da tasti*, 1605) are mostly arrangements of vocal chansons. Claudio Merulo's three books of *Canzoni d'intavolatura d'organo* (1592, 1606, 1611) contain, besides 5 arrangements, 18 canzonas of his own, which, however, seem to belong primarily to the category of ensemble canzona. Original organ canzonas were published by Pellegrini (1599), Mayone (1603, '09), Cima (1606), Trabaci (1603, '15), Cifra (1619), and many others. Among the canzonas of Trabaci [see Neapolitan school II] are the earliest known examples of a new type that became predominant in the 17th century, the so-called *variation canzona*, in which the various sections are based not on different themes but on free rhythmic and melodic variants of a single theme [see *HAM*, no. 191]. Frescobaldi used this procedure in

many of his canzonas (publications of 1615, '28, '35, '45). His example was followed by Froberger, Kerll, Poglietti, and other German composers, including Bach (*BG* xxxviii, no. 20). Although throughout its development the organ canzona retained a sectional form that distinguishes it from the fugue, it influenced the development of the fugue, mainly through the lively character and individual design of its thematic material, in contrast to the *ricercar*. In Germany the term *Fuge* was occasionally used as synonymous with canzona [B. Schmid, *Tabulatur Buch*, 1607: "Fugen, oder wie es die Italiener nennen, canzoni alla francese"; F. X. A. Murschhauser, "Fuga sive Canzon"; see Editions XIV, 30, pp. 159-61.].

II. *Ensemble (instrumental) canzona*. As early as c. 1490-1500 Obrecht and Isaac wrote compositions that in every respect can be regarded as instrumental canzonas. A particularly interesting example is Obrecht's *Tsaet een meskin* [*HAM*, no. 78], with its strongly contrasting sections: first, a contrapuntal elaboration of the Dutch folk tune; second, a more homophonic section based on short motifs. Similar traits are present in some of the *carmina* of the period [see *Carmen* (2)]. In spite of these early precedents, it was not until the 1570's that the ensemble canzona became established, under the name *canzon da sonar* [see Editions XXIII, 2, for description and reprints of these works]. Flourishing chiefly in Lombardy and Venice, such canzonas were published by Merulo (see under I), Maschera (1584; see *HAM*, no. 175), G. Gabrieli (1597, 1615), Canale (1600), Mortaro (1600, '10), Rognioni (1605), Soderini (1608), Banchieri (1596, 1603, etc.), and many others. They fall into three categories. Some works, generally in four parts and closely modeled on the chanson in style and form, were primarily contrapuntal (they always began with an imitative exposition) and had little stylistic contrast among their various sections. Canzonas of this rather conservative type continued to be written throughout the early 17th century. A second type, allied in principle to the *ricercar*, occasionally manifested tendencies toward thematic unity (Canale) of the sort found in the variation canzonas for keyboard written by Frescobaldi [see above]. A third type, represented by the brilliant polychoric canzonas of Giovanni Gabrieli and his followers (1597, Raverii collection 1608, '15), was freer in structure, consisting of an alternation between sections in lively imitation and 4/4 time, and homophonic sections in

triple time. Occasionally these sections were very short and fragmentary [see *Quilt canzona*].

The free, multisectional type of *canzona* reached a climax in the ensemble works of Frescobaldi (four editions, 1623–34). These *canzonas*, marked in the later editions by systematic changes of tempo (“allegro” for the imitative sections in *canzona* style, “adagio” for the homophonic sections in slower rhythms), may well be considered a turning point leading to the *sonata da chiesa*. At the same time, vestiges of the old *canzona*, such as the a b a structure typical of the original chanson and the lengthy introductory fugal section, were retained for a long time. These characteristics are present in certain *canzonas* (*sonate*) of Marini (1626), Buonamente (1636), Merula (1615, ’37, ’39, ’51; see *HAM*, no. 210), Neri (1644, ’51), and Cazzati (1642, ’48, and later). By c. 1650 the terms *canzona* and *sonata* were synonymous and the former was in general replaced by the latter (Legrenzi, Vitali), although the older term continued to be used by some composers. Long associated by theorists and composers with the “allegro” style and also with the fugal style of writing, *canzona* (or *canzone*) came to mean the principal fugal movement of the *sonata* (Young, 1653; Purcell, 1683, ’97; Baldacini [1699], 1720; see also Brossard, *Dictionnaire*, 1703). It also occasionally figures in the operatic \*overture (e.g., in S. Landi’s *Il Sant’ Alessio*, 1634; see *HAM*, no. 208). See *Sonata B*, I.

E.C.G.

**Canzona francese.** See under *Canzona* (5).

**Canzonet, canzonetta** [It.]. In the late 16th and throughout the 17th century, a short vocal piece

in a light vein, much in the character of a dance song [see *Balletto*]. The term was used by (among others) Quagliati (1588), Vecchi (various publications between 1580 and 1600), Monteverdi (1584, 1619), H. L. Hassler (1590; see *DTB* 9), several of the English madrigalists [see Editions XVI, 1, 3, 20, 28], and even later by Cazzati (1660’s). The later *canzonette* usually had instrumental accompaniment.

The name was also used for short instrumental pieces (Vecchi, *Selva di varia ricreatione*, 1590), as well as for short organ *canzonas* (Buxtehude).

**Caoine** [pronounced Keen]. An Irish dirge of ancient tradition. See the articles in *GD*, *GDB*. See also *Coronach*.

**Capelle, Capellmeister** [G.]. Old spelling for *Kapelle*, *Kapellmeister*.

**Capitolo** [It.]. One of the various subspecies of the *frottola*, consisting of a number of three-line stanzas (rhyme scheme aba bcb cdc) sung to the same music. Sometimes the final stanza consisted of four lines, the last of which was sung to a different melody, a sort of coda.

**Capotasto** [It., corrupted forms are *capodastro*, *capotaster*; G. *Kapodaster*; F. *barré*]. A mechanical contrivance used with guitars, lutes, etc., to shorten the vibrating length of all the strings simultaneously. It consists of a small piece of hardwood or metal that can be fixed across the fingerboard. By setting the capotasto across, e.g., the first fret, a piece in C-sharp can be played with the same fingering as if it were in C. See *Barré*.

**Cappella** [It.]. In the Middle Ages, a small place of worship (chapel). In the 14th century the name was used for groups of clerical singers (*cappellani*), superseding the earlier designation *schola cantorum* and eventually coming to mean church choir [see *A cappella*]. After 1600 *cappella* meant any large group of musicians—vocal, instrumental, or mixed. Also see *Kapelle*.

**Capriccio** [It.; F. *caprice*]. (1) A title used by various 19th-century composers, among them Mendelssohn and Brahms, for short piano pieces of a humorous or capricious character. They are usually in ternary form. It also appears as a title of *potpourris* or fantasias (e.g., Saint-Saëns, “Caprice sur les airs de ballet d’Alceste de Gluck”). (2) In the 17th century, *capriccio* is one of the four important prefugal forms [see *Ricercar*; *Canzona* (5); *Fantasia*]. The *capriccio*, as the name suggests, is less restrained than the

others and frequently involves certain peculiarities, such as the use of special themes. This is especially true in the case of Frescobaldi (*Capriccio sopra il cucu*; *Capriccio sopra ut re mi fa sol la*; *Capriccio sopra la bergamasca*). Froberger's 18 capriccios are scarcely different from his canzonas, both being based on Frescobaldi's variation-canzona. Earlier fugal capriccios for instruments (I) or for keyboard (K) were written by V. Ruffo (1564; I), F. Stivori (1599; I), G. de Macque (c. 1590; K), G. M. Trabaci (1603; K), and others. Later pieces, such as J. K. Kerll's *Capriccio sopra il cucco* (c. 1680) and Bach's *Capriccio sopra la lontananza del suo fratello dilettissimo* (1704), are like free fantasias, the latter being a piece of program music about "the departure of his beloved brother." (3) The term also occurs as a noncommittal title of 16th- and 17th-century publications, often vocal; e.g., Jachet Berchem, *Capricci* (1561); Ascanio Mayone, *Primo Libro di diversi capricci per sonare* (1603).

**Capriccio.** Opera in one act by R. Strauss (libretto by C. Krauss), produced in Munich, 1942. Setting: near Paris, 1775.

**Capriccio Espagnol.** A symphonic suite, op. 34, by Rimsky-Korsakov, composed in 1887. A masterpiece of brilliant orchestration, the work is in five sections. Native dance rhythms and melodic figures evoke a Spanish atmosphere.

**Capriccio Italien.** A symphonic poem by Tchaikovsky, op. 45, written in 1880 while the composer was visiting Italy. Italian folksongs provide most of the thematic material.

**Capricorn Concerto.** A concerto for small orchestra, op. 21, composed by Samuel Barber in 1944 and named for his house, "Capricorn," in Mt. Kisco, N.Y. The instruments are treated in the manner of the baroque *\*concerto grosso*, with the flute, oboe, and trumpet set off both as a group and as individual soloists against the string orchestra.

**Caramba.** A musical bow found in El Salvador, Honduras, and Guatemala. Also known as *carimba* and *zambumbia*. J.O.S.

**Carcelera** [Sp.]. A type of *cante hondo* describing prison scenes. See *Flamenco*.

**Card Game, The.** See *Jeu de cartes*.

**Cardillac.** Opera in three acts by P. Hindemith (libretto by F. Lion, after E. T. A. Hoffmann),

produced in Dresden, 1926; new version in Zurich, 1952. Setting: Paris, 17th century.

**Caricature.** See *Satire*.

**Carillon** [F.]. A set of bells (originally four) hung in the tower of a church and played by means of a keyboard or a clockwork mechanism. As early as the 13th century sets of bells were operated mechanically. The use of a keyboard for playing bells can be traced to the early 16th century (Audenarde, 1510). Carillons became extremely popular and achieved a high degree of perfection in the Netherlands, Belgium, and northern France from the 15th through 18th centuries. In the 19th century they spread to England and thence to America. A modern carillon consists of 30 to 50 bells with a clapper inside, tuned chromatically from C or G through three or four octaves. The clappers are connected by wires to long wooden keys, arranged like those of a manual and a pedal of an organ. The manual keys are struck with the closed hand, which is protected by a glove. The largest carillons are those at the University of Chicago Chapel and at the Riverside Church of New York. Other carillons with extensive recital series are the Bok Tower in Lake Wales (Florida), the Luray Tower in Virginia, and the Princeton Carillon. The Curtis Institute, Philadelphia, offers instruction in carillon playing. Modern carillon players make ample use of tremolos, full chords, rapid passages, and other effective devices. In certain circles, however, there is a tendency toward a more reserved style of playing that is certainly worthy of support.

Early composers of carillon music were Matthias van den Gheyn (1721-85) and Potthoff (b. 1726). Old keyboard arrangements called "carillon" are found in O. Chilesotti, *Musica del passato* (\*Editions V, 8) and in Louis Couperin, *Oeuvres complètes* (ed. P. Brunold, 1936). Probably these were played by means of an organ glockenspiel such as that used in Bach's cantata "Schlage doch, gewünschte Stunde." For a lute piece, "Carillon d'Anvers," see *DTO* 50, p. 64. More recent composers of works for carillon are Josef Denijn, J. A. F. Wagenaar, Daniel Pinkham, and John Cage.

*cinistes flamandes* (1877; contains two pieces by Van den Gheyn); L. Rizzardi, *Les Carillons de Belgique* (1938); G. W. Rice, in *MQ* i; J. S. Archer, in *ML* xviii, 176; W. W. Starmer, in *PMA* xxxi; *id.*, in *ZIM* vi; E. Buhle, "Das Glockenspiel in den Miniaturen des frühen Mittelalters" (*CP Liliencron*).

**Carimba.** See *Caramba*.

**Carmen** [L., pl. *carmina*]. (1) A term used by 14th- and 15th-century writers for the upper part (*cantus*) of polyphonic compositions, or for entire compositions, specifically chansons. (2) About 1500, name for instrumental compositions of various types, some of them perhaps arrangements of vocal pieces. They could be considered early instrumental canzonas, *carmen* probably being humanist Latin for *chanson*. Examples exist in the Glogauer Liederbuch [see Editions XVIII A, 4, 8], Isaac (*DTO* 28), Hofhaimer, Senfl, Kotter's tablature of 1515, etc. See H. J. Moser and F. Piersig, ‡*Carmina* (*Nagels Musik-Archiv*, liii).

**Carmen.** Opera in four acts by Bizet (libretto by H. Meilhac and L. Halévy, after a story by Mérimée), produced in Paris, 1875. Setting: Seville and environs, 1820. Not only is *Carmen* one of the most popular operas ever written, but its music has more artistic quality than that of many more ambitious and more "serious" operas.

**Carmina burana.** See under Goliard songs. Carl Orff's *Carmina burana* (1937) is a scenic oratorio based on 25 Latin poems of the 13th century.

**Carnaval des animaux, Le** [F., The Carnival of the Animals]. A "Grand Zoological Fantasy" for orchestra and two pianos by Saint-Saëns, composed in 1886. In a series of brief pieces named for the different animals, the composer uses various instruments and sections of the orchestra in descriptive fashion. Best known from this work is the cello solo, "Le Cygne" ("The Swan").

**Carnavalito** [Sp.]. Early species of a gay dance in duple meter and with a pentatonic melody, still performed by many groups in the Bolivian *Altiplano*. J.O.S.

**Carnaval romain, Le** [F., The Roman Carnival]. Concert overture by Berlioz, op. 9, composed 1843. The themes are taken from his unsuccessful

opera, *Benvenuto Cellini*, after its failure in Paris (1838).

**Carnival songs.** See *Canti carnascialeschi*.

**Carol** [F. *noël*; G. *Weihnachtslied*; It. *canzone di Natale*; Sp. *villancico, cántico de Navidad*]. In present-day usage, a traditional song for the celebration of Christmas. Occasionally the term is used also for other devotional songs of a joyful character (Easter carol; May carol). The name is thought to be derived from the medieval French word *\*carole*, a round dance, the assumption being that this term was associated with early pagan dance-songs performed in celebration of the winter solstice, a ritual that was later merged with Christmas. It should be noted, however, that originally the carol was not necessarily associated with Christmas. The numerous examples in 15th-century sources [see Editions XXXIV, 4] show that the distinguishing characteristic of the carol was not its subject matter but its form, especially the presence of a *\*burden* sung in alternation with a number of uniform stanzas called verses. Some of these medieval carols have a verse refrain as well as a burden, the refrain being the closing line of the burden: B-r V<sub>1</sub>-r B-r V<sub>2</sub>-r, etc. [see Editions XXXIV, 21]. In the 16th century the carol became more varied in form and style but more uniform in subject matter, the emphasis being on Christmas. Numerous carols of the 16th to 18th centuries have been published in collections that also include French and German Christmas songs. See *Noël*.

Lit.: R. L. Greene, *The Early English Carols* (1935); *id.*, *A Selection of English Carols* (1962); \*Editions XXXIV, 4 (J. Stevens, ‡*Medieval Carols*, 1952); E. Routley, *The English Carol* [1958]; E. B. Reed, ‡*Christmas Carols Printed in the 16th Century* (1932; facsimiles); J. A. Fuller Maitland, ‡*English Carols of the Fifteenth Century* [1891, not wholly reliable]; P. Dearmer, R. Vaughan Williams, and M. Shaw, ‡*The Oxford Book of Carols* (1928); G. R. Woodward, ‡*The Cowley Carol Book* (1902); M. F. Bukofzer, *Studies in Medieval and Renaissance Music* (1950), ch. iv; E. Duncan, *The Story of the Carol* (1911); H. J. Massé, in *ML* ii, 67; C. K. Miller, in *Renaissance News* iii (1950); J. Stevens, in *PMA* lxxvii; Y. Lacroix-Novaro, in *RdM* 1935, p. 1; R. H. Robbins, "The Burden in Carols" (*Modern Language Notes* lvii, 16).

**Carole** [F.]. Medieval French name for round dances, danced in a closed circle. The name has

been variously derived from *caraula* (late L. for jump, dance; Lacroix), from *corolla* (small *corona*, i.e., circle; Sachs), from *Kyrie eleison* (Sahlin); and from *chorea* (Gr., dance, dimin. *choreola*, *charola*, *carole*; see the explanation "chorea, gallice charole" given in the 13th-century "Dictionarius metricus" of J. de Garlandia [see Dictionaries of music III]). No specific music for such dances has survived. Possibly the virelai in its original monophonic form was sung with the *carole*. See M. Sahlin, *Étude sur la carole médiévale* (Uppsala, 1940); Y. Lacroix-Novaro, in *RdM* 1935, p. 1; C. Sachs, *World History of the Dance* (1937).

**Carrée** [F.]. The double whole note, or breve.

**Carrure** [F.]. The symmetrical construction of musical phrases in measures of 2, 4, 8, etc., found particularly in dances. See *Vierhebigkeit*.

**Cascarda** [It.]. A dance type of the late 16th century, known only (?) through eleven examples found in Fabrizio Caroso's *Nobiltà di dame* (2nd ed., 1605; see Editions V, 1), which also contains a detailed description of the dance. The dances are all in quick triple meter, very similar to a *gagliarda* (\*galliard).

**Cassa** [It.]. Drum. See Percussion instruments B 2, 3.

**Cassation**. An instrumental form of the 18th century, designed for outdoor performance, that includes elements of the symphony as well as the suite; hence, practically identical with the divertimento and serenade. Among the few compositions so named is a *Cassatio* by Dittersdorf (for 2 horns, violin, viola, cello; c. 1769), another by Haydn (for 2 horns, 2 violins, viola, cello), and two works called *Cassation* by Mozart (K. 63, for 2 violins, 2 violas, cello, 2 oboes, 2 horns; K. 99, for 2 violins, viola, cello, 2 oboes, 2 horns), both in seven movements and opening with a march (instead of a sonata-form movement, as in his divertimenti).

**Casse-noisette**. See *Nutcracker Suite*.

**Castanets** [F. *castagnettes*; G. *Kastagnetten*; It. *nacchere*, *castagnette*; Sp. *castañuelas*]. A percussion instrument (clappers) consisting of two shell-shaped pieces of hardwood hinged together with a string that passes over the player's thumb and first finger. They are used by Spanish dancers as an accompaniment for the bolero, fandango, etc., usually in pairs (one set in each hand). Similar instruments were used in ancient

Rome and were pictured in medieval manuscripts [see under *Cantiga*]. The castanets of the modern orchestra (e.g., in Bizet's *Carmen*) have springs and handles (or a connecting stick) that greatly facilitate playing but detract from the finesse of true castanet playing. For ill. see under Percussion instruments.

**Castrato**. The castration of boy singers was frequently practiced in Italy from the 16th through 18th centuries to preserve the boyish character of the voice. The singing apparatus of the *castrato* (also called *evirato*) combined the larynx of a youth with the chest and lungs of an adult, resulting in an unusually wide range together with sound of great power and of a special timbre that hearers found fascinating. *Castrati* are first documented in the Papal Chapel in 1562. The most famous were F. Senesino (1680–c. 1750), G. Caffarelli (1710–83), and Carlo Farinelli (or Carlo Broschi, 1705–82).

Lit.: A. Heriot, *Castrati in Opera* (1956); F. Haböck, *Die Gesangskunst der Kastraten* (1927); *id.*, ‡*Die Kunst des Cavaliere Carlo Broschi Farinelli* (1923); G. Monaldi, *Cantanti evirati celebri del teatro italiano* (1920); *id.*, in *RMI* xxvi; F. Rogers, in *MQ* v; *AdHM*, p. 1221f.

**Catalectic**. In poetry, a line from which one (or even two syllables of the normal scheme are missing at the end, so that a line of, e.g., eight syllables is reduced to seven (or even six, as in the so-called common meter):

normal:	x' x' x' x' x' (8)
catalectic:	{ x' x' x' x' (7)
	{ x' x' x' x' (7)
	{ x' x' x' (6)

**Catch**. An English \*round of the 17th and 18th centuries. Morley, in his *A Plaine and Easie Intoduction to Practicall Musicke* (1597), mentions the catch as similar to the canon in construction. Today it is often defined as a circular canon, or round. The first publications were Thomas Ravenscroft's *Pammelia* (1609), *Deuteromelia* (1609), and *Melismata* (1611), the second of which contains "Three Blind Mice." These were followed by a long series of collections, among which John Hilton's *Catch that Catch can* (1652; the pun was used earlier as a subtitle for the *Deuteromelia*) is the most famous. Catches were most in vogue in the reign of Charles II, and it was mainly in this period that they acquired a bad reputation because of their indecent texts. Numerous catches of the Res-

toration, including some of Purcell's, are so unabashedly obscene that their texts were bowdlerized in late 19th- and early 20th-century editions. More recent editions, such as that of *The Catch Club* brought out by Da Capo Press (1965), publish Restoration catches in their original state. Sometimes the canonic melody is so constructed that voices entering later fill in rests with melodic fragments set to words that, affixed to the original phrase, change its meaning or create a *double entendre* [see Ex., from *Pammelia*; also P. Scholes, *The Oxford Companion to Music*, s.v.

1 2

My dame has in her hutch at home A lit-tle dog

3 4 5

Hey, dog, hey With a clog

"Catch"]. Frequently the change introduces a salacious note. A long list of publications containing catches is given in *GD* and *GDB*. Modern editions (with revised texts) are: E. F. Rimbault, *The Rounds, Catches, and Canons of England* (1864); P. Heseltine (P. Warlock), ed., *Thomas Ravenscroft: Pammelia and Other Rounds and Catches* [1928]; C. K. Scott, *The Euterpe Round Book* (1913); H. Purcell, *Complete Works* xxii. Ex. in *HAM*, no. 309b. Also see E. F. Hart, "The Restoration Catch" (*ML* xxxiv, 288ff).

**Cathedral music.** See Anglican church music.

**Catholicon.** A term (meaning "universal"), coined by Glareanus in his *Dodecachordon* (1547), for compositions so designed that they may be sung in more than one church mode. The two best-known examples are Ockeghem's *Missa cuiusvis toni* (Mass in any mode) and his *Prennez sur moy fuga*, a triple canon at the distance of a fourth. Both are notated without clefs, and both have been the subject of much discussion. According to the most recent investigation (J. S. Levitan, "Ockeghem's Clefless Compositions," in *MQ* xxiii) the Mass can be performed in four positions, the canon in two.

**Cat's Fugue.** Popular name of a fugue by Domenico Scarlatti, so called because the theme consists of wide and irregular skips in ascending motion, such as might be (and possibly were) produced by a cat walking on the keyboard.

**Cauda** [L.]. (1) In mensural notation, the vertical dash attached to certain notes (*maxima*, *longa*, *minima*, etc.) or to ligatures. With \*ligatures, the presence or absence of the cauda determines the *proprietas*, i.e., the value of the initial note. In the

early 14th century numerous note forms, called *semibreves caudatae* (or *signatae*), were derived from the *semibrevis* by the addition of upward and downward dashes, with or without flags, etc. They form the basis of the Italian notation of the 14th century [see *ApNPM*, pp. 368ff].

(2) In the 13th century, name for passages without texts that are inserted in many conductus as extended vocalizations over the first and/or the last (or next-to-last) vowel of a line of the text, e.g., [*OH* i, 293]:

*Salvatoris hodi-e-----*  
*Sanguis pregu-s-ta-----tur*  
*In quo Syon fili-e-----*  
*Stola candi-da-----tur*  
*Ec-----ce nomen domi-ni-----*  
*De longinquo venit, etc.*

Anon. IV (CS i, 360) distinguishes between the conductus with and without *cauda*, saying that the latter were preferred by the "minores cantores" and thus implying that the former were superior. In numerous conductus the *caudae* (melismatic passages) far outweigh the syllabic passages in length and weight. They also introduce a stylistic contrast, that is, between true polyphony and homophony. Some of them include very interesting examples of imitation, e.g., of \*invertible counterpoint.

**Cavalleria rusticana** [It., Rustic Chivalry]. Opera in one act by P. Mascagni (libretto by G. Menasci and G. Targiono-Tozzetti, based on G. Verga's play), produced in Rome, 1890. Setting: Sicilian village, late 19th century. This opera, which was Mascagni's only success, owes its appeal to the concise and dramatic plot as well as to the realistic musical approach. Widely welcomed as a relief from the numerous imitations of Wagner, it inaugurated the musical movement known as \*verismo and was responsible for a mushroom crop of one-act operas.

**Cavata** [It.]. An inscription or an epigram concisely expressing an important thought. In 18th-century music the term is used occasionally for short epigrammatic ariosos found at the end of a long recitative (*recitativo con cavata*). There are many examples in Bach's choral works, e.g., in the recitativo no. 3 of his cantata "Ein' feste Burg" [see *Arioso*]. The *cavate* in Traëtta's operas [see *DTB* 25] approach the \**cavatina*.

**Cavatina** [It.]. In 18th- and 19th-century operas and oratorios, a short solo song, simpler in style than the aria and without repetition of words or phrases. The proper form for the *cavatina* would seem to be in one section without repetition (except for a short instrumental anticipation of the beginning of the song), in other words, just a "sentence" set to music [see *Cavata*]. Examples of this type are the two *cavatine* in Haydn's *The Seasons*, and also the "Porgi amor" and "L'ho perduta" from Mozart's *Le Nozze di Figaro*, whereas the "Se vuol ballare" from the same opera shows an unusually developed type similar to an aria. Other examples are in Karl Heinrich Graun's *Montezuma* (1755; see *HAM*, no. 282), Rossini's *Il Barbiere di Siviglia* (1816), Weber's *Der Freischütz* (1820), and Gounod's *Faust* (1859). The name has also been applied to instrumental pieces of a songlike character, e.g., Beethoven, Quartet op. 130.

**C.b.** [It.]. Abbr. for *col basso* or *contrabasso*.

**C.d.** [It.]. Abbr. for *colla destra* (with the right hand).

**Cebell.** See *Cibell*.

**Cecilian movement.** A 19th-century movement for the reform of Roman Catholic church music, initiated by K. Proske (1794–1861) and named for St. Cecilia, the patron saint of music. The movement aimed at the reinstatement of Palestrina's *a cappella* music to replace the pompous and rather worldly church music for choir and instruments that had come into use during the 18th century (e.g., Haydn's and Mozart's Masses). It led, in 1867, to the foundation of the *Allgemeiner Deutscher Caecilienverein* (F. X. Witt, 1834–88), which was sanctioned by the Holy See in 1870. In the United States the movement is represented by the St. Cecilia Society, founded (1873) by John Singenberger. The term "Cecilianism" has come to stand for the puristic and rather reactionary tendencies of this society.

**Cédez** [F.]. Slow down.

**Cefaut, ce fa ut.** See *Hexachord III*.

**Celere** [It.]. Quick, swift.

**Celesta.** See *Percussion instruments A*, 4.

**Cello** (abbr. for *violoncello*). The bass size of the violin, tuned an octave and a fifth below it: C G d a. It is about twice the length of the violin (48½ in. as against 23½ in.) with the other measurements nearly in proportion, except for higher ribs (5 in. as against 1¼ in.). [For ill. see under *Violin*.] The cello came into existence along with the violin and viola. Two instruments by Andrea Amati, made between 1560 and 1570, are the earliest preserved specimens. Throughout the 17th century it was used only for accompaniment [see *Thoroughbass II*]. Domenico Gabrielli (1659–90) was one of the first to use it as a solo instrument. Particularly interesting are his pieces (called \**ricercare*) for cello without accompaniment (MS of 1689; see *SchGMB*, no. 228), which are in the same category as Bach's celebrated six suites for cello solo. Another composer of "ricercare" for the cello was G. B. degli Antonii (1687, '90).

Giuseppe M. Jacchini's *Concerti . . . con violoncello obbligato*, op. 4 (1701) begin the repertory of the cello concerto, which was expanded during the 18th century by Antonio Vivaldi, E. F. dall'Abaco (in *Concerti a quattro da chiesa*, op. 2, 1712–14), Leonardo Leo (6 concertos, 1737–38), G. Tartini (properly for viola da gamba), Anton Filtz, Georg Matthias Monn, G. F. Wassmuth (d. 1766), K. P. E. Bach, and Haydn (8 concertos, 2 of which are preserved). Domenico della Bella wrote 12 sonatas "a 2 violini e violoncello" (1704), and G. Bononcini (1670–1747) a sonata for two cellos and other solo pieces. More important is Giacomo Bassevi (called Cervetto; c. 1682–1783), who brought the cello into favor in England and published *Twelve (Six) Solos for a Violoncello with a Thorough Bass for the Harpsichord* (c. 1747, c. 1749), as well as pieces for two and three cellos. His son, Giacomo Cervetto (1747–1837), published *Six Solos* (c. 1775), *Six Duets* (c. 1792), etc. Italian cello music of the 18th century reached a peak with L. Boccherini (1743–1805), who composed numerous cello concertos and sonatas, as well as 113 quintets with two cellos. An important method was published in 1741 by Michel Corrette, who devoted a full chapter to the higher thumb positions. The classical school of cello playing is set forth in

the *Essai sur le doigtier du violoncelle* (1806–19) of Jean-Louis Duport (1749–1819), who also composed sonatas, duets, and other pieces for the instrument.

The 19th- and 20th-century repertory includes concertos by Schumann (op. 129; 1850), Dvořák (op. 104; 1895), Robert Volkmann (op. 33; c. 1860), Saint-Saëns (op. 33, 1873; op. 119, 1902), Lalo (1876), Elgar (op. 85; 1919), Prokofiev (op. 58; 1935–38), Shostakovich (op. 107), Toch (chamber orchestra, op. 35), Hindemith (chamber orchestra, op. 36; 1925), Bloch (*Voice in the Wilderness*, 1936; *Schelomo*, 1916), A. Tcherepnin (*Rapsodie georgienne*, 1922), André Chaplet (*Epiphanie*; 1923), and Ibert (*Concerto*; 1925); sonatas by Beethoven (5), Brahms (op. 38, 1866; op. 99, 1867), Saint-Saëns (op. 32, 1873; op. 123, 1905), Fauré (2), R. Strauss (op. 6; 1883), Lalo (op. 16), Rachmaninoff (op. 19; 1901), Jean Huré (3; c. 1905), Ropartz (2; 1904, '19), Reger (4), Debussy (1915), Casella (1907, '27), Hindemith (op. 25, 1923; op. 11, A minor, 1922), Prokofiev (1), Tcherepnin (3), Britten (op. 65; 1961), and others. Pieces for solo cello have been written by Reger, Kodály, Wellesz, and Hindemith.

**Cellone.** See under Violin family (i).

**Cembal d'amour.** \*Clavecin d'amour.

**Cembalo** [G.; It., abbr. of *clavicembalo*]. Harpsichord. According to C. Sachs (*SaRM*, p. 74f), the word is not derived from Gr. *kymbalon* (hollow vessel, bell; see Cymbal) but from *tym-*

*panon* (same root as tip, zip, G. *zupfen*, to pluck). Therefore the name does not indicate that the instrument's sound resembles that of bells but refers to the plucking of the strings. For *cembalo d'amore*, see Clavecin d'amour.

**Cenerentola, La** [It., Cinderella]. Opera in two acts by Rossini (libretto by J. Ferretti), produced in Rome, 1817. Setting: Italy, 18th century (suggested).

**Cent.** See Cents.

**Centitone.** Unit for measuring intervals, exactly equal to  $\frac{1}{100}$  of a whole tone, hence equal to two \*cents. See Intervals, calculation of, VI. See J. Yasser, "Decitones—Centitones—Millitones" (*Pro Musica*, March 1928, vi, no. 3, p. 12).

**Cento** [L.], **centon** [F.], **centone** [It., patchwork]. The term and its derivatives, "centonization" and "to centonize," refer to literary and musical works made up of selections from other works. Johannes Diaconus, in his *Vita S. Gregorii Magni* (c. 870), says that Pope Gregory I (reigned 590–604) compiled an "*antiphonarius cento*, which is of the greatest usefulness" [see *ApGC*, p. 246n]. This probably means that Gregory's work was a combination and revision of earlier books of a similar kind, i.e., books containing the texts (without music) for the sung items of the Mass. The term "cento" has been used for poems consisting only of refrains [see Refrain III], for \**quodlibets*, and for 18th-century operas put together by several composers [see Pasticcio]. Melodies are said to be centonized if they are pieced together from pre-existing fragments. This procedure is of basic importance in the Tracts of Gregorian chant and to a certain extent also in the Graduals and Responsories, all of which make use of so-called migrant melismas (P. Wagner) or standard phrases (W. Apel).

**Central America.** See under Costa Rica, El Salvador, etc., and under Latin America.

**Cents.** The unit of a scientific and exact method of measuring musical intervals that was introduced by A. J. Ellis (1814–90) and has been widely adopted in acoustics as well as in ethnomusicology. The cent is equal to  $\frac{1}{100}$  of the semitone of the well-tempered scale; thus, the semitone equals 100 cents, and the octave contains 1200 cents. The tones of the well-tempered scale are represented by multiples of 100, as follows:

0	100	200	300	400	500	600
c	c#	d	d#	e	f	f#
700	800	900	1000	1100	1200	
g	g#	a	a#	b	c	

This scale can be conveniently used for diagrams showing the exact position of other intervals, e.g., those of the Pythagorean scale, of just intonation, of non-Western scales, etc. [see Java]. Mathematically, cents are a logarithmic measurement; see Intervals, calculation of, IV.

**Cephalicus.** See under Neumes I (table).

**Cercar la nota** [It.]. In vocal technique, a slight anticipation of the following note, e.g., d-(c)-c. It may also occur in the form of a passing note, e.g., e-(d)-c.

**Ceremony of Carols, A.** A setting for treble voices and harp of nine medieval English carols, composed by Benjamin Britten in 1942. A Latin plainsong processional and recessional enframe the carols, which retain their Middle English texts.

**Cervelas, cervelat** [F.]. French name for the racket (sausage bassoon); see Oboe family III.

**Ces, Ceses** [G.]. C-flat, c-double-flat; see Pitch names.

**Cesolfa(ut), ce sol fa (ut).** See under Hexachord III.

**Cetera, cetra** [It.]. (1) Zither. (2) Cittern [see Guitar family].

**C.f.** Abbr. for *\*cantus firmus*.

**Chacarera.** [Sp.]. A rural dance originating in the province of Buenos Aires and now performed throughout Argentina. It consists of a seven-measure instrumental introduction in alternating 6/8 and 3/4 meter, followed by a seven-measure vocal section in 6/8 meter. After three repetitions of these two sections, a six-measure coda based on a new melody is added. Usually the solo instrumental parts, played by the guitar, are highly ornamented and the rhythm is often syncopated.

J.O-S.

**Chace** [F.]. A French composition of the early 14th century in the form of a strict canon at the unison. Unlike the contemporary Italian *\*caccia*, it does not have a free supporting tenor and is usually a triple canon. The Codex Ivrea [see Sources, no. 9] contains four *chaces*, one of which, "Talent m'est pris," is a circular canon

[see Handschin, in *MD* iii, 81]. Eighteen additional examples are in Machaut's *Le Lay de la fonteinne* and *Le Lay de confort* [see *Polyphonic Music of the Fourteenth Century*, ed. L. Schrade, (3 vols., 1956), ii, 39-51, 52-74], in which every other verse is a triple canon. To the same type belong three Spanish *caças* found in the *\*Llibre Vermell*, set to Latin religious texts. One of the Ivrea *chaces*, "Se je chant," is transcribed in *AMW* vii, 251f (by Bessler; the third imitation is missing).

**Chaconne and passacaglia.** I. Two closely related forms of baroque music, each a kind of continuous variation [see Variations I] in moderately slow triple meter and with a slow *\*harmonic* rhythm, changing generally with the measure. There have been many futile attempts to explain the derivation and original meaning of these terms, and just as many attempts, equally futile, to make a clear distinction between them. Actually, baroque composers used the terms indiscriminately. This does not mean that they could not be put to more apt use today, but unfortunately, modern writers have not succeeded in deciding on acceptable definitions and the literature is full of contradictory and frequently arbitrary statements about the difference between a chaconne and a passacaglia. The attempts at distinction made by later baroque writers such as Walther and Mattheson, e.g., on the basis of tempo (but contradicting each other; see J. Hedar, *Dietrich Buxtehudes Orgelwerke* [1951], pp. 60ff) are of no more than academic interest. The only distinction that is valid is that between continuous variations with or without a *basso ostinato* (*\*ground*). To conform with the titles of the two most famous examples, those by Bach, the former type should be called passacaglia and the latter chaconne. A passacaglia, then, is a continuous variation based on a clearly distinguishable ostinato that normally appears in the bass but that may occasionally be transferred to an upper voice, as in Bach's passacaglia. A chaconne, on the other hand, is a continuous variation in which the "theme" is a scheme of harmonies (e.g., I-VI-IV-V) usually treated so that the first and last chords are fixed whereas the intervening ones can be replaced by substitutes. The difference between these two types is illustrated in the accompanying examples. Ex. 1 and 2 show a very usual ground, the descending tetrachord in its diatonic form and in its chromatic modification, which is used in many passacaglias; Ex. 3 shows the use of a (related)

1

2

3

scheme of harmonies, without ground (chaconne). The characteristic trait of the chaconne is, therefore, a regularly recurrent harmonic structure without a clearly recognizable ostinato. The frequently given interpretation of Bach's chaconne as an ostinato composition is hardly convincing. Although with a reiterated scheme of harmonies it is often possible to reconstruct to some extent an ostinato, such a procedure leads, in the case of Bach's chaconne, to a clearly derivative bass line, which Bach never would have chosen as a point of departure.

II. There is reason to believe that the chaconne originally was a wild and sensual Mexican dance that was imported into Spain during the 16th century. Surviving from 1599 is "An invitation to go to Tampico in Mexico and there dance the chacona." Quevedo calls it the "chacona mulata," and Cervantes the "Indiana amulatada" [see C. Sachs, *World History of the Dance* (1937)]. In Europe, it completely lost its unbridled character, as did the sarabande and, 300 years later, the tango. The passacaglia (probably from Sp. *\*pasacalle*) also originally was a dance or a march. As mentioned above, baroque composers made no clear distinction between passacaglia and chaconne. To the class of passacaglia (as defined in I) belong the Passacaglia of Bach (for organ) and that of Louis Couperin (for harpsichord; *Pièces de clavecin de Louis Couperin*, ed. P. Brunold, rev. ed. by T. Dart [1959], pp. 95ff), as well as "ciaconas" of Buxtehude (*Dietrich Buxtehude: Complete Organ Works*, ed. J. Hedar, 4 vols. [1952], vol. i) and J. K. Kerll [*TaAM* vii, 106], both for organ, and of Pachelbel (for harpsichord; *TaAM* ix, 59). To the same class belong numerous vocal compositions in 17th-century operas and cantatas, e.g., Monteverdi's famous duet "Pur ti miro" from *L'Incoro-*

nazione di Poppea [SchGMB, no. 178; see also Aria III]. To the class of chaconne belong Frescobaldi's "Cento partite sopra il passacaglio" [*TaAM* v, 11] and Georg Muffat's Passacaglia [see *HAM*, no. 240], as well as Bach's Chaconne.

It should be noted that French baroque composers usually employed the terms "chaconne" and "passecaille" for pieces in an entirely different form, i.e., for a rondeau, with reiterated refrain and several couplets [see Rondeau (2)]. Examples are a Chaconne by Chambonnières [*HAM*, no. 212], a Chaconne-rondeau by D'Anglebert [*TaAM* vii, 133; *HAM*, no. 232], and a Passacaille by F. Couperin [*Pièces de clavecin* ii].

A primitive stage of the development is probably represented by *passacalli* and *chiacone* in early 17th-century books for the Spanish guitar, which consist of a series of four-measure phrases such as shown here (from Caliginoso, *Intavolatura di chitarra spagnola*, 1629; see *WoHN* ii, 182).

After 1750 the chaconne and passacaglia became almost obsolete. Beethoven, although probably unfamiliar with the old forms, came very close to the chaconne in his C-minor Variations for piano (1806). The final movement of Brahms' Symphony no. 4, on the other hand, is a deliberate imitation of the baroque chaconne. The 20th-century, with its general interest in older forms and methods of composition, has seen a remarkable revival of the chaconne and even more of the passacaglia, which, because of its contrapuntal rather than harmonic structure, proved particularly attractive to composers such as Busoni (*Tocatta: Preludio, Fantasia, Ciacona*, 1921), Krenek (*Tocatta und Chaconne*, op. 13, 1922), Hindemith (in *Das Marienleben*, op. 27, 1922–23; *Nobilissima visione*, 1938), Berg (in *Wozzeck*, 1922), Piston (*Passacaglia* for piano, 1943), and many others.

L. Stein, in *ML* xl, 150 (20th century); T. Walker, in *JAMS* xxi. See also under *Ostinato*.

**Chaldean chant.** See P. C. Mousses, "La Musique liturgique chaldéenne" (*CP* 1950, p. 164).

**Chalumeau** [F.]. (1) A 17th-century name for (a) an early oboe (shawm), (b) an early clarinet. For ill. see under *Clarinet* family. The chalumeau in Gluck's *Orfeo ed Euridice* (1762) is probably a real clarinet (with keys). (2) The lowest register of the modern clarinet.

**Chamade** [F.] Same as \**chiamata*.

**Chamber music.** I. *General.* Instrumental ensemble music performed by one player for each part, as opposed to orchestral music in which there are several players for each part. According to the number of players (or parts), chamber music is classified as follows: trio (three players), quartet (four), quintet (five), sextet (six), septet (seven), octet (eight). String trios (quartets, etc.) are for stringed instruments only; if one of the strings is replaced by another instrument, names such as piano trio (piano and two strings) or horn quintet (horn and four strings) are used. The violin (cello) sonata, for violin (cello) and piano, is sometimes not considered chamber music on account of the markedly solo character of the parts. In chamber music, emphasis lies on the ensemble, not on the individual player.

The present-day repertory of chamber music begins with the late string quartets (written after 1780) of Haydn and Mozart. These works established the basic principles of form and style to which practically all composers of chamber music have adhered: the form is that of the sonata in four movements; the style is characterized by individual treatment of the parts and exclusion of virtuoso-like elements. Naturally, in some cases these principles have not been observed, as in Beethoven's String Quartet in C-sharp minor, op. 131, with its extremely free form. Yet the fact remains that in chamber music composers have shown a greater respect for tradition than in other fields, the obvious reason being that the relatively limited and fixed resources of, e.g., a string quartet prohibited the introduction of novel features comparable to those of contemporary orchestral or piano music.

The chamber music works (chiefly string quartets) of Haydn, Mozart, Beethoven (opus numbers below 100), and Schubert represent the classical period of chamber music. In his late quartets (op. 127, 130–133, 135, written between

1824 and 1826) Beethoven created an entirely singular type of chamber music, a type too personal to be called "classic" yet too transcendental to be considered romantic. The romantic period of chamber music embraces Schumann, Brahms, Dvořák, and Franck (to name only the most important composers), with Brahms ranking first among them. While Debussy, Ravel, and others (e.g., Schoenberg, string sextet *Verklärte Nacht*, op. 4) tried to exploit the impressionist and colorist resources of chamber music, some later composers returned to a purer style, as a result of the contemporary revival of the contrapuntal approach to composition and of the adoption of a more objective and sober type of expression than prevailed in late romanticism and impressionism [see *Neoclassicism*]. Also see the entries for different kinds of chamber music, particularly String quartet.

II. *History.* Chamber music in its broadest sense already existed in the late Middle Ages. The "instrumental motets" of the Codex Bamberg (c. 1280; see *In seculum*), ensemble pieces such as occur in the Glogauer Liederbuch (c. 1480; see *Liederbuch*), or the *carmina* of Obrecht, Isaac, and Hofhaimer (c. 1500) bear all the hallmarks of true chamber music. So do the 16th-century ensemble \**ricercars* of Adrian Willaert, Buus, and Padovano, as well as the instrumental canzonas [see *Canzona* (5), I] from the end of the century. (Regarding the claim that a canzona by Allegri was the "first string quartet," see under *String quartet* II.) Naturally, all these pieces were not written for, nor restricted to, specific instruments but were performed on whatever instruments were available—viols, recorders, cornettos, or mixed ensembles. The chief type of baroque chamber music is the trio sonata in its two varieties, the *sonata da chiesa* and the *sonata da camera* [see *Sonata da camera*]. It developed in Italy and spread, about 1675, to France, Germany, and England, where it replaced the earlier \**fancy*. About 1750 there emerged a new type of chamber music, the string quartet, with its associates, the string quintet (Boccherini) and string trio (Haydn).

A long list of chamber music associations is found in *Pierre Key's Music Year Book*.

Lit.: Cobbett's *Cyclopedic Survey of Chamber Music*, ed. W. W. Cobbett, 2 vols. (1929; suppl., ed. C. Mason, 1963); H. Ulrich, *Chamber Music* (1948); T. F. Dunhill, *Chamber Music* (1913); N. Kilburn, *Chamber Music*, rev. by G. E. H. Abraham [1932]; G. Stratton and A. Frank, *The Playing of Chamber Music* (1935); H. S. Drinker,

*The Chamber Music of Johannes Brahms* (1932); R. H. Rowen, *Early Chamber Music* (1949); H. Mersmann, *Die Kammermusik*, 4 vols. (1930–33); W. Altmann, *Kammermusik-Katalog* [music pub. between 1841–1941], rev. ed. (1942); N. Ruet, *Musique de chambre* (1930); J. F. Richter, *Kammermusik-Katalog* (music pub. between 1944–1958; 1960); LavE ii.5, pp. 3144ff (repertory and bibliography); S. Laciár, “The Chamber-Music of Franz Schubert” (*MQ* xiv); H. Mersmann, “Beiträge zur Aufführungspraxis der vorklassischen Kammermusik in Deutschland” (*AMW* ii); L. de La Laurencie, “Les Débuts de la musique de chambre en France” (*RdM*, 1934, pp. 25ff, 86ff, 159ff, 204ff).

**Chamber opera.** An opera of small dimensions, of an intimate character, and for small orchestra (chamber orchestra). Sometimes produced in reaction against the great Wagnerian operas, such works include R. Strauss’ *Ariadne auf Naxos* (second version, 1916), Hindemith’s *Cardillac* (1926; rev. 1952), V. Thomson’s *Four Saints in Three Acts* (1928), and Menotti’s *The Old Maid and the Thief* (1939).

**Chamber orchestra.** A small orchestra of about 25 players. Before 1800 most orchestras were of this size, and recent composers have again written for such groups (chamber symphony). See Saltonstall and Smith, *Catalogue of Music for Small Orchestra* (1947); M. Pincherle, *L’Orchestre de chambre* [1948].

**Chamber pitch** [G. Kammerton]. See under Pitch.

**Chamber sonata.** The baroque *sonata da camera*; see *Sonata da camera*; Suite IV.

**Chance music.** See Aleatory music.

**Chandos Anthems.** Twelve anthems by Handel, composed 1716–18 for the Earl of Carnarvon, later Duke of Chandos, and performed at his palace. There also are a *Chandos Te Deum* and a *Chandos Jubilate*.

**Change ringing.** The ringing of a set (peal) of church bells by individual men and in a methodical order, the sequence being prescribed not by a melody but by certain schemes of arithmetic permutation. For instance, a set of five bells, 1, 2, 3, 4, 5, may be played in the order 4 5 2 3 1, 3 5 1 4 2, etc. In actual performance, usually a limited selection of such permutations is played in succession, the main principle being the exchange of two numbers. For instance, in a peal of five bells, the first “change” would be 1 2 3 4 5,

the second, 2 1 3 4 5, the third, 2 3 1 4 5, and so on. Certain standard selections are known under traditional names such as “Grandsire Triple,” “Treble Bob,” etc. The history of change ringing goes back to the 16th century. An important landmark was the publication of *Tintinnalogia* by F. Stedman (1688). Change ringing is still widely practiced in England.

Lit.: J. Trollope, *Standard Methods in the Art of Change-Ringing*, rev. ed. (1940); *id.*, *Grandsire*, rev. ed. (1948); *id.*, *Stedman . . . Incorporating the History of the Method* (1938); E. Morris, *The History and Art of Change Ringing* (1931); J. M. Turner, *The Art and Science of Hand Bell Ringing* [1950?]; R. H. Dove, *A Bellringer’s Guide to the Church Bells of Britain*, rev. ed. (1956); J. Stainer, in *PMA* xlv. See the article in *GDB*.

**Changing note.** See under Nonharmonic tones III.

**Chanson** [F.]. (1) The French word for song, hence the counterpart of the German *Lied*. However, while the *lied* has generally been cultivated by professional musicians, the *chanson* is usually of a more popular nature. Throughout the last two centuries there has been an enormous output of popular chansons, short strophic songs mostly of an amorous character, which are frequently written, set to music, sung on the streets, and sold by one and the same man. Not until the end of the 19th century was the *chanson* cultivated as an artistic form.

The virtual nonexistence of French art songs in the 18th and 19th centuries is in striking contrast to earlier periods. In fact, the early history of the *chanson* (i.e., of songs with French text) is more ancient, fertile, and musically important than that of any other nation’s song literature. The earliest preserved example, a Provençal song, “Hora vos dic vera raizun” [see P. Aubry, *Les Plus Anciens Monuments de la musique française* (1905), pl. I], dates from the 11th century. The 12th and 13th centuries were the era of the troubadours and trouvères, whose melodies constitute an unparalleled treasure of early secular song. The 14th century saw the rise of accompanied songs under G. de Machaut and his successors. These songs are usually in three parts (one vocal and two instrumental) and invariably in one of the *\*formes fixes* (*ballade*, *rondeau*, *virelai*). Composers of the late 14th century (Solage, Senleches, also the Italians Matheus de Perusio and Antonellus de Caserta) developed a style of unparalleled rhythmic and

contrapuntal complexity, which bears the earmarks of overrefinement and decadence. As an antithesis there developed in the Burgundian school of the 15th century (Dufay, Binchois, Lantins; also Ockeghem, Busnois) a new style of singular charm and beauty that may well be regarded as the artistic culmination of early French song. These composers cultivated mostly the \*rondeau and \*virelai (\*bergerette), less frequently the \*ballade. A large number of such songs exist in the various 15th-century \*chansonniers.

The last quarter of the 15th century marked the beginning of a new development characterized by the abandonment of the *formes fixes*, a change from three- to four- and five-part writing, from triple to duple meter, and the adoption of imitative counterpoint as the basic principle of style. This is the type to which the term "chanson" specifically refers in historical studies. It prevailed throughout the 16th century [see below under (2)]. With the early 17th century and the rise of the monodic style, the polyphonic chanson disappeared and, strangely enough, the creative activity in the field of art song ceased abruptly. The interest turned to \*vaudevilles, \*pastourelles, \*bergerettes, and \*brunettes, i.e., to the more popular types that predominated throughout the 18th and 19th centuries [see also *Air de cour*]. Extensive collections of such chansons were published by Ballard, e.g., *Recueil de chansons pour danser et pour boire*, 21 vols. (1627–62). For the development in the 19th and 20th centuries, see Song III.

(2) Specifically, the term "chanson" (polyphonic French chanson) is used for 15th- and 16th-century compositions that are not cast in one of the *formes fixes* but either are through-composed or (later) employ other repeat forms. Early examples are Dufay's "La Belle se siet" [see J. and C. Stainer, *Dufay and His Contemporaries*, 1898, pp. 122ff] and Binchois' "Files à marier" [*HAM*, no. 70], the latter being exceptionally advanced both in style (rapid declamation) and form (A A B). These, however, seem to be isolated cases. Later composers, such as Hayne van Ghizeghem, J. Ockeghem, or A. Busnois, composed only rondeaux and virelais (or bergerettes). The continuous development of the free chanson began near the end of the 15th century. The \**Odhecaton* of 1501 contains about twelve such pieces, among them three by Louis Compère (nos. 26, 28, 41), and one each by Heinrich Isaac (no. 11), Pierre de La Rue (no. 15), and Jean Mouton (no. 36). Com-

père, La Rue, and Josquin (all born c. 1450) are the most prominent of the early chanson composers. With Clément Janequin (c. 1485–c. 1560), Claudin Sermisy (c. 1490–1562), Pierre Certon (c. 1510–72), and numerous later composers the chanson changed from Flemish to typically French, from reserved dignity to nimble elegance and frivolity. The popularity of this new chanson is evident from a vast number of contemporary publications as well as the many hundreds of arrangements that fill the German and Italian lute and keyboard books of the 16th century. Pierre Attaingnant alone printed 70 collections containing chansons between 1528 and 1549; at the same time Jacques Moderne published the eleven books of his *Parangon des chansons* (1538–43).

Many of the chansons are composed in the imitative style of the contemporary motet but with such modifications as were required by the different purpose and text, i.e., quicker and more pungent rhythm, a tendency toward homophonic texture, sectional construction in relatively short phrases ending simultaneously in all parts, and frequent repetition of a section for another line of the poem. Among the various repeat forms are A B A [Josquin's "Faulx d'argent": *HAM*, no. 91; also many chansons by Janequin], A A B (\*Bar form), A A B C C, A B A' C A" (incipient \*rondo form), etc. A characteristic feature of the chanson (as well as its derivative, the instrumental \*canzona) is the use of repeated notes in the initial subject, as illustrated in the accompanying example (Jacotin's "Je suis déshéritée": see *SchGMB*, no. 117). A type of special interest, though of somewhat mediocre quality, is the program chanson of Janequin [see Program music]. See also Canzona (5).

**Chanson balladée** [F.]. Alternative (older?) name, used chiefly by Machaut, for the \*virelai.

**Chanson de geste** [F.]. A French epic poem of the Middle Ages, such as the "Chanson de Roland" (11th century). Such poems were extremely long (more than 10,000 lines of nearly equal meter) and were divided into sections of various lengths (20 or 50 lines), each of which, called a *laisse*, contained one continuous "thought" of the poem. The question as to whether or how the *chansons de geste* were sung has been repeatedly studied without conclusive results. Perhaps they were sung to a short melodic formula that was repeated for every line of a *laisse* except the last, for which a new formula with a more definite close was employed (a a a . . . b). Two such melodies survive, one in the epic "Bataille d'Annezin" (see *GéHM*, p. 261f; also Chailley, in *RdM* 1948, p. 3), the other as a late quotation inserted in Adam de la Halle's play "Le Jeu de Robin et Marion" of c. 1280 [see *ReMMA*, p. 204].

Lit.: Italo Siciliano, *Les Origines des chansons de geste* (1951); F. Gennrich, *Der musikalische Vortrag der altfranzösischen Chansons de geste*

(1923); *GéHM*, pp. 258ff; J. Chailley, "Études musicales sur la chanson de geste et ses origines" (*RdM* 1948, pp. 1ff); J. Chailley, *Histoire musicale du moyen âge* (1950), p. 91.

**Chanson de toile** [F.]. A trouvère poem of the early 13th century dealing with the sufferings of a lovesick girl or an unhappy wife. Five of them survive with their melodies in the "Chansonnier de St. Germain." They consist of six or more stanzas with refrain, the stanza being sung to melodies having forms such as a b a b C ("Bele Doëtte"), a a b c B' D ("Bele Yolanz"), a b a b c D A ("Oriolanz en haut solier"), etc. The alleged relationship between the musical structure of the *chansons de toile* and that of the much older *chansons de geste* (see F. Gennrich, *Grundriss einer Formenlehre des mittelalterlichen Liedes*, 1932, pp. 45ff) is, to say the least, very tenuous.

**Chanson mesurée**. See *Vers mesuré*.

**Chansonnier**. (1) A medieval (13th-century) MS containing the songs of the troubadours and trouvères. The most important ones are (Tb = troubadour; Tv = trouvère): Milan, Bibl. Ambr. R. 71 sup. (Ambrosiana Ch.; Tb; new ed. in U. Sesini, *Le Melodie trobadoriche nel canzoniere Provenzale della Biblioteca Ambrosiana*, 1942). Paris, Bibl. nat. fr. 22543 (Tb, the central source). Paris, Bibl. nat. fr. 20050 (Ch. de St.-Germain; Tb and Tv; fac. ed., G. Raynaud and P. Meyer, 1892). Paris, Bibl. nat. fr. 844 (Ch. du Roi; Tv; fac. ed., J.-B. Beck, 1938). Paris, Bibl. nat. fr. 846 (Ch. Cangé; Tv; new ed. J.-B. Beck, 1927). Paris, Bibl. nat. fr. 12615 (Ch. Noailles; Tv). Paris, Bibl. de l'Arsenal 5198 (Arsenal Ch.; Tv; new ed., P. Aubry and A. Jeanroy, 1909–14). Arras, Bibl. de la Ville 657 (Ch. of Arras; Tv; fac. ed., A. Jeanroy, 1925). See G. Raynaud, *Bibliographie des chansonniers français des XIII<sup>e</sup> et XIV<sup>e</sup> siècles*, 2 vols. (1884); J.-B. Beck, *Die Melodien der Troubadours* (1908), pp. 7ff.

(2) MS collections of 15th-century polyphonic chansons. Some of the most important ones are: Escorial V.III.24 (fac. ed., W. Rehm, 1958; see P. Aubry, *Iter hispanicum* [1908], p. 19). Copenhagen, Kgl. Bibl. Thott 2918 (new ed., K. Jeppesen, *Der Kopenhagener Chansonnier*, 1927). Dijon, Bibl. de la Ville Ms. 517 (partly repr. in E. Droz, *Trois Chansonniers français du XV<sup>e</sup> siècle*, 1927). Seville, Bibl. Colombina 5-I-43 (fac. ed. of Colombina 5-I-43 and Paris N. A. Fr. 4379, D. Plamenac [1962]; see D. Plamenac, in *MQ* xxxvii, xxxviii). Escorial IV.a.24 (see P. Au-

bry, *Iter hispanicum*, p. 30). Washington, Libr. of Congress *M.2.i L 25 Case* (Laborde Chansonnier; see H. E. Bush, in *PAMS* 1940, p. 56). New Haven, Conn., Yale Univ., Mellon Chansonnier (see M. F. Bukofzer, in *MQ* xxviii). Paris, Bibl. nat. Jean de Montchenu Chansonnier (Chansonnier cordiforme; see J. Porcher, in *Les Trésors des bibliothèques de France* v, 100). Paris, Bibl. nat. *fr.* 15123 (Pixérécourt Chansonnier; E. J. Pease, "An Edition of the Pixérécourt Manuscript" [diss. Indiana Univ., 1960]). Paris, Bibl. nat. *fr.* 1597 (see C. M. Shipp, "A Chansonnier of the Dukes of Lorraine" [diss. North Texas State College, 1960]).

There also exist two 15th-century MSS containing monophonic chansons; see *ReMR*, p. 205; G. Reese and T. Karp, in *JAMS* v.

**Chant.** General term for liturgical music similar to plainsong, i. e., monophonic and in free rhythm. Music of this type exists in many non-Western cultures. In particular, the term applies to the liturgical music of the Christian churches, which falls into two main divisions, Eastern chant and Western chant. To the former belong Armenian chant [see Armenia], and \*Byzantine, \*Coptic, and \*Syrian chant; to the latter \*Ambrosian, \*Gallican, \*Mozarabic, \*Gregorian, and \*Old Roman chant. Also see Anglican chant; Psalm tones.

**Chanter.** See under Bagpipe.

**Chanterelle** [F.]. See Cantino.

**Chantey.** See Shanty.

**Chanting.** The singing of the psalms and canticles in the daily offices of the Roman Catholic and, in particular, the Anglican Church. It is characterized by the use of a melody, called psalm tone, that is repeated with every verse of the psalm but that can be adapted to the different lengths of the verses by the iteration of the same tone, the recitation tone. The psalm tones of the Latin (Gregorian) rite are monophonic and in free rhythm. The Anglican chants are harmonized and the cadence is in strict meter. The Anglican Church, however, also makes frequent use of the Gregorian chant. See Psalm tones; Anglican chant.

**Chanty.** See Shanty.

**Chapel** [F. *chapelle*; G. *Kapelle*; It. *cappella*; Sp. *capilla*]. Derived from It. *cappa*, i. e., cape or cloak, the term originally meant a building where the cloaks or other revered relics of saints were

housed. It was later extended to apply to private churches of sovereigns, Popes, and bishops, as well as the staff attached to these churches and, in particular, the musicians and singers employed there. The connotation of "private body of musicians" survives in the Chapel Royal of the English kings, an institution that played a valuable part in the development and cultivation of English music [see *GD* i, 607; *GDB* ii, 176ff; W. H. Grattan Flood, in *ML* V, 85]. See also *Kapelle*.

**Characteristic note.** Leading note.

**Character notation.** See Fasola.

**Character piece** [G. *Charakterstück*]. A convenient term for a large repertory of short 19th-century compositions, mostly for piano or piano and one solo instrument, designed to express a definite mood or programmatic idea. Often these pieces have titles that suggest briefness or casualness, e. g., Bagatelle, Impromptu, Moment musical. Many have programmatic titles, such as "Der Dichter spricht" (The Poet Speaks; Schumann) or *Jeux d'eau* (Water Games; Ravel). Although there is a considerable body of third-rate character pieces, most 19th-century masters also contributed to this field, beginning with Beethoven, who opens the repertory with his *Bagatelles*. Schubert followed with his *Impromptus* and *Moments musicaux*, Mendelssohn with his *Lieder ohne Worte* (Songs without Words) and *Kinderstücke* (Children's Pieces), Chopin with his *Nocturnes*, *Préludes*, *Études*, *Impromptus*, etc. Whereas these composers usually included a number of pieces under one collective title, Schumann went a good deal further toward individualization and programmatic thought by choosing separate names for each piece, as in his *Kinderszenen* op. 15 or in his *Fantasiestücke* op. 12. New collective names introduced by him are *Novelletten*, *Nachtstücke* (Night Pieces), *Bunte Blätter* (Colored Leaves), and *Albumblätter* (album leaves). Brahms followed with *Balladen*, *Rhapsodien*, capriccios, and intermezzi, and Debussy with numerous impressionist character pieces, notably the two books of *Préludes pour piano*. Schumann also wrote long and difficult compositions consisting of a number of character pieces to be played in succession and representing a unified idea (character cycle), among them his *Papillons*, *Davidbündlertänze*, *Kreisleriana*, and *Carnaval*. In sum, the character piece was the favorite and characteristic form of romantic piano music, serving as a vehicle for

expressing every conceivable mood, thought, attitude, or emotion. Most of these pieces are written in the ternary form A B A, a form that proved especially suitable for depicting two contrasting moods, the first dramatic (A), the second lyrical (B), or vice versa.

Interesting precursors of the 19th-century character piece are found in the harpsichord suites of F. Couperin, who introduced an important technique of this genre, i.e., the use of a certain "pianistic figure" as the basic motif of the entire piece (e.g., "Les Barricades mystérieuses" from the *sixième ordre* of his *Pièces de Clavecin*). Many pieces by Rameau and Domenico Scarlatti are in the same category. See Editions XXXIX, 8; M. Vidor, "Zur Begriffsbestimmung des musikalischen Charakterstückes" (diss. Leipzig, 1924); W. Kahl, in *AMW* iii; *id.*, in *ZMW* iii, 459-69; *id.*, in *Zeitschrift für Musik* lxxxix (1922), 177-82, 201-6.

**Charango.** A small guitar (approximately 25 inches long) used mainly in the Andean highlands by Indians and *mestizos* but known throughout South America. It is made of a dried armadillo or *tatú* shell. Most examples have ten strings tuned in pairs according to the following pattern:

Some *charangos* are also built of wood carved to resemble the animal shell used traditionally.

J.O-S.

**Charivari.** A French term of unknown origin that signifies a deliberately distorted and noisy performance, such as was given in provincial towns in front of the homes of unpopular or objectionable persons, or as a mock serenade for a newly married couple. An American corruption of the name is "shivaree," a German term is *Katzenmusik* (cat music), an Italian, *scampata*. There is even a book on the history of the charivari from its origins in the 4th century: G. Peignot, *Histoire morale, civile, politique et littéraire du charivari, depuis son origine vers le IV<sup>e</sup> siècle* (1833).

**Charleston.** A kind of \*fox trot with a characteristic rhythm, probably named for the city in South Carolina. It was popular in the 1920's and was briefly revived in the 1950's (especially in musical comedies).

**Chasse, La** [F., The Hunt]. Title for pieces imitating the commotion of a hunt. Also, modernized spelling for the 14th-century \**chace*. Examples are the "Hunt" Quartet (Haydn, Mozart) and the "Hunt" Symphony (Haydn).

**Chasseur maudit, Le** [F., The Accursed Huntsman]. Symphonic poem by Franck (1882), based on a ballad by Gottfried Bürger (1747-94) entitled "Der wilde Jäger." It tells the story of a huntsman who goes hunting on Sunday instead of going to church, and who is therefore bewitched and pursued by demons.

**Chaunter.** See under Bagpipe.

**Check.** A part of the action of the piano.

**Chefs-d'oeuvre [classiques] de l'opéra français.** See Editions VII.

**Chef d'orchestre** [F.]. Conductor. *Chef d'attaque*, concertmaster.

**Chegança** [Port.]. A kind of traditional dramatic dance-song of Brazil, usually performed at Christmas and probably derived from a dance of the same name that was popular in Portugal during the 18th century. In Brazil the form developed into a short melodrama. Two different specimens became especially popular: the *Chegança dos Marujos* (Arrival of the Mariners) and the *Chegança dos Mouros* (Arrival of the Moors), the former a dramatization of a fight between sailors on board a ship, the latter a battle between Christians and Moors.

J.O-S.

**Cheironomy.** See Chironomy.

**Chekker.** See Echiquier.

**Chelys** [Gr.]. (1) Greek name for the \*lyre, which was frequently made from the shell of a turtle. (2) A 16th-century humanist name for the lute. See Testudo.

**Cheng.** (1) See Jeng. (2) French spelling for sheng, the Chinese mouth organ.

**Cherubic hymn.** (1) In the Byzantine Mass, the *cherubikon* (*cheroubikon*), sung by the choir at the "Great Entrance" (the symbolic entrance of Christ and the cherubim, i.e., angels). An Ordinary chant, it corresponds to the Proper Offertory of the Roman Mass. (2) Name for the Sanctus of the Mass or, more properly, for its Biblical source, the vision of Isaiah, who heard the angels crying unto each other: "Holy, holy, holy is the Lord of hosts" (Isaiah, 6 : 3).

**Chest of viols.** A set of six or more viols, usually including two trebles, two tenors, and two basses, which, in the 17th century, was kept in a chest with several partitions. See T. Mace's *Musick's Monument* (1676), p. 245. See Consort.

**Chest voice.** The lower register of a voice [see Register (2)].

**Cheute** [F.]. Old spelling for \*chute.

**Chevalet** [F.]. Bridge of violins, etc. See Bowing (k).

**Chevé system.** A system of musical notation invented by a French physician, E. Chev  (1804–64), and much used in France for teaching purposes. It combines the principle of the movable do with the old idea of indicating notes by figures (Spanish keyboard tablature—see Tablature II; Jean Jacques Rousseau, 1742; Pierre Galin, 1817). The figures 1 to 7 represent the tones of the scale (in any given key); lower or higher octaves are indicated by a dot under or above the figures. A rest is indicated by o. See E. and N. Chev , *M thode  l mentaire de musique vocale* (1844); *WoHN* ii, 403.

**Chev lle** [F.]. Peg of stringed instruments. *Chev ller*, pegbox.

**Chevrotement** [F.]. Unsteadiness in singing, like the bleating of a goat [F. *ch vre*]. See Goat's trill.

**Chiamata** [It.; F. *chamade*]. In Venetian operas of the 17th century, pieces written in imitation of the "call" after the end of a hunt. See H. Kretzschmar, in *VMW* viii.

**Chiaramente** [It.]. Clearly, distinctly.

**Chiarenzana.** An occasional dance of the Renaissance. It was performed in Florence as early as 1459 at a festival in honor of Pope Pius II. Marcantonio de Pifaro includes fourteen examples in his *Intabolatura de lauto* (1546) that are indistinguishable from the common *pavane* or *passamezzo* of the day. An isolated example in F. Caroso's *Il Ballarino* of 1581 is in the 6/8 meter of a *saltarello* or galliard. L.H.M.

**Chiave** [It.]. Clef.

**Chiavette** (sing. *chiavetta*), **chiavi trasportati** [It.]. A late 16th-century system of writing vocal music with all the clefs moved down or up a third from their normal position, so that, e.g., the F-clef would appear on line 3 (baritone clef) or on line 5 (subbass clef) rather than on line 4

(bass clef; see Clef, Ex. d, nos. 8, 9, 10). Examples of compositions notated in the lowered clefs are quite numerous (Palestrina, *Missa Papae Marcelli*; Taverner, motet "O splendor," see Editions LI, 3; Josquin, "De profundis," see Editions XLVII, 6), while the system with the raised clefs was much more rarely used.

The significance of the *chiavette* has raised considerable controversy among musicologists. Until recently it was generally thought that they indicated a transposition to the lower or upper third, the vocal analogue to transposing instruments of the orchestra. According to this theory, Ex. 1 meant to the singer c e g but was actually sung at the pitch suggested by the position of the notes in connection with the standard clef, i.e., A c# e, or perhaps A b c eb. The implied change can be very easily effected: the notes remain in the same position on the staff, the clef is moved to its normal position, and the key signature of A or of A-flat (E or E-flat for the system of raised clefs) is added. Thus, Ex. 1 has the meaning of Ex. 2 or of Ex. 3. The over-all result of this interpretation is that a composition written in C would actually be in the key of A or A-flat. This interpretation was advanced by R. Kiesewetter (*Galerie der alter Contrapunctisten*, 1847) and H. Bellermann (*Der Contrapunct*, 1877) as a convenience to the modern musician, which indeed it is, and advocated as a historical fact by Riemann and Kroyer. The system with the lowered clefs has been (rather pointlessly) called "high" *chiavette*, because the notation (c e g) is higher than the sound (A c# e), and the other "low" *chiavette*.

Recent studies (Ehrmann, Mendel) have shown that this theory is without historical foundation. The clefs were moved mainly in order to avoid the use of ledger lines, so that the *chiavette* notation would simply mean a change of clef [Ex. 4]. Evidence has been found, however, that the high *chiavette* occasionally indicated transposition down a fourth or a fifth (Federhofer). In a way the whole question is futile, since it depends entirely on the absolute pitch of the 16th century, about which nothing is known, and which, for that matter, probably did not exist. At any rate, the importance of the *chiavette* has been greatly exaggerated in scholarly studies as well as in books for instruction.

**Chiesa** [It.]. In baroque music, *da chiesa* indicates instrumental pieces (sonatas) or vocal pieces with instrumental accompaniment (cantatas) designed for use in the church (*chiesa*), as opposed to similar pieces for secular use, designated *da camera*. See *Sonata da camera*, *sonata da chiesa*.

**Chifonie** [F.]. Medieval (12th–15th cent.) corruption of \*symphonia, i.e., \*hurdy-gurdy.

**Childhood of Christ, The.** See *Enfance du Christ*, *L'*.

**Children's Corner.** Set of piano pieces (with English titles) by Debussy, composed 1906–08, including: 1. *Doctor Gradus ad Parnassum* (humorous allusion to Clementi's \**Gradus ad Parnassum*); 2. *Jimbo's Lullaby*; 3. *Serenade for the Doll*; 4. *Snow is Dancing*; 5. *The Little Shepherd*; 6. *Golliwogg's Cakewalk*. They were written for Debussy's daughter, Claude-Emma, referred to as "Chou-chou" in the dedication.

**Chile.** Chilean music of the colonial period is known only through chronicles and histories since no compositions have as yet been found. During the 16th and 17th centuries music was used mainly for civic and religious purposes. In the 18th century, as French influences appeared, a type of salon music was developed for the *tertulias* (social gatherings). Works by such Spanish composers as Antonio Soler and José Pons were performed, and some examples of native music, mostly anonymous, have survived, among them *villancicos* such as *Coplas al Niño Dios, con violines, oboes, organo y continuo*, and *Venid festivos zagales, a 4 con clarinete, clarin y baxo continuo*, as well as some hymns to the Virgin and the saints.

The first composer and musical director of the Cathedral of Santiago was the Franciscan Father Cristobal Ajuria (c. 1750). Ajuria's popularity was overshadowed, however, by the arrival of a Spaniard, José Campderros, who became musical director of the Cathedral in 1793. Fifteen of his compositions, including two Masses, have been preserved. A contemporary of his, Antonio

Aranaz, wrote a *Misa con todo instrumental* in 1793.

The first native composers in Chile appeared at the time of independence (1810), roughly coinciding with the advent of Italian opera's influence in the country. To this group belong Manuel Robles (1780–1837), composer of the original national anthem (1920); Isidora Zegers de Huneus (1803–69), a noted singer and composer of several songs, minuets, and *contradanzas* for piano, founder of the *Sociedad filarmónica* (1862) and promoter of the founding of the *Conservatorio nacional de música* of Santiago (1849); José Zapiola (1802–85), composer of several hymns, including a highly popular patriotic song, "Himno de Yungay," and band music, as well as author of a book of reminiscences, *Recuerdos de treinta años*, containing valuable information on musical life in Chile from 1810 to 1840; Federico Guzman (1837–85), a noted pianist and composer of more than two hundred works for this instrument as well as for voice and chamber ensembles; Guillermo Frick (1813–96), born in Berlin but living in Chile from 1840 on; and Aquinas Ried (1810–69), a native of Bavaria who came to Chile in 1844, composer of a *Misa Solemne* (1844) and of the first opera written in the country, *La Telésfora* (1846), followed by *Il Granatiere* (1857).

Between 1850 and 1900, art music in Chile seldom rose above the amateur level. Most of the compositions from this period were short salon or virtuoso pieces strongly reflecting European influences. By the end of the century a few opera composers, influenced by Italy, became prominent. In 1895 *La Florista de Lugano* by Eleodoro Ortiz de Zarate (1865–1953) was introduced in Santiago, three years after the first performance in Milan of his *Juana la Loca* (1892). He also wrote *Lautaro* (1897), as well as two more operas, symphonic compositions, and chamber music. In 1902 Remigio Acevedo's (1863–1911) opera *Caupolican* was staged.

Not until a notable group of composers born in the 1880's and 1890's became active did Chile begin to take steps toward its present prominence in Latin American music. Most of these composers were strong supporters of musical nationalism, though they did not neglect abstract music altogether. Enrique Soro (1884–1954), composer of more than eighty works in the romantic tradition, was the first major Chilean composer of high professional competence. His contemporary, Pedro Humberto Allende Sarón (1885–1959), used impressionist

techniques to exploit native rhythms, developing a highly individual style. Following similar paths at about the same time were Próspero Bisquertt (1881–1959), Carlos Lavín (1883–1961), Samuel Negrete (b. 1893), and Juan Casanova Vicuña (b. 1894).

Whereas Javier Rengifo (1884–1958) and Roberto Puelma (b. 1893) remained attached to the romantic tradition, more progressive tendencies appear in the works of Acario Cotapos (b. 1889), Alfonso Leng (b. 1884), Carmela Mackenna (b. 1879), and Carlos Isamitt (b. 1887), the last-named being the first Chilean supporter of serial techniques and the use of Araucanian Indian rhythms.

The most prominent member of the succeeding generation is Domingo Santa Cruz Wilson (b. 1899), internationally recognized as both a composer and an intellectual. He founded the *Sociedad Bach* (1922) and promoted the creation of a faculty of music for the University of Chile (1929), the *Asociación de Conciertos Sinfónicos* (1931), the *Asociación de Compositores* (1936), and the *Instituto de Extensión Musical* (1940), an organization established to operate the National Symphony Orchestra, the National Ballet, and several other ensembles. As a composer he tended to follow contemporary European trends. His efforts toward centralizing all musical activity under university control help account for Chile's prominent place on the musical scene and directly benefited such postimpressionist composers as Jorge Urrutia Blondel (b. 1905), René Amengual Astaburuaga (1911–54), and Alfonso Letelier Llona (b. 1912), as well as their successors.

Of the younger generation of Chilean composers, Juan Orrego-Salas (b. 1919) is known for his chamber music, three symphonies, two ballets, and an opera, *El Retablo del Rey Pobre*. His contemporaries include Guillermo Maturationa (b. 1920), Carlos Botto (b. 1923), Carlos Riesco (b. 1925), Claudio Spies (b. 1925), Alfonso Montecino (b. 1925; also a noted pianist), Gustavo Becerra (b. 1925; an extremely talented modernist), Leon Schidlowsky (b. 1932), Roberto Falabella (1926–58), Darwin Vargas (b. 1925), Tomas Lefever (b. 1925), and Juan Lemann (b. 1928). Still younger composers include José Vicente Asuar (b. 1933), who has composed electronic music; Enrique Rivera (b. 1941), Miguel Letelier (b. 1939); and Fernando García (b. 1930).

Folk music in Chile is largely Spanish in origin, indigenous influences being slight. Use of

3/4 and 6/8 meters predominate in songs and dances such as the *\*villancico*, *\*esquinazo*, *\*tonada*, *\*cuando*, *\*aire*, and *\*cueca*. The last-named, also known as *zamacueca*, is considered Chile's national dance.

**Chimes.** See under Percussion instruments A, 5. The term is also used for a set of real bells (*\*carillon*), for the orchestral *glockenspiel* [see Percussion instruments A, 2], and for various Oriental instruments consisting of a series of tuned sonorous agents (gong chimes, stone chimes). See W. W. Starmer, in *PMA* xxxiv, xxxvi. Also see Cymbalum.

**Chiming.** See under Bell.

**Ch'in.** See Chyn.

**China.** I. *History and sources.* Yang Yinnliou (see Lit.) divides the music history of China into three major periods: (1) from prehistoric times through the Shang (c. 1700–c. 1100 B.C.) and Jou (Chou; c. 1100 B.C.–246 B.C.) dynasties; (2) the Chyn (Ch'in; 246–209 B.C.), Hann (Han; 209 B.C.–A.D. 220), the Three Kingdoms and the Northern and Southern States (220–605), Swei (605–618), and T'ang (T'ang) dynasties (618–906); (3) the Five Dynasties (906–960), Song (Sung; 960–1279), Yuan (1279–1368), Ming (1368–1644), and Ching (Ch'ing; 1644–1911) dynasties. This division is based on the rise, decline, and renaissance of Confucian influence on musical thought in China.

Archaeologists have discovered well-preserved Shang dynasty chimes, bells, and ocarinas, and from the late Jou, fragments of zithers. As early as the 6th century B.C. the classical works of poetry, history, and philosophy mention folk-songs, folk dances, court songs and dances, tribal music, and military and hunting music. Toward the end of this first period a systematized theory and practice of ceremonial music evolved, much of it presumably based on the Jou dynasty

tradition. Such music was used by the emperor for rituals honoring gods and ancestors, for entertaining royal guests, and by the emperor and provincial officers for paying homage to the elderly and virtuous. Instruments from all of the "eight categories" (a division based on the material) are mentioned in the classics. There are bells (metal), chimes (stone), ocarinas (earth), drums (skin), zithers (silk), percussion blocks (wood), mouth organs (gourd), and flutes (bamboo).

During the second period (246 B.C.-A.D. 906) elements of foreign culture introduced through political expansion were readily absorbed. Already before the Hann, the old Jou tradition of ceremonial music had been interrupted by war and finally destroyed by the deliberate purge of Confucianism in the late 3rd century B.C. When the Hann rulers tried to revive the ancient ceremonies, they had to resort to folksongs, newly composed melodies, and even popular and foreign music for melodic materials. Music associated with Buddhist and Taoist rites also began to appear, but it was secular music that dominated the scene.

From central Asia came foreign musical instruments, musicians, and dancers. During the Swei and T'ang periods regular sections of the Music Bureau were in charge of foreign orchestras, which brought with them new musical forms, new modes, and new tunes. Bas-reliefs in the Hann tombs and wall paintings and sculpture in the Duenhwang Caves of north-west China show dancers and orchestras of the first millennium A.D. Further information is contained in the special sections on music often included in the histories compiled for every dynasty since the early Hann, which usually contain extensive citations from musical writings that are otherwise lost. In addition, many memoirs from this period supply anecdotes about famous singing girls, \*pyiba players, and virtuoso drummers, and describe the establishment of musical conservatories under royal patronage. Music, musical performances, and musicians are favorite subjects for T'ang poets. These sources in sum give a vivid impression of the musical life of the times, but the only musical examples from this period that have been preserved are an isolated \*chyn melody and a manuscript of twenty-five pieces written for the \*pyiba found in Duenhwang. The gay entertainment music of T'ang, when introduced into Japan, became a solemn court music, \*gagaku. Since Japanese musical traditions are

conservative, T'ang music may still be present in *gagaku*. Evidence can be found in the notation used for the \*biwa and the mouth organ (shō), which is identical to the Duenhwang pyiba notation, as well as in the Chinese names of orchestral pieces and in the many instruments that are of Chinese origin.

With the Song dynasty (960-1279) began a nationalist era very different from the cosmopolitan past, a time of return to Confucian ideals. Previously imported music was Sinicized, foreign theories brought in line with Confucian cosmology, and reconstruction of Confucian ceremonial music occupied much of the scholars' attention. Throughout the Song, Yuan, Ming, and Ching dynasties, volumes of treatises were written advocating musical reform of one kind or another. However, the chronicles show that conservatism was not wholly dominant. Secular musicians hired for ceremonial performances continued to bring in popular idioms, and they ignored the pitches that had been meticulously calculated by the theorists. Nevertheless the theoretical writings are important sources for later historians. True to the spirit of neo-Confucianism, the theorists stressed detailed examination of concrete matters and wrote much more informatively than the writers from the previous period. With the advent of printing from the end of the T'ang dynasty (618-906), more books with musical notation are preserved. Beginning with the 12th century ritual songs recorded by the philosopher Ju Shi, sources of this kind of music, all written in an easily decipherable pitch notation, appear continuously through the 18th century.

In entertainment music, T'ang dynasty dances gave way to the more intimate Song dynasty songs. Leading poets provided new texts for old melodies. The 17 Poetic Songs of Jiang Kwei (12th century), written in a special kind of Song dynasty popular notation, are examples of this genre. Such poetic songs, gradually organized into regular sequences in a scheme of modes, together with the folk narratives already popular in early Song, were two important influences on the musical drama of the following centuries. More than 150 librettos of the (Mongol) Yuan dynasty (1260-1368) are still preserved. Although no music is given in these texts, the names of the individual tunes all are indicated. The same is true of the musical drama of the Ming dynasty. There is, however, a huge compilation of selections from musical dramas and independent songs published in the early 18th

century (*Jeou Gong Dah Cherng*) that may contain pieces of much earlier date.

The *kuencheu*, often referred to as the classical Chinese opera, is a 16th-century development of the musical drama. Still heard fairly frequently today, it is characterized by a sophisticated singing style and prominent use of the dance, which is closely integrated with the song. The orchestra, which uses the flute as the melody instrument, is generally mellow. The *kuencheu* dominated the musical scene for nearly 400 years. Its literature, melodic materials, dance, and different staging techniques have greatly influenced the various regional theatricals, especially the Peking opera, which was established about 1850 and which today has taken its place in popularity.

Both the *kuencheu* and the Peking opera employ the technique of composing with \*melody types, i.e., use of the same melodic fragments in different songs. However, the two forms differ in that the *kuencheu* also uses a great number of different melodies without repetition whereas the Peking opera relies chiefly on the repeated use of a very few melodies. These few melodies are divided into two groups, the so-called *shipyi* and *ellhwang* types, within which they are either related in melodic materials or by cadential formulas. However, the melodies contrast sharply in tempo and rhythm, and with the added resource of varied percussion figures to underline action and mood and to mark changes of scene, the Peking opera actually has a much wider range of dramatic possibilities than the *kuencheu* of today. The Peking opera has a short history (c. 100 years). Although the highly stylized singing and acting demands a cultivated taste, the Peking opera remains the most popular musical art form.

Instrumental music seems to have been written idiomatically only for the \*chyn and \*pyiba. The chyn repertory is quite large, with compilations dating from the early 15th century. The pyiba repertory, on the other hand, is very modest; collections of pyiba music begin with the early 19th century. Other instruments, such as the 16-stringed zither (*jeng*), horizontal flute (*dyitz*), two-stringed fiddle (*ellhwu*), three-stringed banjo (*sanshyan*), psaltery (*yangchyn*), oboe (*suoonah*), etc., are popular as solo instruments today. Little is known of their early music. What they play today seems to have been mostly borrowed from the chyn and pyiba, or consists of arrangements of traditional popular tunes. A few unusual 19th-century scores for

instrumental ensembles have been preserved, but the kind heard today has developed in South China since the 1920's. Originally such instrumental pieces were used in the musical drama, the melodic materials being based on traditional tunes from various parts of the country. Since the instrumental ensemble became an independent form, original pieces have been composed for it, with new idioms and instruments from other regions sometimes being added. At one time, these even included some elements of popular Western music.

After World War I the mainstream of musical development in China was once more dominated by foreign influences, from Europe, America, and modern Japan. Today, music, if taught in schools at all, is generally only of the Western variety. In musical composition, the rapid social and political changes in China since 1900 have generated a great demand for functional music—songs for political and educational purposes. There are countless organizational songs, propaganda and war songs, and songs commemorating special public and private occasions. Choral music seems to be enjoying great popularity. Cantatas and new-style musical drama constitute a good percentage of the total musical output today.

Many composers have a thorough training in Western music, and they work both in the purely Western idiom and in various combinations of Chinese and Western styles. Composers such as Heh Luhting (Rodin Ho), Hwang Tzyh (Tzu Huang), Jaw Yuanrenn (Y. R. Chao), Lii Weining (W. N. Lee), Liou Sheue'an, Maa Syt-song (Ma Sitson), and Shean Shinghae have written essentially in the style of the common practice period.

Attempts at a harmonic interpretation of Chinese melodies has met with varying degrees of success, because not all traditional melodies suggest a well-defined tonal orientation. Maa, for example, has made use of modal harmonies in folksongs, and Hwang is well-known for his treatment of pentatonic melodies with seventh chords. Although the concept of harmony has indeed opened new possibilities for composition, the more recent developments in Western music, tending away from traditional tonality, have already influenced such younger composers as Jou Wenjong (Chou Wenchung) and Sheu Charnghuey (Shu Tsang-houei) and may well become an equally important factor in the future development of Chinese music.

In traditional music, conscious efforts have

been made—often inspired by nationalism—to preserve and study folksongs, musical theatricals, folk narratives, and instrumental music, all of which have been rapidly disappearing. With the establishment of the Institute of National Music in Peking in 1954, the movement once more gained momentum, and now there are several specialized journals devoted to this field. In general the attitude has been that, technically, these arts need reform. Attempts have been made to adopt Western techniques of composition and performance, and to make changes in the construction of traditional instruments to alter the intonation and enlarge their range and volume. During the first half of the 20th century, except for the handful of compositions for the *pyiba* and the two-stringed *ellhwu* by Liou Tianhwa, there were not many widely known new compositions for traditional instruments. The Peking opera is one medium that has remained relatively creative, in spite of modern-minded critics who began to complain that the melodies were lacking in originality, the acting unrealistic, and the orchestra too loud. In the recent surge of Peking opera writing, however, up-to-date subject matter is still handled in the traditional style. It is too soon to say how successful these new operas will be, but the effort has at least spurred a deeper study and understanding of the genre.

II. *Theory. A. Tonal system.* An overworked aspect of Chinese music theory is the *hwangjong* (*huang chung*, yellow bell), a principal tone of absolute pitch represented by a bamboo pipe whose exact measurement was, for many centuries, both an important theoretical issue for the cosmologists and a practical concern for the government since it involved the metrical standards of length and weight. Time and again, attempts were made to find the correct measurement. Recent investigations (Yang Yinnliou) have shown that there were thirty-five pitch reforms, extending from the late Jou period to the Ching dynasty, during which the pitch for *hwangjong* varied between  $c^{\#}$  and  $a'$ . (Today writers who are not chiefly concerned with the issue of absolute pitch often equate *hwangjong* with middle  $c$ .) From the principal note *hwangjong* eleven additional pitches were derived by the \*Pythagorean (circle-of-fifths) method. The earliest complete account of this method of calculation appears in *The Spring and Autumn of Leu* (3rd century B.C.), although a similar method used to produce a series of five notes already appeared in *Goan Tzyy* (4th century

B.C.) and more recent discoveries of very accurately tuned stone chimes (*ching*) suggest that the system must have been known in the 2nd millennium B.C. The difficulty with this system is that by continuing the same procedure from the 12th note, the resulting *hwangjong* is a little higher than the original [see Comma]. For centuries, this worried the theorists, because—for the sake of cosmological implications—they wanted a closed circle that would make the 12 notes rotate their functions symmetrically. Various methods were attempted. The earliest was by pushing the circle of fifths further in the hope of finding the right note. This resulted in adding a considerable number of extra notes within the octave. Jing Farn (1st century B.C.) went as far as the magic number 60, and Chyan Yueh-jy (A.D. 5th century) went on to 360. But in principle they still had not solved the problem. Tsay Yuanding (12th century) compromised by stopping at 18, since he was content simply to produce an identical seven-note scale from each of the 12 pitches without rotating the functions of every note.

The tempered scale was first attempted by Her Cherngtian (A.D. 5th century), who arbitrarily shifted upward by increasing degrees each succeeding note after the first of the Pythagorean scale. Ju Tzayyuh (16th century) finally created the tempered scale of 12 notes by the method of successively dividing by the 12th root of 2. However, none of these mathematical calculations was put into practice. In fact, in many treatises there was no clear indication as to whether the calculation was based on the lengths of tubes or of strings. Nor was the diameter of the tubes always taken into account.

To what extent \*just intonation is used on the seven-stringed *chyn* is still a moot question. Although the stopping positions are marked at the simple divisions of the strings [see *Chyn*] and the harmonics are certainly much used in *chyn* music, the *chyn* manuals since the 16th century have indicated certain adjustments that seem to bring the intonation closer to the Pythagorean or equal temperament. Some evenly divided minor thirds are indicated by the frets on the traditional model of the *pyiba*. The resulting 3/4-tone intervals that are clearly discernible in *pyiba* music can also be heard in other types of traditional instrumental and vocal music.

B. *Scales and modes.* The first seven notes produced by the circle-of-fifths method form a *fa*-scale that is the orthodox basic scale, *gong diaw*, as mentioned in all theoretical treatises. Their names are, in ascending order: *gong* (*fa*),

*shang* (sol), *yyue* (la), *biann* [\**pien*]-*yy* (si), *yy* (do), *yeu* (re), *biann-gong* (mi). The series of five notes that is mentioned in *Goan Tzyy* (4th cent. B.C.), given in numerical terms, is in the relationship of do-re-fa-sol-la. However, it was the series fa-sol-la-do-re, which first appeared in the 1st century B.C., that became the more common pentatonic scale. The heptatonic fa-scale was first described explicitly by a theorist of the 1st century B.C., although passages vaguely mentioning sets of six notes and seven notes had appeared in the classics long before.

The heptatonic do-scale, although not an orthodox scale, was evidently also used. In the 6th century there were complaints that the do-scale was confused with the fa-scale. In later centuries the modes of ceremonial music were always correctly named with reference to the fa-scale, but in 13th-century chyn music the do-scale was the basis for modal designations.

The Chinese system of modes in its fullest form consists of 84 combinations of scales and final notes. They are produced in the following manner: on the basic heptatonic fa-scale each note can be used as the final; the basic scale itself can begin on any of the 12 pitches. Since there is only a limited ambitus of one octave, the higher the pitch of fa, the greater the portion of the basic scale appears below the final; that is why the pitch of the basic scale at times can also be a relevant factor in characterizing a mode. Thus, with the constant ambitus of c to c', a so-called sol-of-c-mode has its basic scale beginning on c (the notes being c-d-e-f#-g-a-b) and final on d; a re-of-b<sup>b</sup>-mode has its basic scale beginning on b<sup>b</sup> (the notes being c-d-e-f-g-a-b<sup>b</sup>) and final on g.

Some kind of modal concept may have existed in China before the wholesale importation of Central Asian modes in the middle of the 1st millennium A.D. But it was after this foreign impact, which had a lasting influence on Chinese musical theory, that writings about modes became more explicit. By the Sonq dynasty, the complete set of 84 modes, some still retaining their foreign names, was codified. In practice during the Sonq, however, some adjustments were made. For example, in both ceremonial and popular music, four additional semitones above the basic scale were also used; in at least one practical treatise some scales show pentatonic features. The Sonq performer must have been very familiar with the modal system of his day. The popular notational system of the time had ambiguous symbols, but given the modal

name of a piece, he would have to know immediately the true value of the notes. Tsay Yuanding (12th century), a controversial figure of his time, had an entirely different concept of modes. He built the basic fa-scale from each of the 12 pitches upward; hence he extended the ambitus of the entire system to 2 octaves. However, it is doubtful that this was ever put into practice. He also reduced the total system to 60 modes by omitting the mi and si modes, but his most significant contribution was to initiate the use of the beginning and final notes of a melody as a criterion in determining its mode.

Not all of the 84 modes were used in musical composition. Even the so-called "28 modes for popular music" used in the Tarnq and early Sonq periods (the fa-, sol-, la-, and re-modes on C, D<sup>b</sup>, E<sup>b</sup>, F, G, A<sup>b</sup>, and B<sup>b</sup>), which were probably the original nucleus of the 84, were only a theoretical list. Although some academic-minded composers in the Sonq dynasty still occasionally experimented with the less common modes, the list was reduced to 19, 18, or 17; in the Yuan to 12 and 9; and during the Ming to 8. Modes were used not only to organize melodies formally but also for the practical purpose of categorizing music. Gradually, as the meanings of the modes were forgotten, the same melodies were regrouped for nonmusical reasons and their modal labels were confused. The 18th-century *Anthology of Songs* is a case in point.

Even while academic musicians were concentrating on elaborate modal theories, some use seems to have been made of melody-types. At least in some of the Sonq dynasty examples preserved, pieces belonging to the same mode tend to have similar melodic fragments. In the present day Peking opera, melody-types are recognized as such and are given generic names while modes are no longer mentioned.

C. *Speech tones and music.* Tonal inflection of individual syllables is a phonemic element in Chinese speech. Some tones move up or down while others remain on a fairly even level. Some dialects also distinguish relative pitch and length of duration. The musical contour of the tone for the same word will change from one period to another and will vary from dialect to dialect. However, the change by entire tonal groups during the past 1,500 years is so regular that it is possible to establish the abstract tone class for the great majority of words without too much difficulty.

From very ancient times onward, tones were grouped into four classes—Even, Rising, Going

and Entering—the last consisting of syllables ending abruptly in a voiceless stop consonant. In poetry and song, the four tones are grouped under Even on the one hand and Oblique on the other, the latter consisting of the other three tones. The existing Song dynasty songs show that there was indeed a certain amount of distinction in the treatment of the Even and Oblique Tones in music. In *kuencheu* the writers pay great attention to tonal adjustment. In the Peking opera, the relation between melody and word-tone is at times less strict, but there are also many places where the writer makes a special effort to bring out the word-tones for dramatic purposes. Since in these dramatic forms new texts are set to melody-types rather than to a fixed melody, there is much leeway in making adjustments to the tones. In performance, *kuencheu* singers even make some distinction within the three Oblique Tones. For example, there are rules for adding such ornaments as the *échappée* [see Nonharmonic tones I] or *\*cambiata* to bring out more specifically the Going Tone.

The traditional practice is to give the Even Tones relatively longer notes or a slightly descending line, while the Oblique Tones are given quicker, up-and-down moving notes. Many present-day composers still more or less follow this traditional dichotomy of tones, but others adhere more closely to the actual values of modern Mandarin. Composers whose interest is purely in the music itself also compose without regard for the speech tones.

D. *Aesthetics*. The use of music as a medium for the social and political education of the people has been a serious concern of Chinese governments from the time of Confucius. Among the few who have protested against using music for such purposes were the early Taoists, who objected to all the arts on moral grounds, and the Moists, who disapproved of ceremonial music for reasons of economy. The power of music as a force for molding society is already mentioned in the early classics. In the 2nd century B.C., there were elaborate discourses on music in relation to the human spirit and on the use of music to inculcate moderation. About this time, seasonal, directional, and other cosmological connotations of the pitches became an integral part of Chinese musical thought. Men like Ji Kang, the 3rd-century chyn player who came close to a modern psychological explanation of music's influence on the human emotions, or Sheen Gua, a 10th-century intellectual who

observed acoustical phenomena with a scientific eye, were exceptions to the cosmological approach. We read discussions in allegorical terms of the hierarchy of the notes in the scale and anecdotes about the effect of melodies sung with certain notes. At times the do-mode was forbidden; the notes mi and si were regarded by some as unorthodox. In the 14th century, when modes were used to organize the acts in musical drama, their emotional connotations were listed. Even today the choice between the *Shipyi* and *ellhwang* melodies in the Peking opera is still sometimes based upon the emotion associated with each.

The enjoyment of music, instrumental or vocal, is usually assumed to be based on extra-musical elements. Thus, with a few exceptions, all instrumental works, often including the smaller sections, have programmatic or allegorical titles.

In the midst of the Marxist movement for realism in the arts in mainland China, the authorities had on occasion also taken the position of defenders of the stylized tradition in the Peking opera. For example, to summarize a declaration by Ah Jea in *Shihcheu Yanjiou* [Journal for the Study of the Musical Drama, Peking, Jan., 1957]: The Peking opera presents life in an artistic language of its own that has been accepted by the people. It is effective because it selects the essence of reality, and, through condensation and heightening, presents a new kind of reality that is bigger than life.

**Chinese block.** A percussion instrument used in jazz bands that consists of a hollowed-out wooden block. Played with a drumstick, it produces a dry, hollow sound.

**Chinese crescent.** See Turkish crescent.

**Chinese pavilion.** See Turkish crescent.

**Ching.** Korean gong, corresponding to the Chinese \*cheng (2).

**Chironomy.** A term for neumatic signs lacking clear indication of pitch, the inference being that such signs were interpreted to the choir by the conducting precentor, who moved his hands [Gr. *cheir*] in an appropriate and suggestive manner. The clearest information about this method is found in Byzantine sources, according to which it dates from the time of Kosmas and John Damascene (8th century). Motions of the right hand were used together with specific signs of a “finger language,” fingers being raised, lowered, extended, contracted, put together, etc. Similar signs, no doubt, were used for interpretation of the chironomic neumes found in the

earliest MSS of Gregorian chant (10th century). See Neumes II. See E. Wellesz, *A History of Byzantine Music and Hymnography*, rev. ed. (1961), p. 287; M. Huglo, in *RdM* xlix, 155ff.

**Chispa.** A Colombian air similar to the \**bambuco*. It uses alternating groups of three and four beats, in moderately fast tempo, and usually is in the minor mode. I.O.S.

**Chitarra** [It.]. \*Guitar. The *chitarra* is a smaller type, used in Naples.

**Chitarra battente** [It.]. See under Guitar family.

**Chitarrone** [It.]. See under Lute III.

**Chiterna** [It.]. Same as cittern, gittern; see Guitar family.

**Chiuso** [It.]. In horn playing, same as stopped; see Horn I. In 14th-century music, see Overt and clos.

**Choir.** A body of church singers, as opposed to a secular chorus. The name is also used for instrumental groups of the orchestra, e.g., brass choir, string choir, woodwind choir.

**Choirbook** [G. *Chorbuch*]. The large-sized manuscripts of 15th- and 16th-century polyphonic music that were placed on a stand and from which the whole choir (about 15 singers) sang. Examples are Cambrai, Bibl. de la ville, MS. 11 (c. 1430); Bologna, Bibl. univ., MS 2216 (c. 1430); Brussels, Bibl. royale, MS 6428 (c. 1500). See the pictures in *BeMMR*, pp. 234, 248. For choirbook arrangement [G. *Chorbuch-Anordnung*], see under Score II. See also *Cantus lateralis*.

**Choir organ.** Originally, a small organ used to accompany the choir. Today, the third manual of the normal organ, which is provided with stops useful for accompaniment purposes. See Organ III.

**Choir pitch.** See under Pitch (2).

**Chomonie.** See under *Anenaiki*.

**Chor** [G.]. A chorus or choir.

**Choral** [G.]. (1) The plainsong of the Roman Catholic Church, usually called *Gregorianischer Choral* [see Gregorian chant]. Derivatives are: *Choralnotation* (\*monophonic notation); *Choralnote* (plainsong note); *Choralrhythmus* (plainsong rhythm). (2) The hymn tunes of the German Protestant Church [see Chorale]. Derivatives are: \**Choralbearbeitung* (this term may also

apply to the Gregorian *Choral*); *Choralfantasie* (chorale fantasia); *Chorkantate* (chorale cantata); *Choralpartita* (chorale partita); *Choralsvorspiel* (chorale prelude).

**Choral, chorale.** In view of the different meanings and confusing usage of these terms, a few general explanations are needed. According to Webster, *cho'ral* (adj.) means of or belonging to a chorus or a choir, while *choral* (noun) means a hymn tune, a sacred melody. For the latter meaning, the spelling "chorale" is preferred, and the same preference is used in this dictionary. Thus, a "choral fantasia" is a fantasia employing a chorus, whereas a "chorale fantasia" is a fantasia based on a hymn tune. Unfortunately, the situation is further complicated by the fact that the word "chorale" usually refers to the hymn tunes of the German Protestant Church, which in German are called *Choral* (accent on the last syllable), while, on the other hand, the equivalent of the English adjective "choral" is the German noun *Chor-* (united to the noun it precedes). Thus, we have the following equivalents: E. choral fantasia = G. *Chorfantasie*; E. chorale fantasia = G. *Choralfantasie*. Similarly: choral cantata = *Chorkantate*; chorale cantata = *Chorkantate*.

**Choralbearbeitung** [G.]. Generic term for any composition based on a *Choral* (chorale). The term refers chiefly to the various methods of composition used for Protestant chorales from 1600 to 1750 [see *Chorale cantata*; *Chorale fantasia*; *Chorale prelude*; *Chorale variations*; *Organ chorale*]. However, it has also been used by German musicologists (Handschin and others) for compositions based on Gregorian melodies, especially for the organa and clausulae of the 12th and 13th centuries. In its broadest sense, the term would also apply to numerous other types, e.g., 15th- and 16th-century settings of Gregorian hymns, of the Marian antiphons, the Magnificat, and even to Masses such as a *Missa Salve regina*.

**Choral cantata** [G. *Chorkantate*]. A cantata that employs a chorus (as most cantatas by Bach do), as opposed to a solo cantata (the usual type of the 17th-century Italian cantata). For the German term *Chorkantate*, see *Chorale cantata*.

**Chorale** [G. *Choral*]. A hymn tune of the German Protestant Church. The importance of the Protestant chorale lies in its central position in German baroque music as the basis of numerous

cantatas and of the whole tradition of the organ chorale.

Long before any other people, the Germans began to sing hymns in their native language [see Hymn IV]. This continuous tradition came to full flower under Martin Luther (1483–1546). An accomplished musician himself, Luther considered the chorale a pillar of his reform movement and played a very active part in building a repertory of texts and melodies suitable for this purpose. In conformity with his principle of congregational participation, he favored vernacular texts and simple, tuneful melodies. In his search for suitable texts Luther resorted chiefly to Roman Catholic hymns, many of which he (or his collaborators) translated into German, e.g.: "Num komm, der Heiden Heiland" ("Veni redemptor gentium"); "Herr Gott, dich loben wir" ("Te deum laudamus"); "Der Tag, der ist so freudenreich" ("Dies est laetitiae"); "Wir glauben all' an einen Gott" ("Credo in unum deum patrem omnipotentem"), etc. The chief sources for his melodies were secular songs for which he or his collaborators provided new (sacred) texts ["geistliche Kontrafaktur"; see Parody]. Examples of chorale melodies borrowed from such songs are: "Durch Adams Fall ist ganz verderbt" (from the Pavia song: "Freut euch, freut euch in dieser Zeit"); "Von Gott will ich nicht lassen" (from a love song: "Einmal tat ich spazieren"); "Was mein Gott will, das g'scheh' allzeit" (from the chanson: "Il me suffit de tous mes maux," published by Attaignant, 1529); "Auf meinen lieben Gott" (from Regnart's "Venus du und dein Kind").

The earliest sources of Protestant chorales are two publications of 1524, the co-called "Achtliederbuch" (containing 8 poems to 4 melodies; original title: *Etlich Cristlich lider Lobgesang . . . in der Kirchen zu singen*) and the two-volume *Enchiridion oder eyn Handbüchlein* with 25 poems to 16 melodies. These books, as well as those published by Klug (Wittenberg, 1529, '35, '43), Blum (Leipzig, 1530), Schumann (Leipzig, 1530), and Babst (Leipzig, 1545, '53), give only melodies, which were sung by the congregation in unison. Many of the most beautiful chorales, still sung today, are found in these early books. It should be noted, however, that their original form shows a much less conventional and, for that matter, a much more impressive rhythmic form than that of the present day. Especially interesting is the irregularity of phrasing and meter [ex. in *AdHM* i, 448].

The year 1524 also marks the beginning of

musical composition based on the Protestant chorales. J. Walther's *Geystliches Gesangk Buchleyn* [see Editions XLVII, 7] contains 38 polyphonic settings (for three to six voices) of such melodies in the style of the Flemish motet, i.e., with the melody in the tenor and with occasional imitation in the contrapuntal voices [see *HAM*, no. 111; *AdHM* i, 449]. Similar publications are G. Rhau, *Neue deudsche geistliche Gesenge* (1544; *DdT* 34) and J. Spangenberg, *Cantiones ecclesiasticae latinae... Kirchengesenge deudtsch* (1545). The involved polyphonic texture of these pieces naturally excludes the possibility of congregational performance or even participation. A decisive step toward fuller realization of Luther's ideal was taken by Lucas Osiander (1534–1604) in his *Fünfftzig geistliche Lieder und Psalmen* (1586). Here the melody was placed in the discant and a simple homophonic style (cantional style; see *Cantionale*) was adopted for the accompanying parts. His example was followed by Sethus Calvisius (*Harmonia cantionum ecclesiasticarum*, 1597), H. L. Hassler (*Kirchengesänge, Psalmen und geistliche Lieder... simpli-citer gesetzt*, 1608), and S. Scheidt (*Tabulatur-Buch Hundert geistlicher Lieder und Psalmen*, 1650).

The 17th century saw continued activity in the creation of chorale melodies (monophonic as well as polyphonic or with figured bass), although generally with inferior results. The tunes do not possess the originality and forcefulness of the earlier ones, becoming more sentimental and conventional. Nonetheless, composers such as J. Crüger (1598–1662), J. Schop (c. 1590–1667), J. G. Ebeling (1637–76), J. Hintze (1622–1702), and J. R. Ahle (1625–73) contributed many fine tunes to the texts of Paul Gerhardt, Johann Rist, and others. Particularly important is the repertory of compositions based on chorale melodies. The cantatas, oratorios, and Passions of the late 17th and early 18th centuries (especially those of Bach) contain numerous examples of vocal chorale composition in a simple homophonic style as well as in elaborate contrapuntal texture. Simultaneously, there developed the no less impressive repertory of the \*organ chorale, or, as it is often called, chorale prelude.

To the present-day musician the chorales are best known through Bach's harmonized versions. It is interesting to compare Bach's settings with, e.g., those of S. Scheidt, his predecessor by 100 years (b. 1587). The accompanying example (*Jesus Christus unser Heiland*: a. Scheidt,

b. Bach) shows that all the elements of Bach's method are already present in Scheidt. Ex. in *HAM*, nos. 111, 167a, 190.

Jahrhundert* (1853; repr. 1961); Johann Westphal, *Das evangelische Kirchenlied in geschichtlicher Entwicklung* (1911); C. Böhm, *Das deutsche evangelische Kirchenlied* (1927); P. Gabriel, *Das deutsche evangelische Kirchenlied von Martin Luther bis zur Gegenwart* (1951); Archibald W. Wilson, *The Chorales; Their Origin and Influence* (1920). See also the books on Bach by Spitta, Schweitzer, and C. S. Terry; G. R. Woodward, "German Hymnody" (*PMA* xxxii).

**Chorale cantata** [G. *Choralkantate*]. A term applied, usually with reference to Bach's works, to cantatas in which chorale texts (and, as a rule, chorale melodies) are used for movements other than the final one, which is nearly always a harmonized chorale. The following types may be distinguished [see W. G. Whittaker, *Fugitive Notes on Certain Cantatas and the Motets of J. S. Bach* (1924)]: (a) those in which chorale texts are used for all the movements; (b) those in which some of the chorale verses are recast in free poetry in order to allow for aria-like treatment; (c) those in which chorale texts are used in some movements while the others are free recitatives or arias. The only example of (a) is Bach's early cantata, "Christ lag in Todesbanden." An example of (b) is, "Ach Gott vom Himmel," and of (c), "Wachet auf" and "Ein'

feste Burg." C. S. Terry's book, *J. S. Bach, Cantata Texts* (1926), affords an excellent aid to such classification since the chorale texts are distinguished from the free texts by being printed in italics. Bach's predecessors in the use of chorale texts and melodies for cantatas were F. Tunder (1614–67; *DdT* 3), J. Kindermann (1616–55; *DTB* 24), J. Rosenmüller (c. 1620–84), W. Briegel (1626–1712), J. P. Krieger (1649–1725; *DdT* 53/54), J. Pachelbel (1653–1706; *DTB* 6), and J. Kuhnau (1660–1722; *DdT* 58/59).

**Chorale fantasia.** An organ composition in which a chorale melody is treated in the free manner of a fantasia, involving various techniques, such as ornamentation, fragmentation, echo effects, etc. S. Scheidt's *Fantasia super Ich ruf zu dir, Herr Jesus Christ* [*DdT* 1; also in K. Straube, *Alte Meister* (1904)], his greatest organ composition, is actually a \*chorale motet. True chorale fantasias, all of large dimensions (150 to 400 measures), occur in the works of the North German composers. The earliest examples are two compositions by Johannes Stephani, preserved in the organ tablature of Celle, 1601 [\*Editions XI, 17]. Others are by J. Praetorius (*Durch Adams Fall*; in G. Gerdes, *46 Choräle für Orgel* [1957]), H. Scheidemann (*Ein' feste Burg*, preserved in the Peplin tablature), N. Hasse (*Komm heiliger Geist*; in \*Editions XI, 10), J. A. Reincken (*An Wasserflüssen Babylon*; in \*Editions XI, 16), F. Tunder (*Komm Heiliger Geist; Was kann uns kommen an für Not*; repr. in R. Walter, ed., *Franz Tunder: Sämtliche Choralbearbeitungen für Orgel* [1958]), D. Buxtehude (*Nun freut euch, Gelobet seist du, Wie schön leuchtet*), V. Lübeck (*Ich ruf zu dir Herr Jesu Christ*), and G. Böhm (*Vater unser im Himmelreich*; repr. in J. Wolgast, *Georg Böhm: Sämtliche Werke* [1927–32]). To the same type belong some early compositions of Bach's (*Christ lag in Todesbanden, Ein' feste Burg*) that show the influence of Böhm, especially in the peculiar fragmentary treatment of the chorale melody.

**Chorale fugue.** A term often used as a synonym of \*chorale motet but that might better be used for a different type of chorale composition, nearly always for organ, in which there is imitative treatment only of the initial line of the chorale melody, which thus becomes the theme of a real fugue. As a result of this restriction, the chorale fugue is much shorter as well as stylistically simpler than the chorale motet. This type was cultivated mainly by the Middle German composers. One of the earliest examples is

*Erbarm dich mein* by J. S. Bach's great-uncle, Heinrich Bach (1615–92; repr. in A. Ritter, *Zur Geschichte des Orgelspiels*, 2 vols. [1884], ii, no. 101). Many others were written by his sons, Johann Christoph (1642–1703) and Johann Michael (1648–94), and by Pachelbel. Those by J. S. Bach are often termed *fughetta*.

**Chorale motet.** A composition in which a chorale melody is treated in motet style [see Motet II], i.e., as a succession of fugal sections, each based on one of the successive lines of the chorale. Examples abound in vocal music from Josquin ("Veni sancte spiritus") to Bach (first movements of cantatas nos. 16, 27, 58, 60, 73, 95, etc.) as well as in organ music, where the chorale motet is one of the principal types of organ chorale. Perhaps the earliest example is H. Buchner's *Maria zart* (preserved in Kleber's tablature of 1524, where it is designated as *fuga optima*). A number of 16th-century organ hymns also belong to the same type, e.g., Cavazzoni's *Pange lingua* (see Editions IX, 6) and Cabezón's *Christe redemptor* (see Editions XX, 3, p. 54f). In the 17th century the chorale motet represents the most solemn and magnificent treatment of a chorale. M. Praetorius' *Christ unser Herr* (410 measures) and Scheidt's *Fantasia super Ich ruf zu dir*, for example, indicate the beginning of a development that culminated in such works as Bach's *Nun komm, der Heiden Heiland* and *Wenn wir in höchsten Nöten sein*. See W. Morgan, "The Chorale Motet between 1650 and 1750" (diss. Univ. of Southern California, 1956).

**Chorale prelude** [G. *Choralvorspiel*]. An organ composition based on a Protestant chorale and designed to be played before the chorale is sung by the congregation. Actually only simple and short settings belong to this category. For this reason, and because of the close historical connection between the Protestant chorale prelude and the earlier organ hymns of the Roman Catholic service, which cannot in any sense be considered "preludes," the whole subject is treated under Organ chorale.

**Chorale variations.** Variations on a chorale melody, nearly always for organ or harpsichord, occasionally for lute. In the late baroque period this form was often called a partita (Pachelbel, Bach). It was favored especially by the earliest composers of Protestant organ chorales. All the settings by Sweelinck and nearly all those by Scheidt consist of variations, called *versus*. There are many other examples in the works of

Scheidemann, Tunder, Buxtehude, Pachelbel, Böhm, Walther, and others. Bach contributed to this field three sets of his earlier period as well as one of his latest works, the *Fünf canonische Veränderungen über das Weihnachtslied*. The number of variations is sometimes the same as the number of stanzas of the chorale. Occasionally the textual meaning of a stanza is reflected in the musical treatment of the corresponding variation, e.g., by the use of a chromatic motif for a stanza expressing grief. Particularly remarkable for their dramatic pictorialism are Tunder's variations on "Jesus Christus unser Heiland" (repr. in K. Straube, *Choralvorspiele alter Meister* [1951], and in R. Walter, ed., *Franz Tunder: Sämtliche Choralbearbeitungen für Orgel* [1956]). A recent example of chorale variations are E. Krenek's (b. 1900) variations on "Ja ich glaub an Jesum Christum" (*Toccata und Chaconne*, op. 13), in which the chorale is treated as an allemande, sarabande, gavotte, waltz, fugue, and foxtrot (*sic!*). The impression of sacrilege is somewhat mitigated by the reference to what may have been Krenek's model, namely, Buxtehude's variations on "Auf meinen lieben Gott," which consist of an allemande, sarabande, courante, and gigue, thus forming one of the numerous examples of the 17th-century fusion of variation and suite [see Variations IV (2)].

**Choralfuge** [G.]. \*Chorale fugue or \*chorale motet.

**Choralis Constantinus.** A large cycle of liturgical compositions written by H. Isaac (c. 1450–1517) for the Cathedral of Constance, completed by his pupil, L. Senfl, and published posthumously by Formschneider (Nuremberg) in three volumes (1550–55). Similar to the \**"Magnus liber organi,"* written more than 300 years earlier, it consists of settings of the Proper of the Mass but on a much more comprehensive scale. Book I contains the Mass Propers for all Sundays; Book II, those for the feasts of the Lord and the Saints; Book III, those for the Common of Saints and for the Virgin. Each Mass consists (normally) of Introit, Alleluia or Tract, Sequence, and Communion, the Graduals and Offertories being regularly omitted. Books I and II are reprinted in *DTO* 10 and 32, Book III in L. E. Cuyler, *Heinrich Isaac's Choralis Constantinus Book III* (1950).

Lit.: R. Wagner, "Die Choralverarbeitung in Heinrich Isaacs Offizienwerk 'Choralis Constantinus'" (diss. Munich, 1950); L. E. Cuyler,

in *JAMS* iii; O. zur Nedden, in *ZMW* xii, 449; P. Blaschke, in *KJ* xxvi.

**Choralmotette** [G.]. \*Chorale motet.

**Choral music.** Music for a chorus or choir, i.e., vocal music for more than one singer to the part. The music may consist of a single part (monophonic) or of a number of parts (polyphonic, in the broadest sense), with or without instrumental accompaniment.

Choral groups were used in Biblical times as well as in the Greek drama [see Greece; Jewish music]. Their music, as well as that of Christian chant, was monophonic. Gregorian chant was performed either by two alternating choirs [see Antiphonal singing] or by a soloist alternating with a choir [see Responsorial singing]. The latter method was used in polyphonic responsorial chants (graduals, alleluias, responsories), such as the organa of the school of Notre Dame. Only the solo sections of the chant were composed and, accordingly, were sung by a small group of specially trained soloists, the other sections being performed by the choir in plain-song. Evidence of choral polyphony, i.e., polyphonic music performed by a choir, first appears in compositions from c. 1425, in which alternating sections are marked *unus* (or *duo*) and *chorus*. An example is a Credo by Guillaume Legrant [see *HAM*, no. 56], in which the solo sections are written in two-part polyphony and the choral sections in three-part homophony. The appearance, c. 1430, of large \*choirbooks [see Lit., Bukofzer, in *PAMS*, p. 27] is an indication that choral performance became a more general practice. A famous miniature from c. 1470 [see *MGG* ix, opp. cols. 1839–40] shows Ockeghem leading a group of eight singers, obviously two to each part. The papal chapel of that time consisted of nine to twenty-four singers. Throughout the 16th century, Masses, motets, and other forms of sacred music were probably performed by groups of similar size, while solo performance, with one singer to each part, seems to have been the prevailing practice for secular music (chansons, madrigals, etc.).

In the mid-15th century the antiphonal method of Gregorian chant was applied to polyphonic music written for two alternating choruses, which, from c. 1520 on, were also used simultaneously [see Polychoral style]. A similar practice is represented by the \**decani* and *cantoris* choirs used in Anglican churches. The essentially homophonic style of these compositions suggests that fairly large choirs were em-

ployed, especially in the magnificent compositions of the \*Venetian school.

In the early 17th century, the chorus of ancient Greek tragedy was revived in opera, the earliest examples being in Peri's *Euridice* (1600) and Monteverdi's *La Favola d'Orfeo* (1607). The Roman opera particularly is distinguished by extensive use of the chorus [see Opera III]. About the same time, G. Carissimi gave the chorus a prominent role in the oratorio, and H. Schütz, F. Tunder, D. Buxtehude, and others introduced it into the German cantata [see Cantata III]. The long choral compositions in Handel's oratorios and in Bach's Passions and cantatas represent the climax of this development. Their choirs included no more than twenty to thirty singers. The subsequent history of choral music is closely connected with that of the oratorio (Haydn, Mendelssohn, Schumann, and others; see Oratorio IV) and 19th-century opera (Weber, Verdi, and others). A singular contribution to the literature is the last movement of Beethoven's Ninth Symphony [see Choral Symphony].

A significant aspect of 19th- and 20th-century choral music is the use of greatly enlarged choruses. Under the influence of democratic and nationalist ideas, choral groups consisting of many hundreds of middle-class amateurs, both men and women, were formed, first in England for performances of Handel's oratorios, later in Germany. Mendelssohn, in his performance of the St. Matthew Passion in 1829, employed a chorus of 300 singers, more than ten times the number used in Bach's day. Groups numbering into the thousands were not uncommon in some of the \*festivals. Since about 1945 this trend has been partly reversed in performances of old choral compositions for which small groups of well-trained singers have been employed, with most successful results. See Performance practice.

**Choralnotation** [G.]. Properly, the notation of Gregorian chant [G. *Gregorianischer Choral*]. Actually, the term is applied mainly to later repertoires of monophonic music, such as hymns and sequences, or the songs of the troubadours, trouvères, minnesingers, etc. [see *WoHN* i, 146–197]. See Monophonic notation.

**Choralpartita** [G.]. \*Chorale variations.

**Choralrhythmus** [G.]. The rhythmic interpretation of the "Gregorianische Choral," i.e., Gregorian chant; see Gregorian chant VI.

**Choral Symphony.** Popular name for Beethoven's Symphony no. 9 in D minor, op. 125 (1823–24), which in the last movement uses a chorus (and four soloists) in addition to the orchestra. The formal plan of the symphony is: I. Allegro; II. Scherzo with Trio; III. Adagio; IV. Introduction (with quotations of themes from the preceding movements), Allegro assai (with chorus on Schiller's poem, "Ode to Joy" [G. "Freude, schöner Götterfunken"]). The original title is: *Sinfonie mit Schlusschor über Schillers Ode: "An die Freude," für grosses Orchester, 4 Solo- und 4 Chorstimmen*.

**Choralvorspiel** [G.]. \*Chorale prelude.

**Chorbuch** [G.]. \*Choirbook.

**Chord.** The simultaneous sounding of three or more tones, two simultaneous tones usually being designated as an interval. Chords can be divided into two main classes, consonant and dissonant. To the former belong the major and minor \*triad and their \*inversions, i.e., the \*sixth chord and the \*six-four chord; to the latter all the others, e.g., the \*seventh chord, the \*ninth chord, the augmented sixth chord, and the numerous strongly dissonant formations of recent music, some of which are derived from the \*fourth chord [see also Mystic chord], while others are completely unrestricted [see Pitch aggregate; Tone cluster]. The study of the chords, their relationships and functions, is an important field of music theory called \*harmonic analysis. See also Consonance, dissonance II.

**Chorda** [Gr., L.]. In medieval treatises, term meaning note or pitch, each of which was thought to be represented by a string (of the kithara, etc.). Generally, fifteen *chordae* are postulated, each corresponding to one note of the Greek scale, from A to a" (Boethius; Regino, in *GS* i, 240b; Adam of Fulda, in *GS* iii, 351a).

**Chordal style.** A composition or a passage is said to be in chordal style if its texture consists essentially of a series of chords. In strict chordal style there is a given number of parts, usually four (e.g., a hymn); in free chordal style there is no such restriction (e.g., Chopin's *Prélude* no. 20). See Homorhythmic.

**Chordophone.** See under Instruments IV.

**Chorea** [L.]. In medieval writings, a dancing song [Johannes de Grocheo, c. 1300; Robert de Handlo, 1326, see *CS* i, 402]. In 16th- and 17th-century lute books, *chorea* is a generic term for dance (e.g., in the MS lute book of W. Dlugoraj, 1619; see J. Dieckmann, *Die in deutscher Lauten-tabulatur überlieferten Tänze des 16. Jahrhunderts*, 1931, pp. 103ff), or for specific dances such as the *passamezzo* [B. de Drusina, *Tabulatura continens . . . fantasias . . . choreas . . .* (1556); see *ibid.*, p. 116] and the *allemande* [see J.-B. Besard, *Thesaurus harmonicus* (1603): "Chorea quas Allemande vocant germanico"]].

**Chorister.** Boy singer in an English choir. See *GD* i, 641f; *GDB* ii, 123f.

**Chorlied** [G.]. Choral song, particularly without accompaniment (Schumann, Mendelssohn, and others).

**Choro** [Port.]. Originally, Brazilian term for an ensemble of serenaders, i.e., a kind of popular band consisting of small and large guitars, flutes, trumpets, and percussion instruments. The kind of music played by these groups in popular festivities was known as *músicas de choro*. Today the term is very loosely used for many kinds of ensemble music in which one instrument dominates the others and is used for virtuoso improvisation. In form the *choro* may resemble a waltz, a *\*maxixe*, or a *\*samba*. Villa-Lobos and many other Brazilian composers have used the *choro* in art music. J.O-S.

**Chororgel** [G.]. Choir organ.

**Chorton** [G.]. See under Pitch (2).

**Chorus.** (1) A large body of singers, not connected with a church [see Choir]. Also, music for such a body [see Choral music]. (2) Medieval

Latin name for the *\*crwth* or the *\*bagpipe* [see *SaRM*, p. 80]. (3) Same as *burden*, *refrain*.

**Chorwerk, Das.** See Editions VIII.

**Christmas Concerto.** Corelli's *Concerto Grosso* in G minor, op. 6, no. 8, entitled "Fatto per la Notte di Natale" (made for Christmas Night). The closing movement is a *\*pastorale*.

**Christmas Oratorio** [G. *Weihnachtsoratorium*]. Bach's *Christmas Oratorio*, composed in 1734, consists of six church cantatas, intended to be performed on six different days between Christmas Day and Epiphany. The title *Oratorium*, though Bach's own, is somewhat inappropriate, since the work is not based on a continuous narrative. A number of the pieces in the oratorio are borrowed from earlier cantatas. An important forerunner of Bach's work is H. Schütz's Christmas oratorio, entitled *Historia der freuden- und gnadenreichen Geburt Gottes und Marien Sohnes, Jesu Christi* (1664). The edition by Spitta in vol. i of Schütz's complete works was completed (on the basis of newly discovered material) by A. Schering, who also edited a score for practical use.

**Christ on the Mount of Olives.** See *Christus am Ölberge*.

**Christophe Colomb** [F., Christopher Columbus]. Opera in two parts by D. Milhaud (libretto by P. Claudel), produced in Berlin, 1930. Setting: Spain, end of 15th century.

**Christus.** Oratorio by Liszt to words from the Scriptures and the Roman Catholic liturgy, composed 1855-66. Also, an unfinished oratorio by Mendelssohn.

**Christus am Ölberge** [G., Christ on the Mount of Olives]. Oratorio by Beethoven, op. 85 (libretto by F. X. Huber), produced in Vienna, 1803.

**Chroai** [Gr.]. In ancient Greek theory, the microtonic modifications of the two movable tones of the tetrachord. Aristoxenos mentions, in addition to the enharmonic tetrachord that divides the interval of the fourth (a to e downward) into the steps  $2 + \frac{1}{4} + \frac{1}{4}$ , divisions such as  $1\frac{1}{4} + \frac{3}{4} + \frac{1}{2}$  (variant of the diatonic tetrachord  $1 + 1 + \frac{1}{2}$ ) and  $1\frac{5}{8} + \frac{1}{8} + \frac{1}{8}$  or  $1\frac{3}{4} + \frac{3}{8} + \frac{3}{8}$  (variants of the chromatic tetrachord  $1\frac{1}{2} + \frac{1}{2} + \frac{1}{2}$ ). These schemes probably represent attempts on the part of theorists to rationalize microtones such as occur in Oriental melodies, or in the playing of the *\*aulos*. See C. Sachs, *The Rise of Music in the Ancient World* [1943]; *RiHM* i.1,

218; T. Reinach, *La Musique grecque* (1926), p. 20 ("Nuances").

**Chromatic.** The adjective is used in the following connections: (1) Chromatic scale [see Chromaticism]. (2) Chromatic tetrachord or genus [see Greece II]. (3) Chromatic instruments, i.e., instruments capable of producing all (or nearly all) the tones of the chromatic scale. Thus, chromatic horn is the name of the valve horn, as distinct from the natural horn. For chromatic harp, see Harp II. (4) In the 16th century the word *cromatico* occasionally refers to the use not of semitones but of the black notes, *semiminima fusa* (or *croma*), *semifusa* (or *semicroma*), i.e., of the smallest values, corresponding to our modern eighth notes, sixteenth notes, etc. This usage occurs particularly in titles such as *Il Primo Libro de madregali cromatici a cinque* (C. de Rore, 1544), which means madrigals in shorter note values, hence in faster tempo than the earlier madrigals, written in a more sedate style. Another name for the same type was *madrigali a note nere* (in black notes; see J. Haar, "The Note nere Madrigal," in *JAMS* xviii).

**Chromatic Fantasia and Fugue.** A composition for harpsichord by J. S. Bach, which uses extended chromatic harmonies in the fantasy and a chromatic progression in the theme of the fugue. The fantasy is in the character of a free improvisation, alternating among brilliant passage work, quiet arpeggios, and highly expressive recitatives. It is a relatively early work of Bach's, displaying an exuberance and subjectivity absent in his later works.

**Chromaticism.** In the widest sense, the use of pitches not present in the diatonic scale but resulting from the subdivision of a diatonic whole tone into two semitonal intervals, e.g., of f-g into f-f# and f#-g. The application of this principle to all five whole tones of the diatonic scale produces the chromatic scale, with twelve tones to the octave.

Chromaticism appeared first in the chromatic tetrachord of Greek music, in which the (descending) fourth is subdivided into a minor third and two semitones: a-f#-f-e, e-c#-c-B. One of the few remnants of Greek music, the First Delphic Hymn [*HAM*, no. 7a], includes truly chromatic progressions such as b-c'-c'-b and a#-b-c'-c'-b. In Western music, certain semitonal degrees, b<sup>b</sup>, e<sup>b</sup>, f#, occur as early as c. 900 in the "Musica enchiriadis" [see Theory, 3] and in Gregorian chant; in the latter, however,

the e<sup>b</sup> and f# were eventually eliminated by means of transposition [see *ApGC*, pp. 161ff]. In the early 14th century a full chromatic scale was not only discussed by theorists (Marchetto da Padua) but also found on keyboard instruments, at least in the middle octave. However, the "chromatic" tones were not used for chromaticism but for transposed diatonicism, the introduction of leading tones, etc. See *Musica ficta*.

True chromaticism, involving two successive semitones, appears in the 16th century, as the result of Vicentino's endeavors to revive the diatonic, chromatic, and enharmonic genera of ancient Greek music (*L'Antica Musica ridotta alla moderna prattica*, 1555). The role played by Willaert in this matter is uncertain. The earliest indisputable example of melodic chromaticism occurs in the madrigal "Calami sonum ferentes" (1561) by Willaert's pupil Cypriano de Rore, which starts with an imitative passage based on the subject B-c-c#-d-d#-e-f#-g [see *ReMR*, p. 331]. Luca Marenzio (1553-99) and particularly Carlo Gesualdo (c. 1560-1613) exploited the new tonal material harmonically and melodically, by juxtaposing chords such as G major and E major, or A minor and F-sharp major [see *HAM*, no. 161; *SchGMB*, nos. 165, 167]. Highly expressive examples of chromaticism are found in the motets of Lassus' *Prophetiae sibyllarum*, written perhaps as early as 1560.

In vocal music of the baroque period, chromaticism occurs mainly in the form of motifs that accompany words expressing grief, e.g., in H. L. Hassler's motet "Ad Dominum cum tribulauer" [see Editions VIII, 14]. Several composers wrote pieces requiring a full chromatic keyboard, e.g., John Bull in his "Ut re mi fa sol la" [see Hexachord VI], G. P. Cima in his *Partito de ricercari* (1606), which contains an appendix where a short example is transposed in all twelve keys, and M. A. Rossi (b. c. 1600), whose Toccata no. 7 closes with an ascending chromatic scale in major thirds [see Editions IX, 26]. An amusing example of chromatic pictorialism is found in the variation "Alter Weiber Conduct" (Old Hags' Procession) from Poglietti's *Aria allemanda* of c. 1670 [*DTO* 27; *TaAM* viii]. Also common is the use of chromatic progressions for fugal subjects (Sweelinck, Frescobaldi, Kerll, and others; *SchGMB*, no. 158), particularly for countersubjects (common in Bach: *The Well-Tempered Clavier* ii, no. 18; Harpsichord Fugue in A minor; the theme \*B-A-C-H of the *\*Art of Fugue*). An important innovation of the late 17th century is the use of chromatic chords,

mainly the diminished seventh chord. The accompanying figure shows a passage from a toccata by A. Scarlatti [\*Editions X, 13, p. 39]. The most famous example of this kind occurs in the closing passage of Bach's Chromatic Fantasy.

In the classical period of Haydn, Mozart, and the early Beethoven, chromaticism is comparatively rare, aside from the use of rapid chromatic scales in coloraturas, cadenzas, etc. It is not until Beethoven's latest works (e.g., the short slow movement of his Piano Sonata in A major, op. 101) that we find passages reminiscent of those from Bach's Chromatic Fantasy or from his Fantasy and Fugue in G minor for organ. After Beethoven, however, began a new era of chromaticism, characterized by the exploitation of chromatically altered harmony. To describe this phase of chromaticism would be tantamount to writing a study on romantic harmony. The examples given under harmony [see Harmony B (8)] show how greatly chromaticism changed music in the period from 1850 to 1900. After 1900 chromaticism lost its former connotation as a "color modification" of diatonicism and established itself as a tonal province in its own right, based on the equivalence of the twelve tones of the chromatic scale. This idea is clearly apparent in Debussy's \*whole-tone scale and was brought to its extreme in Schoenberg's \*atonality and twelve-tone technique, in which the twelve chromatic notes are treated as a material in their own right, without any pre-established relationships between them [see Serial music].

About 1920, there began a reaction against excessive chromaticism, whether romantic, impressionist, or atonal (expressionist). It found its most conspicuous manifestation in the \*pandiatonicism of composers such as Stravinsky, Poulenc, and others.

**Chromatic scale.** See Chromaticism.

**Chronos, chronos protos** [Gr.]. The temporal or rhythmic unit of ancient Greek music. It is not divisible into smaller values and is usually represented in modern transcriptions by an

eighth note. Values of double or triple duration (quarter note, dotted quarter note) can be derived from it. The *chronos protos* [F. *temps premier*] is also the basis of rhythm in many Eastern cultures, e.g., Arab, Syrian, Hindu, etc.

**Chrotta.** See under Crwth.

**Church modes** [L. *modus, tonus*]. I. The church modes (ecclesiastical modes) are a medieval system of eight scales, each consisting of the tones of the C-major scale (white keys) but starting and closing on d, e, f, or g and limited to the range of about an octave. For each of these four notes, called a final (*finalis*), there exist two modes distinguished by the different position of the octave range (ambitus) and called respectively authentic and plagal. In the *authentic modes* the ambitus extends from the final to the upper octave; in the *plagal modes*, from the fourth below the final to the fifth above it. The octave range or ambitus of either form of mode may be enlarged by the addition of the *subtonium*, i.e., the tone below its lower limit or by a tone (even two) above. This additional tone is of particular importance in the authentic modes, where it is used for cadences (c-d, d-e, etc.), and in these it is also called the subfinal (*subfinalis*). The eight scales just described are the tonal basis of Gregorian chant. Ex. 1 illustrates the two modes on d (the note in parentheses is the

*subtonium*). In the 16th century (H. Glareanus, \*Dodecachordon\*, 1547), the eight-mode system of Gregorian chant was enlarged to include the two scales on a and the two scales on c' (essentially our minor and major), thus bringing the number up to twelve.

The earliest designation (9th century) for the modes was derived from the names *protus*, *deuterus*, *tritus*, and *tetrardus* (corruptions of Gr., first, second, third, fourth) given to the four basic finals: *protus authenticus* (final d; range d–d'), *protus plagius* (d; A–a), *deuterus authenticus* (e; e–e'), *deuterus plagius* (e; B–b), etc. Slightly later we find the most common (and preferable) designation, in which the modes (originally called \**tonus*) are numbered in the same order: *primus tonus* (d; d–d'), *secundus tonus* (d; A–a),

			Fin.	Amb.	Dom.
I.	<i>Protus auth.</i>	<i>Primus tonus</i>	Dorian	d	d-d' a
II.	" <i>plag.</i>	<i>Secundus t.</i>	Hypodorian	d	A-a f
III.	<i>Deuterus auth.</i>	<i>Tertius t.</i>	Phrygian	e	e-e' c'
IV.	" <i>plag.</i>	<i>Quartus t.</i>	Hypophrygian	e	B-b a
V.	<i>Tritus auth.</i>	<i>Quintus t.</i>	Lydian	f	f-f' c'
VI.	" <i>plag.</i>	<i>Sextus t.</i>	Hypolydian	f	c-c' a
VII.	<i>Tetrardus auth.</i>	<i>Septimus t.</i>	Mixolydian	g	g-g' d'
VIII.	" <i>plag.</i>	<i>Octavus t.</i>	Hypomixolydian	g	d-d' c'
IX.		<i>Nonus t.</i>	Aeolian	a	a-a' e'
X.		<i>Decimus t.</i>	Hypoaolian	a	e-e' c'
XI.		<i>Undecimus t.</i>	Ionian	c'	c'-c'' g'
XII.		<i>Duodecimus t.</i>	Hypoionian	c'	g-g' e'

Church modes (Roman numerals refer to Ex. 2, below).

etc. Another terminology, rarely employed in the Middle Ages but commonly used today, borrows its names from ancient Greek theory: the four authentic modes are called Dorian, Phrygian, Lydian, and Mixolydian; the prefix hypo- is employed for the plagal modes (Hypodorian, etc.). To these names Glareanus added Aeolian (for a) and Ionian (for c'). See also Maneria.

II. In addition to the final and ambitus, each mode is usually said to have a third characteristic, called the dominant, somewhat in the nature of a secondary tonal center. As a rule, the dominant is a fifth above the final in the authentic modes, a third above it in the plagal modes. However, the tone b, which was not used as a final [see above], was also avoided as a dominant and was replaced by c' (in modes III and VIII). Another change occurred in mode IV, where the dominant g was raised to a. Actually, these dominants are a characteristic less of the modes—they play only a minor or, at least, a very questionable role in the Gregorian melodies—than of a few special recitation formulas associated with the modes, that is, the eight psalm tones (also tones for the Magnificat, etc.), in which they are used as the pitch for the monotone recitation. Therefore, what is called dominant should properly be called recitation tone (*repercussio, tenor, tuba*; see Psalm tones). Other so-called "characteristics" of the modes—mediant, participant, modulation [see *GD* iii, 483; *GDB* v, 405]—are of very little or highly questionable importance. The above-explained characteristics and names are shown in the table above and in Ex. 2.

In modern writings the twelve-mode system is sometimes enlarged to one of fourteen by the

addition of the Locrian and Hypolocrian, based on the tone b as the final. These modes are mentioned by Glareanus (under the names Hyperaolian and Hyperphrygian) but rejected because they involve a diminished fifth (b-f') above the final, an obvious impossibility in the practice of his day. It is interesting to note, however, that "Locrian" passages are not uncommon in Gregorian melodies of mode III, which sometimes introduce a temporary b-flat.

III. To account for melodies that exceed the ambitus as prescribed in the eight-mode system, late medieval theorists (Marchetto da Padua; see *GS* iii, 101b) introduced, in addition to the terms *tonus perfectus* and *imperfectus* (normal and small range), *tonus plusquam perfectus* (upward extension of authentic, downward extension of plagal), *tonus mixtus*, also called *mixed mode* (downward extension of authentic, upward extension of plagal), and *tonus commixtus* (combination of an authentic with a different plagal). Tinctoris (*CS* iv, 28f) calls the last two formations *mixtio* and *commixtio*.

Zarlino, in his *Istitutioni harmoniche* of 1558, adopted Glareanus' system of twelve modes but placed the Ionian and Hypoionian first, so that the series began with the two modes on c—an early indication of the growing awareness of the importance of the "major mode." In the latter part of the 16th century, French musicians adopted a new terminology by applying Glareanus' names—from Dorian to Ionian—to Zarlino's series of tones, from c to a. This practice occurs for the first time in Claude Le Jeune's *Octonaires de la vanité . . . du monde* (c. 1606; see Editions XXXIII, 1, 8) and is fully explained in C. Guillet, *Vingt quatre Fantaisies . . . disposées selon l'ordre des douze modes* (1610; see Editions XXVIII, 4). It is also observed in Denis Gaultier's *La Rhétorique des dieux* (Editions XLIX, 6, 7; see O. Fleischer, in *VMW* ii).

IV. At one time it was customary to treat the church modes together with the "Greek modes," considering the former derivatives of the latter. This procedure is not to be recommended, since what are usually called "Greek modes" represent a phenomenon of such complexity and involving so many historical changes (many of which are still obscure) that summary statements are likely to be misleading rather than helpful [see Greece II]. The most striking (though by no means the essential) difference between the Greek and medieval systems is that in the former the names Dorian, Phrygian, Lydian, and Mixolydian (D, P, L, M) are associated with a descending series of tones, namely, e, d, c, B, whereas in the latter they occur in an ascending order (d, e, f, g). A (much simplified) explanation of this change is that the Greek octave-segments all had one and the same "tonic," i.e., the tone *a* (*mese*), and that by transposing the descending segments into one and the same octave (e.g., a–a') these "tonics" appear in an ascending order, as shown below:

For a fuller discussion of this problem, see *ReMMA*, pp. 153ff.

The designation, still occasionally en-

countered, of the authentic modes as "Ambrosian" and of the plagal modes as "Gregorian" is entirely without historical foundation. Particularly discreditable is the frequently repeated story that Ambrose "invented" the authentic modes and that Gregory "added" the plagal modes. The implication that the establishment of the theoretical system preceded the actual writing of melodies contradicts the fundamental principles of musical development. Very likely the system of the modes did not originate until the 9th century (they are described for the first time in Aurelian's "Musica disciplina" of c. 850; see *GS* i, 27–63) as an attempt to codify the large repertory of chants that had accumulated, and there is reason to believe that numerous chants were modified to make them conform to the theoretical system.

V. The basic facts and the main problems of the relationship between the eight-mode system and the Gregorian melodies are outlined under Gregorian chant V. Concerning the use of the modes as the tonal basis of polyphonic composition, there is no evidence of methodical treatment prior to the latter part of the 15th century, when the \*Flemish school renewed interest in the Gregorian tradition and in sacred music. The compositions of the 14th century particularly are remarkably free in their tonality, as is already evident from their liberal use of accidentals [see *Musica ficta* IV]. In this respect it is interesting to note that not until after 1500 did composers begin to write polyphonic settings of, e.g., the Magnificat in the various modes (*Magnificat primi toni*, etc.), and that designations such as "toccata primi toni" do not occur before c. 1550 (Andrea Gabrieli). Tinctoris, who seems to have been the first to consider the modes in connection with polyphonic compositions ("Liber de natura et proprietate tonorum," ch. 24; *CS* iv, 29), concludes that a mode is attributable not to the entire composition but only to the individual lines, of which the tenor is the most important. Similarly Glareanus, in his brilliant analyses of the compositions of Josquin and others (*Dodecachordon*), never investigates the mode of a polyphonic composition as such but only the modes of the different voice parts. Pietro Aaron (*Trattato della natura et cognitione di tutti gli tuoni di canto figurato*, 1525), on the other hand, made an attempt to assign a definite mode to a polyphonic composition, saying that the tenor is the determining element [for the difficulties inherent in this proposition and Aaron's attempt to re-

solve them, see *ReMR*, p. 182f]. Modern investigations of "modal usage" in music before 1600 naturally proceed from a different point of view, involving the consideration of harmonic progressions (II-I and III-I rather than IV-I and V-I), cadences, over-all tonality, etc. The omnipresence of the problem of *musica ficta* makes it very difficult to arrive at valid conclusions in this matter. For the role of the church modes in modern music, see *Modality* (also *Mode*). See also the entries under Dorian, Lydian, Mixolydian, and Phrygian.

Cauchie, "La Pureté des modes dans la musique vocale franco-belge du début du XVI<sup>e</sup> siècle" (*CP Kroyer*).

**Church music.** The music of the Christian churches consisted originally of \*chant. In the Eastern Churches (Byzantine, Armenian, Coptic, Syrian) it did not essentially develop beyond monody, but the development in the Roman Catholic Church as early as the 9th century began to embrace polyphonic treatment, thus laying the foundation for the entire development of Western music. Following is a brief survey of the evolution of music of the Roman Catholic, Anglican, and German Protestant churches.

I. The music of the Roman Catholic Church is rooted in the tradition of the Jewish liturgy, as is already evident from the fact that the oldest portions of the Catholic service were the \*psalms and the \*canticles. Some Greek influence appears in the hymns of St. Ambrose [see *Ambrosian hymns*], which differ from the psalms and

canticles in the strictly metrical structure of the text and in the syllabic rather than melismatic style of the music. During the ensuing centuries numerous other chants were added, a process that reached its final stage probably about 800 [see *Gregorian chant* VII]. About the same time came the first attempts to enlarge the Gregorian repertory with newly invented texts and melodies, an activity that is generally known as troping. This led to the monophonic \*sequences, \*tropes, and \*liturgical dramas, as well as, about 900, to the "polyphonic tropes," the organa and their derivatives, the \*clausulae and \*motets of the 13th century. In the latter part of the 13th century the motet, though still retaining its Gregorian ancestry in the *cantus firmus* melody of the tenor, adopted secular (French) texts and occasionally even secular melodies [see *Enté*] for the upper parts, thus showing for the first time an influence of elements that, from the standpoint of the Church, was to be condemned. This and other abuses of a similar nature led to the decree of Pope John XXII, issued from Avignon in 1322, that not only the sacrilegious French motets but all kinds of polyphonic music, with the exception of the archaic organum in parallel fourths or fifths, were no longer to be used. This decree apparently had results that, although sympathetic to the aims of the Church, were detrimental to the development of church music. Indeed, the relative scarcity of sacred compositions in the French and Italian sources of the 14th century may well be explained by the restrictions resulting from the edict; even as late as 1408, polyphonic music (discant) was forbidden in the Cathedral of Notre Dame in Paris. Recent investigations have brought to light a number of Mass compositions, most of which, including the Mass of Machaut, probably were written before 1340 [see *Mass C*].

II. A new era of church music began about 1425. After a long period of secularization, the center of musical activity again shifted back to the Church. Masses and motets became the chief forms of composers such as the English Dunstable (d. 1453), the French Dufay (c. 1400-74), and the long series of \*Flemish masters from Ockeghem (c. 1420-95) and Obrecht (c. 1450-1505) to Lasso (1532-94). Around 1550, Italian composers (Andrea Gabrieli, 1510-86; Palestrina, 1525-94) and Spanish composers (Morales, c. 1500-53; Vittoria, 1540-1611) appeared in successful competition with the Flemish masters, thus leading to an unparalleled flowering of Roman Catholic church music. There also

began, about 1500, a remarkable development of ecclesiastical organ music, designed to supplant the choral performance of hymns, psalm verses [see *Verset*], the Ordinary of the Mass [see *Organ Mass*], and certain chants of special importance, particularly the \*Magnificat and the \*Antiphons *B.M.V.* [see *Salve Regina*]. Composers such as A. Schlick (c. 1450–1527), J. Redford (b. c. 1480), G. Cavazzoni (c. 1525–?), and A. de Cabezón (1510–66) made outstanding contributions in this field.

III. At the same time, however, came the Reformation, which by 1550 led to the establishment of new bodies of church music, chiefly in England [see *Anglican church music*] and Germany. While the English movement found artistic expression in the \*anthem and the \*service (Tallis, 1505–85; Byrd, 1543–1623; Purcell, 1658–95; Handel, 1685–1759), the German Reformation (Luther, 1483–1546) proved to be an event of the greatest musical importance, owing chiefly to the establishment of the Protestant \*chorale as a source of musical creation and inspiration comparable to the Gregorian chant. The chorale not only gave rise to the great wealth of \*organ chorales (Scheidt, 1587–1654; Tunder, b. 1614; Buxtehude, 1637–1707; Pachelbel, 1653–1706; Bach, 1685–1750) but had a lasting—though gradually decreasing—influence on the \*cantata, the chief type of German church music in the baroque period [see also *Chorale cantata*]. Alongside the cantata grew the \*oratorio and the \*Passion, represented by a number of composers from Schütz (1585–1672) to Bach, as well as by Handel in England.

IV. In 17th-century Italy the tradition of Palestrina was continued by the \*Roman school. More important than the activity of this conservative group was the establishment of the oratorio (Carissimi, 1605–74) and the development of instrumental church music, particularly the *sonata da chiesa* (Biagio Marini, 1597–1665; Legrenzi, 1626–90; Corelli, 1653–1713), which, about 1685, spread to England, Germany, and France [see under *Sonata da camera*]. In the 18th century, Italian composers known mostly for their operas (so-called \*Neapolitan school) wrote a large body of church music for voices and instruments, which frequently shows the influence of the virtuoso operatic style. This group includes F. Durante (1684–1755), D. Terradellas (1713–51; *HAM*, no. 298), N. Jommelli (1714–74; *HAM*, no. 299), and G. B. Pergolesi (1710–36), whose *Stabat mater* is one of the few

examples of Italian 18th-century church music generally known today.

V. In the period after 1750 the production of great church music became more scarce, and the ensuing history is a somewhat thinly spread succession of isolated masterworks rather than a continuous development. The oratorio, which found one of its greatest masters in Handel, is perhaps the only type of religious music that can boast of an almost uninterrupted line of composers, English as well as German. More and more, however, it became music for concert hall rather than church. Among the outstanding works of this period are Mozart's *Requiem* (1791), Beethoven's *Missa solemnis* (1823), Rossini's *Stabat mater* (1832), Berlioz' *Messe des Morts* (1837), Brahms' *Ein deutsches Requiem* (1868), Verdi's *Requiem* (1874), Bruckner's *Masses* (1864–67) and *Te Deum* (1881), and Horatio Parker's *Hora novissima* (1893).

Noteworthy 20th-century compositions are Elgar's *Dream of Gerontius* (1900); Holst's *Hymn of Jesus* (1917); Stravinsky's *Symphony of Psalms* (1930) and *Mass* (1948); Walton's *Belshazzar's Feast* (1931); Ernest Bloch's *Sacred Service* (1933); Poulenc's *Messe* (1937); Milhaud's *Service sacré*; Samuel Barber's *Prayers of Kierkegaard* (1954); Randall Thompson's *Passion according to St. Luke* (1963–65), *Mass of the Holy Spirit* (1956), and *Requiem* (1958); and Britten's *War Requiem* (1962). Significant contemporary composers of church music in England and America are listed under *Anthem* and *Service*.

**Church sonata.** The *sonata da chiesa* of the baroque; see under *Sonata da camera*.

**Chute** [F.]. Name for ornamental tones similar to a passing tone (such as occur in the *arpège-ment figuré*; see Arpeggio) or to an anticipation (\*Nachschlag).

**Chyn, guuchyn** (*ch'in*, *ku-ch'in*). A Chinese seven-stringed zither made of hollowed wood, about 4 feet long, 8 inches wide, and 3 inches thick [see ill. accompanying Zither]. The strings, made of silk, are stretched over the entire length of the board. The most common tuning is C–D–F–G–A–c–d. Instead of frets there are 13 studs along the outer edge of the instrument, indicating the following divisions of the strings:  $\frac{1}{8}$ ,  $\frac{3}{8}$ ,  $\frac{1}{2}$ ,  $\frac{3}{4}$ ,  $\frac{1}{2}$ ,  $\frac{3}{4}$ ,  $\frac{1}{2}$ ,  $\frac{3}{4}$ ,  $\frac{1}{2}$ ,  $\frac{3}{4}$ ,  $\frac{1}{2}$ ,  $\frac{3}{4}$ ,  $\frac{1}{2}$ . If one stops the C-string at these points the notes produced by plucking are D–E $\flat$ –E–F–G–A–c–e–g–c'–e'–g'–c'. Except for  $\frac{1}{8}$ , all the divisions are those of \*just intonation. However, various divisions between the studs are also used, e.g., a slight raising of the A and the E. A readjustment for the  $\frac{1}{8}$  stud, which is higher than the major second of the \*Pythagorean scale ( $\frac{3}{2}$ ), is so general a practice that a special symbol has been in use since the 13th century to tell the player to stop the string slightly to the left of the stud.

Chyn playing involves various ways of plucking (e.g., outward and inward), as well as the use of ornaments such as the portamento, vibrato, mordent, and glissando. The notation for the chyn, a tablature, consists of clusters of abbreviated symbols specifying the string number, stopping position, hand, finger, and direction of plucking. Tempo is usually indicated by terms such as “slow down” or “hurriedly.” Some 20th-century chyn books also indicate the main beats.

The chyn enjoys great prestige because of its age and legendary association with the sages and philosophers. Throughout Chinese history it has

been the instrument of the accomplished gentleman. Illustrations of the chyn and relics of chyn-like instruments date back to at least the 3rd century B.C. In the Tarn (T'ang) dynasty (618–906) the chyn was somewhat overshadowed by newly imported instruments but in the Song (Sung) (960–1279) it was revived. The chyn cult reached its height in the Ming dynasty (1368–1644), when numerous treatises and collections of chyn music were printed. The chyn continued to be played throughout the 18th and 19th centuries. Beginning with the 20th century, interest in the chyn sharply declined, and in recent years chyn players of professional quality have been very few. In all, they have managed to preserve an oral tradition of only about eighty pieces.

The earliest chyn melody, “Iou Lan” (The Melancholy Orchid), preserved in a Tarn manuscript, is ascribed to a composer of the 6th century. Seven chyn melodies from the 13th century are still found in present-day collections. The first printed chyn book, *Shern Chyi Mih Puu*, appeared in 1425 and was followed by numerous other collections, together comprising more than six hundred pieces. Practically all chyn pieces have programmatic titles, such as “Liehtzu Riding on the Wind,” or “Dialogue of the Fisherman and the Woodman.” A typical piece has several sections, each based on the thematic material more or less extended, reduced, or rearranged.

In present-day performances, the introductory and concluding sections and the interludes, which are mostly played in harmonics, are in free rhythm, while the other sections are in a more regular rhythm, duple, triple, quintuple, or at times irregular combinations of these.

R.C.P.

**Ciaccona** [It.]. \*Chaconne.

**Cialamello** [It.]. Shawm. See under Oboe family III.

**Cibell, cebell.** A 17th-century name for the gavotte, used by Purcell and others. The name is derived from a song in praise of the goddess Cybele, found in Lully's opera *Athys*. See T. Dart, in *RBM* vi.

**Cim.** Abbr. of *cimelium* [Gr.-L., jewel], librarian's term for a rare book.

**Cimbalom.** A large \*dulcimer used by Hungarian Gypsies and also in dance bands. The peculiar effects of the cimbalom are imitated in Liszt's Hungarian Rhapsody no. 11 ("quasi *Zimbaló*"). See A. Hartmann, in *MQ* ii. For ill. see under Zither.

**Cimbasso** [It.]. A narrow-bore tuba in B<sup>b</sup>.

**Cinelli** [It.]. Cymbals.

**Cinfonie.** See Hurdy-gurdy.

**Cinque-pace** [It. *cinque passi*; F. *cing pas*; Eng. *sinkapass*, *sink pas*, *sink-a-pace*, *sinck a part*, etc.]. The basic five steps of the Renaissance \*galliard and \*saltarello, consisting of a forward thrust of alternate legs (L R L R) on the first four beats of the measure (coincidentally with each thrust the opposite foot executes a bounce), a leap on the fifth beat, and a resting stance (posture) on the sixth. All movements were gentle for the *saltarello* and pronounced for the galliard. The *cinque-pace* sequence was not used continuously; dancers improvised many variations of the simple steps for an indefinite number of measures and the *cinque-pace* sequence was reserved for strategic cadence measures. L.H.M.

**Ciphering.** In organ building, the continued sounding of a pipe, due to some defect of the mechanism.

**Circle canon.** See Canon (1), I (h).

**Circle of fifths** [G. *Quintenzirkel*]. The circular, clockwise arrangement of the twelve keys in an order of ascending fifths (C, G, d, a, etc.), showing that after twelve such steps the initial key is reached again. It presents the keys in their natural order, that is, increasing by one the num-

ber of sharps in the signature. If the circle is viewed counterclockwise (i.e., order of descending fifths: c', f, B<sup>b</sup>, etc.), the keys follow each other with one more flat in the signature. At one point of the circle the transition from the sharp keys to the flat keys must be made, for instance, at G-sharp = A-flat (\*enharmonic change). The scheme of signatures might also serve for the minor keys, by starting from A instead of from C. The series of fifths "closes" only in well-

1. Circle of Fifths

2. Spiral of Fifths

tempered tuning [Ex. 1]. If Pythagorean (pure) fifths are considered, the 12th of these fifths is higher by the Pythagorean comma (about one-eighth of a tone) than the starting tone. Here, a "spiral of fifths" would give a good picture of the unending series of ascending and descending fifths [Ex. 2].

The circle of fifths was first described by J. D. Heinichen, in his *Der General-Bass* (1728, pp. 837ff) and was illustrated (pp. 885ff) by a composition (beginning and ending in A minor) that modulates through 22 keys. (Only E major and F $\sharp$  minor are omitted.) A similar work, "Kleines harmonisches Labyrinth," tentatively ascribed to J. S. Bach (*BWV* 591; reprinted in Bach's *Orgelwerke*, ed. Peters, ix, 16), may also be by Heinichen.

**Circular canon.** See under Canon (1), I (h).

**Cis, Cisis** [G.]. C-sharp, C-double-sharp; see Pitch names.

**Cister, cistre, cither, citole, cittern.** See under Guitar family.

**Cithara.** Medieval spelling of \*kithara.

**Cl.** Abbr. for clarinet.

**Clair de lune** [F.]. A very popular piano piece by Debussy, properly the third movement of his *\*Suite bergamasque*. Written 1890-95, it belongs to his early period, before he began to experiment with such characteristic devices of his later style as parallel chords, whole-tone scale, etc.

**Clairon** [F.]. Bugle. See under Brass instruments IV.

**Claquebois** [F.]. \*Xylophone.

**Clarinblasen** [G.]. See Clarino (2).

**Clarinet family.** A large group of single-reed woodwind instruments [see Reed], in distinction to the oboe family, which includes the double-reed instruments.

I. *The clarinet.* The clarinet consists of a cylindrical pipe made of wood or ebonite (recently also of metal) with a bell-shaped opening at one end and a characteristic mouthpiece (beak) at the other. The beak looks as if it were pinched to form a sharp edge at the top and has a single reed (made from a thin piece of cane) fixed to its back. Played by means of holes and keys, the clarinet has the acoustical properties of a "stopped" pipe, thus overblowing at the twelfth, i.e., the second partial—the octave—

while the even-numbered partials in general cannot be obtained by overblowing, a fact that also affects its \*timbre. From a distance the clarinet looks very much like an oboe, from which, however, it is easily distinguished by the mouthpiece. While the oboe produces a "pastoral," slightly quaint and nasal sound of fairly constant quality, the clarinet is not only fuller and "creamier" in timbre but also shows a distinct variation of timbre in its various ranges (registers). It lends itself to the expression of love and passion as well as fury and parody. On the whole, it is much more "modern" (and, in fact, a much more recent) instrument than the oboe.

Owing to the fact that only the odd-numbered partials can be obtained by overblowing (e.g., c-g'-e''), a number of holes and, consequently, a complicated key mechanism are necessary to obtain the tones in between. The \*Böhm system is popular in America but has not been universally adopted. All clarinets have a written range as shown in Ex. 1, although the higher members of the family occasionally exceed its high point and the lower members become somewhat weak in the top octave. The least characteristic and most troublesome portion of their range is, to the average player, at the top of the first twelfth, the so-called "break" or throat register [see Ex. 2]. The register below the break is called *chalmereau* and that above it *clarion* or *clarino*. All clarinets are notated as \*transposing instruments.

II. *Present forms.* The most common form is the *clarinet in B $\flat$* , which sounds a whole tone lower than written. Next in importance is the *clarinet in A*, the part for which sounds a minor third lower than written. The former instrument is the more brilliant without sacrificing any perceptible fullness. The clarinet in A is sometimes preferred for parts in the sharp keys, which are, of course, easier to play on this instrument than on the other. The bass instrument of the clarinet family is the *bass clarinet in B $\flat$* , whose range is an octave lower than that of the clarinet in B $\flat$  plus an additional semitone provided by a low E $\flat$  key, thereby enabling performance of music written for the now obsolete bass clarinet in A. To avoid too unwieldy a length, the lower

# CLARINET FAMILY

Clarinets: 1. Pibgorn. 2. Hornpipe (Basque). 3. Clarinette d'amour. 4. Chalumeau. 5. Heckelclarina (Heckelphonklarinette). 6. Basset horn (old). 7. Basset horn (modern). 8. Bass clarinet. 9. Clarinet. 10. Tarogato. 11. Saxophone.

end of the instrument is curved upward and ends in a metal bell, while the upper end, likewise of metal, is curved downward to bring the mouthpiece within easier reach for the player. The bass clarinet has less marked differences of register than the higher instruments and its top register is relatively weak. Its lower tones are of remarkable richness and have the advantage, unlike the bassoon, of a very wide dynamic range.

Additional types are the *clarinet in E<sup>b</sup>*, a small instrument pitched a perfect fourth above the clarinet in B<sup>b</sup>; the *alto clarinet in E<sup>b</sup>*, pitched a fifth below the clarinet in B<sup>b</sup>; and the *contrabass clarinet in B<sup>b</sup>* (pedal clarinet), pitched an octave below the bass clarinet. They are commonly found in bands and are occasionally called for in orchestral scores. Parts for the E<sup>b</sup> clarinet are found in Strauss's *Ein Heldenleben*, in Stravinsky's *Sacre du printemps*, and in Ravel's *Daphnis et Chloé*; for the double-bass clarinet in D'Indy's *Fervaal*, in Strauss' *Josephs Legende*, and in Weingartner's *Orestes*. Three obscure modern instruments, related to the clarinet only in that they possess a single reed, have been invented for the sole purpose of playing the solo English horn part in Act III of *Tristan*. They are the *Heckel-clarina*, *Holztrumpete*, and *\*tarogato*. The music in question is generally played by the English horn. Another single-reed instrument is the *\*saxophone*.

III. *Obsolete forms*. During the 19th century a great many other clarinets were built, e.g., the clarinet in C, the clarinet in D (called for in Liszt's *Mazeppa* and Strauss' *Till Eulenspiegel*; now replaced by the clarinet in E<sup>b</sup>), the bass clarinet in C or A (Liszt, *Mazeppa*), the *bathypHONE* (constructed by E. Skorra, 1839), etc. An older instrument is the *basset horn*, an alto clarinet with a narrower bore, thinner wall, and a range four semitones beyond the low E (which sounds A in the usual F pitch). Originally (c. 1770) it was crescent-shaped and in this form was called for by Mozart, singly or in pairs, in *La Clemenza di Tito*, *Die Zauberflöte*, *Die Entführung aus dem Serail*, the Requiem, and in various instrumental works (e.g., K. 411). About 1800 the crescent shape was replaced by a model that was sharply bent (almost forming a right angle) and, somewhat later, it was given the straight form in which it is constructed today. Beethoven used it only in *Prometheus*, and Mendelssohn wrote two concert pieces for clarinet and basset horn with piano (op. 113, 114). Rare later examples, generally played on the

alto clarinet in E<sup>b</sup>, are to be found in R. Strauss' *Elektra*, in F. S. Converse's *Iolan or The Pipe of Desire*, and in R. Sessions' Concerto for violin and orchestra. Finally, there is the *clarinette d'amour*, a larger clarinet in G or A<sup>b</sup> with the pear-shaped bell of the oboe d'amore.

IV. *History and repertory*. In early periods and in non-Western cultures single-reed instruments are much rarer than double-reed instruments (oboes). Double clarinets (in pairs) were known in ancient Egypt but scarcely at all in the Far East. To the present day a triple clarinet, called *launedda*, is used in Sardinia [see *SaHMI*, p. 31]. A primitive European instrument is the *pibgorn* (also called stockhorn, hornpipe), which was originally made of the shinbone of a sheep, with a part of a cow's horn attached as a bell [see *GD* iv, 172, v, 141; *GDB* vi, 752, viii, 90-93]. The forerunner proper of the clarinet is the *chalumeau* (the single-reed type; there was also a chalumeau with double reed, more properly called shawm), a small, usually keyless cylindrical pipe. In the 17th century there existed a number of strangely shaped instruments of this type, especially for the bass size [see W. Heinitz, *Instrumentenkunde*, in *BüHM*, p. 57]. The change from the chalumeau to the clarinet took place between c. 1690 and 1720, owing to the activity of Johann C. Denner and his son Johann Denner, who added finger keys and a speaker key [see *SaHMI*, p. 411f]. These early clarinets had the timbre of oboes rather than of the modern clarinet, owing chiefly to the use of small reeds. Thus, Johann Walther says in his *Musicalisches Lexicon* of 1732 (first mention of the name "clarinet"): "From a distance it sounds rather like a trumpet." This probably explains the name clarinet [see Clarino; Clairon].

Chalumeaux, whether in their primitive or improved form, were used in Reinhard Keiser's operas *Croesus* (1710) and *Serenata* (1716), and are still prescribed in Gluck's *Orfeo* (1762). Rameau, J. W. Stamitz, and Gossec are the composers associated particularly with the early use of the real clarinet in the orchestra. Stamitz also is the composer of one of the earliest clarinet concertos on record. Mozart used the clarinet in some of his later symphonies, notably that in E<sup>b</sup> (1788; K. 543), in which prominent parts covering a wide range are given to two B<sup>b</sup> clarinets. Since that time, two clarinets have been included in every normal orchestra. Berlioz was among the first to use various sizes of clarinet for their particular tonal quality, a practice continued by Liszt, Strauss, and Mahler. From the time of

Wagner the number of clarinets in the orchestra has often been increased, e.g., in Strauss' *Salome* and *Elektra*. Composers since Mozart have provided the instrument with a repertory that in quality and variety is equaled by no other wind instrument. Outstanding compositions are: clarinet concertos by Mozart, K. 622, Weber, op. 73, 74, Concertino, op. 26, Hindemith (1947), and Nielsen, op. 57; clarinet sonatas by Brahms, op. 120, nos. 1 and 2, Hindemith (1939), and Honegger (sonatina); clarinet quintets by Mozart (K. 581), Brahms, op. 115, Reger, op. 146; clarinet trios by Beethoven, op. 11, Brahms, op. 114; Schumann, *Fantasiestücke* for clarinet and piano, op. 73; Stravinsky, 3 *Pieces* for clarinet solo (1919); Berg, 4 *Stücke*, op. 5.

Opperman, *Repertory of the Clarinet* [1960]; L. W. Foster, *A Directory of Clarinet Music* [1940]; T. Dart, "The Mock Trumpet" (*GSJ* vi); E. Halfpenny, "Early English Clarinets" (*GSJ* xviii). I–III by W.D.D.

**Clarino.** (1) The high register of the clarinet [see Clarinet family I]. (2) In the 17th and 18th centuries, a virtuoso method of trumpet playing, practiced by trumpeters trained specially and exclusively in the art of producing the highest harmonics, i.e., from the third octave onward, where they form a continuous scale. It was this training that enabled the trumpeters of Bach's time to play (without valves!) those rapid passages in high position that have baffled the most outstanding trumpet virtuosos of modern times [see Ex., from Cantata 75; *BG* xviii, 183]. Clarino, therefore, is less a name for a special instrument (*clarin trumpet*) than a special manner of playing the natural long-tube trumpet of the baroque period. The modern *Bach trumpet*, a short, straight, three-valve instrument introduced by J. Kosleck in 1884 and designed for rendering clarino passages in Bach's cantatas, is a poor substitute owing to its unsatisfactory tone quality.

Bessaraboff, *Ancient European Musical Instruments* (1941), pp. 192ff, 413n; W. F. H. Blandford, in *Monthly Musical Record*, July 1931, and March to June 1935; H. Eichborn, *Das alte Clarinblasen auf Trompeten* (1894); C. Sachs, in *AMW* ii; M. Rasmussen, in *Brass Quarterly* v, 37–40.

**Clarinet trumpet.** See Clarino (2).

**Clarion.** An ancient English trumpet in round form [see *SaRM*; *MaMI*].

**Clarone** [It.]. (1) Bass clarinet. (2) Older name for the basset horn (Mozart); see Clarinet family II.

**Clarsech, clairseach, clarseth.** The Irish harp [see Harp III].

**Classical Symphony.** Prokofiev's First Symphony, op. 25, composed 1916–17, so called because it is written in a "modernized" Mozart-Haydn idiom, with harmonic dissonances, unexpected rhythmic turns, etc. It is scored for a typical classical orchestra of strings and pairs of each wind instrument. The work is one of the earliest examples of 20th-century \*neoclassicism.

**Classici della musica italiana, I.** See Editions IX.

**Classici musicali italiani, I.** See Editions X.

**Classicism.** In ordinary usage, the term [see Webster] "denotes primarily the principles and characteristics of Greek and Roman literature and art; considered as embodying formal elegance, simplicity, dignity, and correctness of style, and just and lucid conception and order . . . [It] is often used of the principles and qualities of other than Greek and Roman works, esp. when similar in spirit and established as a formal standard." In music the word is used in various ways. Most commonly it means the antithesis of romanticism and is, therefore, applied to periods prior to the romantic school, either to its immediate predecessors, Haydn, Mozart, and Beethoven (Viennese classic school), or to what amateurs sometimes consider "all music before romanticism," i.e., from Palestrina to Beethoven. To others, the word "classic" denotes music of established value and fame, as distinguished from ephemeral works that quickly disappear from the programs. For

still others it means art music or "highbrow" music, as opposed to "popular" music or music for entertainment. The latter definitions, of course, do not deserve serious consideration. The term should be used in either of the following ways: (a) to denote only the "Viennese classic school," that is, Haydn, Mozart, Beethoven, and to some extent Schubert; (b) in a more general way, to denote any period that gives the impression of greater stability, repose, clarity, balance, self-reliance, objectivity, and traditionalism than that preceding or following it. If the latter meaning is adopted, the entire evolution of music might be seen as a recurring shift from the classical to the romantic, romanticism being associated with unrest, exaggeration, experimentation, ostentation, diffusion, subjectivism, etc. Typically classical periods in this sense are those of the 13th century (Perotinus, Franco), the Flemish era (1450–1600), the period of Bach and Handel, and that of the Viennese classic school, whereas the 14th century (Machaut and his successors) as well as the 17th (Frescobaldi, Froberger; see Lament, Courante) and the period of K. P. E. Bach show features more characteristic of romanticism.

The high Viennese classic school embraces the decades from 1770 to 1830 [see Germany V]. Its forms and style emerged from a very complex development that began about 1740 and to which various groups of composers in southwest Germany (Mannheim), Vienna, Paris, Italy, and Bohemia contributed. See Mannheim school; Sonata; Sonata form; String quartet; Symphony.

Damerini, *Classicismo e romanticismo nella musica* (1942); F. Torrefranca, *Le Origini dello stile mozartiano* (1930; also in *RMI* xxvi, xxviii, xxxiii, xxxiv, xxxvi); G. Adler, "Haydn and the Viennese Classical School" (*MQ* xviii); *id.*, "Schubert and the Viennese Classic School" (*MQ* xiv); F. Corder, "The Classical Tradition" (*MQ* iii); H. Tischler, "Classicism, Romanticism and Music" (*MR* xiv); G. Becking, "Klassik und Romantik" (*CP* 1925); W. Fischer, "Zur Entwicklungsgeschichte des Wiener klassischen Stils" (*StM* iii).

**Clausula** [L.]. (1) Cadence, particularly the cadential formulas of 16th-century polyphonic music. Tinctoris (*Diffinitorium* [c. 1475; printed c. 1494]; see *CS* iv, 180) defined clausula as a

"particle at the end of which there is a general pause or a perfection [perfect consonance?]" An elaborate system of classification and terminology (*clausula vera*, *plagalis*, *ficta*, *media*, *diminuta*, etc.) was worked out by 16th- and 17th-century theorists [see "Cadence" in *GD*, *GDB*]. See reference under Glosa. (2) In Ambrosian chant, name for the terminations (*\*differentiae*) of the psalm tones.

(3) The term is employed mainly for a large repertory of polyphonic compositions of the late 12th and early 13th centuries (school of Notre Dame) that are based on a short fragment of a Gregorian chant, in contrast to the organa, which are based on the entire chant (i.e., the entire solo section thereof; see Organum). This meaning of the term goes back to Anon. IV, who says that Perotinus "fecit clausulas sive puncta plurima meliora" (wrote many beautiful clausulae or puncta; *CS* i, 342). Very likely, the compositions referred to are those called "clausulae" today. They are relatively short compositions, invariably based on a melisma of a responsorial chant (Gradual, Alleluia, Responsory). Accordingly, there is no full text in the tenor of a clausula, but only one or two words or sometimes only a syllable [see Incipit] to indicate from which chant the tenor is borrowed. For instance, the clausula GO (of which there are a great number, with identical tenor but different upper parts) is taken from the Gradual *Benedicta es et venerabilis*, whose verse begins with the words: *Vir-go Dei genetrix*. Below is the beginning of this verse in plainsong [*LU*, p. 1265], together

Vir - go

with the beginning of a clausula GO. The parts of a clausula usually are to be sung in vocalization, in the present example to the vowel O.

Many such clausulae (well over 500; about a dozen in three parts, the others in two) are pre-

served in the sources of Notre Dame. They were probably intended to serve as substitutes [G. *Ersatzklausel*, substitute clausula] for the corresponding sections (in the case above, the section GO) in the organa of Leoninus, which form the \**"Magnus liber organi."* These organa consist, in alternation, of "organal" sections in a relatively free rhythm and of "discant" sections [see Discant] in strictly measured counterpoint. It is the latter sections for which Perotinus and his collaborators provided substitutes, often longer and in a more precise rhythm [see *HAM*, nos. 28 and 30]. Occasionally the original discant sections of the Leoninus organa are also spoken of as clausulae.

No less important than the connection of the clausulae with the older organum is another, pointing toward a later development, i.e., the motet. In fact, most of the early motets are directly derived from clausulae, retaining their music but underlaying a full text to the upper part. For the identification of a clausula (such as GO, \*IN SECLUM, NOSTRUM, LATUS) the complete list given in F. Ludwig, *Repertorium organorum recentioris et motetorum vetustissimi stili* (1910), pp. 25-29 and, particularly, pp. 79-95, is indispensable. See F. Gennrich, *Sankt Victor Clausulae und ihre Motetten* (1953). See also F. Gennrich, ed., *Aus der Frühzeit der Motette*, 2 vols. (1963); *ReMMA*, pp. 298ff; *AdHM*, pp. 218ff.

**Clave.** See Claves; also Percussion instruments B, 8.

**Clavecin, clavessin** [F.]. \*Harpsichord.

**Clavecin d'amour, cembal d'amour, cembalo d'amore.** A clavichord (not a cembalo, i.e., harpsichord), built by G. Silbermann about 1721, in which the strings are twice the normal length and are struck in the middle. The instrument had no damping cloth woven between

the strings, like that required in the ordinary clavichord to damp the shorter section of the string. Therefore both sections of the string would sound the same tone, with a highly desirable result of increased volume. In spite of its various advantages, the instrument did not become popular. It is described in Mattheson's *Critica musica*, 2 vols. (1722-25), ii, 243n, 380, and in Adlung's *Musica mechanica organoedi*, 2 vols. (1768), i, 212, ii, 123-26. See E. van der Straeten, in *Musical Times*, Jan. 1924.

**Claves.** Cylindrical hardwood blocks used in Cuba and throughout the Antilles. They are struck together, with the cupped palm of the hand providing resonance. J.O-S.

**Clavicembalo** [It.]. Harpsichord.

**Clavichord** [F. *clavicorde*; G. *Klavichord*, *Clavier*; It. *clavicordo*; Sp. *clavicordio*]. A stringed keyboard instrument in use from the 15th through 18th centuries. The clavichord consists essentially of a rectangular case with a keyboard either projecting from or set into one of the longer sides. The part of the case to the right of the keyboard is occupied by the soundboard, and the strings run across the case from right to left. When the player depresses a key, its tangent (a brass blade driven into the back end of the key) strikes a pair of strings. The portion of the strings to the left of the tangent is damped by a strip of cloth (listing); the portion to the right (which passes over a bridge that transmits the strings' vibrations to the soundboard) is set into vibration by the blow of the tangent. When the key is released, the tangent falls away from the strings, which are then immediately silenced by the cloth damping. Since the point at which the tangent strikes the strings determines their vibrating length, one can produce several different pitches from a single pair of strings by causing a number of tangents to strike the strings at

Clavichord action.

different points along their length. However, since a single pair of strings can produce only one pitch at a time, keys whose tangents strike the same pair of strings cannot be sounded simultaneously. For this reason, clavichord builders seem from the earliest times to have taken care that only notes forming dissonances with each other would be sounded from the same string. Clavichords in which pairs of strings are struck by more than one tangent are called fretted [G. *gebunden*]; those in which each key has its own pair of strings are called unfretted or fret-free [G. *bundfrei*].

The sound of the clavichord is very soft and is often disappointing at first hearing. However, after becoming accustomed to the small tone and the special touch required to make the instrument sound its best, the performer is usually won over by the extraordinary sensitivity and responsiveness of the instrument. Variations in the force with which the keys are struck produce variations in loudness in much the same way as they do on the piano, and the dynamic range of good instruments is quite wide. A special (and often overrated) effect unavailable on any other keyboard instrument is the *\*Bebung*, a kind of vibrato achieved by varying the pressure with which a key is held down.

*History.* The clavichord appears to have developed from the *\*monochord*, as evidenced by the facts that the instrument was often called *monochordium* in the 15th century and that, until the third quarter of the century, its strings were all tuned in unison. The earliest record of the name "clavichord" is in the "Der Minne Regel" of Eberhard Cersne (1404). The mid-15th-century manuscript of Henri Arnaut de Zwolle shows a layout drawing of a three-octave instrument, and an intarsia of 1479-92 depicts an instrument with a range of four octaves. A somewhat smaller range of C-g'' or C-a'' with a *\*short octave* in the bass seems to have been usual in the early part of the 16th century. By the middle of the century, however, the range of C-c''' (still with a short octave) became standard. This range was only rarely exceeded in the 17th century, but by the middle of the 18th century builders were making clavichords with a five-octave compass FF-f'''.

The earliest surviving clavichords are all Italian and date from the middle of the 16th century. However, interest in the instrument appears to have died out in Italy by the end of the century, and the vast majority of the surviving 17th- and 18th-century examples are

German. In contrast to the Italian instruments, which had projecting keyboards and strings that ran parallel to the back of the case, the typical German clavichord has an inset keyboard and strings that run obliquely from the front right to the back left. Although instruments in which some strings were struck by as many as four tangents continued to be built in the 17th century, the larger instruments generally had no more than two tangents striking the same pair of strings. The only real limitation of these instruments lay in the fact that their tuning could not be changed when desired to permit playing pieces in remote keys (possible only when each pitch has its own pair of strings). Consequently, instruments of this kind continued to serve the needs of most musicians well into the 18th century and were built by makers of the first rank at least as late as the 1780's.

Unfretted clavichords, which required about half again as many strings as the instruments just described (and were, accordingly, more difficult to tune and maintain) appeared in the last years of the 17th century. The exact date of their introduction is difficult to establish. However, Johann Speth in the preface to his *Ars magna consoni ed dissoni* (1693) explicitly calls for a clavichord in which "each key has its own strings and not some [strings] touched by two, three, and even four keys." Large unfretted clavichords continued to be built in Germany and Scandinavia through the first decade of the 19th century, in most cases by makers who were building pianos during the same period.

The precise role of the clavichord in the history of keyboard music is difficult to establish. Although the word *Clavier* appears frequently on the title pages of German publications, the term means "keyboard instrument" as well as "clavichord," and such a collection as Bach's *\*Clavier-Übung* (4 pts., 1731-42) contains works explicitly designated for harpsichord and for organ. The clavichord was, however, the usual domestic instrument of the 16th, 17th, and 18th centuries in Germany, and its value as an instrument for teaching and practice had been emphasized from the early years of the 16th century. This popularity doubtless stemmed as much from musical considerations as the more mundane ones of cheapness and ease of maintenance and tuning. On the other hand, the clavichord seems to have been the preferred medium of performance only during the period of *Empfindsamkeit* [see *Empfindsamer Stil*] in the second half of the 18th century, a period that produced

the instrument's most ardent partisans, including K. P. E. Bach. His *Versuch über die wahre Art das Clavier zu spielen* (2 pts., 1753–62; new ed. and trans. by W. J. Mitchell [1949]) is an eloquent appreciation of the clavichord as well as a thorough study of keyboard technique. His F-sharp minor fantasia “K. P. E. Bach's Empfindungen” and “Abscheid vom Silbermannschen Clavier” (new ed. by A. Kreutz [1950]), with their abrupt contrasts, crescendos, diminuendos, and explicitly indicated *Bebung*, are among the most idiomatic clavichord pieces ever written. See also Keyboard music.

Ripin, “The Early Clavichord” (*MQ* liii); M. S. Kastner, “Portugiesische und spanische Clavichorde des 18. Jahrhunderts” (*AM* xxiv). E.M.R.

**Clavicymbal.** \*Harpsichord.

**Clavicytherium.** A harpsichord with a vertical body like that of the upright piano [see Harpsichord II]. It was in use from the 16th through 18th centuries. An early record of it is a reproduction in Virdung's *Musica getutscht* (1511). See *SaRM*, p. 217; N. Bessaraboff, *Ancient European Musical Instruments* (1941), pp. 324ff.

**Clavier.** (1) French term for keyboard (pronounced klavi-é; in English usage klá-vi-er). (2) German term (pronounced kla-vээр) used in the baroque period as a generic designation for keyboard instruments such as the harpsichord, clavichord, and organ [see *Clavier-Übung*]. Later it denoted mainly, if not exclusively, the clavichord (K. P. E. Bach). Johann Adam Hiller, in the preface to his *Lieder für Kinder* (1769), clearly refers to the clavichord when he says that the pieces should never be played on the “Flügel oder Spinet” but on a good “Clavier.” In the 19th century the term was transferred to the piano (in modern German, \*Klavier).

**Clavier Hans.** See Keyboard III.

**Clavier-Übung** [G.]. A title (lit., keyboard study) used by J. S. Bach for four publications of keyboard music. *Clavier-Übung* i (1731) contains the six partitas; ii (1735), the \*Italian Concerto and the French Overture; iii (1739), a number of organ chorales preceded by the Prelude in E<sup>b</sup> and ending with the Fugue in E<sup>b</sup> (\*St. Anne's Fugue) and four duets; iv (1742), the \*Goldberg Variations. The contents of vols. i, ii, and iv are specifically for the harpsichord, while that of vol. iii is specifically for the organ except for the duets, which could also be played on the harpsichord or clavichord. The title was adopted by Bach from earlier publications such as Kuhnau's *Neue Clavier-Übung* (1689, '92) and Johann Krieger's *Anmuthige Clavier-Übung* (1699).

**Clavilux.** An instrument invented by Thomas Wilfrid c. 1920 for the performance of color music [see Color organ].

**Clavis** [L., pl. *claves*]. Literally, a key to open a door. In medieval theory *clavis* was primarily the designation for the “clef” letters f, c' and (later) g' because these provide the “key” for the correct reading of the notes written on the staff. Thus, Marchetto da Padua says that there are two *claves*, f and c' (*F grave*, *c acutum*), that “open every *cantus*” [*GS* iii, 120]. Other writers use the term with a wider meaning, similar to that of the present-day key. Simon Tunsted says [*CS* iv, 207] that the seven Latin letters A, B . . . G are called *claves* because through them the melody of all music is opened. Tinctoris speaks [*CS* iv, 4] of twenty *claves*, one for each note from G to e'', as did Philippe de Vitry [*CS* iii, 36] and others. The *clavis* letters were often written on the keys of the instruments [see *CS* i, 214, 257], and this custom probably accounts for terms such as clavichord, clavicembalo, clavier, Klavier, etc.

**Clef** [F.; G. *Schlüssel*; It. *chiave*; Sp. *clave*]. A sign written at the beginning of the staff in order to indicate the pitch of the notes. There are three such signs [see Ex. a], which respectively represent the tones g', c', and f, hence the names G-clef, C-clef, and F-clef. The G-clef, also called violin clef, is used on the second line of the staff; it indicates that the note on the second line is g'. The F-clef, also called bass clef, is used on the fourth line; it indicates that the note written on the fourth line is f. The C-clef is used in two positions, on the third line (alto clef or viola clef)

or on the fourth line (tenor clef); see Ex. b. The G-clef is used for the upper staff of piano music and for all high instruments (violin, flute); the F-clef is used for the lower staff of piano music and for all low instruments (cello, double bass). The alto clef is used for the viola and instruments of a similar range; the tenor clef for the high range of the cello, the bassoon, the tenor trombone, etc.

*History.* The clef signs evolved from the letters they stand for. Ex. c shows early shapes, illustrating the gradual corruption of the letters c, f, and g. In music prior to 1750 each of these signs occurs in various positions. See Ex. d, which also shows the position of middle C (c')

- a. The G-clef; three forms of the C-clef; the F-clef.
- b. Positions of the clefs on the staff.
- c. Early forms of the clefs.
- d. Position of each clef and middle C (c') in music prior to 1750: 1. French violin clef. 2. Violin clef, also called G-clef or treble clef. 3. Soprano clef or descant clef. 4. Mezzo-soprano clef. 5. Alto clef or C-clef. 6. Tenor clef. 7. Baritone clef. 8. Baritone clef. 9. Bass clef or F-clef. 10. Sub-bass clef.

in each clef. In the 17th century the G-clef on the first line was essentially French and that on the second line Italian. This distinction was so definite that Couperin resorted to it to differentiate the two styles in his *Apothéose de Lully*.

The great variety of clef positions encountered in old music results from the desire to avoid ledger lines. Whenever the range of a voice exceeded the five-line staff, the position of the clef was changed or another clef was introduced. In modern musicological publications of 15th- and 16th-century music the old clefs are largely retained, a method that, although justifiable

on historical and scholarly grounds, has been a practical drawback. It is gratifying to see that in most present-day publications only the F-clef and the G-clef are used, the latter also in a modification (with subscript 8) indicating transposition an octave below. As a matter of fact, this

clef is very well suited to replace the alto clef as well as the tenor clef since its range is practically the same as that of the other two [see Ex. e]. For reforms of clefs, see *WoHN* ii, 339ff. See *Chiavette*.

**Clemenza di Tito, La** [It., The Clemency of Titus]. Opera in two acts by Mozart (libretto by Metastasio, rev. by C. Mazzolà), produced in Prague, 1791, at the coronation of Emperor Leopold II as King of Bohemia, for which it had been commissioned. Setting: ancient Rome. While it contains much fine music, it cannot be compared with Mozart's masterpieces of the same period, *Le Nozze di Figaro*, *Don Giovanni*, and *Die Zauberflöte*.

**Clerical dances.** See under Dance music I; Religious dances.

**Climacus.** See under Neumes I (table).

**Clivis.** See under Neumes I (table).

**Cloches** [F.]. Bells, especially those of the orchestra.

**Clocking.** See under Bell.

**Clock Symphony.** Popular name for Haydn's Symphony no. 101 in D major, composed in 1794 in London. The name refers to the ticking motif in the Andante.

**Clockwork instruments.** See under Mechanical instruments I, III.

**Clos** [F.]. See Ouvert and clos.

**Close.** \*Cadence.

**Close harmony.** Chords in close position, i.e., with all the four notes within an octave or a twelfth. See Spacing.

**Clubs, musical.** See Societies.

**Clutsam keyboard.** See under Keyboard III.

**C.O., c.o.** [It.]. Abbr. for *coll' ottava*; *c.o.b.*, *coll' ottava bassa*. See *Coll' ottava*.

**Cobla** [Cat.]. The popular dance band of Catalonia (northeast Spain, Barcelona). It consists of \*pipe and tabor (*fluviol i tambor*), shawms, cornetts, horns, trombone, and double bass. The use of pipe and tabor (formerly also bagpipes) indicates a very ancient tradition. The main dance played by the *coblas* is the \**sardana*. See H. Bessler, "Katalanische Cobla und Alta-Tanzkapelle" (CP 1949).

**Coda** [It.]. A concluding section or passage, extraneous to the basic structure of the composition but added in order to confirm the impression of finality. Probably the earliest realization of the coda is found in compositions of the early Flemish masters (Ockeghem, Obrecht, Josquin), in which the final note of one or two voices frequently is sustained while the remaining parts continue for two or three measures [see, e.g., Hofhaimer's "Meins Traurens ist," in HAM, no. 93]. Fugues often close with a shorter or longer coda, usually based on a pedal point (e.g., Bach, *The Well-Tempered Clavier* I, C major). Bach's Organ Fugue in A minor closes with a coda in brilliant toccata style. Likewise in sonatas, symphonies, etc., a coda is found at the end of each movement. In slow movements it usually serves as an epilogue, whereas in fast movements it often leads to a final climax, frequently combined with quickening of tempo (\**stretto*). In movements in sonata form the coda frequently takes on considerable dimension, occasionally becoming a second development section [e.g., the first movement of Beethoven's Fifth Symphony]. A short coda is sometimes called *codetta*. However, this term more commonly means a closing passage at the end of an inner section, such as the exposition in sonata form or the first section (A) of a slow movement in ternary form A B A). Beethoven's Piano Sonata op. 2, no. 3 is recommended for a study of the coda in its various manifestations. Here even the Scherzo ends with a coda to be played after the repetition of the Scherzo ("Scherzo da capo e poi la coda").

**Codetta.** (1) See under Coda. (2) In the exposition of a fugue, any short transitional section between two entries of the subject (generally between the second and third).

**Codex Bamberg, Burgos, etc.** See under Sources.

**Coffee Cantata.** A secular cantata by Bach, "Schweigst stille, plaudert nicht" (Be quiet, don't prattle), for solo voices, chorus, and orchestra, composed c. 1732. It is a little dramatic scene

between the father, Schlendrian, and his daughter, Lieschen, who, in spite of threat and persuasion, will not give up her beloved coffee until the father promises to get her a husband. In the end, however, she will have the coffee as well. The music is appropriate for this innocent jest to a degree hardly expected of Bach.

**Col arco** [It.]. With the bow (after *pizzicato*).

**Colascione, colachon.** See under Lute II.

**Colinde.** See Koleda.

**Colla, coll'** [It.]. "With the." *Colla destra, sinistra*, with the right, left hand. *Colla parte, colla voce* (with the part) is an indication directing the player of the accompaniment to "follow along" with the main part, which is to be performed in free rhythm. *Colla punta d'arco*, with the point of the bow. Also *col*, as in \**col arco*.

**Collect.** In the Roman Catholic rite, one of the prayers [L. *oratio*] offered by the priest at Mass (after the Gloria; see Mass, table), so called because it represents the collected prayers of all present. It is sung to special recitation tones called *toni orationum* [see LU, p. 98]. It is part of the Proper of the Mass, and normally two or three collects are used in one Mass.

In Anglican rites, the collect is a short prayer to be used for a particular day in liturgical services. It normally consists of four parts: the Address to the Deity, the Petition, the Oblation, and a final Doxology. When intoned by the officiant, this form is clearly brought out by the cadence at the end of the Address, a half-step inflection at the end of the Petition and again at the end of the Oblation, and another cadence on the Doxology. The following example is the proper Collect for Christmas Day from the Book of Common Prayer:

Al - migh - ty God, who hast . . . of a pure vir -

gin; Grant that we . . . by thy Ho - ly Spir - it;

through the same our Lord Je-sus Christ, who liv-eth

ev - er, one God, world with - out end.

See *LU*, p. 98; *The Choral Service*, rev. ed. (1927), pp. xiii–xv.

**Collegium musicum.** Name for musical associations formed by amateurs for the performance of serious music. Nowadays the name is used for such associations connected with a university and devoted to the cultivation of old music. As early as 1616 a musical society in Prague was called *Collegium musicum*. In 1660 M. Weckmann (d. 1674) founded a *collegium musicum* at Hamburg. Particularly famous was that of the University of Leipzig, which flourished under Kuhnau (1688), Telemann, and Bach (1729–39). The movement was transferred to America in 1744 by the Moravians, who established such organizations at Bethlehem, Pa., Salem, N.C., and elsewhere in Pennsylvania, Maryland, and North Carolina. The first modern *collegium musicum* was founded by H. Riemann at the University of Leipzig, in 1909, as a revival of the old one. An important step was the introduction, at the University of Freiburg under W. Gurlitt (c. 1920), of old instruments such as recorders, viols, harpsichord, baroque organ, etc. Today most German and a number of American universities have a *collegium musicum*. See M. Gondolatsch, in *ZMW* iii; M. Seiffert, in *SIM* ii; D. McCorkle, "The Collegium Musicum Salem" (*JAMS* viii).

**Col legno** [It.]. In violin playing, striking the strings with the bow-stick instead of playing with the hair.

**Coll' ottava** [It.]. At the octave. An indication to duplicate the written notes at the upper octave. Similarly, *coll' ottava bassa* calls for duplication at the lower octave.

**Colombia.** Art music in Nueva Granada—present-day Colombia—dates from 1537, when Juan Perez Materano, expert in plainchant, organist, and author of the treatise *Canto de órgano y canto llano* (which, according to a Royal License of the time, was to have been published in 1554) arrived in Cartagena de Indias. The most important composer who came from Spain to the New World during the 16th century was Gutierre Fernandez Hidalgo (c. 1553–1618), who arrived in Bogotá in 1584. The following year he was appointed musical director of the Cathedral, a position to which Gonzalo Garcia Zorro (d. 1617), a *mestizo* priest and musician, had been appointed ten years before. Ten Psalms, three Salves, and nine Magnificats by Fernandez Hidalgo are preserved in the Cath-

edral archives. By the turn of the century the Cathedral of Bogotá had become an important center for church music. Its archives contained—and still contain—a large store of European polyphony and early baroque music. In 1650 José de Cascante (d. 1702) was appointed musical director. A dozen of his compositions, mainly *villancicos*, are preserved. His successor, Juan de Herrera y Chumacero (c. 1665–1738), a native of Bogotá, was one of the most prolific colonial composers of Nueva Granada. Thirty-three of his works survive, among them six Masses, polychoral Latin compositions, lamentations, psalms, and *villancicos*. Juan Ximenez, one of Herrera's eleven assistants, between 1709 and 1724 wrote a number of *villancicos* for voice and continuo that are preserved in the archives of the Bogotá Cathedral. The first composer to succeed Herrera as musical director of the Cathedral was Salvador Romero, whose *Lectio secunda a 12* (1762) is also preserved in Bogotá. The development of church and secular music in Bogotá at the end of the 18th century owed much to Archbishop Baltasar Martínez Compañón, one of the foremost intellectuals of the colonial period, who had taught plainchant in Peru before coming to Bogotá in 1791.

The first famous church composer following Colombia's independence was Juan de Dios Torres, who produced two extremely simple Masses (1827, '28) and a hymn (1844), preserved in the cathedral archives. Among his contemporaries were Nicolas Quevedo Rachadell (1803–74); Juan Antonio de Velasco (d. 1859), composer and conductor, the first to promote Haydn, Beethoven, and Mozart in Colombia; and Enrique Price (1819–63), who was born in England and about 1840 came to Bogotá, where he founded the *Sociedad Filarmónica* (1847). This institution served as the basis for the creation of the *Academia Nacional de Música*, established in 1882 by his son, Jorge W. Price (1853–1953), and transformed in 1909 into the *Conservatorio Nacional*.

During the second half of the 19th century numerous Colombian composers followed the Italian operatic tradition of the time. Among them were Julio Quevedo Arévalo (1829–97), especially noted for his church music, and José María Ponce de León (1846–82), who composed the first operas written by a native Colombian, *Esther* (1874) and *Florinda* (1880), as well as a Requiem Mass (1880), *Apoteosis de Bolívar*, and *Sinfonia sobre temas colombianos* (1881), an early example of musical nationalism here.

During the first decades of the 20th century a group of composers known as the forerunners of modern nationalism in Colombia contributed to the generally inactive musical scene. The most important of them were Carlos Umaña Santa-Maria (1862–1917), Andrés Martínez Montoya (1869–1933), and Santos Cifuentes (1870–1932). Not until the 1930's did Colombian music regain some stature, largely owing to a distinguished group of composers that includes Antonio María Valencia (1902–52), founder of the Cali Conservatory, Jesús Bermúdez Silva (b. 1884), Daniel Zamudio (1887–1952), Gonzalo Vidal Pacheco (1863–1933), and José Roza Contreras (b. 1894). The most important figure of this generation is Guillermo Uribe-Holguín (b. 1880), a skillful composer and educator who has produced more than one hundred works, most of them nationalist in character.

In 1936, Guillermo Espinosa (b. 1905), a well-known conductor and promoter of Latin American music abroad, founded the National Symphony Orchestra. In 1953 he was appointed chief of the Music Division of the Pan-American Union in Washington, D.C.

The most important Colombian composers of the next generation are Carlos Posada-Amador (b. 1908); Adolfo Mejía (b. 1909); Roberto Pineda-Duque (b. 1910), who uses the twelve-tone technique; Fabio Gonzalez-Zuleta (b. 1920), an eclectic and skillful composer of symphonies, choral works, and chamber music; and Luis Antonio Escobar (b. 1925), a talented neoclassicist who has won international recognition. Still younger composers are Blas Emilio Atehortúa (b. 1933) Marco Aurelio Venegas, Alfredo Aragon Guerrero, and Jacquelin Nova (b. 1938).

The folk music of Colombia derives from various sources, of which the most important are Spanish and African. Some scholars would also mention Arab and Jewish influences. All these have mingled in varying proportions with indigenous elements. The *\*bambuco*, the most characteristic of all dance-songs and the best known throughout Colombia, represents a combination of African, Spanish, and Indian traditions. The *\*pasillo* reflects stronger Spanish influences, and the *\*torbellino* and *\*guabina* are closer to indigenous music. Other native songs and dances are the *porro*, *\*galerón*, *\*chispa*, *cañas*, *bundes*, *fandanguillos*, and *\*mejorana*, the last-named imported from Panama.

**Colophane, colophony.** See under Rosin.

**Color** [L.]. (1) In 13th-century theory *color* signified various special devices of composition and performance, such as the repetition of a melodic phrase, its imitation (in *Stimmtausch*; see *Stimm-*), quotations from other sources [see Refrain III], or embellishments, especially the vocal *\*vibrato* [see J. de Garlandia, CS i, 115f]. The first meaning survived in the *color* of the *\*isorhythmic* motet; the last in the present-day term *\*coloratura*. (2) For *color temporis*, *color prolotionis*, see Mensural notation V.

**Color and music.** The physical and psychological relationships between colors and sounds have been the subject of numerous studies. Physically, both the pitches of the musical scale and the colors of the optical spectrum are vibrations of specific frequencies. The frequencies of audible sound range from about 16 to 40,000 cycles per second; those of visible light, from about 450 to 780 million million cycles per second. Since the latter two figures are nearly in the ratio 1:2, it would seem reasonable to compare the visible spectrum from red to violet not to the entire audible musical scale but only to an octave or, more nearly, to a seventh, e.g., to the tones 450 to 780 (approximately *a'* to *g''*). This analogy seems to be supported by the fact that both the colors in the spectrum and the diatonic tones are seven in number. However, there are various incongruities: (a) Newton's distinction of seven colors is arbitrary; in fact, his scheme was partly influenced by the preconceived analogy to the musical scale. (b) There are infinitely more colors in the spectrum than there are tones in the musical octave, since the former is a continuous and the latter a discrete multitude. (c) Most serious of all, the spectrum, unlike the musical octave, lacks the identity or, at least, similarity, of its lower and upper end. The chief studies in this field are those of Newton (1700), Goethe (1810), and Helmholtz (numerous essays, 1860–80).

Among musicians the psychological or syn-

esthetic approach to the question of color and sound has been more popular than the physical. A number of musicians, particularly in Russia and England, have been inclined to associate particular sounds with particular colors. The various schemes of coordination differ widely, however. For instance, Rimsky-Korsakov interpreted the keys of C, D, A, F and F-sharp (all major) as white, yellow, rosy, green, and grayish-green, respectively, while Scriabin interpreted them as red, yellow, green, red, and bright blue. In Chinese music, certain tones are associated with specific colors. Colors have also been associated with entire works—e.g., *Tannhäuser*, blue; *The Flying Dutchman*, green (the “blue cave” of Venus and the “green sea”?)—and even with composers (Mozart, blue; Chopin, green; Beethoven, black). An example of a composition based on color impressions is Arthur Bliss' *Colour Symphony* (1922; rev. 1932), each movement of which represents the associations of a specific color (e.g., purple: royalty, pageantry, and death). Obviously the whole matter of color-sound synesthesia is largely subjective.

More important are the synesthetic analogies between the optical colors and the timbres (tone “colors,” G. *Klangfarben*) of instruments. The terms “orchestral colors” and “orchestral palette” are widely used to signify a musical technique reminiscent of, and largely derived from, methods used in modern painting [see Impressionism]. However, these terms refer only to the general technique of modern orchestration, without implying any specific analogy between particular colors and instruments. In fact, any such specific coordination is no less subjective than color-key relationships. Color associations are common in Oriental music (China, India, Egypt, etc.), where, however, they are part of a cosmologic symbolism far removed from the subjective and psychological approach of Western music [see Lit., Wellek]. See Color organ.

Lit.: A. B. Klein, *Colour-music—The Art of Light* (1926), bibl.; O. Ortmann, *Theories of Synesthesia in the Light of a Case of Color-Hearing* [1933]; A. W. Rimington, *Colour-Music The Art of Mobile Colour* (1912); T. F. Karwoski and H. S. Odber, *Color-Music* [1938]; A. Lange, *Arthur Lange's Spectrotone System of Orchestration* (1943); F. Suarez de Mendoza, *L'Audition colorée* (1899), bibl.; G. Anschütz, *Kurze Einführung in die Farbe-Ton-Forschung* (1927); *WoHN* ii, 460f; L. Sabaneyev, in *ML* x, 266; E. Whomes, in *PMA* xiii; A. Wellek, in *ZMW* xi.

**Coloration.** (1) The use of colored (originally red, later black) notes in early notation; see Mensural notation V. (2) The use of stereotyped written-out ornaments in music of the 15th and 16th centuries; see Ornamentation III; Colorists; Intabulation.

**Coloratura** [It.]. A rapid passage, run, trill, or similar virtuoso-like material, particularly in vocal melodies of 18th- and 19th-century operatic arias: *aria di coloratura*, *aria di bravura*, *Koloraturarie*. A famous example is the aria of the Queen of the Night in Mozart's *Zauberflöte*. The term is also used for the stereotyped ornamentation formulas of 16th-century keyboard and lute music [see Colorists].

**Colorists** [G. *Koloristen*]. A name introduced by A. G. Ritter [see Lit.] and widely adopted for a group of German organ composers of the late 16th century, including Elias Nicolaus Ammerbach (1530–97), Bernhard Schmid the older (c. 1520–90), Jacob Paix (1556–1617), B. Schmid the younger (b. 1548), and others, who used stereotyped ornamentation formulas (*coloraturas*) in their lute and keyboard compositions. Although the name serves as a convenient designation, it is rather misleading in both its literal interpretation as well as its pejorative implication. It is true that the musicians of this group made abundant use of *coloraturas* that now seem stereotyped and meaningless, particularly in their arrangements [see Intabulation] of motets and chansons. However, this method reflects contemporary performance practice and was used by many organists and lutenists throughout the 16th century; it occurs in the keyboard and lute books of Attaignant (c. 1530) and the lute books of Hans and Melchior Newsidler (1536, '76), as well as in A. Gabrieli's keyboard arrangements of French chansons (c. 1550) and in those of the Fitzwilliam Virginal Book (c. 1600). Ritter's harsh judgment of the “colorists” is all the more unjust since these composers actually made outstanding contributions in another field, i.e., dance music. It should also be noted that B. Schmid the older in his publication of 1577 expressly says that he would prefer to leave the “art of the composer unchanged,” and that his “modest” *coloraturas* are added only for the benefit of young and inexperienced players” [see Frotscher i, 154]. To include Johannes Woltz (tablature of 1617) in this group, as Ritter does, is not correct, since Woltz renounced the addition of *coloraturas* altogether. Even more misleading is the

inclusion of Arnolt Schlick [see *AdHM* i, 385], who is not only much too early (died c. 1520) but also has much greater stature than the others.

Lit.: A. G. Ritter, *Zur Geschichte des Orgelspiels* (1884); G. Frotscher, *Geschichte des Orgelspiels und der Orgelkomposition* (1935); W. Apel, "Early German Keyboard Music" (*MQ* xxiii, 231f); W. Merian, *Der Tanz in den deutschen Tabulaturbüchern* (1927; transcriptions).

**Color organ.** The keyboard of the organ, harpsichord, and piano has been frequently used as a medium for coordinating sound and color [see Color and music]. In 1720 a Jesuit priest, L.-B. Castel (1688–1757), constructed a "Clavecin oculaire" in which the keys were mechanically connected to colored tapes; numerous similar contrivances were devised during the 18th and 19th centuries. These apparatuses were based on the idea of an exact correspondence between a single sound and a single color and were intended to provide an "optical translation" of a composition. More recently, the idea of a literal translation has been replaced by "general coordination" between musical and optical impressions, as in the color organ of Mrs. M. H. Greenwalt (exhibited in New York, 1921). Still further from the idea of strict sound-color analogy is the *clavilux* of T. Wilfred, which was exhibited in New York in 1922 and which, so far, has proved the most successful color organ, probably owing to the fact that it altogether renounces the coordination of sound and light and merely bestows upon optical phenomena the essential musical factors of time, rhythm, and changing combinations. It has no sound-producing apparatus and is designed only as a medium for a new art of color, in which optical phenomena (colored circles, squares, spirals, etc.) projected on a screen move rhythmically in "crescendo," "decrescendo," "accelerando," "ritardando," etc.

Among composers, Scriabin was the most outspoken protagonist of color music. In *Prometheus* (op. 60, 1910) he undertook to demonstrate the affinity, scientific and spiritual, that he believed existed between tone and color. He prescribed a special instrument for it, a "clavier à lumières" [It. *tastiera per luce*] invented by Rimington. The only recorded performance of the composition with color accompaniment took place in 1915 in Carnegie Hall, New York. For literature, see under Color and music.

**Colpo d'arco** [It.]. Stroke of the bow (of violins, etc.).

**Combattimento di Tancredi e Clorinda, II** [It., The Duel between Tancred and Clorinda]. Opera (madrigal) in one act by Monteverdi (libretto based on Tasso's *Gerusalemme liberata*), produced in Venice, 1624. Setting: battlefield, 1099.

**Combination pedal, stops.** See under Organ IV.

**Combination tone, resultant tone** [F. *son résultant*; G. *Kombinationston*; It. *tono di combinazione*; Sp. *tono resultante*]. In musical acoustics, a tone of different pitch that is heard when two loud tones are sounded simultaneously. Its frequency is the difference (*differential tones*) or the sum (*summation tones*) of the frequencies of the two primary tones or of their multiples. For example, if the two primary tones have the frequencies 1200 and 700, the following differential tones (D) and summation tones (S) can be heard:  $D_1: 1200 - 700 = 500$ ;  $D_2: 2 \times 1200 - 700 = 1700$ ;  $D_3: 2 \times 700 - 1200 = 200$ ;  $S_1: 1200 + 700 = 1900$ ;  $S_2: 2 \times 1200 + 700 = 3100$ ;  $S_3: 2 \times 700 + 1200 = 2600$ , etc. Although the combination tones are frequently referred to as an acoustical phenomenon, they actually are a physiological phenomenon. If the vibrations 1200 and 700 are produced, none of the vibrations 500, 1700, etc., actually exists; it is the inner ear (*cochlea*) that, owing to its "non-linear" organization, produces the aural sensations corresponding to the greater or lesser frequencies. "Nonlinear" here means that the combination of two sounds with the intensities  $a$  and  $b$  is not a simple linear sum,  $a + b$ , but a more complicated formula, involving powers of  $a$  and  $b$ . The linear formula is valid only for small intensities; as a matter of fact, combination tones are heard only if the original tones are sufficiently loud.

The differential tones, which are more easily recognized than the summation tones, were discovered by G. Tartini in 1714 and described in his *Trattato di musica* of 1754 (an earlier description appeared in a book by G. A. Sorge, *Vorgemach der musicalischen Composition*, 1745–47). The tone known as Tartini's tone [It. *terzo suono*, "third tone"] is the first of the combination tones above, determined by the difference of the original frequencies. The accompanying table shows Tartini's tone for various intervals ( $c'$  arbitrarily = 300).

Tartini's tone can easily be heard on the harmonium, organ, and violin. On the violin, it was recommended by Tartini and other violinists (Leopold Mozart) as a means of controlling the

correct intonation of double stops, since a slight inaccuracy results in a more recognizable change of the low-pitched differential tone. The name "beat-tones," formerly applied to differential tones, is misleading. It is derived from the theory advanced by T. Young (1773–1829) that the differential tones are quick \*beats (more than 40 per second). This theory was refuted by Helmholtz, who discovered the summation tones by calculations based on the principle of "nonlinear superposition," thus paving the way for the modern theory. Modern research has shown that certain well-established musical sounds, e.g., that of the G-string of the violin, are physically nonexistent, being produced only aurally as the differential tones of their upper partials [see Tone color].

Practical application of the first differential tone is made in the \*acoustic bass of organs. For literature, see under Acoustics; also E. Darmon, in *CP Masson*.

**Come** [It.]. As, like. *Come prima, come sopra*, as at first, as above; *come stà*, as it stands, i.e., without improvisations.

**Comédie** [F.]. Term occasionally used for operas in a light, slightly comical vein. For *comédie-ballet*, see under Ballet; also *Entr'acte*.

**Comes** [L.]. See *Dux, comes*.

**Comic opera**. I. *Definition*. General name for an opera or other dramatic work with a large admixture of music, on a light or sentimental subject, with a happy ending, and in which comic elements are present. The category thus includes a number of types, such as the operetta, vaudeville, *opéra bouffe*, musical comedy, etc., the distinctions among which are not always clearly marked. Until the middle of the 19th century comic operas (except for the Italian *opera buffa*) usually contained spoken dialogue; in more recent times this feature has tended to disappear, so that a distinction on this basis is no longer generally valid. Incidentally, it should be noted that not all operas with spoken dialogue are "comic," though in France the name *opéra comique* is traditionally applied to such works, even when they are serious or tragic,

e.g., Bizet's *Carmen*. The music of comic opera is almost always more "popular" in style than that of serious opera, generally easier both to perform and to comprehend, and appealing to less sophisticated audiences. Its function is relatively less important than in serious opera, and in some forms (e.g., musical comedy) it is usually confined to a series of "hit" songs or other musical specialties. The scenes and personages of comic opera are apt to be taken from everyday life, or if fantasy is present it is treated in a sentimental or amusing fashion. Frequently there is satire of manners, allusion to current topics, or parody of the serious opera style.

II. *History*. A. Comic scenes early made their way into serious opera, and the juxtaposition of serious and comic episodes is a general feature of 17th-century librettos. Examples may be found in S. Landi's *La Morte d'Orfeo* (1619) and *Il Sant' Alessio* (1632), in D. Mazzocchi's *La Catena d'Adone* (1626), and G. Cornachio's *Diana schernita* (1629), all of the Roman school. L. Rossi's *L'Orfeo* (Paris, 1647) is another instance. The same practice may be observed in Monteverdi's *L'Incoronazione di Poppea* (1642), Cavalli's *Giasone* (1649), Cesti's *Il Pomo d'oro* (1666 or '67), and to an even greater degree in later Venetian works. The earliest independent comic operas are V. Mazzocchi's *Chi soffre speri* (1639) and A. Abbatini's *Dal male il bene* (1653), both in collaboration with M. Marazzoli and to librettos by Giulio Rospigliosi (later Pope Clement IX). The last-mentioned work is notable for its use of parlando recitative and for its ensemble finales, features that are prominent in the later comic-opera style. Another early example is J. Melani's *La Tancia* (Florence, 1656), which contains a parody of the famous incantation scene of Cavalli's *Giasone*. In the second half of the 17th century Venice was the center of a considerable school of comic opera that has not yet been fully studied [see H. C. Wolff, "Die venezianische Oper," in *ZMW* xvi].

B. With the abolition of comic episodes in the "reformed" opera librettos of Apostolo Zeno and Pietro Metastasio, the comic opera as a separate genre took on renewed importance. Comic opera of the 18th century shows well-defined national types. The Italian *opera buffa* began early in the century to evolve out of \*intermezzi performed between the acts of serious operas. The fully developed independent form, of which the most famous early example is Pergolesi's *La Serva padrona* (1733), retained traces of its origin in the designation "inter-

mezzo" and in the customary division into two acts (as opposed to the three-act arrangement of the *opera seria*). The Italian buffo operas are remarkable for the liveliness and humor of their action, for the high development of comic characterization in their music, and for the use of ensemble finales. The leading composers were Logroscino, Galuppi, Pergolesi, Anfossi, P. A. Guglielmi, Piccinni, J. Haydn, Paisiello, Cimarosa, and Mozart. Toward the end of the century the Italian comic opera (like that of all other countries) tended to combine with the earlier farcical-intrigue plot some elements of the semiserious, sentimental drama; at the same time its music changed accordingly, becoming on occasion more expressive, lyric, and dignified. Examples of this later type are Piccinni's *La Buona Figliuola* (1760, libretto by Goldoni), Paisiello's *Nina* (1789), Mozart's *Le Nozze di Figaro* (1786), and Cimarosa's *Il Matrimonio segreto* (1792).

C. The French *opéra comique*, beginning before 1715 with popular farces and satires that mingled spoken dialogue with songs to familiar airs (*vaudevilles*), was given a new direction by the example of the Italian buffo opera [see War of the Buffoons] and developed a type known as *comédie mêlée d'ariettes*, i.e., a spoken "comedy mingled with [newly composed] songs," of which the chief composers were J.-J. Rousseau (*Le Devin du village*, 1752), Gluck (*La Rencontre imprévue*, Vienna, 1764), F.-A. Philidor (*Tom Jones*, 1765), Monsigny (*Le Déserteur*, 1769), and Grétry (*Zémire et Azor*, 1771; *Richard Cœur-de-Lion*, 1784). The romantic quality of the librettos of many of these works and the frequent comment on political and social problems show the influence of Rousseau and the Encyclopedists.

D. The typical English 18th-century form was the \*ballad opera, which was succeeded by similar works using original music by such composers as Thomas Arne (*Love in a Village*, 1762), Charles Dibdin (*The Waterman*, 1774), William Shield (*Rosina*, 1782), and Stephen Storace (*The Haunted Tower*, 1789). With respect to subject matter and treatment, the course of English comic opera in this period parallels the French *opéra comique*.

The corresponding form for this period in Spain is the \**tonadilla* [see also *Zarzuela*; *Sainete*].

E. In Germany the \*Singspiel was cultivated at Leipzig by J. A. Hiller, using for the most part plays adapted from French *opéras comiques* by C. F. Weisse (*Die Jagd*, 1770, from Monsigny's

*Le Roi et le fermier*). Other North German composers were Georg Benda (*Der Dorfjahrmarkt*, 1775; in *DdT* 64), C. Neefe, and J. André. In Vienna a different type of Singspiel, strongly influenced by the Italian buffo style, developed. The chief composers were I. Umlauf (*Die Bergknappen*, 1778; in *DTO* 36), Mozart (*Die Entführung aus dem Serail*, 1782), Dittersdorf (*Doktor und Apotheker*, 1786), and J. Schenk (*Der Dorfbarbier*, 1796; in *DTO* 66).

F. In the 19th century comic opera lost some of its earlier distinctive character, approaching on the one hand the style, form, and subject matter of serious opera or on the other hand tending toward the light, purely "entertainment" types, such as \**vaudeville*, \**operetta*, \**zarzuela*, etc. In Italy the *opera buffa* was continued by Simon Mayr, F. Paër, Rossini, and Donizetti. The French *opéra comique* is represented by Boieldieu (*La Dame blanche*, 1825), Auber (*Fra Diavolo*, 1830), L. J. F. Herold (*Le Pré aux clercs*, 1832), Adam (*Le Postillon de Longjumeau*, 1836), and Victor Massé (*Les Noces de Jeannette*, 1853). A special type of comic opera is represented by the *opéras bouffes* of Offenbach (*Orphée aux enfers*, 1858, rev. 1874; *La Belle Hélène*, 1864; *La Vie parisienne*, 1866). English comic operas were composed by Sir Henry R. Bishop (works of 1804–40), but the best English works in the comic vein are those of W. S. Gilbert and Arthur Sullivan (*H.M.S. Pinafore*, 1878; *Iolanthe*, 1882; *The Mikado*, 1885). The best-known German comic operas of this period (known as \**Spieloper*) are K. Kreutzer's *Das Nachtlager von Granada* (1834), Lortzing's *Czaar und Zimmermann* (1837) and *Der Wildschütz* (1842), O. Nicolai's *Die lustigen Weiber von Windsor* (1849), Flotow's *Martha* (1847), and P. Cornelius' *Der Barbier von Bagdad* (1858). Similar to these is H. Berlioz's *Béatrice et Bénédict* (1862). One of the most popular comic operas of the 19th century was Smetana's *The Bartered Bride* (1866). The Viennese operetta of the late 19th and early 20th centuries (J. Strauss the younger, *Die Fledermaus*, 1874, *Zigeunerbaron*, 1885; F. Lehár, *Die lustige Witwe*, 1905) inspired imitation in many countries.

Since the middle of the 19th century, comic opera of various sorts has been cultivated in all countries, chiefly by composers not distinguished in any other field. These works are very numerous but for the most part ephemeral. A few comic operas of lasting merit and on a large scale have been produced, of which three deserve particular mention: Wagner's *Meister-*

singer von Nürnberg (1868), Verdi's *Falstaff* (1893), and R. Strauss' *Rosenkavalier* (1911). An extremely clever and witty *opéra bouffe* is Poulenc's *Les Mamelles de Tirésias* (1947). Notable examples of modern comic opera in England include Holst's one-act *The Perfect Fool* (1923) and Vaughan Williams' *Sir John in Love* (1929).

Abert, "Paisiello's Buffokunst und ihre Beziehungen zu Mozart" (*AMW* i). D.J.G.

**Comma, schisma.** Terms for minute differences in pitch that occur in the calculation of intervals if the same note is obtained through different combinations of octaves, perfect fifths, and pure major thirds. The *ditonic* (or *Pythagorean*) comma is the difference between twelve perfect fifths and seven octaves. Thus the \*circle of fifths, if based on pure fifths, becomes a "spiral" of fifths. The *syntonic* (or *Didymic*) comma (named for Didymus, a Greek theorist, b. 65 B.C.) is the difference between four perfect fifths (C–G–d–a–e') and two octaves plus a major third (C–c–c'–e'). The *schisma* is the difference between eight perfect fifths plus one major third (C–g–d–a–e'–b'–f#''–c#'''–g#''''–b#''') and five octaves (C–c–c'–c''–c'''–c'''). The *diaschisma*

is the difference between three octaves (C–c–c'–c'') and four perfect fifths plus two major thirds (C–G–d–a–e'–g#''–b#'). The following table shows these differences expressed in various ways (*F* = fifth; *O* = octave; *T* = third; see Intervals, calculations of, II).

Ditonic comma 12 *F* – 7 *O*

$$= \left(\frac{3}{2}\right)^{12} \times \left(\frac{1}{2}\right)^7 = \frac{3^{12}}{2^{19}} = \frac{531441}{524288} = 23.5 \text{ cents}$$

Syntonic comma 4 *F* – 1 *T* – 2 *O*

$$= \left(\frac{3}{2}\right)^4 \times \frac{4}{5} \times \left(\frac{1}{2}\right)^2 = \frac{3^4}{2^4 \times 5} = \frac{81}{80} = 21.5 \text{ cents}$$

Diaschisma 3 *O* – 4 *F* – 2 *T*

$$= 2^3 \times \left(\frac{2}{3}\right)^4 \times \left(\frac{4}{5}\right)^2 = \frac{2^{11}}{3^4 \times 5^2} = \frac{2048}{2025} = 20 \text{ cents}$$

Schisma 8 *F* + 1 *T* – 5 *O*

$$= \left(\frac{3}{2}\right)^8 \times \frac{5}{4} \times \left(\frac{1}{2}\right)^5 = \frac{3^8 \times 5}{2^{15}} = \frac{32805}{32768} = 2 \text{ cents}$$

The first three microintervals have approximately the value of one-fourth of a semitone (25 cents). A difference of six cents is discernible to very sensitive ears.

The ditonic comma is also the difference between the two semitones of the \*Pythagorean scale, and the syntonic comma that between the two whole tones of \*just intonation. The schisma is also the difference between the ditonic and syntonic comma, as well as that between the syntonic comma and diaschisma:

$$\frac{3^{12}}{2^{19}} \times \frac{5 \times 2^4}{3^4} = \frac{3^8 \times 5}{2^{15}};$$

$$\frac{3^4}{2^4 \times 5} \times \frac{3^4 \times 5^2}{2^{11}} = \frac{3^8 \times 5}{2^{15}}$$

The diaschisma is explained by medieval theorists (Boethius, Tinctoris), as one-half of the *semitonium minus* (*diesis*) of the Pythagorean scale. The schisma nearly equals the difference between the Pythagorean fifth ( $\frac{3}{2}$  = 702 cents) and the fifth of equal temperament (700 cents). This difference is therefore also called schisma.

**Commedia dell' arte** [It.]. A type of comical stage presentation that developed in Italy about 1500. It had no music, but its traditional characters—the rich Venetian merchant, his unfaithful wife, the unscrupulous lawyer, the Bolognese doctor,

the comic servant, etc.—have often been introduced into musical comedies, from O. Vecchi's *L'Amfiparnaso* (1597) and G. Pergolesi's *La Serva padrona* (1733) to Mozart's *Le Nozze di Figaro* (1786) and Stravinsky's *Pulcinella* (ballet, 1920). See W. Smith, *The Commedia Dell'Arte* (1964); N. Pirrotta, "Commedia dell'Arte and Opera" (*MQ* xli).

**Commiato** [It.]. See under Envoi.

**Commixtio** [L.]. See under Church modes III.

**Common chord**. Name for the major triad.

**Common meter**. See under Poetic meter II.

**Common of the Mass**. Term sometimes used instead of Ordinary of the Mass [see Ordinary and Proper].

**Common of Saints** [L. *Commune Sanctorum*]. See under Gregorian chant I.

**Common time**. Name for 4/4 meter.

**Commune sanctorum** [L.]. See under Gregorian chant I.

**Communion** [L. *communio*]. In the Roman Catholic service, the last of the five items of the Proper of the Mass, sung after (originally during) the distribution of the Host. Originally it was an antiphon with the psalm verse *Gustate et videte* (*Taste ye and see*) from Psalm 33 (32) or with other psalm verses [see Antiphon (3)]. However, these verses disappeared in the 12th century so that only an antiphon (*antiphona ad communionem*) remained. The Communion antiphons are moderately melismatic melodies (although many are neumatic), sung chorally with a soloistic *\*incipit*. They are particularly interesting from the point of view of Gregorian tonality [see *ApGC*, pp. 140ff]. In the Anglican rite, Communion often means the entire Mass. See Mass D.

**Community music schools**. Evolved during the late 19th century in the United States, these schools offer individual instrumental and vocal instruction to all ages. As either independent, nonprofit organizations or as Settlement departments these schools have placed the study of music within the reach of all. The National Guild of Community Music Schools was organized in 1937 to coordinate these schools across the country.

**Comodo** [It.]. Comfortable, easy.

**Comparative musicology** [G. *Vergleichende Musikwissenschaft*]. See under Ethnomusicology.

**Compass**. The range of notes obtainable from an instrument or voice.

**Complement**. The difference between the octave and any interval, therefore identical with inverted interval [see Inversion (1)]. For instance, the complement of the fifth is the fourth, and that of the sixth, the third.

**Completorium** [L.]. In Roman Catholic liturgy, Compline [see Office]. In the Milanese rites, a chant sung at Vespers [see Ambrosian chant].

**Compline**. See under Office.

**Composition**. I. The process of creating musical works; also, a musical work. Literally meaning "putting together," the term is particularly suitable for early polyphonic music, in which various voice-parts are indeed put together. In the more complex music of later periods, this meaning is less obvious, yet an opera by Wagner or a symphony by Tchaikovsky involves the "putting together" of numerous diversified elements just as much as voice-parts were "put together" in early music. Moreover, the term is highly appropriate for the twelve-tone technique and even more for more recent methods of creating music by putting together assorted sounds on a recording tape [*\*electronic music*, *\*serial music*].

It is well-nigh impossible to make general statements that would be valid for the whole field of musical creation. The composition of a Gregorian Tract or of a troubadour song has as little in common with that of a B-minor Mass as has Schumann's writing the *Kreisleriana* with Messiaen's *Mode de valeurs et d'intensités*. Only with reference to a given period is it possible to indicate to some degree what elements enter into the creative process. Thus, a symphony by Beethoven may be said to result from the coordination of traditional ingredients, such as tonality, harmony, rhythm, orchestration, and form, with others of a highly original and personal character, notably the gifts of melodic invention and dramatic development.

II. The term *componere* was used first in connection with the writing of melodies. Guido's "Micrologus" of c. 1030 includes a chapter, "De comoda vel componenda modulatione" (About the Appropriate Composition of a Melody), in which he points out certain principles (similarity, contrast, symmetry) that should be observed when small particles (neumes) are

put together into a coherent whole. Johannes de Grocheo (c. 1290) was perhaps the first to apply the term to polyphonic music. He calls a two- or three-part piece *musica composita* and its author *compositor*. Writers of the 14th and 15th centuries emphasized the difference between written composition and improvised singing. Thus, Tinctoris in his "Liber de arte contrapuncti" (1477) speaks of "sive componere sive super librum canere" [see *Discantus supra librum*]. His definition, "compositor est alicuius novi cantus editor," is the first indication that originality was recognized as an essential attribute of a composer. Nicolaus Wollick (*Opus aureum*, 1501) again emphasized the contrast between *compositio* and *\*sortisatio*.

In subsequent centuries there appeared numerous books about composition. A few of these are mentioned here in order to illustrate the various elements that enter into the process in increasing number and diversity. D. Ortiz, in his *Trattado de glosas* (1553), deals with the art of diminution (figuration) for voices and instruments. G. Coperario's "Rules how to compose" (c. 1610) provide instruction in counterpoint, as does J. Fux's *Gradus ad Parnassum* (1725). A. Agazzari's *Del sonare sopra il basso con tutti li stromenti* (1607) is the first of a long series of treatises on thoroughbass. With J. Rameau's *Traité de l'harmonie* (1722) the harmonic aspect of music becomes the center of attention. Berlioz in his *Grand Traité d'instrumentation* (1844) laid the foundation for the art of orchestration. With D'Indy's *Cours de composition musicale*, 4 vols. (1903–50), we arrive at the first attempt to treat the subject from a historical point of view, beginning with Gregorian chant and closing with the forms and styles of late romanticism. To the present day, D'Indy's work has remained unique. Among the books dealing with 20th-century methods of composition, two written by eminent composers may be singled out: P. Hindemith's *The Craft of Musical Composition*, 2 vols. [1942] and E. Krenek's *Studies in Counterpoint Based on the Twelve-Tone Technique* [1941].

**Composition pedals, stops.** See under Organ IV.

**Compostela, school of.** A mid-12th-century school housed in the monastery of Santiago (St. James) at Compostela in the Pyrenees. A number of compositions, monophonic and polyphonic, for the Office of St. James are preserved in the Codex Calixtinus [see Sources, no. 2] The polyphonic style of this school is closely related

to that of \*St. Martial. Examples in *HAM*, nos. 27b, 28b. See Conductus; Organum (2) III.

**Compound binary form.** Name for \*sonata form. It expresses the fact that the sonata form is originally and historically a binary form but of large dimensions and composite structure. See also Binary and ternary form.

**Compound interval.** See under Interval.

**Compound meter, time.** See under Meter.

**Compound stop.** Same as mixture stop. See Organ VI, IX (f).

**Computer, musical applications of.** The use of digital computers and other electronic data-processing devices for musicologic purposes began about 1948, notably in the folksong research of Bertrand Bronson. Computers have made significant contributions to music and musical research in at least five areas: (1) information retrieval, using input languages developed by Brook and Gould, Logemann, Kassler and Regener, Bauer-Mengelberg, and others, with applications such as H. Lincoln's thematic index of 16th-century Italian music, L. Bernstein's index of 16th-century chansons, K. Levy's comparative studies of Byzantine notation, and J. LaRue's concerto and symphony indexes; (2) \*style analysis, such as L. Lockwood's study of Josquin's Masses, A. Forte's analysis of atonal structures, J. LaRue's studies on the formation of tonality and criteria for articulation, G. McPeck's classification of 15th-century chansons, S. Jay's harmonic analysis of Mozart and Beethoven, G. Lefkoff's systematic analysis, and R. Jackson's harmonic analysis; (3) composition, as in Hiller and Isaacson's *Illiad Suite* (1956); (4) sound generation, as in the Bell Laboratories' Music IV system; and (5) acoustic analysis. New York University has undertaken a comprehensive project to develop a collection of programs and routines of general utility, including translators for a variety of input languages, event compilers, correlation of paired distributions, and specialized display formats. [Also see under Electronic music.]

An important development is the digital electronic computer, which by-passes the special electronic oscillators and wave-shaping circuits of the RCA instrument [see Synthesizer] and synthesizes musical sounds directly from mathematical functions supplied to the computer by the composer. The output of the computer is simply stored on magnetic tape and played back like an ordinary sound recording. The inherent

versatility and precision of this method presents virtually unlimited possibilities.

**Con** [It.]. With; e.g., *con brio*, with vigor; *con moto*, with motion; *con ottava* (*con 8va*), with the higher octave; *con alcuna licenza*, with some license, specifically regarding tempo.

**Con amore.** See *Amorevole*.

**Con ardore.** See *Ardore*.

**Con brio.** See *Brio*.

**Con calore.** See *Calore*.

**Concentus.** See *Accentus*, *concentus*.

**Concert.** I. A public performance of music, especially one involving a group of musicians (a performance given by a soloist is called a recital). Concerts are a fairly recent institution. Through the end of the 17th century, musical performances took place in churches, in the homes of princes or wealthy persons who could afford a private orchestra, or in closed circles,

such as \*academies or \*collegia musica. Actually, the church was the only place where the common people could hear well-prepared performances of good music. The first step toward public performance was taken with the foundation of the Teatro San Cassiano in Venice in 1637 [see Opera houses]. The first concerts (nonoperatic) open to the public were organized by John Banister, a London violinist, in 1672. They continued for six years, with a daily afternoon program. They were followed, in 1678, by a long series of concerts arranged by a London coal merchant, T. Britton, which took place in a loft over his coal-house, continuing weekly for thirty-six years. Later came the Concerts of Ancient Music (1776-1848; after 1785 called "King's Concerts"), which were largely devoted to the works of Handel; the Salomon Concerts (1791-95), for which Haydn wrote his famous twelve symphonies (London Symphonies); and the Crystal Palace Concerts (1855-1901), conducted by August Manns every Saturday afternoon in the winter season.

II. In France, public concerts began with the foundation, by A. Philidor, of a series of concerts called *Concert spirituel*, which continued from 1725 until the French Revolution (1789). They took place only around Easter and were largely devoted to sacred music. They became the model for similar institutions in Leipzig, Berlin, Vienna, and Stockholm. Although revived in 1805, the *Concert spirituel* became less important with the establishment of the *Concerts du Conservatoire*, which were started by F.-A. Habeneck in 1828 and which still continue. These concerts greatly enhanced the 19th-century development of orchestral music and contributed much to the growing interest in the music of Beethoven, Berlioz, Schubert, *et al.* A more popular enterprise and of international fame are the *Concerts populaires*, conducted by J. Pasdeloup from 1861 till 1884 and revived in 1920, under the name *Concerts Pasdeloup*, by Rhené-Baton and A. Caplet.

III. The earliest German concert institutions are the *Gewandhaus Konzerte* of Leipzig, which started in 1781 under J. A. Hiller as a continuation of his *Liebhaberkonzerte* (1763-78) and other enterprises of passing importance. Until 1884 they took place in the *Alte Gewandhaus* (Old Cloth Hall), which was replaced in that year by a new concert hall, the *Neue Gewandhaus*. Famous conductors there were Mendelssohn (1835-43), under whom the concerts first attained international recognition, Arthur Ni-

kisch, Wilhelm Furtwängler, and Bruno Walter.

For the development of concerts in America, see under United States. Also see Orchestras.

**Concertant** [F.], **concertante** [It.]. An 18th-century name for symphonies (*symphonie concertante*, *sinfonia concertante*) with parts for one or more solo instruments, after the model of the earlier \*concerto grosso but in the style and form of the Mannheim school. Such works were written by C. Cannabich, K. Stamitz, Haydn, and Mozart. See also B. Brook, *La Symphonie française dans la seconde moitié du XVIIIe siècle*, 3 vols. (1962), ii, pt. 2.

**Concertante**. See under Concerto III.

**Concertato** [It.]. A term used occasionally in the early 17th century in connection with various manifestations of the novel principle of "contrast" or "rivalry," e.g. in T. Merula's *Canzoni, overo sonate concertate* (1637). In 17th-century vocal works, *coro concertato* means a small body of singers, in contrast to the full chorus, the *coro ripieno* or the *cappella*. The term has been recommended as a generic designation for the numerous and varied forerunners of the true concerto [see *BuMBE*, p. 20 and *passim*].

**Concertgebouw**. See under Orchestras III.

**Concert grand**. The largest size of piano, built for concert performance. See Piano.

**Concert halls**. For the acoustical properties of concert halls, see bibl. under Architectural acoustics. See also *LavE* ii.6, 3860.

**Concertina**. See under Accordion.

**Concertino**. (1) In baroque music, the soloist group of the \*concerto grosso. (2) A composition of the 19th–20th centuries in the style of a con-

certo but in free form, usually in a single movement with sections of varying speed and character. A German name for this type is *Konzertstück*. Examples are Weber, *Concertino for Clarinet* op. 26; Schumann, *Introduction and Allegro appassionato* op. 92 (piano and orchestra). Others are by Anton Rubinstein (piano, op. 113), Bruch (violin, op. 84), John Carpenter (piano, 1917), E. von Dohnányi (cello, op. 12), Leo Janáček (piano and chamber orchestra), Jean Françaix (piano, 1932), and W. Piston (piano and chamber orchestra, 1937).

**Concertmaster** [F. *chef d'attaque*; G. *Konzertmeister*; It. *violino primo*; Sp. *concertino*]. The first violinist of an orchestra. He is entrusted with violin solo passages, represents the orchestra in negotiations with the management and the conductor, and occasionally substitutes for the latter.

**Concerto** [F., It.; G. *Konzert*; Sp. *concierto*, *concerto*]. I. *General*. A concerto is a composition for orchestra and a solo instrument (most often piano or violin), formerly also for orchestra and a small group of solo instruments [see *Concerto grosso*]. An essential trait of the concerto is that the soloist(s) and the orchestra are not in a master-servant relationship (as in the case of orchestral accompaniment) but compete on equal terms. This meaning is implied by the name itself, which is usually thought to be derived from L. *concertare*, "to fight," "to contend." Recently another derivation has been suggested, from L. *conserere*, "to join together," "to unite" [see F. Giegling, in *CP* 1949, p. 129], mainly because the spelling *conserto* occasionally has been found (A. Agazzari, 1607 and 1613).

The development of the concerto from Mozart to the present day generally follows that of the \*sonata, from which it borrowed its chief features of form and style. There are, however, the following differences: (a) the concerto practically always has only three movements, the scherzo being omitted (Brahms' Piano Concerto op. 83 is one of the few exceptions); (b) the first movement is written in a modified \*sonata form in which the exposition, instead of being repeated in full, is written out twice, first in a preliminary and abbreviated form with the tonic as the main key throughout and for the orchestra only, then in its full form for the soloist and orchestra and with the proper modulation into the dominant, a form known as *concerto-sonata form*; (c) the last movement is usually in \*rondo

form, whose light character lends itself well to displays of brilliance and to a "happy ending"; (d) a soloist \*cadenza appears regularly in the first movement, usually near the end of the recapitulation but sometimes, less elaborately, in the other movements as well.

The solo part of a concerto is always written in a highly virtuosic style designed to show the equality, if not superiority, of the single player over the entire orchestra. Concertos are classified according to the solo instrument, as piano (violin, cello, etc.) concertos. A concerto in a free one-movement form is called a \*concertino [G. *Konzertstück*].

II. *The present repertory.* The present-day repertory of the piano concerto begins with the latest concertos by Mozart, composed between 1785 and 1791 (K. 466 in D minor; K. 467 in C major; K. 482 in E-flat major; K. 488 in A major; K. 491 in C minor; K. 503 in C major; K. 537 in D major (\*Coronation Concerto); K. 595 in B-flat major). In these compositions Mozart established the classical form and style of the concerto. Beethoven's five piano concertos, especially the last two, in G major (op. 58, 1805–06) and in E-flat major (\*Emperor Concerto, op. 73, 1809), represent the artistic high point of the literature. There followed Weber (op. 11, 1810; op. 32, 1812; *Konzertstück* op. 79, 1821), Mendelssohn (op. 25, 1831; op. 40, 1837), Chopin (op. 11, op. 21, both c. 1830), and Schumann with his beautiful Concerto in A minor (op. 54, 1841–45). Chopin's concertos suffer from an inferior treatment of the orchestra. Liszt's two concertos, in E-flat major (1849) and A major (1849–57), show a tendency toward technical display for its own sake that continues, particularly in the concertos of Russian composers such as Anton Rubinstein (five concertos, notably op. 70 in D minor and op. 94 in E-flat), Tchaikovsky (B-flat minor op. 23, 1875; G major op. 44, 1880; E-flat major op. 75, 1893), Rimsky-Korsakov (C-sharp minor, 1882–83), and many others. A conspicuous feature of the Russian concertos is the prevalence of octave-playing over other devices of piano technique. Grieg contributed an effective and very popular concerto in A minor (op. 16, 1868). A new peak of artistic perfection was reached by Brahms in his piano concertos in D minor (op. 15, 1854) and B-flat major (op. 83, 1878–81). There followed concertos by Franck (*Variations symphoniques*, 1885); MacDowell (D minor op. 23, 1884–85); Scriabin (F-sharp minor op. 20, 1898); Rachmaninoff (F-sharp minor op. 1, 1890–91,

rev. 1917; C minor op. 18, 1901, rev. 1942; D minor op. 30, 1909; G minor op. 40, 1927, rev. 1942); Reger (F minor op. 114, 1910); Prokofiev (D-flat major op. 10, 1911; G minor op. 16, 1912–13, rev. 1923; C major op. 26, 1917–21; B major op. 53, 1931, for the left hand alone; G major op. 55, 1932); Ravel (G major, 1930; D major, 1930, for the left hand alone); Bartók (1926, 1930–31, 1945); Stravinsky (for piano and wind instruments, 1922–24, rev. 1950); Hindemith (op. 36, one for piano and twelve solo instruments); Copland (1925); and Vaughan Williams (1926–30). Some of the 20th-century \*neoclassical works approach the idiom of the baroque \*concerto grosso [see below for concertos for orchestra].

The repertory of violin concertos is somewhat smaller and, on the whole, less significant. It includes works by J. S. Bach (3, 1 for two violins), Haydn (9), Viotti (29), Mozart (7), Kreutzer (19, 2 for two violins), Beethoven (1), Paganini (4), Spohr (15), Mendelssohn (1), Schumann (1, recently discovered), Gade (1), Brahms (1), Wieniawski (2), Saint-Saëns (3), Bruch (3), Tchaikovsky (1), Dvořák (1), Elgar (1), Delius (1), R. Strauss (1), Glazunov (2), Sibelius (1), Pfitzner (1 for two violins), Reger (1), Schoenberg (1), Holst (1 for two violins), Respighi (1), Bloch (1), Bartók (2), Stravinsky (1), Syzmannowski (2), Casella (1), Bax (1), Berg (1), Prokofiev (2), Milhaud (3), Piston (2), Hindemith (1), Krenek (1), Walton (1), Khachaturian (1), Shostakovich (1), Barber (1), Menotti (1), and Britten (1).

Several modern composers have written compositions under the seemingly self-contradictory title "concerto for orchestra," i.e., without a solo instrument. This was an attempt by the neoclassicists of the 1920's to revive the baroque *concerto grosso*, in which the soloist role is much less important than in the modern concerto. These concertos resemble the old form in their use of a chamber orchestra, emphasis on "motoric" rather than emotional impulse, and linear design rather than massed sound or orchestral effects (Stravinsky, *Concerto en mi<sup>b</sup>*, 1937–38). Some of them introduce the baroque \*concertino, i.e., a group of three or two solo instruments alternating with the full ensemble, e.g., H. Kaminski, *Concerto grosso* (1922); E. Bloch, *Concerto grosso* no. 1 (1924–25), no. 2 (1953); E. Krenek, *Concerto grosso* (2; 1921, '24); P. Hindemith, *Konzert für Orchester* op. 38 (1925); W. Piston, *Concerto for orchestra* (1933); B. Bartók, *Concerto for Orchestra* (1943);

S. Barber, *Capricorn Concerto* op. 21 (1944).

III. *History.* The term "concerto" was first used for vocal compositions supported by an instrumental (or organ) accompaniment, in order to distinguish such pieces from the then current style of unaccompanied *a capella* music. To this category belong the *Concerti ecclesiastici* (church concertos) of Andrea and Giovanni Gabrieli (1587; see *HAM*, no. 157) and Adriano Banchieri (1595), both for double chorus, as well as those by Ludovico Viadana (1602; see *HAM*, no. 185; *SchGMB*, no. 168) and Hortensio Naldi (1607; see *RiHM* ii.2, 313f), both for solo parts in the then novel monodic style. The use of the name "concerto" for accompanied vocal music persisted throughout the baroque period, e.g., in Schütz's *Kleine Geistliche Concerte* of 1636 and several cantatas by Bach that he called "Concerto."

In purely instrumental music the term came to mean contrasting performing bodies playing in alternation. This style, which some 17th-century writers called *stile moderno*, is one of the most typical traits of baroque music. On the basis of the definition above, the history of the concerto prior to Mozart can be divided into three periods: 1620–70; 1670–1750; 1750–80. It should be noted that, particularly in the first period, the presence or absence of the names *concerto* or *concertante* is not decisive, since various names, such as *canzona*, *sonata*, and *sinfonia*, were used without clear distinction for a variety of styles and types.

(a) 1620–70. While Viadana's *Sinfonie musicali a otto voci* (1610) represents the instrumental application of G. Gabrieli's double-chorus style, the *Sonate concertate in stilo moderno* by D. Castello (1621, '29) mark the beginning of an important literature, that of the \**canzona* (a one-movement piece with a number of short sections of contrasting character) with solo passages, mostly for the violin. [For a slightly earlier example by Usper (Francesco Spongia), see A. Einstein, in *CP Kretzschmar*.] This *concerto canzona*, as it might be called, was further cultivated by G. B. Fontana (d. 1630; *Sonate a 1.2.3 per il Violino, o Cornetto*, 1641), T. Merula (*Canzoni, ovvero sonate concertate per chiesa, e camera*, 1637; also *Il quarto libro delle canzoni da suonare*, 1651), M. Neri (*Sonate et canzone a quatro*, 1644; *Sonate da sonarsi con varij stromenti*, 1651; see *RiHM* ii.2, 150ff; also J. Wasielewski, *Instrumentalsätze*), V. Albrici (*Sinfonia à 6*, 1654), and A. Bertali (MS sonatas, 1663).

(b) 1670–1750. In this period the baroque

concerto reached its peak. The main advance over the previous period is the replacement of the sectional *canzona* structure by a form in three or four different movements, and the adoption of a fuller, more homophonic style, with increasing melodic emphasis on the upper parts. Within the extensive literature of this period three types can be distinguished (according to A. Schering): the *concerto-sinfonia*, the *concerto grosso*, and the *solo concerto*. The first category, which is of passing importance, uses contrasting technique (sections in tutti character and others in a more brilliant style) rather than contrasting instrumental bodies. It preceded the other two and is important chiefly because it contributed to the development of a virtuoso violin style. It was cultivated first by the members of the \*Bologna school, including Cazzati, G. M. Bononcini, Aldrovandini, and Torelli, and later by Albicastro (*Concerti*, c. 1703) and E. Dall'Abaco (*Concerti a quattro da chiesa*, c. 1712–14).

Closer to the mainstream of the concerto's development is the *concerto grosso*, which must be considered the classical type of baroque concerto. It is characterized by the use of a small group of solo players (*concertino*) in contrast to the full orchestra (*concerto*) [see *Concerto grosso*].

The solo concerto, i.e., the concerto for a single soloist and orchestra, is the latest of the three types. Although solo technique was extensively used in the concerto-canzones, the first examples of this style applied to the baroque sonata are in the *Concerti a cinque* op. 2 (1700?) by Tomaso Albinoni. His concertos (also in his op. 5, 7, 9) are usually in three movements and contain short solo passages, mostly in the character of figural passage-work. Important progress was made by the great master Giuseppe Torelli (d. 1709), who holds a central position in the development of all the types of baroque concerto. In his op. 6 (*Concerti musicali a 4*, 1698) and still more in op. 8 (*Concerti grossi*, 1709; see *HAM*, no. 246; *SchGMB*, no. 257), the solo violin is of equal importance with the orchestra. He also established the standard form of the concerto, in three movements, allegro-adagio-allegro, with the first movement in \*ritornello form. Torelli's idea was continued by Alessandro Scarlatti (1659–1725; see *HAM*, no. 260) and particularly by Vivaldi (c. 1680–1743), whose numerous violin concertos (*Estro armonico* op. 3, 4, 6, 7) soon became famous owing to the expanded role of the solo instrument and a new style of rhythmic vitality and precision.

Vivaldi's soon became the model of concerto style [see *HAM*, no. 270]. Bach (together with J. G. Walther) transcribed a number of Vivaldi's concertos for the organ (or harpsichord) alone, and Bach also made, in his famous Italian Concerto (1735), an original contribution to the somewhat self-contradictory type of concerto for a single player who in turn represents first the orchestra and then the soloist. It should be noted that pieces such as the introduction to his English Suites nos. 3 and 5 are also "Italian concertos" or at least first movements thereof.

Bach also wrote the first concertos for harpsichord and orchestra, starting with transcriptions of violin concertos (by himself, Vivaldi, and others). Of his 18 concertos for one to four harpsichords (with orchestra), only the one in C major for two harpsichords and the two for three harpsichords are original compositions. Handel's 18 organ concertos (pub. 1738, '40, '60) belong to the last examples of the baroque solo concerto. Here, as in his harpsichord suites, he mixed sonata movements with dancelike ones (minuet, musette, siciliano). In Italy the violin concerto remained the favored type, and violinists such as F. M. Veracini (1690–c. 1750), C. Tassarini (1690–c. 1765), P. Locatelli (1695–1764), and Tartini (1692–1770) gradually moved away from the true baroque style of the Vivaldi concerto toward a new type, characterized by more melodious though frequently sentimental themes, a clearly homophonic structure, and forms foreshadowing the classical concerto.

(c) 1750–80. In this period of transition from the baroque concerto to the classical concerto the initiative was taken by German composers, mainly two sons of J. S. Bach's. K. P. E. Bach's concertos follow in their first movements a scheme that clearly shows three sections, exposition–development–recapitulation, with the exposition played twice, first by the orchestra, then by the soloist, and the recapitulation being shortened. While his exposition still lacks a second theme, this is generally found in the concertos of Johann Christian Bach (1735–82), which, more than any others, are the true predecessors of Mozart's piano concertos. Haydn's numerous concertos (17 for piano, 9 for violin, 6 for cello, and others) seldom rise above the mediocre, lacking the inspiration that pervades his quartets and symphonies. Only one piano concerto and one or two cello concertos by Haydn are of more than academic interest.

**Concerto form.** Name for the form of the concerto (three movements) or, more commonly, for that employed in the first movements of the late baroque concertos (Torelli to Bach). See *Ritornello* form.

**Concerto grosso.** The most important type of baroque concerto [see *Concerto* III (b)], characterized by the use of a small group of solo instruments, called *concertino* or *principale*, against the full orchestra, called *concerto*, *tutti* or *\*ripieni*. The concertino usually consists of two violins and a thoroughbass (cello plus harpsichord), i.e., the same ensemble that constitutes the baroque \*trio sonata. The ripieni are a small string orchestra, later occasionally including wind instruments (trumpets, oboes, flutes, horns).

The earliest known examples of the *concerto grosso* principle occur in two *Sinfonie a più instrumenti* by A. Stradella (1644–82). Some *concerti grossi* by Corelli (1653–1713), although published much later, would seem to be of a date close to Stradella's, because they show the patchwork structure of the earlier canzona with quick changes of a considerable number of short

"movements" (nos. 1, 2, 5, 7 of the 12 *Concerti grossi* op. 6, 1712). G. Muffat's (1645–1704) 6 *concerti grossi*, published 1701 [DFO 23], probably also belong to about 1680. They contain suitelike movements (e.g., sonata-corrente-grave-gavotta-rondeau) and show relatively little contrast between the concertino and the concerto. In Torelli's (1658–1709) *concerti grossi* (pub. 1709, written c. 1690) the two violins of the concertino are treated much more individually, so that the style approaches that of a concerto for two solo violins. These *concerti*, together with the later *concerti* of Corelli's op. 6, represent a high point of classical balance and dignity. F. Geminiani (1687–1762; op. 2, 1732; op. 3, 1733) carried on the tradition of Corelli but adopted the four-movement scheme of the *sonata da chiesa* as the standard form (most of Corelli's *concerti* have five or more movements).

A new trend in *concerto grosso* style was inaugurated by Vivaldi (1669?–1741), who consistently used the three-movement scheme allegro–adagio–allegro and largely discarded the contrapuntal treatment of the earlier masters in favor of a novel style of rhythmic precision and dynamic drive. The *concerti grossi* of P. Locatelli (1695–1764) are direct imitations of Vivaldi's, as are, on a much higher artistic level, Bach's \*Brandenburg Concertos of 1721. Handel, in his Grand Concertos op. 6 (1740), although incorporating elements of Vivaldi's style, retained, like Corelli, the larger number of movements.

The neoclassical movement of the 20th century has brought about a remarkable revival of the *concerto grosso*, chiefly as a reaction against the virtuoso-like solo concerto of the 19th century. See Concerto II.

**Concert pitch.** See Pitch (2).

**Concitato.** [It.]. Excited, agitated. For *stile concitato*, see under Style.

**Concord, discord.** Concord is a combination of sounds that is pleasing to the ear (triads, seventh chords, and other "agreeable-sounding" chords), while discord consists of deliberately harsh and unpleasant combinations. The terms are used for aesthetic rather than technical descriptions.

**Concordance, discordance.** Terms introduced by

C. Stumpf [G. *Konkordanz, Diskordanz*] to denote the subjective aspect of \*consonance, dissonance. According to this terminology, the third, although a consonance, was a discordance in the Middle Ages but is now a concordance. Conversely, the fourth, always a consonance, was a concordance in the 9th century (organum of the fourth) and a discordance in the 16th.

**Concord Sonata.** The second of two piano sonatas by Charles Ives, composed 1909–15. Its complete title is "Concord, Mass., 1840–1860." Ives provided a guide to the content by adding titles to the four movements: *Emerson, Hawthorne, The Alcotts, and Thoreau*. Stylistically the sonata is representative of Ives' progressive techniques (extreme dissonance, complex rhythms, etc.), which mark him as a pioneer in 20th-century musical developments.

**Concrete music.** See *Musique concrète*.

**Conducteur** [F.]. An abridged orchestral score, usually a reduction for the piano, as distinct from the *grande partition*, or full score.

**Conducting.** I. *Technique.* Conducting means directing a performing group—orchestra, chorus, opera—in order to bring about complete coordination of all the players and singers. Its basic aspect is beating time, i.e., the clear indication of the metric pulse by the conductor's right hand, often with the help of a baton. A clear and decisive downstroke will fall on the first beat of each measure, while the last beat will be indicated by an upstroke. The intermediate motions of the hand depend upon the meter and tempo, and may require from two to six or more beats. The accompanying illustration shows the basic diagrams for 2, 3, 4, and 6 beats. In addition, the conductor indicates—mainly with the left hand—the entrances of instruments or voice-

parts, shadings of dynamics, and other details of performance. Suggestive motion of the whole body and facial expressions are used to indicate subtle changes of mood.

Many present-day conductors, especially the leaders of choral groups, discard the baton, preferring to use both hands in evocative gestures. Side by side with this there has been a tendency to neglect time-beating and to cultivate highly expressive (and, often, somewhat undisciplined)

motions, which represent a supreme effort to impose the conductor's personality upon the orchestra but frequently are irritating to the audience. C. Munch's book, *I Am a Conductor* (1955), has provoked comments that indicate a reaction against the attitude of many present-day conductors: "It is not their hearts and souls that conductors need to cultivate, but their brains and tastes. . . . Just for a change, I would like to hear performances that are only correct" [see *Notes*, June 1955, p. 441]. The ideal, attained by only a few, is, no doubt, a combination of all these qualities.

Attempts have been made by orchestras to perform without a conductor, especially in the Soviet Union under the obvious influence of political considerations. They were soon abandoned because they required a disproportionate number of rehearsals and turned out to be rather ineffective. Indeed, their failure has enhanced rather than detracted from the stature of the modern conductor, who today is a dominating figure of musical life. Often his role is that of a star, and he is surrounded by admirers who consider all other conductors inferior and his "readings" alone authoritative. Many a concert-goer, it must be feared, is more interested in the attitudes and interpretations of his favorite conductor than in the music itself. Not since the days of the celebrated "songbirds" of the 18th century has there been such partisanship over the relative merits of performance. True enough, the temptation of the spectacular, with an occasional sacrifice of musical truth, is not always resisted. Nonetheless, discounting overpraise and occasional lapses from good taste, the modern orchestra and the command of its resources by a number of outstanding conductors is one of the great musical achievements of our time.

II. *History.* The earliest manifestation of conducting is \*chironomy, i.e., the use of hand signs to indicate melodic motion. Egyptian and Sumerian reliefs dating from c. 2800 B.C. show "conductors" directing players of harps and flutes by means of such signs. The choric dances of Greek antiquity were led by a *choreutes* who indicated the main beat by an audible downward motion of the foot [see *Arsis* and thesis]. In Gregorian chant, hand signs were used in order to explain to the singers the melodic motion of the "chironomic" neumes. Early polyphonic music was performed by soloists and therefore—like the modern string quartet—did not require a conductor. This situation changed about the

middle of the 15th century, when performance of polyphonic music by small choirs became a common practice [see Choral music]. The basis of 15th- and 16th-century conducting was the \*tactus, indicated by a downward and upward hand motion, each such motion representing the beat (temporal unit) somewhat as a "visible metronome." No attempts to distinguish between strong and weak beats entered into this practice, which is eminently suitable for music of this period and has indeed been revived in some present-day performances of compositions by Ockeghem, Josquin, Palestrina, and other early masters.

In the 17th century, the change from a polyphonic to an essentially homophonic texture, which often shows the influence of dance rhythms, together with the employment of larger ensembles consisting of voices and instruments, paved the way for the modern type of conducting, characterized by a visible distinction between strong and weak beats. The leader of the group—often the organist or harpsichordist—may have used his hand, a rolled-up sheet of paper, a wooden stick, or some other suitable implement. Occasionally, when the conductor's signs could not be seen by all the performers—as was often the case in churches—it was necessary to make them audible, e.g., by lightly knocking a key against the organ bench, as Daniel Speer recommended in 1687 (*Grund-richtiger, kurtz, leicht und nöthiger Unterricht der musicalischen Kunst*). By the end of the 17th century the violin had acquired so much authority that the first violinist replaced the organist as conductor. Lully may have been one of the first to assume this role and, at the same time, to introduce the traditional motions for beating time, which are explained by M. de Saint Lambert (*Les Principes du clavecin*, 1702) and M. P. de Montéclair (*Nouvelle Méthode pour apprendre la musique*, 1709). In Germany and in Italy, however, the older practice of repeated down- and up-motions was generally retained throughout the 17th century. Not infrequently there were two conductors, as during Haydn's visits to London in 1791 and 1794, when Haydn directed from the piano and Salomon from his violin. The last great violinist-conductor was F. Habeneck (1781–1849).

In the early part of the 19th century leadership became generally entrusted to an independent and authoritative conductor standing in front of the group and using a baton. Most of these were composers, e.g., Spontini, Spohr,

Weber, and Mendelssohn. The first professional conductor was O. Nicolai (1810–49) in Vienna, followed by Hans von Bülow (1830–94), Ernst von Schuch (1846–1914), Arthur Nikisch (1855–1922), Felix Weingartner (1863–1942), Bruno Walter (1876–1962), Wilhelm Furtwängler (1886–1954), and Fritz Busch (1890–1951). In France, Habeneck was followed by C. Lamoureux (1834–99), E. Colonne (1838–1910), Camille Chevillard (1859–1923), and Pierre Monteux (1875–1964). The most famous Italian conductor was Arturo Toscanini (1867–1957).

**Conductor's part.** An abbreviated score of orchestral works. It usually includes the leading part (chiefly first violin) with the other important instruments cued in.

**Conductus** [pl. *conductus* or *conducti*]. A term commonly used today as a generic designation for Latin strophic songs of the 12th and 13th centuries, a repertory that is the counterpart of the body of troubadour and trouvère songs of the same period. Originally *conductus* probably meant "introduction." The liturgy of St. James in the Codex Calixtinus of c. 1150 [see Compostela, school of] includes four "*conductum* S. Jacobi," each of which serves as an introduction to a lesson [ed. P. Wagner, pp. 39ff, 94ff]. In Beauvais' Daniel play of c. 1140 [see Liturgical drama] the term seems to mean "escorting" or "processional" song (*Conductus reginae venientis ad regem*). See also the *Conductus ad tabulam*

(known as "Song of the Ass") in *HAM*, no. 17a. Although these are the only known references in the 12th century, the term is now used in the much wider sense indicated above. Thus it includes poems with quite varied subject matter—religious, contemplative, lyrical, political, satirical, etc. A large repertory of such songs exists in the sources of \*St. Martial (there called *versus*) and also in the Florentine Codex of the school of Notre Dame [see "Magnus liber organi"]. These songs all are monophonic, some of those in the latter being by Perotinus [*HAM*, no. 17c]. However, many of the polyphonic compositions (*organa*?) of St. Martial have also been considered *conductus*, particularly by H. Spanke [see St. Martial, Lit.].

Much better defined is the polyphonic *conductus* of the 13th century, which, according to the author of "Discantus positio vulgaris," Franco, Odington, and other theorists of the time, represents one of the chief types of 13th-century polyphony, side by side with *organa*,

*clausulae*, and motets. However, the *conductus* are not based on liturgical chants but (with few exceptions) on freely invented melodies, to which one, two, or (rarely) three parts are added in note-against-note style [see Homorhythmic], a technique that sharply contrasts with the rhythmically differentiated style of the *organa*, *clausulae*, and motets. A special type of *conductus* that was considered superior was the *conductus habens caudam*, i.e., a *conductus* with cadential extensions over some vowels of the various lines of the poem [see *Cauda* (2)] and sometimes melismatic beginnings. There are a number of three-voice *conductus* (at least one, *Salvatoris hodie*, by Perotinus) that are remarkable for their great length, resulting from the insertion of numerous elaborate *caudae* that, in contrast to the syllabic sections, are in a style similar to that of the *organa* or *clausulae* [see *OH* i, 293ff]. Some *conductus*, found in the so-called MS of St. Victor (Paris, Bibl. nat., lat.

15139), have *caudae* making use of double counterpoint [see Y. Rokseth, "Le contrepoint double vers 1248," in *CP Laurencie*] and other very advanced devices. They mark the end of a production that, in sheer quantity, far outweighs the organa, clausulae, and even motets of the 13th century.

The rhythmic interpretation of the (simply syllabic) conductus is still controversial. Some scholars advocate interpretation in modal rhythm, e.g.,  $\frac{6}{4}$  |  $\text{JJJJJ}$ , instead of  $\frac{4}{4}$  |  $\text{JJJJJ}$  [see Modal theory]. Others prefer the latter rendition, admitting modal rhythm only for the *caudae* that are written in the ligature system of \*modal notation [see *ApNPM*, pp. 258ff]. Examples in *HAM*, nos. 38, 39; *SchGMB*, no. 16 (the "instrumental" opening and close is actually vocalization).

The term "conductus style" has been widely adopted by musicologists to denote note-against-note style, particularly with reference to English compositions of the 14th and 15th centuries and to early 14th-century Italian compositions (madrigals), which are written in what might be called "ornamented conductus style."

**Conductus motet.** See under Motet A II.

**Confinalis** [L.]. Same as *affinalis* [see *Affinales*].

**Conflicting signatures.** Another term for Partial signatures.

**Confractorium** [L.]. In \*Ambrosian, \*Gallican, and \*Mozarabic chant, an item of the Proper of the Mass, corresponding liturgically to the Roman Communion.

**Con fuoco.** See *Fuoco*.

**Conga.** [Sp.]. Dance of African heritage, developed mainly in Cuba but popular in many other Latin American countries where carnival festivities take place. The music is in 2/4 meter based on a two-measure rhythmic pattern, always with a symmetrical first measure and a syncopated

second:  $\text{♩} \text{♩} \text{♩} \text{♩}$  |  $\text{♩} \text{♩} \text{♩} \text{♩}$  |. This pattern is the rhythmic backbone for constantly repeated short phrases of two to four measures. The dancers stand behind one another and form a chain that moves in circles or in a straight line. The texts of the *conga* often satirize current events. J.O-S.

**Congada.** See *Congo*.

**Con garbo.** See *Garbato*.

**Congo.** A kind of symbolic play presented by Negro slaves in Brazil from the mid-17th century on, during religious celebrations honoring certain Negro saints. Most famous are the *congos* in honor of St. Balthazar and St. Benedict. The music for these plays was the *congada*, a markedly African dance in duple meter, based on the monotonous repetition of short, syncopated rhythmic patterns. J.O-S.

**Congoerá.** Scraper made of human or animal bone used by the Guaraní Indians of Paraguay. It is similar in function to the Cuban *güiro* and the Brazilian \**reco-reco*. J.O-S.

**Con grandezza.** See *Grandezza*.

**Congresses.** Among the numerous congresses held more or less regularly by the various music societies, those devoted to musicological topics deserve special mention. Most of them have been held under the auspices of the *Internationale Gesellschaft für Musikwissenschaft* and the *Internationale Musikgesellschaft* [see Societies III, 1, 2]. See R. S. Angell, "Congresses in Musicology" (*Notes* I, no. 2). The reports containing the papers read at these congresses are listed in the Abbreviations at the front of this book under *CP* 1906, etc. For more complete information, see W. Kahl and W.-M. Luther, *Repertorium der Musikwissenschaft* (1953), p. 43. See also M. Briquet, *La Musique dans les congrès internationaux, 1835-1939* (1961).

**Con gusto.** See *Gusto*.

**Conjunct, disjunct.** Notes are called "conjunct" if they are successive degrees of the scale, "disjunct" if they form intervals larger than a second. For conjunct, disjunct tetrachord, see Greece II.

**Conjunctura** [L.]. A symbol (ligature) of \*square

notation, consisting of a *longa* followed by two or more rhombs (lozenges; the later *semibrevis*), always forming a descending scale passage. It developed from the neume *climacus* [see Ex. under Neumes]. For the rhythmic interpretation, see *ApNPM*, pp. 240ff.

**Con lancio.** See *Lancio*.

**Consecutives.** See under Parallel fifths, octaves.

**Consequent.** See Antecedent and consequent.

**Conservatory** [F. *conservatoire*; G. *Konservatorium*; It., Sp., *conservatorio*]. A school specializing in musical training. Originally, a *conservatorio* was a charitable institution for the education of orphans, but at an early time the main emphasis was placed on music. The oldest institutions of this type are the *ospedali* of Venice, so called because they were attached to hospitals, e.g., *Ospedale dei Mendicanti* (1262), *della Pietà* (1346), *San Salvatore degli Incurabili* (1517), etc. The name *conservatorio* originated in Naples: *Conservatorio Santa Maria di Loreto* (1537), *Sant' Onofrio a Capua* (1576), *De' Poveri di Gesù Cristo* (1589), *Della Pietà dei Turchini* (1583). Nearly all the great Italian composers of the 17th and 18th centuries were pupils or teachers at these institutions. [See H. Hücke, in *CP Osthoff*.]

The most important of the present-day conservatories are:

**Austria.** Akademie für Musik und darstellende Kunst, Vienna (1817) and Salzburg (Mozarteum, 1880); Linz, Bruckner-Konservatorium (1823); Innsbruck, Städtische Musikschule (1818).

**Belgium.** Conservatoire Royal de Musique in Brussels (1813), Ghent (1812), Liège (1826).

**British Isles.** London, Royal College of Music (founded 1873 as National Training School of Music; present name assumed 1883) and Royal Academy of Music (1822); Birmingham, Birmingham and Midland Institute of Music (1866); Glasgow, Royal Scottish Academy of Music (1885); Dublin, Royal Irish Academy of Music (1848).

**Canada.** Toronto, Toronto Conservatory of Music (1886); Montreal, McGill University (1821), Faculty of Music; Halifax, Dalhousie University (1818), Conservatory of Music.

**Finland.** Helsinki, Sibelius-Akademie (1882).

**France.** Paris, Conservatoire National de Musique (1784) with branches in many other cities.

**Germany.** Berlin, Hochschule für Musik (1869), Städtisches (formerly Stern'sches) Kon-

servatorium (1850); other institutions, called Staatliche Hochschule für Musik, in Dresden (1856), Frankfurt (1878), Cologne (1850), Leipzig (1843), Munich (1846), Stuttgart (1856), Weimar (1872).

**Italy.** Bologna, Conservatorio di Musica G. B. Martini (1804); Florence, Cons. di Musica Luigi Cherubini (1811); Genoa, Liceo Musicale Pareggiato N. Paganini (1829); Milan, Cons. di Musica Giuseppe Verdi (1807); Naples, Cons. di Musica S. Pietro a Majella (1808); Rome, Cons. di Musica S. Cecilia (1877); Venice, Cons. Musicale Benedetto Marcello (1877).

**Netherlands.** Amsterdam, Amsterdamsch Conservatorium (1862); The Hague, Koninklijk Conservatorium voor Muziek (1826); Rotterdam, Muziekschool van de Maatschappij tot Bevordering der Toonkunst (1829).

**Scandinavia.** Copenhagen, Det Kongelige Danske Musik-konservatorium (1866); Stockholm, Kungliga Musikhögskolan (1771); Oslo, Musikk-Konservatoriet (1883).

**Spain and Portugal.** Barcelona, Conservatorio Nacional de música y Declamación (1838); Madrid, Real Conservatorio de Música y Declamación (1830); Lisbon, Colegio de Música y Arte (1835).

**Switzerland.** Basel, Musikschule und Konservatorium (1867); Geneva, Conservatoire de Musique (1835); Zurich, Konservatorium für Musik (1876).

**United States.** In the United States (as well as in Canada) most of the institutions specializing in musical training are connected with universities and colleges, nearly all of which have a department or a school of music. Of the independent conservatories, or those loosely affiliated with colleges or universities, the following may be mentioned: Baltimore, Peabody Conservatory of Music (founded 1857; opened 1866); Oberlin, Ohio, Oberlin Conservatory of Music (1865); Boston, New England Cons. of Music (1867); Cambridge, Longy School of Music (1915); Cleveland, Cleveland Institute of Music (1920); New York, Juilliard School of Music (1920; begun in 1905 as the Institute of Musical Art); Rochester, Eastman School of Music (1921); Philadelphia, Curtis Institute of Music (1924); St. Louis, St. Louis Institute of Music (1924); San Francisco, San Francisco Cons. of Music (1917).

**U.S.S.R.** Moscow, Gossudarstvennaja Konservatorija Imënem P. I. Tschajkovskovo (1886); Leningrad, G. K. Imënem N. A. Rimskovo-Korssakova (1862).

**Con slancio.** See *Slancio*.

**Console.** (1) The case that encloses the keyboard, stops, etc., of an organ. Formerly placed in front of the organ, it is now often detached, the sole connection being electric wiring. (2) See Piano III.

**Consonance, dissonance.** Terms used to describe the agreeable effect produced by certain intervals (consonant intervals, e.g., octave, third) compared to the disagreeable effect produced by others (dissonant intervals, e.g., second, seventh) or similar effects produced by chords.

Consonance and dissonance are the very foundation of harmonic music, in which the former represents the element of normalcy and repose, the latter the no less important element of disturbance and tension.

In spite of numerous efforts, no wholly satisfactory explanation and definition of consonance and dissonance have yet been found. The shortcoming of the definition above is not so much that it is based entirely on subjective impressions but that it fails to account for the consonant quality of the fourth and fifth. Indeed, from the point of view of musical composition of all eras, these two intervals must be regarded as consonances second only to the unison and octave; however, according to the definition above they would certainly rank after the third and sixth and might perhaps be termed dissonant (especially the fourth has a decidedly unpleasant effect for an unbiased listener). It is chiefly for this reason that the "pleasant-unpleasant" theory is unsatisfactory. Following are the most important theories of consonance and dissonance.

I. (a) According to the Pythagorean theory, the smaller the numbers that express the ratio of the frequencies of intervals (or of the lengths of the corresponding strings), the more consonant the intervals. This theory leads to an order of the intervals that conforms rather well to musical practice:

<i>unis.</i>	<i>8ve</i>	<i>5th</i>	<i>4th</i>	<i>6th</i>	<i>3rd</i>
c-c	c-c'	c-g	c-f	c-a	c-e
1:1	1:2	2:3	3:4	3:5	4:5
<i>3rd</i>	<i>6th</i>	<i>2nd</i>	<i>7th</i>	<i>7th</i>	
c-e <sup>b</sup>	c-a <sup>b</sup>	c-d	c-b	c-b <sup>b</sup>	
5:6	5:8	8:9	8:15	9:16	

The chief objection to this theory is that it fails to account for the fact that a minute modification of a consonant interval—too slight to be

noticed by the ear—brings about highly complicated ratios of frequencies. For instance, the well-tempered fifth, which the ear cannot distinguish from the Pythagorean (pure) fifth, is represented by (approximately) the fraction  $2^{93}/439$ .

(b) According to Helmholtz' theory of beats [see Helmholtz-Ellis, *Sensations of Tone*, rev. ed. (1885), pp. 186ff], intervals are consonant if no disturbing \*beats are produced by the two tones or by their harmonics; otherwise, they are dissonant (beats are most disturbing if they number 33 per second, least disturbing if they are less than 6 per second, or more than 120 per second). The chief disadvantage of this theory is that the dissonant or consonant character of an interval varies with the octave in which it lies, as appears from the following table:

c-e	33 beats	c-d	16 beats
c'-e'	66 beats	c'-d'	32 beats
c''-e''	132 beats	c''-d''	64 beats
		c'''-d'''	128 beats

It appears that the third c-e would be as "dissonant" as the second c'-d', and that the second c'''-d''' would be as "consonant" as the third c''-e''.

(c) According to Helmholtz' theory of *Klangverwandtschaft* (relationship of sounds), two tones are consonant if their harmonics (up to the eighth, but excluding the seventh) have one or more tones in common. From the accompanying example it appears that there are three such common tones in the case of the octave, two for the fifth and the fourth, and one for the third and the sixth, major as well as minor. No such common tones exist for the second and the seventh, which therefore are classed as dissonance. This definition is more satisfactory and useful than any other, since it establishes a clear

demarcation between consonant and dissonant intervals, a result that, from the musical point of view, is more desirable than the "gradual decline of consonance" implied by the other theories. Its only drawback is that the "dissonant" seventh harmonic must be eliminated (otherwise

D, with the seventh harmonic  $c''$ , would be consonant to C). One could, however, argue that the seventh harmonic of D is noticeably lower than  $c''$  ( $6\frac{3}{4}$  versus 1).

(d) C. Stumpf's theory of *Tonverschmelzung* (amalgamation of sounds) is a psychological explanation based on large-scale experimentation. The consonant nature of an interval is measured by the degree to which the sound produced by the two simultaneous tones evokes, in the mind of musically untrained listeners, the impression of a single sound instead of two different tones. Thus, the percentage of listeners judging (wrongly) in favor of "one tone" (*Verschmelzung*) gives a measurement of the degree of consonance or dissonance. Following is the result of Stumpf's experiment:

8ve	5th	4th	3rd	tritone	2nd
75%	50%	33%	25%	20%	10%

It should be noted that in this series the fifth and the fourth appear as better consonances than the third. The chief shortcoming of this theory is that consonance and dissonance are no longer contradictory or exclusive terms but represent gradations.

(e) After an examination of all these scientific theories, the practical musician will probably be satisfied with a very simple common-sense rule, in a way a practical condensation of Helmholtz' *Klangverwandtschaft*: *Every interval contained in the major (or minor) triad and its inversions is a consonance; all other intervals are dissonances.*

II. Chords can be classified as consonant or dissonant on the basis of the following definition: A consonant chord is one in which only consonant intervals (octave, perfect fifth, perfect fourth, third, sixth) are found; a dissonant chord is one that includes at least one dissonant interval (second, seventh, diminished fifth, etc.). This places the triads and their inversions (except for the diminished and augmented triad) in the former category, and all the other chords (seventh chords, ninth chords) in the latter, in full conformity with musical experience and practice.

III. *History.* Ideas about which intervals are consonant and which dissonant have changed considerably during the course of music history. In the earliest polyphony, c. 900, the fourth was the foremost consonant interval, with the fifth replacing it at a somewhat later date [see *Organum* (2), I]. Guido admitted four *concordiae*—fourth, whole tone, major third, and minor third

—but ruled out the fifth and the semitone ["Micrologus," ch. xiii]. In the 13th century the unison and octave were regarded as perfect consonances, the major and minor third as imperfect, the fourth and fifth as intermediate [Garlandia; CS i, 104]. Both major and minor sixths were considered dissonances. Tinctoris, in his *Diffinitorium* (c. 1475), distinguished between *concordantia perfecta*, which cannot be used in parallel motion, and *concordantia imperfecta*, which can. To the former category belong the unison and upper and lower fifth, to the latter, the major and minor third and sixth [CS iv, 180a]. The fourth, although theoretically a consonance, was admitted only with a third or fifth below it. These concepts remained basic until the end of the 19th century. Also see Third.

In 20th-century music the distinction between consonance and dissonance has become more or less obsolete, particularly in styles using atonality and serial techniques. Hindemith [*The Craft of Musical Composition*, 2 vols. (1941–45)], however, devised a system whereby the 12 tones are arranged in a definite order of consonance-degree derived from the combination tones: octave, fifth, fourth, major third, minor sixth, minor third, major sixth, major second, minor seventh, minor second, major seventh, and tritone (augmented fourth or diminished fifth).

Lenzen, *Geschichte des Konsonanzbegriffes im 19. Jahrhundert* (1933); S. Krehl, "Die Dissonanz als musikalisches Ausdrucksmittel" (*ZMW* i); A. Machabey, "Dissonance, polytonalité, atonalité" (*RM* 1931, no. 116).

**Consort.** A 17th-century English term for instrumental chamber ensembles or compositions written for them. A group including only instruments of the same family was called "whole consort" (consort of viols, recorders; see Chest of viols), whereas a group consisting of various kinds was called "broken consort." Thomas Morley's *First Booke of Consort Lessons* of 1599, written for treble lute, pandora, cittern, bass viol, flute, recorder, and treble viol, contains good examples of the broken consort. Later publications are: Philip Rosseter, *Lessons for the Consort* (1609); John Adson, *Courtly Masquing Ayres* (1611; repr. 1621); William Lawes (d. 1645), "The Royal Consort" and the "Great Consorte" (MSS; see *GD* iii, 118; *GDB* v, 94);

Matthew Locke, *Little Consort of Three Parts* (1656) and "Consort of Four Parts" (MS; see *GD* iii, 224; *GDB* v, 353–55). The compositions in these collections vary from ricercar-like fantasias [see *Fancy*] in the earliest works to suite-like pieces in the latest. Locke's consorts [new ed., P. Warlock (1932)] are suites consisting of a Fantasia, Courante, Ayre, and Sarabande [see *Suite III*]; according to Roger North [*Memoires of Musick*, 1728] these were "the last of the kind that hath been made." A publication by William Leighton, *The Teares or Lamentacions of a sorrowfull Soule* (1614), includes a number of "consort songs," i.e., four-part compositions (psalms, hymns) for voices reinforced by a broken consort.

**Consul, The.** Opera in three acts by Gian Carlo Menotti (to his own libretto), produced in New York, 1950. Setting: a European country, the present. For the most part, the drama takes precedence over the music, which consists largely of accompanied recitative with occasional arias, numerous ensembles, and ballet scenes of considerable dramatic strength.

**Contemporary music.** See Twentieth-century music.

**Contes d'Hoffmann, Les** [F., The Tales of Hoffmann]. *Opéra fantastique* in three acts with prologue and epilogue by J. Offenbach (libretto by J. Barbier and M. Carré, based on stories by E. T. A. Hoffmann), produced in Paris, 1881. Setting: Germany and Italy, 19th century. Offenbach died before completing the work, which was orchestrated by E. Guiraud. In musical style the opera approximates the operetta form, which Offenbach had preferred in his earlier works. Within this class, however, it is among the most ambitious and successful examples.

**Continuo.** Abbr. for *basso continuo*; see Thoroughbass. In the scores of baroque composers (Bach, Handel), the bass part that was performed by the harpsichord or organ, together with a viola da gamba or cello.

**Contra** [It.]. (1) Abbr. for \*contratenor. (2) As part of other terms, the word has one of two meanings: (a) "against," e.g., in *contrapunctus* [see Counterpoint] or \*contratenor, from which

terms such as contralto, haut-contre, and basse-contre are derived; (b) the lower octave, a meaning probably derived from the 16th-century manner of indicating the tones below the great octave (C, D . . .) by a dash written underneath (C, D . . .), i.e., in a position "contrary" to that used for the higher octaves (c, d . . . or, c', d' . . .). This led to the term "contra-octave" for the octave below the great octave and, consequently, to names such as *contrabasso* [G. *Kontrabass*], contrabassoon, and contrabass-clarinete for instruments of the lowest range.

**Contra(b)basso** [It.]. \*Double bass.

**Contrabassoon.** See under Oboe family I, D.

**Contradanza** [It.]. See Contredanse.

**Contrafactum** [L.]. A vocal composition in which the original text is replaced by a new one, particularly a secular text by a sacred one, or vice versa. The earliest known examples of this procedure (also called "adaptation") are in Gregorian chant in connection with feasts of a later date, such as that of the Trinity (9th century), whose Mass chants employ older melodies supplied with new texts referring to this feast [see *ApGC*, p. 69]. Numerous Alleluias, antiphons, hymns, and sequences are *contrafacta*, the same melody occurring with different texts, in one case more than eighty (antiphon *Apud Dominum*; Gevaert's *thème* 29, see *ApGC*, p. 399). In the 13th century, substitution of French for Latin texts (or vice versa?) was common. A famous example is the Provençal (troubadour) *Lai Markol*, for which there is a French as well as a Latin *contrafactum*. Even more common is the replacement of Latin by French texts in the upper parts of 13th-century motets [see *AdHM* i, 234f]. Oswald von Wolkenstein's "Der May" [see *HAM*, no. 60] is a *contrafactum* of J. Vailant's "Par maintes foyes" [see W. Apel, *French Secular Music of the Late Fourteenth Century* (1950), no. 69]. Numerous Protestant chorales employ pre-existent melodies for their new texts, and many of the melodies used for the Calvinist Psalter were borrowed from secular songs [see *Souterliedekens*]. Similar methods were employed in the *laude* of the 16th century, a particularly striking example being the use of the same music for the *lauda* "Jesu, Jesu" and the carnival song "Visin, visin" [see *ReMR*, p. 167].

In 17th- and 18-century French usage the transfer of texts was called *parodie*, e.g., in *Parodies bachiques sur les airs et symphonies des opéra* (pub. C. Ballard, 1695). These *parodies*

were instrumental pieces (dances) to which a poetic text was added. The songs of Lully's operas especially were often provided with new texts, occasionally parodistic, i.e., caricaturing, a procedure frequently termed \*parody rather than *contrafactum* by modern writers. Quite a few *contrafacta* are in the works of Bach (e.g., B-minor Mass) and Handel. J.-J. Rousseau, in his *Dictionnaire de musique* (1768), under "Parodie," made the remark that all the stanzas of a strophic song except the first are "parodies," i.e., *contrafacta*.

Lit.: F. Gennrich, *Die Kontrafaktur im Liedschaffen des Mittelalters* (1965); *id.*, *Lateinische Liedkontrafaktur* (1956); K. Hennig, *Die geistliche Kontrafaktur im Jahrhundert der Reformation* (1909); F. Gennrich, "Interationale mittelalterliche Melodien" (*ZMW* xi); K. von Fischer, "Kontrafakturen und Parodien italienischer Werke des Trecento und frühen Quattrocento" (*AnnM* v); J. Müller-Blattau, "Kontrafakturen im älteren geistlichen Volkslied" (*CP Fellerer*); D. J. Grout, "Seventeenth-Century Parodies of French Opera" (*MQ* xxvii); R. Haas, "Wiener deutsche Parodieopern um 1730" (*ZMW* viii); G. Cucuel, "Les Opéras de Gluck dans les parodies du XVIIIe siècle" (*RM* 1922, nos. 5, 6); R. T. Daniel, "Contrafacta and Polyglot Texts in the Early English Anthem" (*CP Apel*).

**Contrafagotto** [It.]. Double bassoon.

**Contralto** [It.]. (1) Same as \*alto voice (female). (2) See Violin family (d).

**Contra-octave**. See under Pitch names.

**Contrappunto** [It.; L. *contrapunctus*]. Counterpoint. *C. doppio*, double counterpoint. *C. alla mente*, extemporized counterpoint [see *Discantus supra librum*].

**Contrapunctus** [L.]. See under Counterpoint II.

**Contrapuntal**. In the style of counterpoint.

**Contrary motion**. See under Motion.

**Contratenor**, abbr. *contra*. In compositions of the 14th and early 15th centuries, name for a third voice-part, added to the basic two-voice texture of discant (*superius*) and tenor. It has about the same range as the tenor, with which it frequently crosses, so that the lowest note may fall now to the tenor, now to the contra. Its contour is usually much less melodic than that of the other two parts, to which it was added for harmonic completeness. With the establishment, about 1450 (Ockeghem, Obrecht), of four-part

writing and the consequent separation of ranges, the contratenor split in two parts: the *contratenor altus* (high c.) or, simply, *altus* (alto), and the *contratenor bassus* (low c.) or, simply, *bassus* (bass). This process explains the name \*alto (high) for a part that, from the modern point of view, can hardly be considered "high," as well as the use of the term countertenor for the male alto.

**Contra-violin**. See under Violin family (b).

**Contrebasse** [F.]. Double bass. *Contrebasson*, double bassoon.

**Contredanse** [F; G. *Contratanz* or *Kontretanz*; It., Sp. *contradanza*]. A dance that attained great popularity in France and elsewhere during the late 18th century. It was performed by two (or more) couples facing each other and executing a great variety of steps and motions. The music consists of a long series of eight-measure phrases that may be repeated over and over. It is now generally accepted that the contredanse developed and took its name from the English \*country dance, which it resembles in various respects. As early as 1699 we find "Contredanses anglaises" in Ballard's *Suite de danses*. The *contredanse* developed later into the française and the \*quadrille. Beethoven wrote 12 Contredanses for orchestra (1803), one of which (no. 7) he used in the final movement of the Eroica Symphony. See also Cotillon.

**Con vaghezza**. See *Vaghezza*.

**Convertible counterpoint**. Same as \*invertible counterpoint.

**Conzert** [G.]. See *Konzert*.

**Coperto** [It.]. Covered. *Timpani coperti*, kettle-drums muted by being covered with a cloth.

**Copla** [Sp.]. Couplet or stanza of Spanish songs such as the \*cantiga or \*villancico. See *Couplet*.

**Coptic church music**. The liturgical music of the Copts (a Christian sect in Egypt and other parts of northeast Africa). See *GD*, sup. vol., p. 178f; *GDB* ii, 867f; H. Hickmann, in *CP* 1950; R. Ménard, in *RdM* 1954, p. 21; *id.*, in *Études grégoriennes* iii, 135.

**Copula** [L.]. A term pertaining to 13th-century polyphonic music, which is discussed by several theorists (J. de Garlandia, Franco, Odington; see *CS* i, 114, 116, 133, 247) but in such uncertain and contradictory terms that it is difficult to determine its meaning. Relatively clear (and in

agreement with the etymological derivation from *L. copulare*, to connect, couple) is Garlandia's statement that "copula is midway between organum purum and discantus" (CS i, 114). To this he adds rather cryptic remarks seeming to indicate that quicker note values are used in the *copula*. Very likely the term denotes the short connecting passages that frequently appear in organa at the end of a section, connecting it with the next section. These often are written in smaller values (*fractio modi*). See W. G. Waite, "Discantus, Copula, Organum" (*JAMS* v).

**Copyright, musical.** The Constitution of the United States gives Congress the power to "promote the progress of science and useful arts by securing for limited times to authors and inventors the exclusive right to their respective writings and discoveries." [Art. I, Sec. 8.] The first Copyright Act of the United States was signed by President Washington in 1790, and thereafter several general revisions and numerous amendments were enacted. A copy of the copyright regulations presently in force may be obtained from the Copyright Office, The Library of Congress, Washington, D.C. 20540.

Copyright is applied for through the Copyright Office in Washington and may be secured for both published and unpublished musical and dramatic works. As soon as the formal requirements are fulfilled, the authorized person receives the exclusive right to print, reprint, publish, copy, and vend the work in question, or authorize someone else to do so; to arrange or adapt it if it is a musical work; and to perform or represent the work publicly for profit. The composer of a copyrighted work is protected against mechanical reproduction (phonograph records, tape recordings, etc.) as well as live performance. Moreover, judicial decisions in various cases have established precedents concerning performances of musical works in hotels and restaurants, motion-picture theaters, radio broadcasts, etc.

Owing to the proliferation of media since 1900, it has become increasingly difficult for the single author to protect his rights adequately in an individual capacity. As a result, collective musical organizations have been established in most countries. The leading American organization is the American Society of Composers, Authors and Publishers (ASCAP).

Since the need for legal protection of copyright passes national boundaries, several inter-

national conventions and treaties have been established. The most important of these are the International Copyright Union, established by the first Bern Convention (1886) and reinforced by three later conferences, and the Pan-American Copyright Conventions, a series of agreements entered into by the United States and various Latin American countries. Further, in the past international copyright could be secured by individual treaties between single countries. Even without a treaty, mutual protection of copyright (reciprocity) could be acknowledged by a proclamation of the President of the United States, and numerous such proclamations have been issued. Further details about such international agreements are found in the *United States Code*, Title 17, and in *Copyright Protection throughout the World*, published by the United States Department of Commerce.

Pohlmann, *Die Frühgeschichte des musikalischen Urheberrechts (ca. 1400-1800)* (1962); H. Kownatsky, "Copyright Law Revision" (*Notes*, March 1961).

**Coq d'or, Le.** See *Golden Cockerel, The*.

**Cor** [F.]. (French) horn. *Cor anglais*, English horn; *cor à pistons*, valve horn; *cor de basset*, basset horn; *cor de chasse*, hunting horn; *cor des Alpes*, alphorn; *cor d'harmonie*, valve horn; *cor naturel*, natural horn. Also see under Horn I, II.

**Coranto** [It.]. See *Courante*.

**Corda** [It.]; **corde** [F.]. String. In piano compositions, *una corda* (abbr. *u. c.*) calls for the use of the left pedal (soft pedal), whereby the entire keyboard is moved a little to the right so that the hammers strike only one string instead of two or three. This muting effect is canceled by *tutte le corde* (*t. c.*) or *tre corde*. In the slow movement of his Sonata op. 106 Beethoven demands the almost impossible finesse of *poco a poco due e poi tre corde* ("gradually two and then three strings"). *Corde à vide*, *corda vuota* mean open string (of the violin).

**Corda vuota.** See *Vuoto*.

**Corelli clash.** See under *Cadence* II [Ex. 24].

**Coriolan Overture.** Orchestral composition by Beethoven (op. 62, 1807), written as an overture to a play by H. J. von Collin about the same

subject as Shakespeare's *Coriolanus*. It is one of Beethoven's most concisely dramatic and masterful compositions, similar in spirit to the Fifth Symphony.

**Cori spezzati** [It.]. Properly, *coro spezzato*, i.e., divided choir. See Polychoral style.

**Corista** [It.]. Orchestral pitch; tuning fork. *C. di camera*, chamber pitch.

**Cornamusa** [It.]. (1) A bagpipe used in the Abruzzi mountains of Italy. (2) A 16th-century reedcap instrument (described by Praetorius), probably similar to the *dolzaina*. See *MaMI*.

**Cornemuse** [F.]. Generic term for \*bagpipe.

**Cornet** [F. *coronet à pistons*; G. *Kornett*; It. *cornetto*; Sp. *cornetin*]. See Brass instruments III and accompanying illustrations. Not to be confused with the \*cornett. Also, name of an organ stop; see Organ IX (e).

**Cornett** [F. *coronet à bouquin*; G. *Zink*; It. *cornetto*; Sp. *corneta*]. A medieval instrument (the earliest known picture of it dates from the 13th century; see *Cantiga*) that, in one form or another, was used until the middle of the 19th century. It consists of a straight or slightly bent tube of wood (occasionally ivory, possibly originally goathorn), which is octagonal in cross section, usually with a cup-shaped mouthpiece. Although in some books this instrument is called a \*cornet, leading to confusion with an entirely different 19th-century instrument, the two types usually are distinguished by the different spelling. The cornett had a very gentle sound that blended well with strings and with the human voice. It was widely used in church music, e.g., in eleven of Bach's cantatas, as a support for the chorale melody. In addition to the normal cornett (*Zink*, *cornetto*), pitched in a, there was a soprano size (*Kleiner Zink*, *cornettino*) pitched in e' and a tenor size (*Grosser Zink*; *cornone*) pitched in d. The above-mentioned instruments had a separate cup-shaped mouthpiece, but there was also a cornett, usually of straight shape, that had a small funnel-shaped opening carved out of the upper end of the tube. This was the *Gerader Zink* (*cornetto diritto*) or *Stiller Zink* (*cornetto muto*), so called on account of its softer sound. In the 16th century a bass size was added, which, in order to bring the finger holes within easy reach of the hands, was bent in a clumsy serpentine shape and therefore was called *serpent*. In spite of its appearance, which has been compared to a drainpipe suffering from an

intestinal disorder, it was a highly artistic instrument that was held in great esteem throughout the 16th century. It was particularly favored in French church music, hence the 19th-century name *serpent d'Église*, "church serpent." The serpent was still in favor with early 19th-century composers, such as Rossini (*Le Siège de Corinthe*), Mendelssohn (*Meeresstille und glückliche Fahrt*; *Paulus*), Wagner (*Rienzi*), and Verdi (*Les Vêpres siciliennes*, 1855). By this time, however, the instrument had a shape similar to the tuba's. Instead of the serpentine tube, in 1788 J. J. Regibo built one bent back on itself in the shape of a bassoon, and in this form it became known as *Russian bassoon*. An improved variety of this instrument was the metal *bass horn*, invented about 1800, also called *English bass horn* [F. *basse-cor*]. All these instruments retained the six finger holes of the old cornetts. [See Brass instruments V (b).] The addition of more finger holes operated by keys led to the *chromatic bass horn* and *ophicleide*. [See ill. under Brass instruments.] See G. Karstadt, in *AMF* ii; M. Rasmussen, in *Brass Quarterly* i.

**Cornetta** [It.]. \*Cornet.

**Cornetto** [It.]. \*Cornett or \*cornet.

**Cornett-ton** [G.]. See under Pitch (2).

**Corno** [It.]. Horn. *Corno a mano*, natural horn; *corno a macchina* (a *pistoni*, *cromatico*, *ventile*), valve horn; *corno inglese*, English horn; *corno di bassetto*, basset horn; *corno da caccia*, hunting horn. In Bach's scores *corno* usually means the old \*cornett [G. *Zink*]. For Bach's *corno da tirarsi* see under Trumpet II (slide trumpet). See also Horn I, II.

**Cornopean**. Older name for the \*cornet.

**Cornu** [L.]. An ancient Roman horn; see Brass instruments V (a).

**Coro** [It.]. Choir, chorus. *Coro spezzato* (also *coro battente*), see under Polychoral style. In organ music, *gran coro* means full organ.

**Corona** [L., It.]. The pause, the sign for which resembles a crown.

**Coronach, corronach**. A funeral dirge of Scotland. It was chanted by the bard (*Seannachie*) on the death of a chief or other prominent personage of the clan. The verses described the virtues and deeds of the dead person. The music was rather wild and rude, frequently interrupted by the wails of women mourners. Similar songs and

customs prevailed in Ireland (\**caoine*). Schubert wrote a "Coronach" for women's chorus (op. 52, no. 4) to a text from Sir Walter Scott's *The Lady of the Lake*.

**Coronation Anthems.** Four anthems by Handel, composed for the coronation of George II (1727), entitled: 1. "Zadok the Priest"; 2. "The King shall rejoice"; 3. "My heart is inditing"; 4. "Let thy hand be strengthened." Purcell also wrote a coronation anthem, "My heart is inditing," for the coronation of James II (1685).

**Coronation Concerto.** Mozart's Piano Concerto in D major (K. 537, 1788), so called because he played it (together with another concerto, K. 459) at the coronation of Emperor Leopold at Frankfurt in 1790. The latter is also called Coronation Concerto.

**Coronation Mass.** Mozart's Mass in C major (K. 317, 1779), composed for the annual coronation of the statue of the Virgin at the shrine of Maria Plain, near Salzburg, Austria.

**Corrente** [It.]. See Courante.

**Corrido** [Sp.]. A Mexican type of narrative folk ballad, derived from the Spanish *romanze* and sung also in various other Latin American countries. The texts concern either local events or historical and legendary subjects and are arranged in stanzas of eight-syllable lines. The music is secondary to the text. The melodies are repeated as many times as there are stanzas, and the only element of variation is found in the instrumental episodes interpolated between stanzas. The singing is usually accompanied by guitars and harps or by a full \**mariachi* ensemble. J.O-S.

**Cortège** [F.]. A composition in the character of a solemn procession or a triumphal march.

**Cortholt, cortol.** Same as curtall [see Oboe family III].

**Cosa rara, una.** See *Una Cosa rara*.

**Così fan tutte, ossia la scuola degli amanti** [It., Thus Do All (Women), or The School of Lovers]. Comic opera in two acts by Mozart (libretto by L. da Ponte), produced in Vienna, 1790. Setting: Naples, 18th century.

**Costa Rica.** The traditional music of Costa Rica is strongly Spanish in character, indigenous and Negro influences being less obvious than in the music of other Latin American countries. The most typical native form is the \**punto*, a gay and

lively dance associated especially with the province of Guanacaste. The *pasión* is a song in the Spanish tradition, and its cultivation in Costa Rica dates from the early colonial era.

The beginning of art music in Costa Rica coincides with the composition of the national anthem (1853) by a native amateur composer and band leader, Manuel María Gutiérrez (1829-87). His son, Carlos María Gutiérrez (1865-1934), is also well known in Costa Rica. A considerable number of 19th-century composers are listed by J. R. Araya [see Lit.]. Most of them wrote songs and instrumental pieces in the popular vein, and occasionally major forms. Among the most prominent are Rafael Chavez Torres (1839-1907); José Campadabal (1849-1905), and his son, Roberto Campadabal (1881-1931); Pedro Calderón Navarro (1864-1909), a native of Spain and composer of church music; and Alejandro Monestel (1865-1950), a noted organist and composer, a prolific composer of church music as well as works for band and orchestra based on folk materials.

To a later generation belong Julio Fonseca (1885-1950), who wrote a *Suite Tropical* based on folk materials, several Masses, and a romanticist *Cantata a la Música*; Julio Mata (b. 1899), a modernist, whose works include a *Suite Abstracta*, a light opera (*Toyupán*), and an operetta (*Rosas de Norgaria*); Cesar A. Nieto (b. 1892), composer of a ballet, *La Piedra de Toxil*; José Quesada (b. 1894), whose works include an orchestral poem, *El Son de la luna*, and band arrangements of Costa Rican dances; and J. Ismael Cardona (b. 1877), author of a *Suite Miniatura* for orchestra.

The younger generation of Costa Rican composers includes Bernal Flores (b. 1937), who has written a Symphony no. 1 for strings (1964) in traditional European style.

**Cotillon, cotillion.** A popular dance of the 18th and 19th centuries, used especially at the close of an entertainment. It includes a large variety of steps and figures that are executed by a leading couple and imitated by all the others. The cotillon has no particular music; any dance music (waltz, polka, mazurka) can be played for it. The cotillon is mentioned, as a variety of the \**contredanse*, in the 1752 edition of the *Diction-*

*naire universel de Trévoux* but not in the edition of 1743. See also Farandole.

**Coulé** [F.]. A French 18th-century *agrément* in the character of an *appoggiatura*. For *coulé sur une tierce*, see *Appoggiatura*, double II; *Nachschlag*.

**Coullisse** [F.]. The slide of a trombone or a slide trumpet.

**Council of Laodicea.** A church council (A.D. 367) that played an important part in the development of Byzantine church music. It abolished the use of instruments and congregational participation in the performance of the chant in order to prevent it from deteriorating.

**Council of Trent.** A council of the Roman Church, held at Trento (South Tyrol, now Italy) 1545–63, where important decisions regarding church music were made. The council abolished all the tropes and sequences with the exception of four [see *Sequence II D*]. The Cardinals' determination to restore the dignity of the service, after the growing corruption and secularization of the previous centuries, acutely endangered the continued development of polyphonic music because for a time they considered abolishing all music in the service other than plain-song. There is, however, no truth to the frequently repeated story that Palestrina "saved music" by composing his *Missa Papae Marcelli*, which, we are told, so greatly impressed the Cardinals that they desisted from their plan [see *Marcellus Mass*]. Actually, Palestrina's role in the council was rather inconspicuous and much slighter than that of Jacobus de Kerle and others. See also *Mass C II e*. See K. Weinmann, *Das Konzil von Trient und die Kirchenmusik* (1919); O. Ursprung, in the preface to *DTB* 26; H. Leichtentritt, in *MQ* xxx; K. G. Fellerer, in *MQ* xxxix; *ReMR*, pp. 448ff.

**Counterexposition.** A name sometimes given to the second exposition of a fugue.

**Counterfugue** [G. *Gegenfuge*]. A fugue in which the answer (*comes*) is the inverted form of the subject (*dux*), e.g., nos. 5, 6, 7 of Bach's *Art of Fugue*. This method was used as early as the 16th century, probably first by A. Gabrieli. See *Inversion* (2).

**Counterpoint** [G. *Kontrapunkt*; F. *contrepont*; It. *contrappunto*; L. *contrapunctus*; Sp. *contrapunto*]. I. *Definition*. The term, derived from *punctus contra punctum*, i.e., "note against note" or,

by extension, "melody against melody," denotes music consisting of two or more lines that sound simultaneously. Counterpoint is practically synonymous with \*polyphony except for differences of emphasis. The latter term is preferred for early music and the former for later periods (16th to 18th centuries). Also, the latter has the connotation of a broad stylistic and historical classification (polyphony vs. monophony and homophony), and the former that of systematic study for the purpose of instruction (Palestrina counterpoint, Bach counterpoint, strict and free counterpoint, etc.).

The individual melodies or strands of a contrapuntal composition constitute the horizontal element of its \*texture, while the intervals occurring between them represent the vertical element. These two elements, distinct and yet inseparable, represent a generating and a controlling force respectively. The former is essential, the latter incidental. Yet it is the latter that primarily determines the various kinds of counterpoint used from the Middle Ages to the present day and therefore serves as the means for classification (in terms of evolution). This does not mean that the other aspects—evolution of melodic lines and of rhythmic coordination—are less important, but only that, owing to their more complex character, they take second place in a systematic study.

II. *Theory*. The earliest designations for polyphonic music were \*organum and discantus (c. 900–1300). The term *punctus contra punctum* was used first in the treatise of Petrus dictus Palma oiosa of 1336 [see *SIM* xv, 508, 513]. About 1350 the term *contrapunctus* appeared in various treatises, some of which describe it as *nota contra notam* [see *CS* iii, 12, 23]. Throughout the 14th century *contrapunctus* meant note-against-note style. Thus, the author of the *Ars contrapunctus secundum Philippum de Vitriaco* (de Vitry lived from c. 1290 to 1361) distinguished between *contrapunctus* and *cantus fractibilis*, admitting only in the latter the use of several notes against one [*CS* iii, 23]. Tinctoris in his *Diffinitorium* (c. 1475) called both types *contrapunctus*, distinguishing them as *simplex* and *diminutus* [*CS* iv, 180].

Up to 1300, the intervals admitted in theoretical treatises were unison, octave, fifth, and fourth, together with the third as an "imperfect consonance." In three-voice counterpoint (first discussed by Franco) the governing principle was that the *triplum* must be added in consonance with either the tenor or the *duplum*,

though not necessarily with both. Thus, vertical combinations such as 1-4-5, 1-4-7, 1-3-4 were permissible and actually occur in musical practice. Johannes de Muris, however, stated that all three parts must be consonant [see CS iii, 68]. Four-part counterpoint is discussed in a "Tractatus de musica figurata et de contrapuncto" from the second half of the 15th century and is illustrated by a table showing the admissible combinations [CS iv, 447ff]. The earliest document for florid counterpoint is the Vatican treatise from c. 1150 [Ottob. lat. 3025; in F. Zamminer, *Der Vatikanische Organum Traktat* (1959)], which contains about 350 examples showing how to write a melismatic upper part above the various intervallic progressions (c-d, c-e, etc.) of the tenor. A similar, much later document is Conrad Paumann's "Fundamentum organisandi" (1452). The first theorist to discuss florid counterpoint and give definite rules concerning dissonance treatment, etc., is Tinctoris (*Liber de arte contrapuncti*, 1477; see ReMR, pp. 140ff). Johannes Cochlaeus (*Musica*, 1507) and Pietro Aaron (*Libri tres de institutione harmonica*, 1516) state that all the parts are best composed simultaneously, not in \*successive counterpoint. Giovanni Lanfranco, in his *Scintille di musica* (1533), distinguishes four \*species of counterpoint that are essentially identical with those of J. J. Fux. The equal importance of both the linear and the vertical aspect of counterpoint is emphasized by Vicentino (*L'Antica Musica*, 1555) and even more by Zarlino, whose *Istitutioni harmoniche* (vol. iii, 1558) is the first comprehensive study of counterpoint. Zarlino was also the first to deal systematically with imitation, canon, double counterpoint, and other *obblighi*, a subject presented in a more limited manner by H. Buchner [in his "Fundamentum" of c. 1525; repr. in VMW v].

In the 17th century traditional counterpoint as taught by Zarlino (today usually referred to as Palestrina counterpoint) was called *contrapunto osservato* and was retained as the basis of instruction. The main objective of theorists such as Diruta, Cerone, Zacconi, Banchieri, Berardi, and numerous others was to present the rules in a simplified form. The final link in this development in Fux's *Gradus ad Parnassum* (1725), a work that contains hardly anything new but has served to perpetuate the tradition of the *stile osservato* to the present day [see Species]. The actual contrapuntal practice of the baroque period differed from the rules, mainly in the much freer treatment of dissonances. As early as

the 1580's Vincenzo Galilei (c. 1520-91) wrote two treatises, "Il Primo Libro della prattica del contrapunto intorno all' uso delle consonanze" and "Discorso intorno all' uso delle dissonanze" (not published), in which he admits dissonances on the strong beat, upward resolutions, multiple appoggiaturas, diminished fourths and augmented fifths, seventh chords, and other formations characteristic of the *seconda prattica* or, as it is generally called today, Bach counterpoint. The only other author dealing with this type of counterpoint is Christoph Bernhard (1627-92) in his "Tractatus compositionis augmentatus" and "Ausführlicher Bericht vom Gebrauche der Con- und Dissonantien" (c. 1660), which also remained in manuscript.

In the 18th century, what little was written about counterpoint (e.g., J. P. Kirnberger's *Die Kunst des reinen Satzes in der Musik*, 1774-79) shows counterpoint in complete subservience to harmony. J. G. Albrechtsberger, in his *Gründliche Anweisung zur Komposition* (1790, 1818) returned to the species used by J. J. Fux, admitting much more freedom in the treatment of dissonances. In L. Cherubini's *Cours de contrepoint et de fugue* (1835) and H. Bellermann's *Der Kontrapunkt* (1862), the strict counterpoint of the late 16th century was revived.

III. *Practice*. By and large, contrapuntal practice developed along the same lines as theory, though usually preceding it by a considerable number of years. Thus, thirds occur in practical sources as early as c. 1150; four-part counterpoint sporadically c. 1200 (Perotinus) and c. 1330 (*Messe Notre Dame* of Machaut), and continuously from 1400 on (Dufay, Ockeghem); and imitation quite frequently throughout the 15th century. Only V. Galilei's explanation of 17th-century counterpoint seemed to inaugurate a new phase rather than summarize practice. Examples illustrating contrapuntal practice up to 1200 are given under Organum. The subsequent development up to c. 1620 is illustrated by the examples on the next page.

The last example illustrates an isolated case of "deliberate revolt" rather than common practice. By and large, 17th-century compositions are based on the principles known as "Bach counterpoint," which differs from "Palestrina counterpoint" mainly in that it is based on "tonal" (instead of "modal") harmonies, admitting six-four chords, seventh chords, and diminished seventh chords. After Bach the emphasis shifted to accompanied melody. However, contrapuntal passages are found in the late works

1. Perotinus (?), *organum triplum "Jacet."* Three-voice counterpoint admitting "dissonant concordances" such as 1–4–7 on strong beats (see meas. 3). 2. Machaut, "*Comment puet.*" Considerable dissonance between widely spaced 1–5–8 consonances. Separation of the voice ranges. 3. Dunstable, "*Sancta Maria.*" Panconsonant counterpoint with full triads, often in I, IV, V positions. 4. Ockeghem, *Missa Mi-Mi.* Counterpoint in four parts of similar design and equal importance. Note the "irregular" resolutions (\*). 5. Josquin, "*Laudate pueri Dominum.*" Imitative counterpoint in *stile osservato*, which, however, Josquin does not always "observe." 6. Frescobaldi, *Capriccio cromatico con ligature al contrario.* All *appoggiaturas* (ligature) are resolved upward, i.e., contrary (*al contrario*) to the rules of the *stile osservato*.

of Haydn and Mozart as well as in Beethoven, Schumann, Mendelssohn, Liszt, Brahms, Franck, and other 19th-century composers. In contrast to the harmonically oriented counterpoint of this period is the dissonant counterpoint of the 20th century, where the linear aspect rules supreme and the vertical is almost meaningless. See also Canon; Discant; Fugue; Invertible counterpoint; Linear counterpoint; Polyphony; Texture.

Jeppesen, in *MQ* xxi.

**Countersubject.** See under Fugue I (c).

**Countertenor.** Old name for (male) \*alto, derived from *contratenor altus* [see Contratenor].

**Country dance.** A generic term for English dances of folk origin, of which there are a great variety. They differ in the arrangement of the dancers as well as in the steps and gestures, but all are group dances. The dancers usually stand in two long lines, men and women facing each other, and move forward and back in figures that change with every eight-measure phrase of the music. There is a definite similarity (if not direct connection) between these English dances, which flourished especially throughout the 17th and 18th centuries, and the French \*branles of the 16th century. The melodies written for these dances all are simple, gay tunes with a marked rhythm and in symmetrical eight-measure phrases. The authoritative source for the country dances is Playford's *The English Dancing Master* (1651; fac. repr., 1957), which contains more than a hundred charming tunes, each accompanied by directions and figures for the dancers. Enlarged editions of this book continued to appear until 1728. Throughout the 18th century and early 19th century (till 1830) numerous publications of country dances were issued, frequently in booklets small enough to fit in the dancing master's pocket. Recently there has been a considerable revival of country dances, in England as well as in the United States. See *Contredanse*; Dance music III.

**Coup d'archet** [F.]. Bow stroke.

**Coup de langue** [F.]. Tonguing.

**Coupler** [G. Koppel]. See under Organ IV.

**Couplet** [F.]. In French poetry, the stanza of a poem (not two rhyming lines, like the English couplet). The corresponding Spanish term, \**copla*, denotes the various stanzas of the *villancico*, which alternate with the refrain (*estribillo*). In music, the term *couplet* is used mainly for the various sections of the 17th-century rondeau, which are connected by the reiterated refrain [see Rondeau (2); also Rondo]. In 18th and 19th-century light opera (Singspiel, operetta) *couplet* means a strophic song of a witty character. Properly these should be called *couplets* (stanzas), but the singular form was generally adopted in Germany (Johann Strauss), where it was also used, from about 1890 to 1910, for popular refrain songs of a light and humorous character. Today the couplet is found in musical comedy, burlesque, and popular songs.

**Courante** [F.; It. *corrente*, *coranto*]. A dance that originated in the 16th century and became, in the mid-17th century, one of the standard movements of the suite. Arbeau, in his *Orchésographie* (1589), describes it as a dance (in duple time!) with jumping movements and a great variety of figures, according to the dancer's ability and fancy. T. Morley, on the other hand, describes it as "travising and running" [*A Plaine and Easie Introduction to Practicall Musicke* (1597), p. 181], in contrast to the leaps of the *volta*. The earliest known musical example, "La corante du roy" in B. Schmid's tablature of 1577 [see W. Merian, *Der Tanz in den deutschen Tabulaturbüchern* (1927), p. 112], does not show any differences from the \**saltarello*. However, a number of "Corrantos" of the Fitzwilliam Virginal Book vaguely foreshadow the 17th-century courante with their generally lighter texture and short "running" figures. In the 17th century the dance became stylized as two types, the Italian *corrente* and the French *courante* [for a similar case, see under Gigue (2)].

(a) The Italian *corrente* is in quick triple time (3/4, sometimes 3/8), with continuous running figures in a melody-accompaniment texture. It appears to be the direct outgrowth of the late 16th-century type as exemplified in the Fitzwilliam Virginal Book. It also must be considered the earlier of the two types, since it appears already clearly established in Schein's *Banchetto musicale* (1617), Frescobaldi's *Toccate e partite d'intavolatura di cimbalo* (2nd ed., 1615–16), and S. Scheidt's *Tabulatura nova* (1624).

Later examples are in M. Cazzati's *Corrente e Balletti* (1662, '63; the distinction made here between *c. alla francese* and *c. alla italiana* is scarcely borne out by a difference in style), in the *Sonate da camera* by Corelli (op. 2, 4), in the keyboard suites of Zipoli (*Sonate d'Intavolatura per Organo*, 1716), etc.

(b) The French courante is much more refined. It is in moderate 3/2 or 6/4 time, with a frequent shift from one of these meters to the other (i.e., from the accents  $\bar{1} \ 2 \ \bar{3} \ 4 \ \bar{5} \ 6$  to the accents  $\bar{1} \ 2 \ \bar{3} \ \bar{4} \ 5 \ 6$ ; see Hemiola II). The resulting instability of rhythm is typical of the courante. Equally subtle is its texture, a free contrapuntal fabric in which the melodic interest frequently shifts temporarily from the upper to one of the lower parts. More than any other type of baroque music, the courante gives the impression of "blurred contours" that is a typical ro-

mantic feature in music history [see Romanticism]. Quite properly it has been compared to the quickly changing movements of a fish [Écorcheville]. Examples abound in the works of Chambonnières, L. Couperin, Froberger, D'Anglebert, F. Couperin, and others. The two accompanying examples illustrate the corrente [Ex. 1, Frescobaldi] and the courante [Ex. 2, Chambonnières].

The courantes of Bach's suites are usually of the French type. Especially remarkable for its rhythmic ambiguity is the courante of the English Suite no. 2; in others, the change from 3/2 to 6/4 occurs chiefly in the final measure of each section. The Italian type occurs in the French Suites nos. 2, 4, 5, 6 and in the Partitas nos. 1, 3, 5, 6. In the original edition of the Partitas [*Clavier-Übung* I, 1731] the distinction between courantes and correntes is carefully indicated by Bach; unfortunately, later editors, including those of the BG, have substituted the name Courante for some or all of the correntes. See Dance music III. See C. Sachs, *World History of the Dance* (1937), pp. 361ff.

**Course** [F. *chœur*; G. (*Saiten*)chor; It. *coro*; Sp. *orden*]. In stringed instruments, chiefly those of the lute type, a group of strings tuned in unison or in the octave and plucked simultaneously in order to obtain increased volume. On the 16th-century lutes double-courses were used for the lower strings, as follows: G-g c-c' f-f' a-a' d'-d' g' (also G-G c-c f-f a-a d'-d' g'). In order to simplify the terminology, the single string g'' is also called a "course," so that the 16th-century lute would have 11 strings in 6 courses. A bass-course is a string (single or double) that runs alongside the fingerboard without crossing the frets; hence, it is invariable in pitch. See Lute. Unison courses of two or three strings are used for the higher ranges of the piano and harp.

**Courtaud, courtall.** Same as curtall [see Oboe family III].

**Covered fifths, octaves.** Same as hidden fifths, octaves. See under Parallel fifths, octaves.

**Cow bells** [G. *Kuhglocken*]. Instruments similar in shape and sound to the bells worn by cows in the Alps, but without clapper and struck with a drumstick. They were used by R. Strauss in his *Alpensinfonie* (op. 64; 1915) and are also used in dance bands.

**Crab motion, crab canon** [G. *Krebsgang, Krebskanon*]. See Retrograde; Canon (1), I.

The image contains two musical examples, each consisting of a system of two staves (treble and bass clef). Example 1, titled '1. Corrente (Frescobaldi)', is in 3/4 time and features a lively, rhythmic melody in the treble staff with frequent eighth and sixteenth notes, and a more active bass line. Example 2, titled '2. Courante (Chambonnières)', is in 3/2 time and shows a more elegant and flowing melody in the treble staff, with the bass line providing a steady harmonic support. Both pieces are in G major, indicated by one sharp (F#) on the treble staff.

1. Corrente (Frescobaldi). 2. Courante (Chambonnières).

**Cracovienne** [F.]. See *Krakowiak*.

**Crash cymbal.** Two large circular brass plates made slightly convex so that only the edges will touch when they are struck together. See *Cymbals*.

**Creation, The** [G. *Die Schöpfung*]. Oratorio by Haydn, composed in 1797. It is based on a poem compiled by Lidley from Milton's *Paradise Lost*, which was suggested to Haydn by the concert-manager Salomon during his second stay in London (1794-95). Upon Haydn's return to Vienna, the text was translated into German by his friend, Baron van Swieten, and this translation (*Die Schöpfung*) became the basis of the oratorio, which was first performed in Vienna in 1798.

**Creation Mass.** Popular name for Haydn's Mass in B-flat (1801), used because a theme from his oratorio, *The Creation*, appears in the "Qui tollis."

**Creatures of Prometheus.** See *Geschöpfe des Prometheus*.

**Crécelle** [F.]. Rattle.

**Credo** [L.]. The third item of the Ordinary of the Mass. In plainsong, the first phrase, "Credo in unum Deum," is sung by the officiating priest, and the chorus enters at "Patrem omnipotentem." The Credo (*Symbolum apostolicum*) became part of the Mozarabic liturgy as early as 589 (Council of Toledo) and was officially prescribed from the Frankish liturgy in 798. It was the last of five Ordinary chants to be incorporated into the Roman Mass (in 1014 at the insistence of Emperor Henry II). Even today, the Credo melodies are grouped separately from other items [LU, pp. 64ff]. The oldest melody [LU, p. 64, no. 1], often called the "authentic Credo," is found in MSS of the 11th century, but because of its formal structure it is generally thought to be of earlier origin [see *ApGC*, pp. 412ff].

Early polyphonic settings (14th to 16th centuries) nearly always begin with "Patrem omnipotentem" and are often indexed under "Patrem" in modern editions. In polyphonic Mass compositions of the 17th and 18th centuries the Credo is usually treated in a majestic and forceful style, expressing unshaking belief in the creed of the Church. A contrasting expression, however, is given to the sections "Et incarnatus est" and "Crucifixus" [see Mass III]. See R. Hannas, "Concerning Deletions in the Polyphonic Mass Credo" (*JAMS* v); M. Huglo, "Origine de la

mélodie du Credo 'authentique' de la Vaticane" (*RG xxx*). See *Creed*.

**Creed.** Name for three texts of the Roman and Anglican rites. (1) Nicene Creed (named after the Council of Nicea, A.D. 325), used in the \*Credo of the Mass. (2) Apostle's Creed, *Credo in Deum Patrem omnipotentem*, formerly used in the Offices, either monotoned (Anglican Offices) or said "secretly," i.e., silently except for the initial words and the final versicle and response (Anglican monasteries and Roman Catholic churches). (3) Athanasian Creed, *Quicumque vult salvus esse* (Whosoever wants to be saved), used particularly on Trinity Sunday at the Office of Prime (LU p. 227). See F. J. Badcock, *The History of Creeds* (1930).

**Crembalum** [L.]. \*Jew's-harp.

**Crescendo, decrescendo**, abbr. *cresc.*, *decresc.*, or *decr.*; indicated by the signs < and >. The usual terms and signs for increasing or decreasing volume. For the latter, the word *diminuendo* (*dim.*) is also used. For their history, see Expression marks.

**Crescendo pedal.** See under Organ VII.

**Crescent.** See Turkish crescent.

**Cretic meter.** In ancient Greek music, name for \*quintuple meter.

**Criticism.** See Music criticism.

**Croche** [F.]. Eighth note. See under Notes; also Crotchet.

**Croiser les mains.** See *Croisez*.

**Croisez, croisement** [F.]. Indication to cross the hands in piano playing.

**Croma** [It.]. Eighth note. See under Notes.

**Cromatico** [It.]. Chromatic. See especially under Chromatic (4).

**Cromorne.** See under Oboe family III. See C. Sachs, in *SIM* xi, 590ff.

**Crook or shank.** See under Wind instruments IV (b); Horn II; Trumpet II.

**Crooning.** A style of singing softly and sentimentally, with sliding and moaning effects, that was introduced about 1930 by popular American radio singers (e.g., Bing Crosby, Rudy Vallee).

**Cross fingering** [F. *doigté fourchu*; G. *Gabelgriff*]. In playing wind instruments with side holes, any

fingering in which open holes alternate with closed ones, in contrast to "normal" fingering, in which all open holes are at the lower end of the pipe and all closed ones at the upper end. While the normal fingering produces most of the diatonic tones of the main octave, cross fingering is necessary for the semitones and the tones of the higher octave. On modern instruments (flutes, clarinets, oboes) cross fingering is largely avoided owing to the elaborate system of keys (\*Böhm action).

**Cross flute** [F. *flûte traversière*; G. *Querflöte*; It. *flauto traverso*; Sp. *flauta travesa*]. Older name for the present-day flute, so called because it is held crosswise to the body. See Transverse flute.

**Cross relation** [F. *fausse relation*; G. *Querstand*]. Cross relation (or false relation) is the appearance in different voices of two tones that, owing to their mutually contradictory character (e.g., major and minor third of the same triad), would normally be placed as a melodic progression in one voice. In other words, cross relation means the use in "diagonal" position of what properly is a "horizontal" element of musical texture [see Texture]. The most important progression of this kind is the chromatic progression, e.g., E<sup>b</sup>-E, which is so strikingly "horizontal" that the ear is disturbed if it hears the first tone in one voice and the second in another [Ex. 1]. In classical harmony and counterpoint, such progres-

sions are considered bad (false) and the rule prohibiting them helps prevent the student from making such an error. Nevertheless, in numerous instances the disturbing effect is sufficiently mitigated to make cross relation acceptable, e.g., if it occurs between inner voices [Ex. 2] and,

particularly, if the "false" relation between one voice and another is rectified by a strikingly "good" relation in each of these voices, i.e., if there is enough melodic (contrapuntal) individuality in each voice to distract the listener's attention from the diagonal clash [Ex. 3; Mozart]. Another, considerably weaker type of cross relation is that involving the tritone (e.g., E-B<sup>b</sup>); it is usually avoided between two outer voices [Ex. 4].

Although cross relations generally are not used in "classical" harmony and counterpoint, they are frequently found in earlier music. In the 16th century, the normal manner of proceeding from A major to F major was to place the C-sharp and C-natural in different voice-parts [Ex. 5]. The compositions of Byrd, Gibbons, and Frescobaldi contain numerous interesting examples of cross relation [Ex. 6, 7], and also of what might be called, somewhat antithetically, "vertical cross relation," i.e., the simultaneous sounding of two chromatic tones [Ex. 8; other examples under *Musica ficta*]. In modern music, cross relations are, of course, very common, the impression of "falsity" diminishing with the increasing disintegration of the harmonic system of the 19th century.

**Cross rhythm.** The simultaneous use of conflicting rhythmic patterns, e.g., three notes against four, or of conflicting accents, e.g., 3/4 meter against 4/4 meter. See Polyrythm.

**Crot.** See Crwth.

**Crotales** [F.], **crotalum** [Gr.-L.]. The *crotalum* of Greek and Latin antiquity was a rattle or clapper similar to the castanets, consisting of two wooden or metal shells held in one hand. The French *crotales* usually means a clapper, specifically the castanets. See under Cymbals.

**Crotchet.** In British terminology, the quarter note. This is the old *semiminima*, which in black notation was written with a flag attached to the stem [see Notation, Ex. 6, no. 15] and therefore occasionally called *crochata* (hooked; see Crook), e.g., by Anon. I [CS iii, 337a]. In white notation, however, the hook appeared with the *fusa*, hence the French *croche* for the eighth note.

**Crowth, crowd, cruit.** See Crwth.

**Crucible, The.** Opera in four acts by R. Ward (libretto by B. Stambler, after A. Miller's play), produced in New York, 1961. Setting: Salem, Mass., 1692.

**Crucifixus.** A section of the Credo of the Mass. In Mass compositions it frequently appears as a separate movement of sorrowful expression, as in Bach's B-minor Mass.

**Crumhorn.** Cromorne. See Oboe family III.

**Crwth.** A six-stringed bowed stringed instrument probably of ancient Celtic descent. It is conspicuous for its rectangular shape, which is strongly reminiscent of the Greek \*kithara. The oldest illustrations (11th century) show the instrument without a fingerboard and played like a harp. It was used with a bow from the 12th or 13th century, and later a fingerboard was added, whereby it became associated with the violin family [see ill. under Lyra; also in *GD*, ii, opp. 542, and v, opp. 514; *GDB*, iv, opp. 90, and viii, opp. 146]. The instrument was still used in Wales in the early years of the 19th century. It is also known by the anglicized name *crowd* and the Irish names *crot* and *cruit*. A medieval Latin name, used in the 11th to the 14th centuries, is *chorus* [see *SaRM*, p. 80]. The medieval form, without fingerboard, is usually called *rotta* or *rotte*. The *chrotta*, mentioned by Venantius Fortunatus (6th century), was probably the same as the *rotta* [see *MaMI*, p. 134f].

Lit.: N. Bessaraboff, *Ancient European Musical Instruments* (1941), pp. 314ff; H. Panum, *The Stringed Instruments of the Middle Ages*, rev. and ed. J. Pulver [n.d.]; F. W. Galpin, *Old English Instruments of Music*, rev. ed. T. Dart (1965); A. Baines, ed., *Musical Instruments through the Ages* (1961); O. Anderson, *The Bowed-Harp*, ed. K. Schlesinger (1930).

**C.s.** [It.]. Abbr. for *colla sinistra*, with the left hand.

**Csárdás** [Hung.]. A Hungarian dance of the early 19th century, first recorded about 1835. Although it was claimed to be of rustic origin, it probably represents a ballroom variant of the old \**verbunkos*. It is in rapid 2/4 time, considerably faster than the *friss* (fast) sections of the *verbunkos*. The slow *lassu* sections were not incorporated into the *csárdás*.

**C sol fa ut.** See under Hexachord III.

**Cuando** [Sp.]. One of the oldest Latin American dance forms still popular, mainly in Argentina and Chile. Its similarity to the \*minuet confirms its European origin. J.O-S.

**Cuba.** Little is known about musical activity in Cuba during the 16th century. The earliest

known native musician was Miguel Velásquez, who was organist in the Cathedral of Santiago (1544). In 1682 the post of musical director of the Cathedral of Santiago was established and was filled by Domingo de Flores. Not until the second half of the 18th century did Cuba produce a major composer, Esteban Salas (1725–1803), a native of Havana and a prolific composer of church and secular music, influenced partly by the European late baroque and partly by the early classic school. Among his more than ninety liturgical compositions are several Masses, litanies, psalms, and a Stabat Mater. In addition, he wrote almost two hundred *villancicos* with Spanish texts, some of which are called *cantadas* or *pastorelas*.

Salas was succeeded at Santiago by Francisco José Hierrezuelo (1763–1824), who in turn was followed by Juan Paris (1759–1845), a native of Barcelona; a few of his compositions, written in Viennese classic style, have been preserved. Other composers of the period included Antonio Raffelin (1796–1882), who wrote a Mass and three symphonies; Manuel Saumell (1817–70), who wrote numerous *contradanzas* for piano in the Cuban popular vein; Laureano Fuentes (1825–98), composer of sacred music, several *Sinfonías* (overtures), chamber compositions, and an opera, *Seila* (1865); Nicolas Ruiz Espadero (1832–90), a pianist who wrote a considerable number of virtuoso compositions for his instrument; and Gaspar Villate (1851–1912), who wrote several operas (*Angelo*, 1867; *Zilia*, 1881; *Baltazar*, 1885) and an unfinished music drama, *Cristobal Colón*.

The most outstanding musician of the second half of the 19th century was Ignacio Cervantes (1847–1905), who studied first in Havana and then in Paris, where he absorbed all the influences of the Second Empire. Of his compositions, the most important are his twenty-one *Danzas* for piano, written between 1875 and 1895, which represent the first skillful stylization of Cuban folk music.

Nationalism in the 20th century is brilliantly represented by Amadeo Roldán (1900–39) and Alejandro García Caturla (1906–40), who mingled elements of European music with the spirit of Cuban folk music. José Ardévol (b. 1911) became a prominent leader of modern music in Cuba. In addition to producing a vast number of compositions, especially chamber music, Ardévol has been an outstanding teacher and promoter of contemporary music, through both the *Grupo Renovación* and the Havana Chamber

Orchestra, which he established. In 1922 Gonzalo Roig (b. 1890), author of the well-known lyric comedy *Cecilia Valdéz*, founded the Havana Symphony Orchestra, and two years later the Philharmonic Orchestra was established under the direction of Pedro Sanjuán (b. 1886).

Of Ardévol's pupils, the best known are Harold Gramatges (b. 1918), Edgardo Martín (b. 1915), Serafin Pró (b. 1906), Juan Antonio Cámara (b. 1917), Gisela Hernández (b. 1910), and Argeliers León (b. 1918). Their contemporaries, Enrique Gonzalez Mantici (b. 1912), Natalio Galán (b. 1919), Hilario González Iñiguez (b. 1920), Carlo Borbolla, and Fabio Landa (b. 1924) have also contributed outstanding works. Of this generation, Julián Orbón (b. 1925) and Aurelio de la Vega (b. 1925) are the best known outside Cuba. Orbón has combined the Spanish tradition with contemporary techniques, notably in such works as his *Tres Versiones Sinfónicas* (1953), Concerto Grosso (1955), string quartet (1951), and *Tres Cantigas del Rey* (1960). De la Vega has moved from the neoromanticism of an early trio (1949) to the atonal idiom of his string quartet (1957), symphony in four parts (1960), *Estructuras* (1963), and *Coordinates* (1964), the last-named an electronic piece. Juan Blanco (b. 1920) has produced \**musique concrète* and \*electronic music, while Leo Brower (b. 1939) has written some skillful serial compositions.

A prominent composer of light music and musical comedies is Cuba's internationally recognized Ernesto Lecuona (1896-1964).

Cuban folk music stems from two main traditions, Spanish and African. The Spanish tradition is strongly reflected in the rural songs generically known as \**punto*. This type developed from the Spanish *contradanza*, which by the mid-19th century acquired characteristics far different from its original models, leading to the \**habanera*, \**guajira*, \**guaracha*, \**tonada*, and \**bolero*. African influences are more evident in urban folk music, which differs from that of Spanish origin mainly in its wide use of syncopation. Such types include the *danzón*, \**rumba*, \**son*, \**macumba*, and \**conga*. The \**tumba* was introduced to Cuba from Haiti.

Lapique Becali, *Catalogación y Clasificación de la Música Cubana* (1963); A. León, *Música Folklorica Cubana* (1964); A. Carpentier, "Music in Cuba" (*MQ* xxxiii). Also see under Latin America. J.O-S.

**Cue.** In orchestral parts including a long rest, a short passage taken from another leading instrument and printed in small notes, in order to warn the player of the entry of his part.

**Cueca, zamacueca** [Sp.]. The most popular Latin American dance in Chile. It is always based on alternations of 3/4 and 6/8 meter in fast tempo, and generally employs eight-syllable quatrains followed by improvised dialogues similar to the *relaciones* in the Argentinian \**gato*. The first section of the tune is sometimes slow and in the minor mode, followed by another section in rapid tempo in a major mode whose melody always ends in a cadence on the third or fifth degree of the scale. The melody is usually sung in parallel thirds. Hand claps by singers and dancers underline the simple chordal accompaniment of guitars, which uses only tonic and dominant chords. The *cueca* is danced by a couple, with the woman constantly trying to attract her partner's attention and then escaping his pursuit. See P. Garrido, *Biografía de la Cueca* (1943). J.O-S.

**Cuivre** [F.]. *Instruments de cuivre* or simply *les cuivres* are the brass instruments of the orchestra. *Cuivré* calls for a forced, harsh tone in playing, especially of the horn [see Horn I].

**Cumbia.** Afro-Panamanian dance form, in duple meter, moderately syncopated and performed either as a purely instrumental piece or as a song accompanied by a \**mejoranera*. Two varieties are known in Panama: the *cumbia plebeya*, of a rustic and sensual character, and the *cumbia de salón*, performed with steps and figures similar to those used in the polka. J.O-S.

**Cunning Vixen, The** [Cz. *Lišky Příhody Bystroušky*]. Opera in three acts by L. Janáček (to his own libretto), produced in Brno, 1924. Setting: fairy tale.

**Currende** [G.]. In the 16th and 17th centuries, name for the choruses of Latin schools (*Gymnasium*) in Germany. Their members were usually boys lacking in funds who, by singing in the streets and for special occasions such as funerals and weddings, helped provide for their support. There has been a revival of this custom in various German towns. See Quemapas. See G. Schünnemann, *Geschichte der deutschen Schulmusik* (1928); W. Nicolai, in *Bach-Jahrbuch* (1914).

**Corrientes.** Same as \**conjuntura* or, at least, the quick diamond-shaped notes of the *conjuntura*.

**Cursive and tonic.** Terms applied to the termination formulas of Gregorian recitatives (psalm

tones, Introit tones, responsorial tones), depending on whether they are invariable or subject to modification (insertion of extra notes for additional syllables of the text). The more ornate terminations (used for the verses of Introits and Responsories) are usually cursive, while the simple ones (for the psalms and canticles) are tonic. The cursive endings consist of five units (single notes or short groups of notes) to which the last five syllables of the text are sung, regardless of their accentual structure, whether  $\cdot \times \times \cdot \times$  or  $\times \times \cdot \times \times$  or  $\cdot \times \times \cdot \times \times$ , etc. In tonic terminations the accented syllables always fall on the same unit. See *ApGC*, pp. 215 (Fig. 49), 231 (Fig. 55).

**Cursus.** In classical Latin, a principle of rhythmic structure used in the closing words of a sentence and designed to give prose a certain poetic quality (Cicero, Quintilian). The most important scheme was the *cursus planus*, which consisted of a trochee and a palimbacchius:  $- \cup | - - \cup$ , e.g., *mēmbra firmāntūr*. In accordance with the principles of Latin poetry, this and other combinations (*cursus tardus*, *cursus velox*) are based on the quantity (measuring) of syllables [see Poetic meter III] and hence are called metrical *cursus*. According to a theory advanced at Solesmes, these were replaced, after 400, by rhythmical *cursus*, which is based on the quality (speech accent) of the syllables. The rhythmical *cursus planus* would be:  $\cdot \times \times \cdot \times$ , e.g., *mēmbra firmāntur*. Dom Mocquereau tried to show that the rhythmic *cursus* plays an important role in Gregorian chant, i.e., that the accented syllables are sung to a higher pitch (tonic accent). This theory, to which he devoted the major part of vol. iv of the *Paléographie musicale*, cannot be considered valid. Equally untenable is the theory advanced by Dom P. Ferretti (*Il cursus metrico e il ritmo delle melodie gregoriane*, 1913) that the cadential formations of Gregorian chant were influenced by the metrical *cursus*. See H. B. Briggs, in *PMA* xxiv; H. Bewerunge, in *ZIM* xii; *ApGC*, pp. 297ff.

**Curtain tune.** Same as act tune [see Entr'acte].

**Curtal(I).** See under Oboe family III.

**Custos** [L.]. See under Direct.

**Cycle.** (1) In musical acoustics, designation for a double vibration [see Acoustics I]. (2) Designation for various systems of equal temperament, i.e., systems whose tonal material is obtained by dividing the octave into a number of equal intervals. The simplest is the twelve-tone division, which is the basis of present-day music. Its justification lies in the fact that twelve pure fifths

( $\frac{3}{2}$  = 702 cents; see table under Intervals, calculation of) are very close to seven octaves. Its "error" is  $12 \times 702 - 7 \times 1200 = 24$  (more nearly 23) cents (Pythagorean \*comma). The error is much smaller in the 53-division, called Mercator cycle (after Nicolas Mercator, c. 1620–87), which is based on the fact that 53 pure fifths are equal to 31 octaves with an error of only 3.62 cents. This system had been proposed in China as early as 40 B.C., by Jing Farng [see China]. It has the advantage of having practically perfect fifths (701.9 as against 702) and thirds (384.9 as against 386). However, the large number of notes involved renders it useless for practical purposes. Another cycle, named after Christian Huygens (1629–95), has 31 tones to the octaves. It proceeds from the fact that 31 pure thirds are equal to 10 octaves with an error of 34 cents. Its thirds (387 cents) are even more perfect than those of the Mercator cycle but its fifths less so (697 cents). This division was used (approximately) in Vicentino's \*arcicembalo. A 19-division was discussed by Zarlino and Salinas and is expressly called for in a "chromatic" chanson by Costeley [see K. J. Levy, in *AnnM* iii, esp. pp. 216ff]. It is the only one that could be put to practical use. See J. M. Barbour, *Tuning and Temperament* (1951), pp. 113ff.

**Cyclic, cyclical.** (1) Generally, term for any musical form including several movements; thus, the sonata, suite, toccata, cantata, etc., are cyclic forms. (2) Specifically (and preferably), compositions—usually sonatas or symphonies—in which related thematic material is used in all or in some of the movements. One example of cyclic treatment is Schubert's *Fantasie* op. 15 ("Wanderer"). Still more conspicuous is the use of identical material in Berlioz' *Symphonie Fantastique*. Cyclic treatment was used by Bruckner, who in several of his symphonies restates the initial theme of the first movement in the closing climax of the last. It was more clearly established as a principle of composition by César Franck, Vincent d'Indy, Saint-Saëns, Fauré, and Dukas. Statements regarding the presence of cyclical treatment in Beethoven's sonatas, etc., should be accepted cautiously, except, of course, in those obvious cases where a movement shows the insertion (usually in the character of a reminiscence) of a short section from another movement, as, e.g., in the Fifth Symphony, the piano sonata op. 101, and the Ninth Symphony. Cyclic treatment is, however, clearly indicated in many Masses of the 15th and 16th centuries, all of whose movements are based on the same tenor

or begin with identical opening measures (*can-tus firmus* cycle, motto cycle; see Mass B II c). It is also present in the variation canzona [see Canzona (5), I] and, to some extent, in early baroque compositions (canzonas, sonatas) showing a rounded structure, A B C . . . A [see Sonata B I; *HAM*, nos. 191, 208].

**Cylinder.** See Valve.

**Cymbalon.** See Cimbalum.

**Cymbals.** A percussion instrument (idiophone) consisting of two metal plates struck together. Cymbals in the form of two small saucers attached to handles or held by means of leather straps were used in ancient Egypt, Greece, and Rome (*\*crotalum*). Similar instruments have been introduced by Debussy (*cymbales antiques*) and Ravel (*crotales*). These are small cymbals of thick metal that can be tuned to a definite pitch. The normal orchestral cymbals are much larger, of thin metal, and of indefinite pitch; see Percussion instruments B, 6. Choke cymbals and sizzle cymbals are varieties used in jazz bands. See H. Hickmann, *Cymbales et crotales dans l'Égypte ancienne (Extrait des Annales du Service d'Antiquités de l'Égypte, vol. xlix, Cairo, 1949)*.

**Cymbalum** [L.; pl. *cymbala*]. In the Middle Ages, a small bell. Such bells were made in graded sizes, from four to eight, and hung on a frame to be used as chimes. They were also called *nolae*, *campanae*, and *tintinnabula*. Various writers give detailed prescriptions for the amount of metal to be used for each bell. See J. Smits van Waesberghe, *Cymbala (Bells in the Middle Ages)* (1951).

**Cythara.** Medieval spelling of *\*kithara* but used as a generic designation for stringed instruments.

**Cythringen.** See under Guitar family.

**Czakan** [G. *Stockflöte*]. An early 19th-century contraption made for the enjoyment of music during a walk in the country. It was in the form of a walking stick whose upper part consisted of, or contained, a detachable flute (or recorder?). It was popular in Austria and Hungary from about 1800 to 1850.

**Czardas.** Erroneous spelling for *\*csárdás*.

**Czechoslovakia.** The earliest known Czech musical culture dates from the conversion to Christianity in the first half of the 9th century. The missionaries Cyril and Methodius, who arrived

there in 863 or 864, established the liturgy of the Eastern Church. From the beginning of the 10th century Gregorian chant spread throughout Bohemia, Moravia, and Slovakia. Important documents of Gregorian chant on Czech soil are the Prague Troper (1235), the *Evangeliiář* (Gospel) of 1293, and the *Tobiáš Agenda* of Bishop Tobiáš of Bechyně (1294). The oldest surviving Czech religious song is the famous "Hospodine, pomiluj ny" (Lord have mercy on us), written in 1055. It became so popular that it was used at coronations of Czech kings. "Svatý Václave" (St. Wenceslaus) from the 12th century is a secular prayer that was sung at important state functions and before battles, and "Jezu Kriste, šedřý kněže" (Jesus Christ, noble prince) was later used by Jan Hus. St. Vitus' Cathedral in Prague was the center of musical activity, and in 1259 a cathedral choir of twenty-four priests and twelve choir boys ("bonifantes"—*boni infantes*) was formed.

In the 13th and 14th centuries the minnesingers Heinrich von Meissen (Frauenlob) lived at the Prague court under Wenceslaus II (reigned 1278–1305), and Heinrich von Mügeln (d. c. 1371) during the reign of John of Luxemburg (1310–46). During the reign of Charles IV (1346–78), who founded Charles University, there lived three composers of Czech religious and secular songs: the Dominican monk Domaslaus; the Magister Závš of Zap (c. 1350–1411), a few of whose monophonic songs have been preserved; and the Archbishop of Prague, Jan of Jenštejn (1350–1400), whose compositions reveal French influence. Dramatic plays for Christmas and Easter became very popular. In the "Plankty" (Laments of the Virgin Mary) and especially in the satirical Easter play *Mastikár* (The Quack) Czech was preferred to the Latin text. As a result of the Reformation, led by Jan Hus (c. 1371–1415), all polyphonic and ornate singing was banned. Religious songs were turned into war songs. The Taborites especially used bold and forceful revolutionary battle songs, the best known of which is "Ktož jsú Boží bojovníci" (Ye Who Are God's Warriors), which still lives in 19th- and 20th-century Czech compositions [e.g., Smetana's *Má Vlast*, Dvořák's "Husitská" overture, etc.]. Most of the Hussite songs are preserved in the *Jistebnice Cantionale* (c. 1420). From the Hussite songs there developed, in the second half of the 16th century, the *Rorate* chants [see Rorantists].

The Hussite tradition was continued from the second half of the 15th century by the Bohemian

(later Moravian) Brethren. Their spiritual songs were collected in beautifully illustrated books (*cantionales*) containing hymns, canticles, and historical songs. The oldest is the *Mladoboleslav Kancional* (1501), and the most important the *Šamotulský* (1561). The rich musical tradition of the Brethren was ended in their homeland by religious persecution, but it was continued abroad. Jan Amos Komenský (Comenius, 1592–1670) produced the *Amsterdam Canticale* (printed 1659), which contains 150 psalms and 430 songs. In the early 18th century the Brethren moved to America and other countries.

Vocal polyphony was cultivated especially by the Literary Brethren (*fraternitates literatorum*), who organized choral singing in many Czech towns somewhat in the manner of guilds. The most interesting of their splendidly illuminated song books is the *Hradec Králové* [Königgrätz] *Speciálník* of 1611, which contains 300 compositions, mostly motets and Mass sections. The high point of polyphony came during the Counter-Reformation at the splendid court of Rudolph II (1552–1612), the last Hapsburg emperor to reside in Prague. He employed outstanding composers from England, the Netherlands, Spain, Italy, and Germany, among them Charles Luython, Philipp de Monte, Jacob Regnart, Lambert de Sayve, Jacobus de Kerle, Jakob Hassler, and especially Jacobus Gallus (Jacob Handl, 1550–91). Representatives of the native polyphonic school were Jan Trajan Turnovský, sometimes called the "Bohemian Palestrina," Jiří Rychnovský, and especially Kryštof (Christof) Harant of Polžic (1564–1621), who combined the native style with that of the French, Venetian, and Netherlands schools.

The development of Czech music came to a sudden halt with the defeat of the Protestants in the battle of White Mountain (near Prague) in 1620. In the baroque era it came, belatedly, under the influence of the Italian madrigal and Florentine monody, except in church music. During this time numerous native composers of German parentage left their homeland, among them Christoph Demantius (1567–1643), Andreas Hammerschmidt (1612–75), and the famous violinist Heinrich Ignaz Franz Biber (1644–1704), who together with Pavel Josef Vejvanovský (c. 1643–93) was employed by the Archbishop Karl Liechtenstein-Kastelkorn in Kremsier (Moravia). Johann Sigmund Kusser (Cousser, 1660–1727) left his native Bratislava (Pressburg) and later played an important part in the early Hamburg Opera. Composers who

remained in their homeland wrote mostly baroque church music. The most important were Adam Michna of Otradovice (c. 1600–70), Jan Dismas Zelenka (1679–1745), who studied counterpoint with J. J. Fux in Vienna, the Minorite monk Bohuslav Matěj Černo-horský (1684–1742), and František Václav Miča (1694–1744), head of the orchestra of Count Questenberg in Jaroměřice, who wrote cantatas and operas (*L'Origine de Jaromeriz in Moravia*). Černo-horský's pupils included Jan (Johann) Zach (1699–1773?) and František Tůma (1704–74), who also studied with Fux. Both wrote, besides Masses and Requiems, a great many secular instrumental works, and they influenced the early style of Mozart. Another important pupil of Černo-horský's was the organist Joseph Seeger (1716–82), who in turn counted among his pupils Antonín Koželuch (1738–1814), Václav (Wenzl) Pichl (1741–1804), and Jan Vaňhal (Johann Wanhal, 1739–1813).

The 18th century saw an enormous emigration of Czech musicians, mostly for economic reasons. In Mannheim, Jan Václav Stamic (Johann W. A. Stamitz, 1717–57) developed a new orchestral style together with his countrymen Franz Xaver Richter (1709–89), Jiří Čert (1708–89), Antonín Fils (Filtz, 1730–60), and Karl Stamitz (1745–1801). For religious reasons the entire Benda family (Protestant) went to Berlin. Its most prominent member, Georg (Jiří) Benda (1722–95), originator of the staged \*melodrama, settled in Gotha. In Paris lived the piano virtuoso and composer Jan Ladislav Dusík (Johann Dussek, 1760–1812), the horn player Jan Václav Stich (Giovanni Punto, 1746–1803), and Antonín Rejcha (Reicha, 1770–1836), who wrote, among other things, chamber music for wind instruments and many works on music theory, and was the teacher of Berlioz, Gounod, and Franck at the Paris Conservatory. The emigration to Italy was headed by Josef Mysliveček (1737–81), called "Il Boemo," who wrote many operas in Italian style.

The greatest number of Czech musicians in the 18th century moved to Vienna, beginning with František Tůma. Florian Gassmann (1729–74) studied in Italy and wrote operas, both *seria* and *buffa* (*La Contessina*). J. Antonín Štěpán (Joseph Anton Steffan, 1726–97) was court pianist and wrote many piano compositions. Jan Vaňhal (Wanhal, 1739–1813), like most of the Czech composers in Vienna, contributed to the development of the preclassical style. Wagenseil's successor at the Vienna court

was the versatile teacher and composer Leopold Koželuch (1752–1818). Many \*Singspiele and the romantic opera *Oberon* were written by Pavel Vranický (Paul Wranitzky, 1756–1808), a friend to Haydn, Mozart, and especially Beethoven. František Krommer-Kramář (1759–1831) wrote excellent concertos for violin, oboe, and clarinet, as well as chamber music. The Singspiel composers included Wenzel Müller (1767–1835, *Die Schwestern von Prag*), Ferdinand Kauer (1751–1831, *Das Donauweibchen*), and Vojtěch Jírovec (Adalbert Gyrowetz, 1763–1850), who wrote the opera *Agnes Sorel* for the Congress of Vienna. One of the most talented piano composers and a friend of Beethoven's was Jan Hugo Voříšek (Johann Hugo Woržischek, 1791–1825), who influenced both Schubert's and Smetana's piano music. In Prague František Xaver Dušek (Franz Dussek, 1731–99) wrote piano, chamber, and orchestra music. Jan Václav Tomášek (Tomaschek, 1774–1850), nicknamed the "music Pope" of Prague, was a great teacher and composer of piano and vocal music. Characteristic of the late classical and early romantic tradition was Jakub Jan Ryba (1765–1815), with his great output of secular orchestral and church music. Best known are his pastoral Christmas Masses, using simple folk tunes and Czech texts. František Škroup (1801–62) wrote the first Czech romantic opera, *Dráteník* (The Tinker), and also the Czech national anthem. He was the first Czech opera conductor, succeeding Carl Maria von Weber.

The founder of Czech national music was Bedřich Smetana (1824–84). He created the classical form of Czech serious opera (*The Brandenburgs in Bohemia*, *Dalibor*, *Libuše*) and folk opera (the world-famous \**Bartered Bride*, *The Kiss*, *The Two Widows*, and *The Secret*). He also wrote numerous symphonic poems, and chamber, choral, and piano compositions. Antonín Dvořák (1841–1904) represents the climax of full-blooded Bohemian musicianship. In many of his Slavonic dances, rhapsodies, and scherzo movements he used the \**furiant*, and in adagios of chamber music the \**dumka*, both Slavic dances. While the neoromantic Smetana wrote mostly operas and symphonic poems, Dvořák was more interested in nonprogrammatic music (nine symphonies, twelve string quartets and other chamber works, concertos for piano, violin, and cello). His choral and piano music and also his best opera, *Rusálka*, are mostly nationalist in character. Zdeněk Fibich (1850–1900), a quite sophisticated romanticist influenced by Wagner, reflects little of the nationalist

tradition. He wrote mostly operas (*The Bride of Messina*) and melodramas (the trilogy *Hippodamia*). Leoš Janáček (1854–1928), creator of musical realism, was influenced by Borodin and Mussorgsky. Arranger of many Moravian folk-songs, he studied the melodic speech inflections of his people and thus arrived at a new declamatory vocal style. He wrote for every medium but most important are his operas (*Jenufa*, *Katja Kabanova*, etc.) and his *Glagolitic Mass*. The older Janáček grew, the more modern his music became. The link between the classical and modern Czech generation was Joseph B. Foerster (1859–1951), who wrote psychologic-spiritual operas (*Eva*). Dvořák's foremost pupils were Josef Suk (1874–1935), his son-in-law, who as a member of the famous Bohemian String Quartet wrote much chamber music (*Meditation on the Chorale "St. Wenceslaus"* for string quartet), and a symphonic cantata *Epilogue*; and Vítěslav Novák (1870–1949), who composed a symphonic cantata, *The Storm*, and a piano cycle, *Pan*. They continued the legacy of their teacher but were also influenced by French impressionism and brought a new national expression to neoromanticism. Otakar Ostrčil (1879–1935) was influenced by Gustav Mahler (1860–1911), who, although born in Bohemia, is considered in connection with German music. Vítěslav Novák had many pupils, of whom the most important were Ladislav Vycpálek (b. 1882), Boleslav Vomáčka (b. 1887), Jaroslav Křička (b. 1887), Emil Axman (1887–1949), Jan Kunc (b. 1883), Vilém Petrželka (b. 1889), and Václav Kaprál (1889–1947).

Jaroslav Jeremiáš (1859–1918) and his brother Otakar Jeremiáš (1892–1962) continued the tradition of Smetana, while Jaroslav Kvapil (1892–1958) and Karel B. Jiráček (b. 1891; since 1947 in the U.S.) were influenced by Mahler and R. Strauss. A happy amalgamation of national elements and a moderately modern idiom is found in Jaromír Weinberger's (b. 1896) opera *Schwanda, the Bagpiper* (1927), which had international success. Janáček's most talented pupil was Pavel Haas (1899–1944), who died in a concentration camp (opera *The Charlatan*, in avant-garde vein). The champion of atonal and quarter-tone music is Alois Hába (b. 1893; opera *The Mother*); his brother Karel Hába (b. 1898), a viola virtuoso, also writes quarter-tone music. Avant-garde composers include Karel Reiner (b. 1910) and Václav Kašlík (b. 1917). Music for the very advanced modern stage was written by Emil F. Burián (1904–59) and Jaroslav Ježek

(1906–42), who wrote political satire.

Bohuslav Martinů (1890–1959), although he left Prague in 1923 to study with Roussel in Paris and lived many of his last years in the United States, is still considered one of the outstanding Czech composers of the 20th century. He combined a melodic Czech folk idiom with French impressionist tendencies; his earlier works were much influenced by Stravinsky. Of his ten operas, the short *Comedy on a Bridge* is the most performed.

Neoclassicism is represented by Pavel Bořkovec (b. 1894), whose pupils include Jiří Pauer (b. 1919), Viktor Kalabis (b. 1923), and Miloslav Ištvan (b. 1928).

Iša Krejčí (b. 1904) has written three excellent symphonies, orchestral variations on the folksong "Good Night," and a successful comic opera, *The Revolt at Ephesus*. Václav Dobiaš (b. 1909) wrote a cantata, *The Czech Polka*. Miloslav Kabeláč (b. 1908), like many of his contemporaries, wrote polemic music against the Nazis, such as the cantata *Do Not Give Way* (1938), and also a passacaglia for large orchestra, *The Mystery of Time* (1957).

The first important Slovak composer was the neoromantic Ján Levoslav Bella (1843–1936). Influenced by Liszt and Wagner, he composed a four-part chorus, "Our Father," for the 1000th anniversary of the arrival of Saints Cyril and Methodius in Slovakia. Contributors to the development of Slovak national music and the preservation of folksong include Mikuláš Moyzes (1872–1944), Viliam Figuš-Bystrý (1875–1937), and Mikuláš Schneider-Trnavský (1881–1958). Outstanding modern Slovak composers

are Eugen Suchoň (b. 1908) who wrote an unusual dramatic opera, *Krutňava* (The Whirlpool), Ján Cikker (b. 1911; opera *Juro Janošik*), and Alexander Moyzes (b. 1906).

**Czimbalom.** See Cimbalom.

## D

**D.** See Pitch names; Letter notation; Hexachord. In 16th-century \*partbooks D stands for *discantus* (soprano). In harmonic analysis D means dominant.

**Da capo** [It.], abbr. *D.C.* From the beginning. Indication that the piece is to be repeated from the beginning to the end or to a place marked *fine* (*da capo al fine*). It is most frequently found at

the end of the trio to a scherzo (or minuet), indicating that the latter is to be repeated after the trio. *Da capo senza ripetizione* means that the repetitions within the scherzo should be omitted, as is usually done even without this indication. *Da capo e poi la coda*, see Coda; see also *Dal segno*.

**Da capo aria.** See under Aria IV.

**Dactyl, dactylic.** See under Poetic meter I.

**Daily hours.** See under Office.

**Dal segno** [It.], abbr. *D.S.* Indication for repetition, not from the beginning [see *Da capo*] but from another place (frequently near the beginning) marked by the sign §.

**Dame blanche, La** [F., The White Lady]. Opera in three acts by Boieldieu (libretto by A. E. Scribe, based on Sir Walter Scott's *Guy Mannering* and *The Monastery*), produced in Paris, 1825. Setting: Scotland, 17th century.

**Damenization.** See under Solmization III.

**Damnation de Faust, La** [F., The Damnation of Faust]. Dramatic legend in five acts by Berlioz (libretto by the composer and A. Gandonnière, based on G. de Nerval's version of Goethe's *Faust*). Produced (in concert form) in Paris, 1846; stage version (adapted by R. Gunsbourg) in Monte Carlo, 1893. One of the best known numbers is the \*Rákóczi March.

**Damper** [F. *étouffoir*; G. *Dämpfer*; It. *sordino*; Sp. *sordina*]. In pianos and harpsichords, the part of the mechanism that terminates the vibration of the string—hence, the sound—at the moment the key is released. The piano dampers are small pieces of wood, their underside covered with felt, that are placed above the strings. See Piano I; also Mute.

**Damper pedal.** See under Piano I; also Sordino (2).

**Dämpfer** [G.]. (1) The \*dampers of the piano. (2) The \*mutes of the violin. The term *dämpfen* (to damp) is also used for the muting of the horn and other instruments.

**Dance music.** I. In prehistoric times as well as in many primitive cultures (Africa), dance was primarily ritualistic, often containing erotic symbolism and serving to invoke magic, propitiate gods, induce hypnosis and fear, or heal illness. Dances were performed by the medicine man or a select group of warriors. Frequently women were not allowed to dance but only to beat the drums. On the other hand, almost all primitive or truly old cultures (Spain, Frisian and Scandinavian territories, American Indians, etc.) have in their repertory dances for women only. In more refined cultures dance took on a symbolic significance. The ancient Egyptians and Chinese (c. 1000 B.C.) had highly stylized ceremonial dances, with strictly regulated move-

ments. In Greece, dance for the first time developed into an "art," i.e., an expression of beauty for its own sake, although it still retained religious significance. In the last centuries of the pre-Christian era, there appeared in Greece as well as in Rome a large influx of Oriental dances that were strongly erotic and frequently obscene. Dance became the occupation not of priests but of prostitutes. Little is known about dancing in the early Middle Ages. The Church strongly opposed dancing, which it considered heathenish and lascivious. Nevertheless, the very number of edicts against dancing issued by clerical authorities [see, e.g., L. Gougard, "La Danse dans les églises," in *Revue d'histoire ecclésiastique* xv (1914)] is in itself evidence that the continuity of dance among the people as well as the aristocracy was never really disrupted. In the later Middle Ages there is considerable evidence of ritual dancing [see Religious dances], which survives to the present day in Spain [see *Seises*]. In the 14th century, the convulsive dances of the flagellants expressed the fright and despair of a population tortured by plague, fire, wars, and religious scruples.

II. Beginning c. 1300, we find a repertory—at first sporadic, later more and more continuous—of dance music. Among the earliest examples are a number of instrumental pieces—some monophonic, some in two parts—of French or English derivation, all of which have the structure of the \**estampie* or \**ductia* [see *HAM*, nos. 40, 41]. To the same type belong some 14th-century Italian dances (all monophonic) called *istampita* or \**saltarello* [see *HAM*, no. 59]. Dance melodies also occur in tenors, called "Chose Tassin" or "Chose Loyset," of late 13th-century motets [Codex Montpelier, nos. 270, 292, 294, 297].

In the 15th century dance as courtly entertainment and also as an art form reached its first great peak. All over Europe the stately \**basse danse* (bassadanza) and the more intricate \**balli* were taught by choreographers of renown, and the dancing master was as esteemed a member of any princely household as the court musician or chapel singer. More than 200 court dances from the 15th and early 16th centuries with all their choreographic details are preserved in contemporary dance instruction books (Domenico da Piacenza, "Arte del ballo"; Guglielmo Ebreo, "De pratica seu arte tripudii vulgare opusculum"; Antonio Cornazano, "Libro del art del danzare"; the magnificent Burgundian *basse danse* MS; Michel Toulouze's printed dance

book of c. 1486; etc.), whereas the music for these dances is much less precisely documented. The dance treatises themselves contain approximately 100 melodies without accompaniment. In actual performance these skeleton melodies served as a *cantus firmus* of improvised additional voices and percussion (known from iconography of the time as well as literary references to dance bands, courtly and municipal accounts, etc.). Some four-part instrumental pieces, such as "Der Ratten Schwantz" (The Rat's Tail), "Der Pawir Schwantz" (pawir = peasant), "Der Phoben Swanz" (The Peacock's Tail, possibly an early reference to the pavane) and "Der schwartze Knab Dantz" (Dance of the Black Fellow = moresca!) from the Glogauer Liederbuch of c. 1480 [see Liederbuch], the Lochamer Liederbuch, the Buxheim Organ Book, and others give some idea of the structure of dance compositions in the 15th and early 16th centuries but were not necessarily used for actual dance accompaniment.

The increasingly diverse repertory of dances in the 16th century is reflected in the large variety of dance compositions in the collections of lute, keyboard, and ensemble music of the time. As in the 15th century, the starting point was usually a twin arrangement of a slow-moving main dance followed by a lively jumping dance (Nachtanz, tripla, Proportz, Hupfauf, saltarello). Among such pairs are the Italian bassadanza-saltarello and the Franco-Burgundian basse-danse-pas de breban (c. 1400-1550), and the later Italian passamezzo-saltarello (c. 1550-1600), as well as suitelike combinations such as basse danse-recoupe-tourdion (Attaingnant), pavana-saltarello-piva (Petrucci), etc. An important source of information about 16th-century dances in France is the *Orchésographie* of Thoinot Arbeau, an anagram of his real name, Jehan Tabourot (1589; new Eng. ed. by C. W. Beaumont, 1925; M. S. Evans, 1948), a church dignitary from Langres, France, who gave detailed and lively descriptions of the dances above as well as many others, particularly the various *\*branles*. A good cross-section of the Italian repertory of the 16th century is given in the dance treatises by Fabritio Caroso (*Il Ballarino*, 1581; *Nobiltà di dame*, 1600) and Cesare Negri (*Nuove Inventioni di Balli*, 1604); the musical accompaniment for each dance or suite of dances is given in lute tablature, with or without the addition of a *superius* in mensural notation.

III. In the last decades of the 16th century the English virginalists (Byrd, Bull, Gibbons)

brought the pavane and galliard to a high point of artistic perfection, comparable to that reached in the allemandes and sarabandes in Bach's suites. At the same time appeared new dances that were to play a prominent part in the art music of the 17th century, the (German) *\*allemande*, the (French) *\*courante*, the (Spanish) *\*saraband*, and the (English) *\*jig* or *\*gigue*. About 1650 these dances became the standard movements of the *\*suite*, which until then had employed earlier types, such as the *\*padovana*, *\*gagliarda*, *\*intrada*, etc. At the same time a host of new dances, considerably more refined, grew up under the favorable auspices of the French court at Versailles, where Louis XIV patronized dance and ballet to an extent unparalleled in history. Most of them were originally peasant dances of the French provinces, e.g., the *\*bourrée* (from Auvergne), the *\*gavotte* (from Dauphiné), the *\*passepied* (from Brittany), the *\*rigaudon* (from Provence), the *\*loure* (from Normandy), and, most important of all, the *\*minuet* (from Poitou). Together with certain dances of foreign origin, such as the *\*anglaise*, *\*hornpipe*, and *\*polonaise*, and the *\*canarie* (from the Canary Islands), they played a prominent part in the ballets and operas of Lully, Purcell, and Rameau, and became, about 1700, the constituents of the optional group of the suite. An important national type of the 17th century is the English *\*country dance*.

IV. The 18th century cultivated particularly the minuet and did not add much to the repertory of dance music until the end of the century. Then Vienna became a new center of dance music, and the first modern types of dance appeared, the vigorous *\*écossaise* (Beethoven) and the soft swaying *\*Ländler* (Schubert), which soon changed into one of the most famous dances of all time, the *\*waltz*. Between 1830 and 1850 a number of dances quickly superseded one another in popularity, e.g., the Polish *\*mazurka* (Chopin), the *\*quadrille*, the Bohemian *\*polka*, and the *\*galop* (Offenbach). All of them were launched in Paris, confirming the fame of this city as a center of entertainment. The rise of nationalism led to the discovery by composers of a wealth of national dances, among which the Spanish dances figure prominently in variety and individuality of character [see Spain III]. In the early part of the 20th century, the Americas made their contribution to dance music with *\*ragtime*, *\*jazz*, and the *\*conga*, *\*rumba*, *\*tango*, *\*samba*, etc. See also Ballet; Suite. Also under Africa, Bali, China, etc.

See also under Religious dances; Suite; Ballet; individual dance types. rev. I.B.

**Dance of death.** Death as a dancer or as a gruesome fiddler of dance tunes was a favorite sub-

ject of 15th- and 16th-century artists (Holbein, Dürer), who took their inspiration from medieval or contemporary dances incorporating dancers disguised as skeletons. Augustus Nörmiger's tablature of 1598 contains a piece entitled "Matasin oder Toden Tantz," whose peculiar syncopated rhythm was meant to express fear and trembling. In the 19th century two composers used the "Dies irae" as the basis of compositions portraying the idea of the dance of death (Liszt: *Totentanz* for piano and orchestra, 1849, rev. 1853–59; Saint-Saëns: \**Danse macabre*). For a 14th-century Spanish example, see O. Ursprung, in *ZMW* iv, 141ff.

**Danse macabre** [F.]. (1) \*Dance of death. (2) Symphonic poem by Saint-Saëns, op. 40 (1874), that depicts Death playing the violin and dancing in a graveyard at midnight. The music includes the "Dies irae" from the Requiem Mass.

**Dante Symphony.** \*Program symphony with choral ending by Liszt (1856; full title: *Eine Symphonie zu Dantes Divina commedia*), based on Dante's *Divina commedia*. It is in two movements, entitled "Inferno" (see also under "Dies irae") and "Purgatorio."

**Danza tedesca** [It.]. The \**Ländler* or the early \*waltz (c. 1800).

**Danzón** [Sp.]. A Cuban dance of urban origin that belongs to the "danza" group, which probably developed from the *contradanza*. It is in 2/4 meter, with frequent use of the rhythmic pattern . Its classic form is that of a rondo: A B A C A D A, with an 8-measure refrain (A) and three episodes of 16, 32, and 32 measures respectively. The first episode (B) is called "clarinet trio"; the second (C), originally a "trio de metales" (brass trio), but now played by a violin, is in slower tempo; the third (D) employs brief rhythmic patterns similar to those of the \*rumba. Today the *danzón* is performed by an ensemble consisting of a flute, one or two clarinets, piano, violin, double bass, small kettle-drums, and güiro [see *Reco-reco*]. The earliest known examples were written in 1789 by a Cuban composer, Miguel Failde. J.O.S.

**Daphnis et Chloé** [F.]. Ballet by Ravel (choreography by M. Fokine), produced in Paris, 1912. It is based on the Greek legend. Two suites from the ballet music, arranged by the composer, are frequently played in orchestral concerts.

**Daseian notation** [G. *Daseia-Notation*]. A notational system of the 9th and 10th centuries in which the tones of the scale are represented by signs derived from the *prosodia daseia*, i.e., the aspirate sign in ancient Greek [Ex. a]. The signs

in Ex. b indicate the tetrachord d-e-f-g, while others (derived largely from these by turning them upside down or reversing from right to left) indicate one lower and two-and-one-half higher tetrachords that repeat the basic tetrachord in exact transpositions of the fifth. There results a curious scale that avoids diminished fifths but, as a consequence, includes augmented octaves: G A B<sup>b</sup> C | d e f g | a b c' d' | e' f' # g' a' | b' c'' #. This notation is used in 9th-century treatises ("Musica enchiriadis," "Scholia enchiriadis," "Commemoratio brevis"; see GS i, 152ff, 173ff, 213ff; also CS ii, 81) for writing down monophonic melodies (psalm tones, etc.) as well as examples of \*organum [see *ApNPM*, pp. 204ff].

Lit.: E. J. Grutchfield, "Hucbald: A Millenary Commemoration" (*The Musical Times* lxxi, 507ff, 704ff); P. Spitta, "Die Musica enchiriadis und ihr Zeitalter" (*VWM* v); *WoHN* i, 31ff.

**Dastgah.** See under Persia II.

**Daughter of the Regiment, The.** See *Fille du Régiment*.

**Davidsbündler Tänze** [G., Dances of the David-leaguers]. Robert Schumann's cycle of eighteen \*character pieces for piano, op. 6, composed in 1837. The title refers to an imaginary "League of David" frequently mentioned in Schumann's writings on music, to which he entrusted the task of fighting the musical "Philistines" of his day, that is, the mediocre drawing-room music then in vogue. Each piece is signed E. or F., for Eusebius and Florestan, imaginary characters representing respectively the pensive introverted and the impulsive extroverted sides of Schumann's own personality. They also appear in his *Carnaval*, together with a "March of the David-leaguers against the Philistines."

**D. C.** Abbr. for \**da capo*.

**Deaconing.** See Lining.

**Dead interval.** An interval between the last note of a melodic phrase and the first note of the next,

often involving separation by a rest. The term was introduced in teaching counterpoint in order to justify such intervals as the chromatic semitone or the augmented fifth, which in strict theory are not permitted within the course of a phrase but may well occur between phrases.

**Deagan marimbaphone, madimba,** etc. Xylophone-like instruments invented by J. C. Deagan (d. 1936); they are used in P. Grainger's suite *In a Nutshell* [see *MaMI*].

**Death and the Maiden.** See *Tod und das Mädchen*.

**Death and Transfiguration.** See *Tod und Verklärung*.

**Decalogue.** The Ten Commandments, particularly when substituted for the Kyrie in the Anglican service. Each commandment is followed by a people's response, which is a troped form of the Kyrie.

**Decani and cantoris** [L.]. In Anglican church music, two groups of the choir, one by the dean's stall (right side facing the altar), the other close to the cantor (left side). Late 16th-century composers (Tallis, Farrant, Byrd) often employed the groups antiphonally, separately, or jointly to obtain special effects of tone color and sonority, usually without increasing the actual number of parts. See Polychoral style.

**Deceptive cadence.** See under Cadence I.

**Déchant** [F.]. \*Discant. *Déchant sur le livre*, see *Discantus supra librum*. *Déchant de viole*, descant viol.

**Decibel.** See Bel.

**Decrescendo,** abbr. *decr.*, *decresc.* See *Crescendo*.

**Degree.** Term used in harmonic analysis; see Scale degrees.

**Degrees and diplomas.** The degrees most commonly awarded to music students are:

1. *B.A.* (with major in music). The Bachelor of Arts degree is given for completion of a liberal arts course (normally four years) in which music is stressed but in which nonmusical studies predominate. Graduation with honors means that the student has done some special work during his senior year, generally a paper or original composition of some magnitude, and has maintained a high scholastic average.

2. *B.Mus.* The Bachelor of Music degree is given for completion of a course of study (normally four years) in which musical studies

(piano, voice, violin, etc., or composition, theory, opera, music history and literature) predominate and a minimum of nonmusical studies is required.

3. *M.A.* (in music). The Master of Arts degree represents the logical continuation of the B.A. course of study. In some institutions it is limited to such areas as musicology, theory, or composition. Residence requirements vary from one to two years. Most schools require a thesis that calls for some research. In most instances the student must demonstrate reasonable ability in piano playing, sight reading, and similar musical skills.

4. *M.Mus.* In the Master of Music degree as in the B.Mus., the emphasis is less on nonmusical subjects and more on musical ones. This degree is given chiefly by conservatories and schools of music. M.Mus. degrees are given in various fields of concentration—performance, theory, composition, history and literature, aesthetics, conducting, etc. The special requirements vary greatly among the various schools. Most schools require a thesis or its equivalent, such as a long composition, or public concerts in the case of a performing major.

5. *Ph.D.* (in music). In the United States, the Doctor of Philosophy degree is an "academic" degree in the sense that the major field is usually within the areas of theory, musicology, or music education. One to three years of residence are required or customary. The candidate must submit an acceptable dissertation showing distinctly original work. In addition, he normally must pass an oral examination covering all branches and fields of music. Some institutions grant Ph.D. degrees in musical composition, in which case a composition of some scope is substituted for the dissertation.

6. *Mus.D.* The Doctor of Music, originally a purely honorary degree in the United States, is now an earned degree in a small number of institutions. It may be earned in the applied areas, for example, in voice, piano, strings, composition, conducting, and the like. The requirements are generally similar to those for the Ph.D., except that performances may replace the dissertation, or at least a portion of it. The examination procedures are similar to those for the Ph.D.

7. *D.M.A.* The Doctor of Musical Arts degree is similar in requirements and purpose to the earned Mus.D. degree. Although the examination procedures are similar to those for the Ph.D., performances usually satisfy a considerable portion of the dissertation requirement.

8. *Education degrees:* B.Mus.Ed.; B.Pub. School Mus.; M.M.Ed. These degrees are generally given by state universities and schools of music to students preparing to teach in the public schools. The Mus.Ed.D. degree has in many respects become similar to the Ph.D. in music. In some institutions it is identical to the Ph.D. in music education, except that no foreign languages are required; in others it is designed as a preparation for teaching at the college level; in still others, for teaching or supervising music in the public schools.

9. *Diplomas, certificates, etc.:* It is impossible to describe all the various awards of this kind that are made throughout the United States. State teaching certificates are required of public-school music teachers, and requirements vary somewhat from state to state. Music schools in particular give out a variety of diplomas, certificates, and the like. Since each individual school sets the standard, the value of such awards depends directly upon the excellence of the school granting them. In some schools the term "artist's diploma" is used to indicate that it is given for excellence in performance.

10. *Foreign degrees:* (a) *Great Britain.* The British system of degrees is most similar to the American. Mus.B., Mus.M., and Mus.D. degrees are given, the requirements varying somewhat among the various universities. The Mus.B. candidate is expected to have already received the B.A. degree, or to pass preliminary examinations of equivalent difficulty. In this respect the British degrees are different from the American. The Mus.M. is seldom given. All the British degrees in music are concerned primarily with the candidate's possession of a technique of composition, although in a few universities performance or musicological research may be substituted. Several universities give Litt.B., Litt.D., or Ph.D. degrees for work in musical research. A great number and variety of diplomas are granted by various music schools in Great Britain (see P. Scholes, *Oxford Companion* [1955], p. 283f). In general three grades are observed—Associateship, Licentiate, and Fellowship. The latter, being the highest, is sometimes purely honorary.

(b) *Germany and Austria.* The only degree given is the Dr. Phil. (Ph.D.). Since this is so, the German Ph.D. in many instances represents a lesser achievement than the American Ph.D. Indeed, some of the German dissertations are no longer and contain little more information than an American master's thesis, although others are splendid contributions to musical research.

and often are full-size books. In addition to writing a dissertation, the candidate must pass various examinations, in music as well as in one or two secondary fields (e.g., philosophy, mathematics, acoustics).

(c) *Other European countries.* The remaining countries of Europe do not lay so much stress on academic degrees. In France the Doctor of Letters (D. ès Lettres) may be awarded for musicological research. Degrees in musicology are given by the universities of Paris and Strasbourg. The Paris Conservatory, however, and similar schools (Brussels, for example) have systems of recognizing achievement by means of first and second prizes, certificates, and diplomas of various sorts. E.B.H.; add. by W.C.

**Dehors, en** [F.]. Emphasized.

**Delasol(re), de la sol (re).** See under Hexachord III.

**Démancher** [F.]. In string playing, the shifting of the left hand from one position to another.

**Demi-** [F.]. Half. *Demi-jeu*, see *Pleinjeu*; *demi-pause*, *demi-soupir*, see Notes; *demi-ton*, semitone; *demi-voix* or *mezza voce*, see *Mezzo*.

**Demisemiquaver.** See under Notes.

**Denkmäler der Tonkunst.** See Editions XIII, XIV, XV.

**Denmark.** Very little is known about early Danish music, although the \*lur, a beautiful long S-shaped trumpet [see ill. under Brass instruments] of the latter part of the Nordic Bronze Age (c. 1100–600 B.C.), has been discovered more often in Denmark than anywhere else. The Norse sagas mention the harp, and this instrument is depicted in both its triangular and rounded forms—the latter probably an ancestor of the \*crwth—on monuments in the Scandinavian lands. A 10th-century Arab traveler described the ritual singing of the heathen inhabitants of Schleswig as “bestial.” Toward the end of this century Christianity was established in Denmark and plainsong hymns and sequences were imported or composed, including the Office of St. Canute found in a 13th-century MS, Codex Kiloniensis (S.H./84/8vo, Univ. Lib., Kiel). During the 12th and 13th centuries Danish clerics regularly studied in Paris, where they came in contact with the polyphonic music of Notre Dame. At the Danish court during the later Middle Ages (c. 1250–1350) the folksong ballad (*folkevisen*) was extensively cultivated and many MS collections of the verses are extant.

The earliest printed ballad-verse was Anders Sørensen Vedel's *It hundrede udvalde danske viser* (1590), but few folk melodies are recorded before 1800, one exception being a fragment of tune and words at the end of a late 13th-century MS, Codex Runicus (AM./8vo/28, in the Arnamagnæan Collection, Univ. Lib., Copenhagen). After the Reformation (completed in Denmark by the mid-16th century) a series of printed service books appeared, the tunes being mostly of German Lutheran origin. During the 16th century a number of English and Flemish or Netherlands composers came to Denmark, among them Adrianus Petit Coclico, who served the court from 1556 to 1562, and John Dowland, court lutenist to Christian IV from 1598 to 1606. Among the earliest Danish composers known to us by name are Mogens Pedersøn (*Pratum spirituale*, 1620) and Hans Nielsen (c. 1580–after 1626), who both studied with G. Gabrieli in Venice [see Editions VIII, 35]. During the 17th and 18th centuries music in Denmark seems to have been almost completely dominated by Italian, French, and German musicians; however, one of the greatest of North European musicians, Dietrich Buxtehude (c. 1637–1707), was almost certainly of Danish parentage and spent the first 30 years of his life in Danish territory [also see under Germany].

A new Danish development began when a German composer, J. A. P. Schulz (1747–1800), court musical director at Copenhagen from 1787 to 1795, established opera by writing \*Singspiele in Danish (*Høstgildet*, *Peters Bryllup*, *Indtoget*). He was followed by three other German-born composers: F. L. A. Kunzen (1761–1817), grand operas *Holger Danske* (1789), *Erik Ejegod* (1798), and several *Singspiele*; C. E. F. Weyse (1774–1842), the great master of Danish romantic song, whose work in this field was continued by Peter A. Heise (1830–79); and Friedrich Kuhlau (1786–1832), the well-known composer of piano sonatas and flute music, who wrote the Singspiel *Elverhøj* (1828), still popular in Denmark.

Niels W. Gade (1817–90), the first important Danish-born composer of the 19th century (symphonies, overtures, chamber and choral works), is the Danish counterpart of Schumann and perhaps even more of Mendelssohn, whose romantic lyricism he tinged with a distinctive touch of Nordic color. He is as characteristic of Danish refinement and sensitivity as Grieg is of Norwegian vigor and ruggedness. A contemporary of Gade's, less known outside Denmark, was J. P. E. Hartmann (1805–1900), who wrote

sonatas, symphonies, and music for several ballets devised by August Bournonville on national romantic subjects; he is not to be confused with his grandfather, J. E. Hartmann, to whom is attributed the Danish national song, "Kong Christian stod ved højen Mast."

The most important among more recent Danish composers is Carl Nielsen (1865–1931), who, mainly through his six symphonies, has attained an international reputation almost comparable to that of his contemporary, Finland's Jean Sibelius. Practically all 20th-century Danish composers show the influence of Nielsen's original treatment of symphonic form, combining it with impressionist or neoclassical tendencies, e.g., Jørgen Bentzon (1897–1951), Knudåge Rørsager (b. 1897), and Finn Høffding (b. 1899). Of the next generation, Vagn Holmboe (b. 1909), an outstanding composer of symphonies and chamber music, Jørgen Jersild (b. 1913), a distinguished teacher as well as a composer of fine craftsmanship, and Niels Viggo Bentzon (b. 1919), a prolific writer of works for piano, orchestra, and chamber ensembles, all deserve mention. Still younger composers of importance are Bernhard Lewkowitch (b. 1927), best known for his Masses and other choral works, and Per Nørgård (b. 1932), a pupil of Holmboe and Høffding, who has developed an individual style based on free serial and improvisatory procedures.

Hammerich, "Musical Relations between England and Denmark in the XVII. Century" (CP 1911); B. Wallner, "Scandinavian Music after the Second World War," in *LBCM; AdHM* ii, 1106 (bibl., p. 1112); *LavE* i.5, 2594; *MGG*, "Dänemark," bibl. rev. J.H.

**Déploration** [F.]. A 15th- and 16th-century name for a composition written on the death of a musician, usually by one of his pupils. See Lament (2).

**De profundis** [L.]. Psalm 129 (130). See Penitential psalms.

**Derb** [G.]. Robust, rough.

**Des, deses** [G.]. D-flat, d-double-flat. See Pitch names.

**Descant**. Anglicized form of L. *discantus* and a variant of \*discant. Throughout the Middle Ages the term was used indiscriminately with other terms, such as *descaunt*. In the 17th century it took on special connotations in instrumental practice. *Descant viol* and *descant recorder* are names for the highest-pitched instruments, a fourth or a fifth above the treble size [see Viol II; Recorder]. *Descant clef* is an older name for the soprano clef [see Clef, history]. In certain 17th-century writings descant takes on the special connotation of ornamentation or variation, whenever such devices are employed in the melody. Finally, in modern hymn-singing, an obbligato part that soars above the tune is known as a descant. While formerly such descants were improvised, the modern practice is to supply them in the printed hymnals. The same method is also known by the wholly inappropriate name "fauxbourdon" or "faburden" [see Fauxbourdon (3)]. rev. S.K.

**Descort** [F.]. See under Lai.

**Descriptive music**. See Program music; Word painting.

**Desolre(ut), de sol re (ut)**. See under Hexachord III.

**Dessus** [F.]. Old term corresponding to \*treble, while *par-dessus* corresponds to \*descant. Thus, *dessus de viole*, treble viol; *par-dessus de viole*, descant viol.

**Détaché** [F.]. See under Bowing (b).

**Detonieren** [G.]. To sing off pitch; to waver in pitch.

**Deuterus** [Gr.]. See under Church modes II.

**Deutlich** [G.]. Clear, distinct.

**Deutsches Requiem, Ein**. A work for solo voices, chorus, and orchestra by Johannes Brahms, op. 45, composed 1857–68, after the death of his mother. It consists of seven movements based on German texts freely selected from the Scriptures, instead of the authoritative Latin text of the liturgical Requiem Mass [see Requiem Mass]. Its first complete performance was in 1869 in Leipzig.

**Deux Journées, Les** [F., The Two Days]. Opera in three acts by Cherubini (libretto by J.-N. Bouilly, produced in Paris, 1800. Setting: Paris and environs, 1617.

**Development.** A term carrying two meanings in musical structure: (1) The treatment of musical materials to convey a sense of expansion (increased scope of structure) or exploration (significant shifts in harmonic direction); (2) the section in sonata form that is devoted to such treatment, i.e., the development section.

(1) Development procedures are generally distinguished from the exposition or statement of musical materials. The exposition presents musical ideas; development involves working over these ideas in a variety of ways. The material may: (a) be divided into smaller figures (this creates an effect of stretto, or compressed action, often leading to considerable extensions in structure, as in the beginning of the development section of the first movement of Mozart's Symphony no. 41); (b) have its motifs or figures regrouped into new phrases (this presents the original material in a new light, with a different rhetorical effect, as in the first movement of Beethoven's Symphony no. 8); (c) have the contour or character of its motifs altered (this often imparts a different expressive value to the original material, as in the fugato of the development of the first movement of Beethoven's Quartet in F major op. 18, no. 1); (d) be associated with harmonic explorations and digressions (this creates a sense of continuous and even unpredictable movement, and provides a basis for the use of a, b, and c. Such harmonic activity can be found in virtually any development section of a classical or romantic sonata form). These are only a few of the ways development may take place; there are many more.

The function of development in musical structure has changed from period to period. The sharpest distinction between exposition and development of musical material is found in music of the 18th and early 19th centuries. In this period the exposition tends to consist of well-defined and relatively complete statements, in which the component figures and phrases complement each other on various levels, conveying an impression of over-all symmetry. To support this symmetry there is a strong and stable sense of key, secured by a series of cadences, the last of which is often an authentic cadence. Whenever this symmetry is seriously disrupted, particularly on higher levels of structure (phrase and period), development may be said to take place. Development can be used in moving from one important structural area to another, e.g., in the development section proper of sonata form (see below), in the transition from

the first key to the second in sonata form; also, it may be used to expand an area of the structure through harmonic digressions (first or second key areas in sonata form, the coda of any extended movement). In the classical treatment of development, the centrifugal motion with which the process begins is balanced later by an emphatic arrival at a harmonic objective, an opposing centripetal action. This gives rise to periods of considerable length, carrying great musical intensity. Development can be incorporated into any form, such as *introduction* (Mozart, Prague Symphony); *minuet* (Haydn, Symphony no. 102, second reprise); *rondo* (Beethoven, Quartet op. 18, no. 1, finale, second large episode); *variation* (Beethoven, Quartet op. 18, no. 5, third movement, coda); *fantasia* (Mozart, Fantasia in C minor, K. 475, opening section).

In the baroque period melodic material characteristically undergoes intensive manipulation throughout a movement; there is constant play of a small number of motifs, within rather narrow harmonic limits. In the first movement of his Brandenburg Concerto no. 3, Bach carries out a relentless development of the figures presented in the opening tutti.

Development in romantic music is epitomized in the Prelude to Wagner's opera *Tristan und Isolde*. Here, development employs freely constructed sequences on rising dynamic curves, building to peaks of great expressive intensity. In contrast to classical techniques, the counterbalance of a strong drive to a cadence is lacking; instead, there generally is a sudden drop in tension so that a new line of developmental action may begin. Still another treatment of development is found in the variations and transformation of themes, used by Liszt (Sonata in B minor) and Richard Strauss (*Till Eulenspiegel*) in the 19th century and by the tone-row school in the 20th century (Schoenberg, Quartet no. 4 op. 37). Here the theme undergoes drastic transformations of style and function. It may be used as a main theme, auxiliary figure, or chord while retaining something of its original contour or intervallic relationships.

(2) The development section in \*sonata form generally consists of a more intensive working over of material than any other part of the form. Within the sonata form as a whole, it serves to carry the action, through expansions and digressions, from one important structural point to another. Basically, the development stands as a link between the confirmation of the second key at the end of the exposition and the return to

the tonic at the recapitulation. The object of the development section, common to all sonata-form movements of the classical era, is to lead back to the home key. The obligation to arrive at the tonic and create a strong sense of expectation for that arrival imposes restraints on harmonic exploration. Following the cadence that ends the exposition, we hear an increased rate of key change; sooner or later the harmony reaches a point of furthest remove from the home key, the apex of the centrifugal motion. It may be a strong cadence upon a distant degree of the scale or it may comprise a phrase or period in a fairly remote key that stabilizes the harmony momentarily. (Often, the point of furthest remove will be a cadence or a section in the mediant or submediant areas if the home key is major, e.g., Mozart, Sonata in D major, K. 576, first movement.) Then the harmonies will shift direction toward the tonic. Two examples are given below. (The point of furthest remove is underlined twice):

Mozart, Sonata in D major, K. 576, first movement:

a V of B<sup>b</sup> B<sup>b</sup> g a V of B e A (as V of D)  
(rising action) (falling circle of fifths)

Beethoven, Quartet in C minor op. 18, no. 4, first movement:

g c F f G (as V of C)

(f–G–c represents a broad authentic cadence to the home key)

The development section generally makes some reference to melodic material from the exposition. The Beethoven movement cited above paraphrases the exposition, working over the principal theme from each key area of the exposition. The Mozart movement is concerned with the motifs from the first and last phrases of the exposition. At times Mozart introduces new material in the development section (Quartet in B<sup>b</sup> major, K. 458, first movement) as does Beethoven (first movements of Symphonies no. 3 and 4). In some development sections there is little or no reference to previously heard material (e.g., Mozart, Quartet in E<sup>b</sup>, K. 428, first movement).

In the 18th century, development processes were used throughout the various sections of sonata form; the development section itself was not necessarily the most critical part of the form. However, in the later works of Haydn and Mozart and especially in the works of Bee-

thoven, the development section gradually took on greater scope, becoming the crucial area of the structure, where the flight away from the tonic and dominant keys went far afield and assumed a dramatic power that eventually, in the 19th century, colored every aspect of sonata form. Also see Sonata form. L.G.R.

**Devil and Daniel Webster, The.** Opera in one act by D. Moore (libretto by S. V. Benét, based on his story), produced in New York, 1939. Setting: New Hampshire, the 1840's.

**Devil's Trill Sonata.** A violin sonata by Tartini (MS now lost), said to have been inspired by a dream in which the devil appeared to him. The long trill for which it is named occurs in the last movement.

**Devisenarie** [G.]. See under Motto.

**Dezime** [G.]. The interval of the tenth.

**Diabelli Variations.** Beethoven's op. 120 (1823), consisting of a series of 33 variations on a waltz by Diabelli (full title: *33 Veränderungen über einen Walzer von A. Diabelli*). They were written in response to a request, sent by Diabelli (Viennese publisher) to 51 composers, to contribute one variation each to a collective set that was meant to represent a cross-section of the composition in Austria of his day. The entire collection was published under the title *Vaterländischer Künstlerverein* (Society of Artists of the Fatherland) in two volumes, the first of which contained the variations of Beethoven, the second those of the 50 other composers (Schubert, Moscheles, Kalkbrenner, Liszt—who was then eleven years old—and others). For the complete list, see *GD* v, 457; *GDB* viii, 690–91.

**Diabolus in musica** [L.]. Late medieval nickname for the \*tritone, which in musical theory was regarded as the "most dangerous" interval. See Mi-fa.

**Diacisma, diaschisma.** A microtonic interval in medieval theory, defined as one-half of the *semitonium minus* (*diesis*). See *GS* ii, 313n (Boethius); *CS* iv, 181 (Tinctoris). See Comma, schisma.

**Dialogue** [F.; G. *Dialog*; It. *dialogo*; Sp. *diálogo*]. A 17th-century vocal composition whose text is in the form of question and answer, or contains such portions. Dialogues are usually written for two singers whose parts alternate. In a way, they represent the vocal counterpart of the *stile concertante* of 17th-century instrumental music. In addition to their frequent use in operas, there are

various collections of cantatas written in the style of dialogues, so-called *dialoghi fuor di scena* (dialogues without stage performance), e.g.: O. Vecchi, *Dialoghi* (1608); M. da Gagliano, *Dialogo di ninfa e pastore* (1611; *RiHM* ii.2, 33); G. F. Capello, *Motetti e dialoghi* (1615; *SchGMB*, no. 180); A. Hammerschmidt, *Dialogi oder Gespräche zwischen Gott und einer gläubigen Seelen* (1645; new ed. *DTO* 16; *HAM*, no. 213); J. R. Ahle, *Erster Teil geistlicher Dialogen* (1648; selections in *DdT* 5); Henry Lawes, *Ayres and Dialogues* (1653, '55, '58). The dialogue technique was frequently used in choruses and arias of oratorios, Passions, etc.; see M.-A. Charpentier's short "sacred history," *Dialogue entre Madeleine et Jésus* (*HAM*, no. 226, where it is mistakenly said to be from another work, *Le Reniement de St.-Pierre*). Famous examples are the initial chorus, "Kommt, ihr Töchter," and the alto aria, "Sehet, Jesus hat die Hand" from Bach's St. Matthew Passion, in which the chorus comes in with such questions as "Wen?" "Wie?" "Wohin?" "Wo?"

In French 17th-century organ music the title "Dialogue" is commonly given to pieces employing contrasting registrations in alternation for phrases of eight and four measures (N.-A. Lebègue and others; see, e.g., Editions I, 9, p. 18).

The history of the dialogue in music begins with the so-called dialogue tropes of the 10th and 11th centuries, e.g., the Christmas trope "Hodie cantandus est" and the Easter trope "Quem quaeritis" [see Liturgical drama]. Some of the \*caccie of the 14th century include lively dialogue passages. In the 16th century, dialogue technique was used in the *frottola*, *lauda* (dialogue *lauda*), chanson (Le Jeune), and quite often in the madrigal (Verdelot, Willaert, Lassus, and others).

Lit.: T. Kroyer, "Dialog und Echo in der alten Chormusik" (*JMP* xvi); I. Spink, "English Seventeenth-Century Dialogues" (*ML* xxxviii); A. Dolmetsch, ‡*Select English Songs and Dialogues of the 16th and 17th Centuries*, 2 vols. (1898, 1912).

**Dialogues des Carmélites, Les** [F., The Dialogues of the Carmelites]. Opera in three acts by F. Poulenc (libretto by G. Bernanos), produced in Milan, 1957. Setting: France, 1789.

**Diapason.** (1) In Greek and medieval theory, the interval that includes "all the tones," i.e., the octave [see *Diapente*; *Diatessaron*; Interval]. Derived meanings, chiefly used in French ter-

minology, are: (2) range of voice; (3) concert pitch (usually *diapason normal*; see Pitch 2) or tuning fork (also *diapason à branches*). (4) The main foundation stop of the organ, also called principal. See Organ IX.

**Diapente** [Gr.]. Ancient Greek and medieval name for the fifth *Epidiapente*, fifth above; *subdiapente* or *hypodiapente*, fifth below; *canon in epidiapente*, canon at the fifth above.

**Diaphonia, diaphony.** (1) In Greek theory, dissonance, in contrast to \**symphonia*, consonance. This meaning survives in various medieval writings: Isidore of Seville (d. 636; *GS* i, 21); Marchetto da Padua (c. 1320; *GS* iii, 80); Tinctoris (c. 1480; *CS* iv, 182). (2) More commonly, the term is used by theorists of the 9th to 12th centuries to mean two-part polyphony: "Musica enchiriadis" (c. 900; *GS* i, 165); Guido d'Arezzo, "Micrologus" (c. 1030; ch. xviii: "De diaphonia"). The term *discantus* is probably the Latin translation of *diaphonia*. (3) *Diaphonia basilica* is a term used by Johannes de Muris (c. 1320; *GS* iii, 239) for the *organum duplum* in which the tenor consists of long-held notes. The name is derived not from Gr. *basileus*, king (giving rise to the mistranslation "royal counterpoint") but from Gr. *basis*, base, foundation.

**Diaschisma.** Same as \**diacisma*.

**Diastematic.** See under Neumes II.

**Diatessaron** [Gr.]. Greek and medieval name for the interval of the fourth. *Epidiatessaron*, fourth above; *subdiatessaron*, *hypodiatessaron*, fourth below. See also *Diapente*.

**Diatonic.** The natural scale, consisting of five whole tones and two semitones, as it is produced on the white keys of the keyboard. There is, of course, a corresponding scale in each key. Music is called "diatonic" if it is confined to the notes of this scale, to the exclusion of chromatic tones. For instance, in C major, the melodic progression c-d-e and the chord d a c' are diatonic, while c-d#-e and d a<sup>b</sup> c' are chromatic. "Diatonicism" means music whose tonality is predominantly diatonic, i.e., nonchromatic, such as the works of Haydn and Mozart. For a recent modification of diatonicism, see Pandiatonicism. For the diatonic genus of Greek theory, see Greece II. For diatonic semitone, see Semitone.

**Dice music.** See Aleatory music.

**Dichterliebe** [G., Poet's Love]. See under Song cycle.

**Dictionaries of music.** These are of several types: (1) those that offer merely the pronunciation, translation, and brief definition of foreign musical terms (e.g., T. Baker, *A Dictionary of Musical Terms*); (2) those that cover the entire field of music with emphasis on separate entries and definitions (e.g., H. Riemann, *Musiklexikon*) or on longer articles including all aspects of the topics (e.g., Grove's *Dictionary of Music and Musicians*); (3) those that cover all periods and fields of composition but are restricted to biographies only (e.g., *Baker's Biographical Dictionary of Musicians*), or to topics without biographical entries (e.g., M. Brenet, *Dictionnaire pratique et historique de la musique*); and (4) those that are limited to a particular period (e.g., A. Eaglefield-Hull, *A Dictionary of Modern Music and Musicians*), a particular country (e.g., E. Refardt, *Historisch-biographisches Musikerlexikon der Schweiz*), or a field (e.g., W. W. Cobbett, *Cobbett's Cyclopedic Survey of Chamber Music*).

The following list groups the dictionaries under three headings: I. General dictionaries (including types 1, 2, and 3 above) published after 1870; II. Special dictionaries (including type 4) published after 1870; III. Earlier dictionaries.

**I. General dictionaries after 1870.**

A. United States: J. W. Moore, *A Dictionary of Musical Information* (1876). J. D. Champlin, Jr. and W. F. Apthorp, *Cyclopedia of Music and Musicians*, 3 vols. (1888–90). T. Baker, *A Dictionary of Musical Terms* (1895; 25th ed., 1939). *Id.*, *Baker's Biographical Dictionary of Musicians* (1900; 5th ed., comp. rev. by N. Slonimsky, 1958; suppl. 1965). W. L. Hubbard, *The American History and Encyclopedia of Music*, 12 vols. (1910). W. S. Pratt, *The New Encyclopedia of Music and Musicians* (1924, originally planned as abridgment of Grove; rev. ed., 1929). O. Thompson, *The International Cyclopedia of Music and Musicians* (1939; 7th ed. rev. by N. Slonimsky, 1956). W. Apel, *Harvard Dictionary of Music* (1944; rev. ed. 1969). *Id.* and R. T. Daniel, *The Harvard Brief Dictionary of Music* (1960). M. Cooper, ed., *The Concise Encyclopedia of Music and Musicians* [1958].

B. England: G. Grove, *A Dictionary of Music and Musicians*, 4 vols. (1879–89, Index, 1890; 4th ed., H. C. Colles, 5 vols., 1940; 5th ed., E. Blom, 9 vols., 1954, Suppl. Vol., 1961; American Suppl., ed. W. S. Pratt, published for 2nd and 3rd ed.). P. Scholes, *The Oxford Companion to Music* (1938; 9th rev. ed. 1955). *Id.*, *The Con-*

*cise Oxford Dictionary of Music* (1952). E. Blom, *Everyman's Dictionary of Music* (1946; 2d rev. ed. 1954). J. A. Westrup and F. L. Harrison, *The New College Encyclopedia of Music* (1960). W. J. Smith, *A Dictionary of Musical Terms in 4 Languages* (1961).

C. France: R. Vannes, *Essai de terminologie musicale* (1925). M. Brenet, *Dictionnaire pratique et historique* (1926; new ed., 1930). N. Dufourcq, ed., *Larousse de la musique*, 2 vols. (1957). F. Michel, ed., *Encyclopédie de la musique*, 3 vols. (1958–61).

D. Germany: H. Mendel, *Musikalisches Conversations-Lexikon*, 11 vols. (1870–79; vol. 12, suppl., 1883). H. Riemann, *Musik-Lexikon* (1882; 12th ed., W. Gurlitt, 3 vols., 1959). R. Eitner, *Biographisch-bibliographisches Quellen-Lexikon der Musiker und Musikgelehrten bis zur Mitte des neunzehnten Jahrhunderts*, 10 vols. (1900–04; vol. 11, suppl. *Miscellanea musicae bio-bibliographica*, ed. H. Springer and others, 1912–16; reprint with additions, 11 vols. in 6, 1959). H. Abert et al., *Illustriertes Musik-Lexikon* (1927). H. J. Moser, *Musiklexikon* (1935; rev. ed., 2 vols., 1955). F. Blume, ed., *Die Musik in Geschichte und Gegenwart*, c. 12 vols. (1949–).

E. Italy: C. Schmidl, *Dizionario universale dei musicisti* (1890; 2 vols., 1926; suppl. 1938). A. della Corte and G. M. Gatti, *Dizionario di musica* (1925; 5th ed., 1956). C. Sartori, ed., *Dizionario Ricordi della musica e dei musicisti* (1959).

F. Spain: F. Pedrell, *Diccionario técnico de la música* (1894). A. Albert Torrellas and J. Pahissa, *Diccionario de la música ilustrado*, 2 vols. [1927, '29]. A. Albert Torrellas, *Diccionario enciclopédico de la música*, 4 vols. (1947–52). J. Pena and H. Anglés, *Diccionario de la música Labor*, 2 vols. (1954).

G. Other countries (this list gives at least one recent dictionary for each of the following countries).

Belgium: R. Vannes and A. Souris, *Dictionnaire des musiciens (compositeurs)* (Brussels, 1947).

Canada: Sœurs de Sainte-Anne, *Dictionnaire biographique des musiciens Canadiens* (1935).

Czechoslovakia: G. Černušák, et al., *Československý hudební slovník*, 2 vols. (Prague, 1963–65).

Denmark: H. Panum and W. Behrend, *Illustreret Musiklexikon* (1924–26).

Finland: S. Ranta, *Suomen säveltäjiä puolentoista vuosisadan ajalta* (1945).

Latvia: W. Neumann, *Lexikon baltischer Tonkünstler* (Riga, 1909).

Netherlands: L. M. G. Arntzenius, *et al.*, *Encyclopedie van de Muziek*, 2 vols. (1956).

Norway: O. Gurvin and Ø. Anker, *Musikkleksikon* [1948–49].

Poland: J. W. Reiss, *Podręczna encyklopedia Muzyki* (1949–50).

Portugal: E. Vieira, *Dicionario biografico de musicos portugueses*, 2 vols. (Lisbon, 1900).

Sweden: N. Broman, J. Norrby, *et al.*, ed., *Tonkonsten*, 2 vols. (1955, '57).

Switzerland: E. Refardt, *Historisch-biographisches Musikerlexikon der Schweiz* (Leipzig-Zurich, 1928). W. Schuh, *et al.*, *Schweizer Musiker-Lexikon; Dictionnaire des musiciens suisses* (1964).

U.S.S.R.: S. A. Pavliuchenko, *Kratkii Muzykal'nyi Slovar'* (1950). A. Vodarsky-Shiraeff, *Russian Composers and Musicians, A Biographical Dictionary* (New York, 1940). G. B. Bernandt and A. Dolzhanskii, *Sovietskie kompository; kratkii biograficheskii spravochnik* (Moscow, 1957).

## II. Special dictionaries after 1870.

A. United States and Great Britain: J. Julian, *A Dictionary of Hymnology* (1892; 2nd rev. ed. with suppl. 1907; reprinted, 2 vols., 1957). J. Towers, *Dictionary-Catalogue of Operas and Operettas* (1910). J. Pulver, *A Dictionary of Old English Music & Musical Instruments* (1923). *Id.*, *A Biographical Dictionary of Old English Music* (1927). W. W. Cobbett, *Cobbett's Cyclopedic Survey of Chamber Music*, 2 vols. (1929–30; 2nd ed., 3 vols., 1963, last vol. ed. by Colin Wilson). N. Slonimsky, "Concise Biographical Dictionary of Twentieth-Century Musicians," in *Music Since 1900* (1937; 3rd ed. 1949). *Who's Who in Music* (annual, 1937–41). C. Reis, *Composers in America* (1938; rev. and enlarged 1947). *Bio-bibliographical Index of Musicians in the United States Since Colonial Times* (District of Columbia Historical Records Survey 1941; 2nd. ed. 1956). D. Ewen, *Living Musicians* (i.e., performers; 1940). *Id.*, *The Book of Modern Composers* (1942; 2nd ed., 1950). *Id.*, *European Composers Today* (1954). G. Saleski, *Famous Musicians of Jewish Origin* (1949). C. Hopkinson, *A Dictionary of Parisian Music Publishers 1700–1950* (1954). D. H. Boalch, *Makers of the Harpsichord and Clavichord 1440–1840* (1956). K. Jalovec, *Italian Violin Makers* (1957). S. Marcuse, *Musical Instruments, A Comprehensive Dictionary* (1964).

B. France: F. Clément and P. A. Larousse, *Dictionnaire lyrique ou histoire des opéras* (1869?;

rev. ed. *Dictionnaire des opéras* [*Dictionnaire lyrique*], A. Pougin, 1905). R. Vannes, *Dictionnaire universel des luthiers* (1932; 2nd rev. ed., 2 vols., 1951, '59). R. Wright, *Dictionnaire des instruments de musique* (1941).

C. Germany: U. Kornmüller, *Lexikon der kirchlichen Tonkunst* (1870; rev. ed. 2 vols., 1891, '95). S. Kümmerle, *Encyklopädie der evangelischen Kirchenmusik*, 4 vols. (1888–95). W. L. von Lütgendorff, *Die Geigen- und Lautenmacher vom Mittelalter bis zur Gegenwart* (1904; 6th ed., 2 vols., 1922). C. Sachs, *Real-Lexikon der Musikinstrumente* (1913, rev. ed. 1964). J. Zuth, *Handbuch der Laute und Gitarre* (1926). A. Weissenbäck, *Sacra Musica: Lexikon der katholischen Kirchenmusik* (1937). S. Longstreet and A. M. Dauer, *Knaurs Jazzlexikon* (1957). F. K. Priberg, *Lexikon der neuen Musik* (1958).

D. Italy: C. Dassori, *Opere e operisti (dizionario lirico 1541–1902)* (1903). A. de Angelis, *L'Italia musicale d'oggi. Dizionario dei musicisti* (1918; 3rd ed., 1928). U. Manferrari, *Dizionario universale delle opere melodrammatiche*, 3 vols. (1954–55). C. Sartori, *Dizionario degli editori musicali italiani* (1958).

## III. Earlier dictionaries.

Some music entries are found in such early dictionaries as the 10th-cent. *Kitab al-Aghani al-Kabir*, compiled by al-Ishbahani, Abu al-Faraj, 'Ali bin al Hussein, 897–967 (mod. ed. Nashr al-Hurini, Bulak, 1868), and the *Dictionarius metricus* ascribed to J. de Garlandia (ed. A. Scheler, Leipzig, 1867) from the early 13th century. The earliest music dictionary is an 11th-cent. *Vocabularium musicum* (repr. in J.-A.-L. de La Fage, *Essais de diphthéographie musicale*, 1864, i, 404–8). Much more complete is J. Tinctoris' *Terminorum musicae diffinitorium*, c. 1475 (repr. in CS iv, 177ff; German trans. by H. Bellerma in *JMW* i, 55–114; French trans. by A. Machabey, *Lexique de la musique, XVe siècle*, 1951; English trans. by C. Parrish, *Dictionary of Musical Terms*, 1963). This was followed, but only after more than two centuries, by the *Clavis ad thesaurum magnae artis musicae* (Prague, 1701) of the Bohemian organist T. B. Janowka, and by the *Dictionnaire de musique* (Paris, 1703) of Sébastien de Brossard.

France. From Brossard, who was not familiar with Janowka's work, stems the line of French music dictionaries continued most notably by: J. J. Rousseau, *Dictionnaire de musique* (Geneva, 1767; 2 vols., 1825); N. É. Framery and P. L. Ginguené, *Musique*, 2 vols. (Paris, 1791, 1818),

contained in the *Encyclopédie méthodique* (vols. 185–186); A. E. Choron and F.-J.-M. Fayolle, *Dictionnaire historique des musiciens*, 2 vols. (Paris, 1810, '11), the first French biographical dictionary of musicians; F.-H.-J. (Castil-Blaze), *Dictionnaire de musique moderne* (Paris, 1821; 2nd ed., 2 vols. 1825; rev., 1 vol., 1828); F.-J. Fétis, *Biographie universelle des musiciens et bibliographie générale de la musique*, 8 vols. (Paris, 1835–44; 2nd ed. rev., 10 vols., 1860–70; 2-vol suppl. by A. Pougin, 1878, '80); and the still useful compilation, L. Escudier, *Dictionnaire de musique d'après les théoriciens, historiens et critiques les plus célèbres*, 2 vols. (Paris, 1844; 5th ed., 1872).

**Germany.** The German dictionaries begin with M. Praetorius' *Syntagma musicum*, vol. iii (1619; repr. 1916; fac. ed. W. Gurlitt, 1958) and continue with lists appended to a number of treatises, e.g., C. Demantius' *Isagoge artis musicae* (8th ed., 1632; see *MF* x, 48ff), J. A. Herbst's *Musica practica* (1642), etc. The earliest independent dictionary was J. G. Walther's topical and biographical *Musikalisches Lexikon* (Leipzig, 1732; fac. ed. R. Schaal, 1953). This was followed (in addition to biographical and other material found in J. Mattheson's writings, especially his *Grundlage einer Ehren-Pforte*, Hamburg, 1740; new ed. M. Schneider, 1910) chiefly by: E. L. Gerber, *Historisch-biographisches Lexicon der Tonkünstler*, 2 vols. (Leipzig, 1790, '92; rev. ed., 4 vols., Leipzig, 1812–14); H. C. Koch, *Musikalisches Lexicon* (Frankfurt-am-Main, 1802; rev., Heidelberg, 1865); G. Schilling, *Universal-Lexicon der Tonkunst*, 6 vols. (Stuttgart, 1835–38; suppl., 1842).

**England.** Following an unimportant volume entitled *A Short Explication of Such Foreign Words as Are Made Use of in Musick Books* (London, 1724), England's first significant music lexicon is J. Grassineau, *A Musical Dictionary* (London, 1740; 2nd ed., 1769), an expanded translation of Brossard's *Dictionnaire de musique*. A slightly later topical dictionary is T. Busby, *A Complete Dictionary of Music* (London [1786? 1800?]; 4th ed., 1813), while the first biographical dictionary of musicians is J. S. Sainsbury's *A Dictionary of Musicians*, 2 vols. (London, 1824; 2nd ed., 1827).

**Italy.** Italy's first dictionary of music was that of P. Gianelli, *Dizionario della musica sacra e profana*, 3 vols. (Venice, 1801; 3rd ed., 7 vols., 1820), superseded by P. Lichtenthal, *Dizionario e bibliografia della musica*, 4 vols. (Milan, 1826).

**United States.** Although Busby's dictionary

(see under England above) had been published in America in 1827, the most important early American dictionary is J. W. Moore, *Complete Encyclopaedia of Music* (Boston [1852]; App., 1875).

Works in other languages are: B. Saldoni, *Diccionario biográfico-bibliográfico de efermèrides de músicos de españoles*, 4 vols. (Madrid, 1868–81); J. de Vasconcellos, *Os músicos portugueses*, 2 vols. (Oporto, 1870); W. Sowinski, *Les Musiciens polonais et slaves, anciens et modernes* (Paris, 1857; in Polish, Paris, 1874); J. Verschuere-Reynvaan, *Muzijkaal kunstwoordenboek* (Amsterdam, 1795, incomp.; Vlis-singen, compl., 1805; new ed., Amsterdam, 1847); C. Envallson, *Svenskt musikaliskt lexikon* (Stockholm, 1802).

For completion of the list above, see J. B. Coover, *Music Lexicography* (1958; this is a later edition of *A Bibliography of Music Dictionaries*, 1952); E. Magni-Dufflocq, "Dizionario di musica" (*Bolletino bibliografico musicale* viii), and s.v. "Dictionaries" in *GDB* and "Lexika" in *MGG*.

L.H.; add. by C.G.R.

**Dido and Aeneas.** Opera in three acts by Purcell (libretto by Nahum Tate, after Virgil's poem), produced about 1689 at Josias Priest's boarding school for girls in Chelsea (London). Setting: Carthage, after the fall of Troy. The moving simplicity of the plot, together with Purcell's expressive music, make *Dido and Aeneas* an important work of early opera, midway between Monteverdi and Gluck. Particularly famous is Dido's "Lament" before her death, a \*chaconne based on a chromatic modification of the descending tetrachord.

**Didymic comma.** See under Comma.

**Dièse** [F.]. The sharp sign [see Accidentals; Pitch names]. In the 17th century, also used to indicate the major mode, e.g., *mi dièse*, E major.

**Dies irae** [L.]. A rhymed sequence [see Sequence II, B], probably by Thomas of Celano (d. 1256), which is among the most impressive products of late medieval poetry and music. It is one of the five sequences still surviving in the Roman liturgy, being sung in the Requiem Mass [LU, p. 1810]. Its plainsong melody, which is a good example of a mixed mode [see Church modes III], shows the characteristic structure of the sequence, aa bb cc; it is sung three times and is *Amen*. It may have originated as a trope to the responsory *Libera me* (from the Burial Service; LU, p. 1767; also *HAM*, no. 14), particularly its

second verse: *Dies illa, dies irae, calamitatis et miseriae* . . . . Not until the mid-16th century did it become an integral part of the Requiem Mass. Brumel's *Missa pro defunctis* includes the earliest (?) polyphonic composition of the "Dies irae," later examples being found in the Requiem Masses of O. Vecchi, G. F. Anerio, and others. More recent composers have usually retained only the text and have written for it free music of a highly dramatic character (Mozart, Cherubini, Verdi). However, the old melody has frequently been incorporated into program compositions having death or damnation as their subject, e.g., Berlioz' *Symphonie fantastique* (last movement: "Dream of a Witches' Sab-

bath"), Liszt's *Totentanz* and \*Dante Symphony, Saint-Saëns' \**Danse macabre*. See J. Yasser, "Dies Irae, The Famous Medieval Chant" (*Musical Courier*, Oct. 6, 1927).

**Diesis** [Gr.]. (1) In early Greek theory (Pythagoras), the diatonic semitone of the \*Pythagorean scale. This meaning survives in many medieval treatises, in which *diesis* is explained as the *semitonium minus* [see Semitone]. (2) In later Greek theory, the quarter tone of the enharmonic genus. This meaning survives in Martianus Capella (c. 400), who says that the *diatesaron* consists of five *hemitonia* or of ten *dieses*. It reappears in the writings of Vicentino (1555), who tried to restore the Greek system. Other writers explain the *diesis* still differently, e.g., as a fifth of a tone (Marchettus; *GS* iii, 73). Tinctoris, in his *Diffinitorium*, lists seven different meanings of *diesis* (*CS* iv, 182). (3) In some 15th-century treatises the term is used for the sharp sign, e.g., by Nicolaus Capuanus (*Compendium musicale*, 1415; see H. Riemann, *Geschichte der Musiktheorie*, 2nd ed. [1920], p. 252; see also *CS* iv, 444). This meaning survives to the present day in Italian and French terminology [see *Dièse*]. (4) In modern writings on acoustics the term is occasionally used to designate certain theoretical intervals, about a quarter tone in size. The difference between four minor thirds (of

just intonation) and the octave is called *great diesis* ( $(\frac{65}{54})^4 \cdot 2 = \frac{648}{625} = 63$  cents), while that between the octave and three major thirds is called *minor diesis* or *enharmonic diesis* ( $2 \cdot (\frac{5}{4})^3 = \frac{128}{125} = 41$  cents); see Enharmonic (2).

**Diferencia** [Sp.]. A 16th-century name for a variation. The *diferencias* of Luis de Narváez' *Delphin de música* (1538; see *HAM*, no. 122; *ApMZ* ii) are among the earliest preserved examples of variations [see Variations IV (1)]. Cabezón wrote outstanding *diferencias* for keyboard instruments [repr. in Editions XX, 3, 4, 7 and 8]. Examples in *HAM*, nos. 122, 124, 134. See also Glosa.

**Difference tone, differential tone.** See Combination tone.

**Differentiae** [L.]. The various endings of a psalm tone. See *Euouae*.

**Diluendo** [It.]. Fading away.

**Dimeter.** See under Poetic meter.

**Diminished intervals.** See under Interval.

**Diminished seventh chord.** See Seventh chord.

**Diminished triad.** See Triad.

**Diminuendo** [It.], abbr. *dim.* or *dimin.* Same as decrescendo.

**Diminution** [*L. diminutio*]. (1) Term in counterpoint and in mensural notation; see Augmentation and diminution. (2) The breaking up of the notes of a melody into quick figures, as is frequently done in variations; hence, synonymous with figuration or ornamentation. See Ornamentation I; also Division.

**Diphona** [Gr.]. See under *Bicinium*.

**Diplomas.** See Degrees and diplomas 9.

**Direct.** A mark (  ) that in early manuscripts and publications is given at the end of each staff (or only of the page) to warn the player of the first note of the following staff (or page). The Latin name is *custos*. Its earliest occurrence, in 11th-century MSS of Gregorian chant, is an indication of the transition from chironomic to (approximately) diastematic neumes.

**Directaneus.** See under Psalmody I.

**Dirge.** A vocal or instrumental composition designed to be performed at a funeral or at memorial rites. The name is derived from L.

*Dirige Domine*, an antiphon from the Office for the Dead [see *LU*, p. 1782].

**Dirigent, dirigieren** [G.]. Conductor, to conduct.

**Dis, disis** [G.]. D-sharp, d-double-sharp; see Pitch names. In earlier music, *dis* often stands for e-flat, e.g., in Bach's St. Matthew Passion: "Wiederhole den Choral aus dem Dis" (Repeat the chorale in e-flat). As late as 1805, Beethoven's *Eroica* Symphony was described, at the first performance, as being "in Dis."

**Discant.** (1) A 12th- to 15th-century term for certain types of polyphonic music in which a part was composed against the plainsong, or in some cases perhaps improvised. It may be a translation of Gr. *\*diaphonia*, which until c. 1100 (John Cotton) was synonymous with organum. However, by c. 1175, when various sections of organum began to be stylistically differentiated, a 12th-century "Tractatus de Musica" [in J.-A.-L. de La Fage, *Essais de diphthéographie musicale*, 2 vols. (1864), i, 355], strictly distinguished discant from organum, the former designating two-voice polyphony in note-against-note style, the latter a more elaborate setting employing (or at least including) melismas in the upper part (melismatic organum; see Organum III). Perotinus was skilled in the art of discant, being described as "optimus discantor," while Leoninus was called "optimus organista." In the 13th century, Garlandia even distinguished a third style, *\*copula*, midway between discant and organum (CS i, 114, 175). The term "discant" originated as a designation for the upper voice only, the lower part being called "cantus" (*cantus* = voice; *discantus* = second, or counter, voice). However, the term also was used—and commonly is today—for the combination of both parts, and its original connotation has appeared in the terms *\*descant*, *descaunt*, *\*déchant*, *déschant*, and *discantus*. In the 13th century, discant continued to denote non-melismatic music (one or only a few notes against each note of the cantus), but with the emphasis on strict measurement in modal rhythm [see Modes, rhythmic]. Thus, Garlandia says (CS i, 106), "Discant is the concurrence of various parts according to the principles of modal meter and of the equivalence of note values." It thus denotes the style used in the so-called discant sections of the organa of Notre Dame and in the two types of polyphony that originated from these, the *\*clausula* and *\*motet*. Stylistically, the *\*conductus* also belongs to the cate-

gory of discant. Its opposite is the "organal" sections, in which the upper part moves in long melismas (with less strict adherence, if any, to the rhythmic modes) above a few sustained notes of the tenor. For examples of 12th- and 13th-century discantus, see respectively under Organum (Ex. 4) and Clausula. As appears from these examples, the two parts move mainly in contrary motion. The ideal of contrary motion was mentioned in the 13th-century "Tractatus de Discantu" (in J.-A.-L. de la Fage, *Essais*, i, 358; CS i, 311) but became an essential characteristic of discant theory only at the end of the 13th century, when modal rhythm was replaced by mensural rhythm.

The 13th- to 15th-century treatises on discant deal chiefly with the rules of consonance and voice-leading in part music. In the 14th century, discant was equated with the expressions "nota contra notam" or "punctus contra punctum"; hence the abbreviated form "contrapunctus" or "counterpoint." Thus, discant adopted the connotation of counterpoint, and it continued to be used in that sense by both English and Continental writers through the 15th century.

(2) "English discant" is a recently introduced term (by M. Bukofzer) for a 15th-century style of three-part writing characterized by (a) the extensive use of sixth chords, often in succession (parallel), and (b) the lowest part's being a *cantus firmus*. The term is meant to distinguish this style from authentic discant as described in treatises from the 12th century on, which treated of perfect consonances and the principle of contrary motion. It should be noted, however, that none of the 15th-century English treatises on discant contains a clear reference to a distinct "English discant" as defined above, but they adhere closely to the traditional connotation of the term "discant" as counterpoint. Perhaps it would be advisable to replace the term "English discant" with designations such as "sixth-chord style with *cantus firmus* in the lowest part." Bukofzer also used the term "English discant" to distinguish one English practice from Continental *\*fauxbourdon*, in which the borrowed melody is in the highest part. See Ex. (close of the Te Deum melody; c. 1300). However, the insistence on the position of the *cantus firmus*

limits the usefulness of the term, since there are numerous compositions (or sections of compositions) in the same musical style that have the *cantus firmus* in the upper part (e.g., an English Sanctus from c. 1300; see G. Schmidt, in *AMW* xv, 238), in the middle part, or, often, no *cantus firmus* at all (e.g., the Gloria in *HAM*, no. 57b). The confusion between discant as practiced in England and a technique of parallel sixth chords stems in part from the treatise c. 1480 of the Italian (?) Guilelmus Monachus, who described what appears to have been an improvisory technique as a *modus faulxbourdon* practiced in England [CS iii, 288]. Also see *Discantus supra librum*.

(3) Name for the uppermost part (soprano, treble) of a polyphonic composition; used frequently today in connection with 14th- and 15th-century compositions in which a *cantus firmus* appears in the upper part (rather than in the tenor), nearly always in an embellished form (paraphrase). This technique was applied to hymns (Codex Apt, late 14th century; Dufay and others, 15th century), Marian antiphons (Dunstable, Dufay; see *HAM*, no. 65), Masses or Mass sections (see Discant Mass), etc. See also *Descant*.

Lit.: *ReMMA*, pp. 398ff; W. G. Waite, *The Rhythm of Twelfth-Century Polyphony* (1954); "Discant or Measured Music," in *OH*, i, ch. vi; S. W. Kenney, *Walter Frye and the "Contenance angloise"* (1964), ch. 5; E. Apfel, *Studien zur Satztechnik der mittelalterlichen englischen Musik*, 2 vols. (1959); M. Bukofzer, *Geschichte des englischen Diskants und des Fauxbourdons* (1936); T. Georgiades, *Englische Diskanttraktate aus der ersten Hälfte des 15. Jahrhunderts* (1937); R. Crocker, "Discant, Counterpoint, and Harmony" (*JAMS* xv); S. B. Meech, "Three Musical Treatises in English from a Fifteenth-century MS" (*Speculum* x); J. Handschin, "Zur Notre Dame-Rhythmik" (*ZMW* vii); *id.*, "Zur Geschichte der Lehre vom Organum" (*ZMW* viii); E. Apfel, "Der klangliche Satz und der freie Diskantsatz im 15. Jahrhundert" (*AMW* xii); E. H. Sanders, in *MD* xix. rev. S.K.

**Discant Mass** [G. *Diskantmesse*]. A recent term for Masses or Mass sections of the fourteenth and fifteenth centuries in which the borrowed *cantus firmus* does not appear, as is usual, in the tenor but in the upper part, often in an embellished form. Among the earliest examples is an English Sanctus from c. 1300 [reprinted in Schmidt, *AMW* xv, 238]. In a Credo by Zacha-

rias de Teramo of c. 1400 [*DTO* 61, p. 16], the melody of Credo I alternates in the two upper parts, with only a few notes added here and there. In Dufay's *Missa Sancti Jacobi* of c. 1428 several sections (end of the Introit, third Kyrie, Communion) have the Gregorian melody in the upper part, slightly embellished. More fully paraphrased plainsongs are used in a number of sections of a Mass by Reginald Liebert [*DTO* 53, p. 1; see the analysis on pp. 95ff]. In Ockeghem's *Requiem Mass* also the various liturgical melodies (Introit, Kyrie, etc.) appear mostly in the discant. On the whole it seems that discant treatment was employed for individual Mass sections rather than for a complete Mass. The term "discant Mass" is therefore somewhat misleading. Furthermore, the same practice is found in other categories, such as hymns and Marian antiphons.

Assigning certain earlier Mass compositions (Gloria, Credo of the Mass of Tournai; Credo of Machaut's Mass) to this type is based on the (questionable) assumption that their seemingly free upper parts actually are highly elaborate \*paraphrases of liturgical melodies [see R. von Ficker, in *StM* vii; J. Handschin, in *ZMW* x and *KJ* xxv]. For a refutation of these assertions, see M. F. Bukofzer, *Studies in Medieval and Renaissance Music* [1950], p. 52.

**Discantus.** See *Discant*.

**Discantus supra librum** [L.; F. *déchant sur le livre*]. Designation for methods of improvising polyphony (or rather, harmony) on the basis of a single notated melody found "in the book," i.e., the book of Gregorian chant. The \*organum of the 9th and 10th centuries, proceeding largely in parallel fourths or fifths, may be considered an early type of *discantus supra librum*, since its rules enabled a singer to improvise a second voice (*vox organalis*) to the plainsong melody (*vox principalis*). Usually, the term is applied to more elaborate methods of improvised harmonization of the 14th and 15th centuries. One of these, described (not quite clearly) by Simon Tunstede [CS iv, 294a], seems to be a "modernization" of the early organum of the fifth. Four singers perform doubled parallel fifths, while a fifth singer, the "discantor," introduces thirds, sixths (?), and tenths; see Ex. 1, in which the "part from the book" is indicated by black notes, the doubling parts by white notes, and the discantor's part by lozenges.

To the same category of improvised harmonization belongs a method described by an anony-

mous early 15th-century English writer (Brit. Mus. *Lansdowne* 763) as \*faburden. Here also, only one part is notated and two singers improvise melodies resulting in sixth chords with occasional open triads (1–5–8). According to the most recent explanations [by B. Trowell, in *MD* xiii] the method was as follows: one singer sings the melody as written, e.g., d–e–f–g–f–e–d; another singer (treble) duplicates the melody at the upper fourth, g–a–b–c'–b–a–g; a third singer (faburdener) derives from the written melody a modified one by replacing each of its tones, except the first and last, by its upper third, d–g–a–b–a–g–d, but actually singing it a fifth lower, G–c–d–e–d–c–G. The result is sixth-chord harmony with the *cantus firmus* in the middle [see Ex. 2].

Very similar to this is a method described c. 1480 by the Italian (?) Guilelmus Monachus as a *modus faulxbourdon* practiced in England [CS iii, 288]. Here the derivative melody moves a third *below* the written melody and is transposed by one singer to the upper fifth and by another to the upper octave. The result is sixth-chord harmony with the *cantus firmus* in the lowest part [see Ex. 3]. As can easily be seen, the upper-third modification of the melody can also be used to produce sixth-chord progressions with the *cantus firmus* in the topmost part by singing it at the lower octave and doubling the original melody at the lower fourth. The result is shown in Ex. 4.

Finally, it should be mentioned that Tunstede's method has been interpreted as calling not for 1–5–8–12 but for 1–3–6–10 progressions, therefore as in Ex. 3 with a fourth part added a fifth above the third [Ex. 5, transcribed by W. Apel; see M. F. Bukofzer, *Geschichte des englischen Diskants* (1936), p. 20; B. Trowell, "Faburden and Fauxbourdon" (*MD* xiii)]. See

Abbé Jean Prim, "Chant sur le livre in French Churches in the 18th Century" (*JAMS* xiv). See also Fauxbourdon; Sixth-chord style.

**Discantus visibilis.** See under Sight.

**Discord.** See Concord, discord.

**Disinvolto** [It.]. Jaunty, unconstrained.

**Disjunct.** See Conjunct, disjunct.

**Diskant** [G.]. Soprano; see Discant. *Diskantmesse*, see Discant Mass.

**Disposition.** The arrangement of stops, manuals, pedals, couplers, etc., of an organ.

**Dissonance.** See Consonance, dissonance.

**Dital harp.** See Harp lute.

**Dithyramb** [Gr. *dithyrambos*]. A song in honor of the Greek god Dionysus. Originally it probably was a strophic song sung by a chorus or by the whole crowd attending the feast of the god. From the 6th to the 4th century B.C. it grew more elaborate, with the inclusion of \*aulos accompaniment, soloists, and dancing groups. Thus it became a compound form consisting of various "movements," which has been compared to the cantata. It also adopted a dramatic and emotional character, full of unbridled passion. Toward the end of the 4th century B.C. it degenerated into a kind of theatrical performance in which various characters were frequently portrayed by a single actor.

Modern composers have occasionally used the word as a title for compositions of a free and passionate nature. See *ReMMA*, pp. 12ff; *RiHM* i.1, 129; *AdHM* i, 58; T. Reinach, *La Musique grecque* (1926), p. 149.

**Ditonus** [L.]. Medieval name for the major third, equal to two whole tones. For ditonic scale, see under Pentatonic scale (b).

**Div.** Abbr. for \**divisi*.

**Divertimento** [It.]. (1) Fugal episode. (2) A term frequently used in the 18th century, especially in Austria, for an instrumental composition written primarily for entertainment and hence in a rather light vein. The title Divertimento (or *Divertissement*) was given to an enormous variety of types. Usually, however, such compositions were written for small ensembles (strings, winds, or mixed groups; three to eight or more players) and consisted of a number (three to ten) of relatively short movements, some of which are modeled after the sonata while others are dances (especially minuets), marches, or variations. Among the composers of divertimenti are I. Holzbauer, Leopold Mozart [see *DTB* 17],

G. C. Wagenseil, J. C. Monn [see *DTO* 39], J. Starzer [see *DTO* 31], K. Ditters von Dittersdorf, Michael Haydn [see *DTO* 29], and, most prominently, F. J. Haydn and W. A. Mozart. In one of his autograph catalogs Haydn used the title *Divertimento* for 162 compositions, among them his Baryton trios. More than 50 of them are *divertimenti* as defined here. Mozart wrote 37 compositions called *Divertimento*. Later examples include Schubert's *Divertissement à l'Hongroise* (op. 54, for piano, 4 hands), A. Roussel's *Divertimenta* (op. 6, for 5 winds and piano), and F. Busoni's *Divertimento* (op. 52, for flute and orchestra). Compositions such as Beethoven's Septet op. 20 and Schubert's Octet op. 166 belong to the same category. Closely related types are the \*cassation, \**Feldmusik*, and \*serenade. See G. Hausswald, "Der Divertimento-Begriff bei Georg Christoph Wagenseil" (*AMW* ix).

**Divertissement** [F.]. (1) Fugal episode. (2) A musical potpourri, frequently in the form of pieces extracted from an opera. (3) In French baroque opera, the ballets, dances, entr'actes, etc.—in short, all those pieces that served merely to entertain without being essential to the plot. (4) Same as \*divertimento.

**Divided stop.** A device of organ building that makes it possible to use different registrations for the upper and lower halves of the manual. It was frequently found in organs of the 17th century, especially in Spain, where all stops were divided stops. Contemporary terms are half-stop (Purcell or Blow), *registro spezzato* [It.], *registre coupé* or *rompu* [F.; in Brit. Mus. add. MS 29486], *medio registro* [Sp.], and *meyo (meio) registro* [Port.]. Spanish organ composers often prescribed this device in their works, making a distinction between *registro alto*, *de tiple*, *de dos tiples* (solo part in the upper half) and *registro baxo*, *vajo*, *dos vajos* (solo part in the lower half). See Editions XI, 14 (Francisco Peraza, S. Aguilera de Heredia), and XXXII, 6, 12 (F. Correa de Araujo).

**Divisi** [It.], abbr. *div.* Used in orchestral scores to indicate that an instrumental body, e.g., the first violins, is to be divided into two groups for rendering passages that include full chords, doubling in thirds, etc. See under *A due*; also *Gymel* (2).

**Divisio** [L.]. (1) In 13th-century notation *divisio modi* is a small vertical dash of indefinite length that is regularly placed at the end of an *ordo*, i.e., a melodic phrase in modal meter. It is

equivalent to a rest. (2) In 14th-century Italian notation, *divisiones* are metrical schemes comparable to our 4/8, 6/8, 9/8, 12/8, etc. meters, so called because they are arrived at by dividing a long note (*brevi*) into smaller values. See *ApNPM*, pp. 370ff.

**Division.** A 17th- and 18th-century term for \*figuration, that is, the breaking up of a melody into quick figures and passages [see also Ornamentation I; Coloratura]. In particular, the term refers to the predominantly English practice of a harpsichordist's playing a ground bass (with its thoroughbass chords) to which a viol or flute player, "having the said Ground before his eyes, as his Theme or Subject, plays such a variety of Descant or Division in Concordance thereto, as his skill and present invention do then suggest unto him" [C. Simpson, *The Division-Violist*, 1659]. Such music, chiefly extemporized, was called "divisions upon a ground." Important English publications besides Simpson's are: John Playford, *The Division Violin* (1684); *The Division Flute* (anon., 1722). See Improvisation III; *Partimento*.

A modern counterpart of the 17th-century method of divisions exists in \*boogie-woogie.

**Division viol.** See under Viol IV, 2.

**D la sol (re).** See under Hexachord III.

**Dixie.** A song by Daniel D. Emmett (1815–1904), written in 1859 for his Negro minstrel shows. Ironically, it was adopted by the Confederate troops during the Civil War.

**Do, doh.** See under Solmization I; Tonic sol-fa.

**Doctrine of affections.** See Affections, doctrine of.

**Doctrine of figures.** See Figures, doctrine of.

**Documenta polyphoniae liturgicae sanctae ecclesiae Romanae.** See Editions XVa.

**Dodecachordon.** An important theoretical book by H. Glareanus (original name Heinrich Loris, 1488–1563), published in 1547, in which the traditional system of eight \*church modes is enlarged to a system of twelve. The book is also remarkable for its highly judicious and comprehensive analysis of the works of Josquin and other masters of the early 16th century. A German translation by P. Bohn appeared in 1888 [Editions XLVII, 16]. See C. A. Miller, "The *Dodecachordon* of Heinrich Glarean" (diss. Univ. of Michigan, 1950); *id.*, in *MD* xv;

A. Schering, "Die Notenbeispiele in Glarean's Dodekachordon" (*SIM* xiii). The name was used by Claude Le Jeune (d. 1606) as a title for a cycle of motets based on the twelve modes of Glareanus [see Editions XXV, 11].

**Dodecaphonic.** Pertaining to \*twelve-tone technique or compositions [see Serial music].

**Dodecuple scale.** The chromatic scale in its modern interpretation, as used in the twelve-tone technique [see Serial music].

**Doigté** [F.]. Fingering. *Doigté fourchu*, cross fingering.

**Dolce** [It.]. Sweetly, softly.

**Dolcino, dolcian.** See under Oboe family III.

**Dolente, doloroso** [It.]. Sorrowful.

**Domchor** [G.]. The choir of a German cathedral (*Dom*), either Protestant or Roman Catholic.

**Domestic Symphony.** See *Symphonia domestica*.

**Dominant.** (1) The fifth degree of the major or minor scale, so called on account of its "dominating" position in harmony as well as in melody. Many melodies show the fifth as a tone second in importance only to the first degree, the tonic. However, the fifth degree is even more important in harmony as a bass tone, i.e., the root of the dominant triad (g-b-d' in C major). In \*harmonic analysis, this triad is indicated by the numeral V or the letter D. It is most frequently resolved into the tonic triad (I) [see Cadence I]. Other chords with dominant function are the dominant seventh and the dominant ninth [see Seventh chord; Ninth chord]. Of particular importance in harmonic practice are the so-called "secondary dominants," i.e., the dominants of any degree of the scale other than the tonic. These chords account for the majority of accidentals found in music that is essentially diatonic. The designation for such chords is: V of II (V/II), V of III (V/III), etc. [see Ex.]. The early history of the V-I progression is briefly described under Cadence II. (2) For the dominant of the modes, see Church modes II.

**Dominant seventh chord.** See under Seventh chord; Dominant.

**Dominica** [L.]. Sunday [see under *Feria*].

**Dominican Republic.** The indigenous music of the island of Hispaniola at the time of the Spanish conquest was described by two 16th-century chroniclers, Father Bartolomé de las Casas and Gonzalo Fernandez de Oviedo, Columbus' official historian. Both wrote about dance-songs called *areitos* as performed by the Tainan Indians of the Antilles. Father Las Casas was the first to celebrate a High Mass with the participation of a chorus in the New World (1510). Cristóbal de Llerena (1540-c. 1600) of Santo Domingo was the first musician trained in European music to be appointed to the Cathedral of La Vega.

By the beginning of the 17th century secular music was represented by the \**villancico* and such dances as the *zarabanda* and *calenda*, and later the *fandanguete* and \**tumba*.

Not until the 19th century did a native school of art music begin to develop. This development began with Juan Bautista Alfonseca (1810-75), a native of Puerto Rico who composed instrumental dances in the popular vein, as well as two Masses. His pupil, José Reyes (1835-1905), also a church and dance music composer, wrote the Dominican national anthem (1883). A contemporary of his, José María Arredondo (1840-1924), composed the music for several *zarzuelas*. The foremost figure in the second half of the 19th century was Pablo Claudio (c. 1855-99), who wrote two music dramas, *América* and *Maria de Cuellar*, as well as a great number of instrumental pieces in native dance forms. Other composers of the period were Arredondo's son, Clodomiro Arredondo Murra (1864-1935), who wrote liturgical music and songs, and José María Rodríguez Arresón (b. 1875), composer of a *Sinfonia quasi una Fantasia*, choral music, and dance music.

The link between late 19th-century romanticism and a nationalist school of composition is represented by four composers who used materials from folk music as a basis for larger forms. They are José de Jesús Ravelo (1876-1952), who composed sacred music such as the oratorios *La Muerte de Cristo* (1939) and *La Resurrección de Cristo* (1942), in addition to symphonic compositions and a string quartet; Manuel de Jesús Lovelace (b. 1871), composer of *Escenas Dominicanas* for orchestra; Gabriel del Orbe (b. 1888), composer of art songs and chamber music; and

Augusto Vega (b. 1885), composer of more than three hundred works, including an opera, *Indigena*.

The pioneers of modern music in the Dominican Republic include Esteban Peña Morell (1897–1939), a renowned folk-music collector, composer of a *Sinfonia Bárbara* (1923) and an opera, *Embrujo-Antellano* (1928), and Juan Francisco García (b. 1892), who has consistently employed folk materials in works such as his three symphonies, the overture *Advenimiento*, *Scherzo Clásico* (1941), several works for band, string quartets, and art songs. By combining several Dominican dance forms he established a new form that he called *sambumbia*. To these two men a younger group of nationalists owe much of their inspiration: Enrique Mejía-Arredondo (1901–51); Luís Emilio Meña (1895–1965), composer of a *Sinfonia Giocosa*; José Dolores Cerón (b. 1897); Rafael Ignacio (b. 1897); Julio Alberto Hernández (b. 1900); Ramón Díaz (b. 1901); Luís Rivera (b. 1902); and Enrique de Marchena (b. 1908), the best-known Dominican composer abroad, whose works include a Concertino for flute and orchestra, a Concerto for violin and orchestra, and a *Suite Imágenes*.

With the arrival, in 1940, of the Spanish-born composer Enrique Casal Chapí (b. 1909), more progressive paths were opened. Among the most outstanding followers of his ideas are Ninón de Borouwer (b. 1907), Manuel Simó (b. 1916), and Antonio Morel Guzmán. In addition, there is a large group of composers of dance music, of whom Rafael Petitón Guzmán (b. 1894) is the best known for his *merengues*, *danzas*, and *criollas*, and Juan Bautista Espínola (1894–1923) for his more than five hundred pieces of popular music.

The folksongs of the Dominican Republic are best represented by the *\*tonada* and by a number of Spanish-influenced examples such as the *plena* (working song), *criolla* (serenade), *arení* and *trocha* (children's game-songs), *vela* and *calvarios* (religious songs), etc. Most of the folk dances have evolved from African and Spanish prototypes, the most popular being the *\*merengue*, its derivative the *pambiche*, and the *\*baile de palos*, *carabiné*, *\*mangulina*, *\*sarambo*, and *\*bolero*, the last imported from Cuba.

Lit.: J. M. Coopersmith, *Music and Musicians of the Dominican Republic* (1949); J. F. García, *Panorama de la Música Dominicana* (1947); *id.*, "Formas de la música folklórica dominicana" (*Bol. folk. dom.* i); F. de Nolasco, *La Música en*

*Santo Domingo* (1939); J. M. Coopersmith, "Music and Musicians of the Dom. Rep. A Survey" (*MQ* xxxi, 71, 212). Also see under Latin America. J.O-S.

**Don Carlos.** Opera in four acts by Verdi (libretto, in French, by F. J. Méry and C. DuLocle, based on Schiller's drama; It. trans. by A. Ghislanzoni), produced in Paris, 1867, rev. It. version in Milan, 1884, Setting: Spain, mid-16th century.

**Domp(e).** See Dump.

**Domra.** A Russian long-necked lute [see Lute II] of the 16th and 17th centuries, the forerunner of the *\*balalaika*. See A. S. Faminzin, *The Domra* (1891; Russian); *LawE* i.5, 2493ff.

**Don Giovanni** [It., Don Juan]. *Dramma giocoso* in two acts by Mozart (libretto by L. da Ponte), produced in Prague, 1787. Setting: Seville, 17th century. The original title, *Il Dissoluto punito*, is rarely used today.

**Don Juan.** Symphonic poem by R. Strauss, op. 20 (1881–89), based on a dramatic poem by Lenau.

**Donnermaschine** [G.]. *\*Thunder machine*.

**Don Pasquale.** Opera in three acts by Donizetti (libretto by the composer and G. Ruffini), produced in Paris, 1843. Setting: Rome, early 19th century.

**Don Quixote.** Symphonic poem by R. Strauss, op. 35 (1897), based on the novel by Cervantes and composed in the form of an Introduction, Theme with Variations, and Finale. The variations describe ten adventures of Don Quixote, and the finale depicts his death. In addition to the main "theme of a knightly character," there is a lyrical one portraying Don Quixote in love and a comic one for Sancho Panza.

**Don Rodrigo.** Opera in three acts by A. Ginastera (libretto by A. Cassona), produced in Buenos Aires, 1964.

**Doppel** [G.]. Double. *Doppel-Be*, double flat; *Doppelchor*, double chorus; *Doppelfuge*, double fugue; *Doppelgriff*, double stop; *Doppelkreuz*, double sharp; *Doppelpedal*, double pedal; *Doppelschlag*, turn; *Doppeltriller*, double trill; *Doppelzunge*, double-tonguing. In regard to instruments, the term usually denotes *\*duplex instruments* [see *SaRM*, pp. 114–17].

**Doppelt so schnell** [G.]. Twice as fast.

**Doppio** [It.]. Double. *Doppio bemolle*, double flat; *doppio diesis*, double sharp; *doppio movimento* (*tempo*), double speed; *doppio pedale*, double pedal.

**Dorian.** See under Greece II (c); Church modes I; Modality. The Dorian sixth is the major sixth used in a minor key (e.g., in C minor: c-e<sup>b</sup>-f-g-a-g), so called because it appears in the Dorian church mode (d-f-g-a-b-a). See A. J. Hopkins, "Dorian and Phrygian" (*SIM* iv).

**Dorian Toccata and Fugue.** A Toccata and Fugue in D minor by Bach for organ, written without the customary B-flat in the key signature and therefore having the appearance of a composition in the Dorian mode. Actually, however, the accidentals for D minor are supplied throughout. The use of key signatures with one flat less than is used today (e.g., one flat for G minor, two flats for C minor) was a common practice throughout the 17th century.

**Dot** [F. *point*; G. *Punkt*; It. *punto*; Sp. *puntillo*]. In present-day musical notation a dot is used: (a) after a note, to indicate augmentation of its value by one-half [see Dotted notes]; (b) above a note, to indicate \*staccato or \*portato. In Italian and French keyboard sources of the early 16th century, a dot above or below a note indicates chromatic alteration [see *ApNPM* pp. 4, 6]. See also *Punctus*.

**Dotted notes.** I. *Present usage.* A dot placed after a note adds to it one-half of its value. Thus, a dotted half note equals three quarter notes [Ex. 1a]. Two dots after a note add to it one-half plus one-fourth of its value. Thus, a double-dotted half note equals seven (4 + 2 + 1) eighth notes [Ex. 1b]. In modern practice, dotted notes

are used only if their value does not extend over a bar line; otherwise tied notes are used [Ex. 1c]. Brahms revived an older practice when he wrote dotted rhythm as shown in Ex. 1d.

II. *In baroque music.* Prior to 1750, the dot was frequently used in a different manner, which has been the object of much investigation and controversy. The only proper conclusion is that in the baroque period the dot indicated a prolongation of undetermined value depending on various factors, such as the character of the

piece, the rhythm of the other parts, the tempo, the performer's interpretation, etc. Statements to this effect are found in practically all theory books written between c. 1680 and 1750. J. J. Quantz, in his *Versuch einer Anweisung die Flöte traversière zu spielen* (1752), seems to have been the first to use the double dot, thus paving the way for a clearer indication of different degrees of prolongation. The following cases of the freely used dot are noteworthy:

(a) If dotted notes are used in conjunction with triplets, the dotted rhythm may be modified (attenuated) into a triplet rhythm [Ex. 2; Bach, Partita no. 1]. According to contemporary writers, however, this modification was not obligatory but was left to the performer's discretion. An interesting illustration is the gavotte from Bach's Partita no. 6 [Ex. 3], where neither

the exact nor the assimilated rhythm can be consistently maintained, since the same dotted figure appears in conjunction with triplet groups as well as with groups of four notes. Consistency in this matter (as in many others) concerned Bach much less than it does the student of today. Dotted notes against or in alternation with triplets are very common in the piano compositions of Schubert, probably with the same meaning as in Bach, since the notation  $\text{♪}_3$  does not occur in these works (was it ever used by Schubert?). See S. Babitz, in *MQ* xxxviii, 533ff; E. R. Jacobi, in *MF* xiii, 268ff; G. Horn, in *RdM* 1935, pp. 27ff; E. Harich-Schneider, in *MF* xii, 35ff (the first two writers in favor of assimilation, the others against it).

(b) According to French writers of the early 18th century, compositions written in "French style" (i.e., the style of the slow section in Lully's French \*overture) call for a more pronounced

rhythm than is indicated in writing, so that a dotted note should be performed almost as a double-dotted value, as in Ex. 4. This rendition, if used with taste and moderation, helps bring out the pompous quality of the French overture style and should be applied, though without ostentatious exaggeration, to pieces such as the

prelude to Bach's Partita no. 6 and the Prelude in E-flat minor from his *Well-Tempered Clavier* vol. i, a composition whose true character is far different from the gentle, somewhat boring lyricism with which it is usually interpreted. On the other hand, some modern writers and performers have gone too far in recommending strict double dotted execution for all sorts of pieces that show a remote resemblance to the style of the French overture (e.g., the D-major Fugue of the *Well-Tempered Clavier*, vol. i).

(c) Another free use of the dot, but less likely to lead to confusion, is illustrated in Ex. 5 (used as early as Kotter's tablature, c. 1515; see *ApNPM*, p. 30).

(d) About 1700 dotted rhythm was also applied to passages written in equal notes. See *Inégales*.

III. *Inverted dotting*. The rhythm that is the reverse of the ordinary dotted rhythm; in other words, a dotted note that is preceded, not followed, by its complementary short value (e.g., ♪ ♪.). This rhythm is generally known as "Scotch snap," because it is a typical feature of the \*strathspey and other Scottish folk tunes. Its use, however, is far more widespread. It is a typical feature of American Negro music and of jazz, and it has been maintained that the syncopated effects of jazz have their origin in the Scotch snap [see under Jig]. On the other hand, inverted dotting is also very common in non-Western music, where the normal dotted rhythm is rather rare. In this connection it is interesting to note that Jacobus of Liège (*Speculum musicae*, c. 1330), in defending the *ars antiqua* against the refinements of the *ars nova*, maintains that iambic rhythm (♪ ♪) is preferable to

trochaic rhythm (♪ ♪) because it is "a rhythm full of strength and harmonizing with nature which is always stronger at the end than at the beginning."

In art music, inverted dotting appears first in French songs of the late 16th century to indicate correct pronunciation [see *ApNPM*, p. 129]. It is extremely common in Italian music of the early 17th century and, in fact, represents one of the most typical embodiments of the exaggerated expressiveness of early baroque music (examples in Caccini, *Nuove Musiche* (1601); toccatas of Trabaci, A. Mayone, Frescobaldi). Italian terms for inverted dotted rhythm are *alla \*zoppa* and *stile lombardo* (Lombardic style). Exceptionally clear examples are found in the works of Sammartini and J. C. Bach, who both lived in Milan, the capital of Lombardy. This rhythm also figures prominently in English music of the 17th century (Blow, Purcell), where it is used effectively to bring out the short but accented first syllables that occur in so many English dissyllabics.

**Double.** (1) The French word *double* is a 17th- and 18th-century term for a simple type of variation, consisting chiefly of the addition of embellishments. It occurs especially in certain dances of the suite (Bach, English Suite no. 1: courante with two *doubles*; English Suite no. 6: sarabande with *double*). See M. Reimann, in *MF* v, vi. (2) The English word "double" indicates either instruments of lower pitch or a combination of two instruments in one. The former meaning, which is derived from the double octave, is exemplified by double bass, double-bass clarinet, double-bass trombone, double bassoon, etc., and the latter by double horn, double trumpet, and double flageolet. See Duplex instruments.

**Double [F.].** Term used by the French clavecinists for the \*turn.

**Double appoggiatura.** See Appoggiatura, double.

**Double aria.** See under Aria V.

**Double bass** [F. *contrebasse*; G. *Kontrabass*; It. *contrabasso*; Sp. *contrabajo*]. Also called *bass viol*, *contrabass*. The largest member of the \*violin family, serving in the orchestra somewhat as a 16-foot organ stop and frequently doubling the cellos in the lower octave. The modern instrument has four strings tuned E<sub>1</sub> A<sub>1</sub> D G, notated an octave higher (E A d g). Some instruments have a fifth string, tuned C<sub>1</sub>, and some have a mechanical device controlled by levers

that extends the range of the E string down to C<sub>1</sub>. The upper limit for orchestral parts is a (notated a'), although virtuosos extend the range of the instrument considerably by the use of harmonics. Famous double-bass players have been D. Dragonetti (1763–1846), G. Bottesini (1821–89), and S. Koussevitzky (1874–1951).

More than any other instrument of the violin family, the double bass has been subjected to modification and experiment in shape, size, number and tuning of the strings, etc. As a matter of fact, the principles of violin-building have never been fully applied to this instrument, which to the present day retains various features of the viol family, e.g., sloping shoulders, flat back, tuning of the strings in fourths rather than fifths, etc. This ancestry is evident also in the names "bass viol" and "double bass," both abbreviated versions of the full name "double-bass viol" [see Viol IV, 1]. In the 19th century, instruments with three strings, tuned A<sub>1</sub> D G or G<sub>1</sub> D A, were in great favor. What these lose in compass they gain in brightness of tone on account of the smaller pressure on the table. Even today there are players (particularly in Europe) who hold the bow in the manner of viol-playing, i.e., with the hand underneath the stick. See M. Grodner, *Comprehensive Catalogue of Literature for the String Bass*, rev. ed. (1964); R. Elgar, *Introduction to the Double Bass* (1960); *id.*, *More about the Double Bass* (1963); E. Halfpenny, "A Note on the Genealogy of the Double Bass" (*GSJ* i).

**Double-bass clarinet, trombone.** See under Clarinet family II; Trombone I (d).

**Double bassoon.** See under Oboe family I D.

**Double C** (D, etc.). See under Pitch names II.

**Double cadence** [F.]. A compound ornament, frequently introduced at cadences in music of the 17th and 18th centuries and consisting of a *cadence*, or trill, upon each of two successive notes. The interpretation of the *double cadence* was quite flexible, its details being left to the discretion of the performer, but the following sequence of notes, in which the first trill is reduced to a five-note turn, is typical:

Ex. a shows how the *double cadence* is indicated in 17th-century music (Chambonnières, D'An-

glebert, etc.), while Ex. b represents the 18th-century notation (Bach, Handel, F. Couperin, Rameau) of the same ornament. The name *double cadence* (or its abbreviation, *double*) was often applied to the turn alone. P.A.

**Double chorus.** Use of two choruses in alternation. See Polychoral style.

**Double concerto.** A concerto for two solo instruments and orchestra, such as Mozart's Concerto for violin and viola, K. 364.

**Double corde** [F.]. Double stop.

**Double counterpoint.** See Invertible counterpoint.

**Double croche** [F.]. Sixteenth note. See under Notes.

**Double cursus.** Term for the immediate repeat of a melody, used particularly in connection with medieval music, e.g., for the repeated sections of a sequence or the restatement of a tenor melody in clausulae or motets.

**Double flat.** See under Accidentals.

**Double fugue.** A fugue with two subjects. The term is applied to two different types. (a) A genuine double fugue consists of three distinct sections, each complete in itself: a fugue on the first subject (I), a fugue on the second subject (II), and a fugue on both subjects in contrapuntal combination (I + II). Probably the earliest examples are among the *ricercars* of Andrea Gabrieli (e.g., *Il Terzo Libro de ricercari*, 1596, nos. 3, 4, 6). Bach employed this structure in the great harpsichord fugue in A minor, in the fugue of the organ toccata in F major, and in the G-sharp minor fugue of the *Well-Tempered Clavier*, vol. ii. The fugue in C-sharp minor from the *Well-Tempered Clavier*, vol. i, represents a somewhat simplified scheme, including the sections I and I + II. His *\*Art of Fugue* contains not only double fugues (nos. 9, 10) but also triple fugues of a similar scheme (nos. 8, 11) and an (unfinished) quadruple fugue. (b) Usually, the term is applied to a much simpler type, i.e., a fugue in which the countersubject has an individual character and is consistently used throughout the piece, combined with the main subject; in other words, fugues represented by the last section only of scheme (a). Examples of this type are quite common but usually they treat the secondary theme more freely than is the case in the double fugue proper. For an example see

the *Well-Tempered Clavier*, vol. i, no. 14 (F-sharp minor). See Double theme.

**Double pedal.** In organ playing, the use of both feet simultaneously (rather than, as usual, in alternation) for rendering intervals or two parts. This technique is documented as far back as 1448 [see W. Apel, "Die Tabulatur des Adam Ileborgh" (*ZMW* xvi)]. As early as c. 1520 Arnolt Schlick wrote a composition, "Ascendo al patrem," in ten parts, six for the hands and four for the feet, each foot playing thirds [see M. S. Kastner, ed., *Hommage à l'empereur Charles-quint*, 1954]. While this was a singular achievement, the double-pedal technique was generally practiced and fully developed by the North German organ masters of the 17th century (Tunder, Reincken, Lübeck) and by Bach, whose organ chorales on "Aus tiefer Not" and "An Wasserflüssen Babylons" have a complete part for each foot. In modern organ pieces octave-doubling is very common. It is also used by organists to exploit the limited resources of smaller organs.

**Double sharp.** See under Accidentals.

**Double stop.** The execution of two or more simultaneous tones (intervals, chords, passages in two or more parts) on the violin and similar instruments. Double-stop technique is already used to a remarkable degree in Ganassi's "ricercars" for viola da gamba (1552; see *HAM*, no. 119) and in the earliest violin sonatas (Biagio Marini [1626]; see *SchGMB*, no. 183). It reaches the peak of artistic perfection in Bach's sonatas for violin solo and the height of brilliant virtuosity in the compositions of Paganini.

**Double structure.** A term describing compositions, mostly of the 15th century, having a *cantus firmus* in two parts simultaneously. There are two main types of double structure: one formed by two different *cantus firmi*, the other by the same *cantus firmus* in canonic imitation. The first type is practically identical with what is generally called a *quodlibet*. An early example is Dufay's motet "Ecclesiae militantis," in which the beginning of the Antiphon "Ecce nomen Domini" [*LU*, p. 317] is supplemented by the first four notes of the Antiphon "Gabriel angelus" [*LU*, p. 1417]; see Ex. A much more complex double structure is found in an anonymous "Alma Redemptoris Mater," which has the complete Gregorian melody in the discant, while the first section of the tenor includes three statements of the passage "tuum sanctorum

Gabriel

genitorem" from the "Alma" and the second section the beginning of "Ave regina" [*DTO* 53, p. 37; see A. Orel, in *StM* vii, 69; J. Handschin, in *MD* v, 102]. A famous example is Josquin's motet "O bone et dulcis," based on a combination of "Pater noster" and "Ave Maria." See also *Quodlibet*. Canonic (or freely imitative) double structure is present in several "L'Homme armé" Masses, e.g., those by Faugues and B. Vacqueras [Editions XXXI, Series I, no. 1; see W. Apel, in *Speculum* xxv]. Josquin's motet "Nymphes, nappés" is based on a canon of the plainsong "Circumdederunt," which recurs in his "Christus mortuus" and "Sic Deus dilexit."

Another example of double structure occurs in what has been termed *Diskant-Tenormesse* [see R. Ficker, in *StM* vii, 22], i.e., a Mass (more accurately, a Mass section) characterized "by the simultaneous use of two *cantus firmi*, one of them ornamented in the upper part, the other usually unchanged in the tenor" [*ibid.*, p. 27]. This type is much more problematic than the others, since its existence rests on the often questionable assumption that a seemingly free upper part actually is a highly elaborate paraphrase of a liturgical melody [see under Discant Mass]. Of the various examples cited by Ficker and others, perhaps the most convincing is the Gloria of an anonymous "O rosa bella" Mass [*DTO* 22, p. 34], which uses both the discant and the tenor of Dunstable's chanson not simultaneously but successively. A similar construction occurs in Dunstable's "Veni sancte spiritus," in which the melody of "Veni creator spiritus" is used alternately in the discant and in the tenor. For another meaning of double structure, see *NOH* iii, 187 (Bukofzer).

**Double theme.** A fugal theme that continues beyond the entrance of the answer, including also the counterpoint to the answer, which is treated as a second theme. This method is frequently employed in early ricercars, by Andrea

Gabrieli [see Ex.; *Ricercari... Libro secondo* (1595), no. 13], Frescobaldi, and others. The fugues described under \*double fugue (b) might better be called fugues with a double theme.

**Double-tonguing.** See Tonguing.

**Double touch.** A modern principle of organ construction, devised by Hope-Jones, which allows the keys of the organ to be depressed in two successive degrees, so that different registrations become available simultaneously on the same manual, e.g., a small group of accompaniment stops on the first touch, and a solo stop on the second. Its application is confined to theater organs. See also Harmonium II.

**Double trill.** A simultaneous trill on two different notes, usually a third apart. Its perfect and rapid execution is one of the most difficult technical feats on the piano as well as on the violin. For the latter instrument it appears as early as the middle 17th century [J. Schop; see A. Moser, in *CP Kretzschmar*]. For the piano, the long double trills in Beethoven's Piano Concerto in G major, op. 58, are among the earliest examples.

**Doucement** [F.]. Gently, smoothly.

**Douloureux** [F.]. Sorrowful.

**Down in the Valley.** Folk drama in one act by K. Weill (libretto by A. Sundgaard), produced at Indiana University, 1948. Setting: America, the present.

**Doxology.** An expression of the glory of God. In the Roman liturgy, the name of two important texts, the Lesser Doxology: "Gloria patri (et filio et spiritui sancto, sicut erat in principio, et nunc et semper et in saeculum saeculorum. Amen)"; and the Greater Doxology: "Gloria in excelsis deo (et in terra pax hominibus bonae voluntatis," etc.). The Greater Doxology is the \*Gloria of the Mass. The Lesser Doxology (D) is a part of all the Introits, which follow the scheme A V D A [see Psalmody III]. It also is added as a final verse to all psalms and nearly all canticles, its last six syllables being indicated by their vowels only, thus: \*Euouae [see also Psalm tones]. It is also used elsewhere, e.g., in connection with the "Asperges me" [LU, p. 11].

In the Anglican rites, doxology usually means the metrical verse "Praise God from whom all blessings flow," which is widely sung to the \*Old Hundredth tune. Also, the last verses of many hymns, as well as the addition to the \*"Pater noster" beginning with "For thine is the king-

dom," are included in the term. See E. Werner, "The Doxology in Synagogue and Church, A Liturgico-Musical Study" (*Hebrew Union College Annual* xix, 1946, pp. 275ff).

**Drag.** See under Percussion instruments B, 1.

**Dragma** [Gr.]. A note form of the late 14th century consisting of a double-stemmed semibreve. It is used, with a variety of meanings, in the theoretical and practical sources of the period. See *ApNPM*, *passim*.

**Dramatic music.** Music written for a drama or play (\*incidental music), particularly incidental music written by Henry Purcell, in order to distinguish it from his only complete opera, *Dido and Aeneas*. See J. S. Manifold, *The Music in English Drama* [1956]; E. D. Rendall, in *ML* i, 135ff; W. Barclay Squire, in *SIM* v.

**Drame lyrique** [F.], **dramma lirico** [It.]. Modern terms for opera, not necessarily of a lyrical character. The English term "lyrical drama" is used in the same way.

**Dramma per musica** [It.]. The earliest name for Italian operas (17th century), particularly serious ones (the later *opera seria*). Bach used the term for secular cantatas in dialogue form that were designed for a modest stage performance (*Der Streit zwischen Phöbus und Pan*, *Kaffeekantate*, etc.).

**Drängend** [G.]. Pressing on.

**Dreher** [G.]. An Austrian dance, similar to the \**Ländler*.

**Drehleier** [G.]. \*Hurdy-gurdy.

**Drehorgel** [G.]. Street organ.

**Dreigroschenoper, Die** [G., The Threepenny Opera]. A play with music by Kurt Weill (libretto by Bertolt Brecht), produced in Berlin, 1928. Setting: London, early 18th century. It is a modern \*ballad opera, based on the plot of John Gay's *The Beggar's Opera* (1728), with attractive music in a sophisticated jazz style.

**Dreiklang** [G.]. \*Triad.

**Dreitaktig** [G.]. In phrases of three measures.

**Drone.** (1) The low pipes of the \*bagpipe. (2) A primitive bagpipe, capable of playing only a few low tones and used to accompany other instruments or voices. (3) In musical composition, long sustained notes, usually in the lowest part (drone bass). See Pedal point; *Bourdon*.

**Drum.** I. Generic name for instruments consisting of skin stretched over a frame or vessel and struck with the hands or a stick (or sticks). Drums therefore are practically identical with the category "membranophones" [see Instruments II]. In some primitive cultures, however, there are drums that have no membrane, consisting simply of a tree trunk hollowed out through a narrow longitudinal slit (slit-drum; see *SaHMI*, p. 29f). These are classified as "idiophones."

II. The membranophonous drums are among the oldest and most widespread of all instruments. They are found in all cultures, among the most primitive African and South American tribes as well as in China, India, Arabia, etc. A gigantic, man-size bass drum is depicted on a Sumerian vase of the third millennium B.C. [see *SaHMI*, pl. IV]. Egyptian drums from about 1800 B.C. have been preserved, and drums are mentioned in one of the earliest Chinese poems, dating from 1135 B.C. Drums existed and still exist in a large variety of sizes and shapes, in the form of a barrel, a cylinder, an hourglass, a goblet, etc.

From the Orient the drum was introduced to the Western world via Greece, where the use of the "tympanon" was restricted to the orgiastic cult of Dionysus and Cybele, and later to medieval Europe, where the earliest evidence is an English 12th-century miniature showing a juggler disguised as a bear and striking with his hands a barrel drum hung around his neck. A famous Spanish miniature of the 13th century [see *Cantiga*] shows the player of an hourglass drum, which he carries on his shoulder. Such forms were probably imported from the Orient during the Crusades. Of greater importance was the introduction, before 1300, of the Arabian *nagarah* (naqqarah), small kettledrums used in pairs and called *nacaires* in France, *nakers* in England, *naccheroni* in Italy. The cylindrical drum appeared about the same time under the name *tabor* or, later, *\*tambourin*. In the 15th century kettledrums as well as side drums were adopted by armies as an indispensable part of military equipment. They remained restricted to this sphere until the 17th century, when kettledrums were first used in the orchestra. For the modern orchestral drums, see Percussion instruments A, 1; B, 1-4.

**Drum-Roll Symphony.** Popular name for Haydn's Symphony no. 103 in E-flat (*\*Salomon Symphonies* no. 11), composed in 1795, so called

because of the drum roll in the opening measure of the Introduction.

**Drum Stroke Symphony.** See Surprise Symphony.

**D.S.** [It.]. Abbr. for *\*dal segno*.

**Dualism; dualistic theory.** A theory according to which the tonalities of major and minor are not in the relationship of "primary" and "secondary" but are phenomena of equal value, one being the inversion of the other. The theory is based on the fact that by reckoning downward the intervals of the major triad, the tones of the minor triad are reached: e.g.,  $c'-e'-g'$  becomes, by strict inversion,  $c'-a\flat-f$ . The dualistic principle is foreshadowed in Zarlino's explanation of the major and minor triad [see Arithmetic and harmonic mean]. It was clearly stated by Rameau (1737), Vallotti (1779), and M. Hauptmann (1853). A. von Oettingen (*Harmoniesystem in dualer Entwicklung*, 1866; *Das Duale Harmoniesystem*, 1913) and H. Riemann (*Das Problem des harmonischen Dualismus* [1905] and his other books on harmony) developed this principle to the fullest extent and made it the basis of harmonic analysis. The accompanying example

serves as an illustration. It will be noted that the "minor dominant" corresponds to the "major subdominant," and vice versa. The greatest shortcoming of the theory lies in the fact that in a minor mode the triad is determined not by its lowest but by its highest tone, i.e., the fifth. Hence, the first chord on the lower staff must not be read:  $f$  (fundamental)- $a\flat$  (minor third)- $c'$  (fifth), but downward:  $c'$  (fundamental)- $a\flat$  (major third)- $f$  (fifth). This awkward explanation contradicts the most elementary facts of acoustics and musical experience. The theory has not gained much ground except within the school of Riemann.

Lit.: A. von Oettingen, *Das duale Harmoniesystem* (1913); S. Karg-Elert, *Polaristische Klang- und Tonalitätslehre* [1931]; D. Jorgenson, "A

Résumé of Harmonic Dualism" (*ML* xlv); H. Westerby, in *PMA* xxix; O. Ortmann, "The Fallacy of Harmonic Dualism" (*MQ* x); C. Dahlhaus, "War Zarlino Dualist?" (*MF* x).

**Ductia.** A medieval instrumental form (13th century) that, according to Johannes de Grocheo, is a shorter *stantipes* [see *Estampie*], i.e., with three to four *puncti* [see *Punctus* (2)] instead of five or more. The term does not occur in musical sources. However, examples of the type exist in the "Danse Real" of the *Chansonnier du roy* [see P. Aubry, *Estampies et danses royales*, 1907] and in several two-part instrumental pieces from the MS Brit. Mus. *Harleian* 978 [see *ApNPM*, p. 239f]. Examples in *HAM*, nos. 40a, 41.

**Dudelsack** [G.]. \*Bagpipe.

**Due** [It.]. Two. *Due corde*, two strings, indicates in violin music that the same tone should be sounded on two strings, for greater volume; in piano music, see *Una corda*. See also *A due*.

**Duenna, The** [Rus. *Obruchenie v monastyre*, Betrothal in a Monastery]. Opera in four acts by Prokofiev (libretto by the composer and M. Mendelssohn, based on R. B. Sheridan's play), produced in Leningrad, 1946. Setting: Seville, 18th century.

**Duet** [F. *duo*; G. *Duett*, *Duo*; It. *duetto*; Sp. *dúo*]. A composition for two performers of equal importance, with or without accompaniment. The most important types are: (a) the vocal duet, i.e., songs or arias for two voices with accompaniment [G. *Duett*]. These play a prominent part in operas, particularly "love duets" (practically the whole second act of Wagner's *Tristan* is a "love duet"). Nonoperatic duets occur in the songs of Schubert, Schumann, Brahms, and many others. An early type of unaccompanied vocal duet is the \**bicinium* of the 16th century. A famous operatic duet of early date is the finale of Monteverdi's *L'Incoronazione di Poppea* (1642; see *SchGMB*, no. 178). In the 17th century the chamber duet (chamber cantata for two singers, with accompaniment) was a much cultivated type. Early examples are by Monteverdi, Marco da Gagliano, and Frescobaldi. See K. Jeppesen, *La Flora* (1949), iii, nos. 27ff; L. Landshoff, *Alte Meister des Bel canto*, 2 vols. [n.d.]; E. Schmitz, in *JMP* xxiii; also *RiHM*, ii.2 and ii.3. There are numerous duets by Steffani (some pub. in Chrysander's edition of Handel and in *DTB* 11) and Durante (some pub. by Cherubini). Examples in *HAM*, nos. 209 (Landi),

257 (Campra), 273 (Durante), 287 (Pergolesi). (b) The instrumental duet, for example, for two violins with or without piano accompaniment [G. *Duo*]. Only a few composers (Rode, Spohr, Romberg) have written such pieces, in which the piano part is usually mere chord-filling. Works in which this part has individual significance, as, for example, in the sonatas by Bach, are called \*trio sonatas. (c) The piano duet, i.e., music for two pianists (four hands), either on the same or on two instruments [see *Piano duet*].

**Dugazon.** See under *Soubrette*.

**Duke Bluebeard's Castle.** See *Bluebeard's Castle*.

**Dulce melos.** See under *Echiquier*.

**Dulcimer** [F. *tympanon*; G. *Hackbrett*; It. *salterio tedesco*]. (1) Medieval stringed instrument, a variety of \*psaltery and almost identical to it in shape but having a flat soundboard, often triangular, with ten or more parallel strings that are struck by small hammers (the psaltery is plucked). Thus the dulcimer and psaltery are related to each other as are their ultimate descendants, the piano and harpsichord. The dulcimer originated in the Middle East (Assyria, Persia), whence it migrated in three directions: (a) to Spain and western Europe, where it appeared as early as the 12th century, as seen in the reliefs of the cathedral in Santiago de Compostela (1184); (b) to Turkey and thence to Hungary, where it still is used by Gypsies under the name \*cimbalom; (c) to China, where it appeared about 1800 and was called yangchyn, i.e., "foreign zither." In the early 18th century Pantaleon Hebenstreit revived the instrument in a greatly enlarged and improved form, the so-called \*pantaleon. Also see *Instruments IV*, A, 1, b. See *MaMI*.

(2) A plucked folk instrument of uncertain ancestry but with features derived from the German Scheitholt and the Swedish \*hummel, played in the southern Appalachian Mountains of the U.S. It consists of an elongated oval sound box of wood, about a yard long and nine inches wide, on which is mounted a narrow fretted fingerboard. In a three-string instrument, one string, tuned C, may be the melody string, while the other two strings, tuned G, sound as a drone bass to the melody. The player lays the instrument flat, across his knees or on a table. Traditionally the strings are plucked with a goose quill. The dulcimer, also called "dulcimore," is generally used to accompany singing and only rarely as a solo instrument.

Lit. *For* (2): J. F. Putnam, *The Plucked Dulci-*

*mer of the Southern Mountains*, rev. ed. (1961); A. W. Jeffreys, *Tuning and Playing the Appalachian Dulcimer* (1958); C. Seeger, "The Appalachian Dulcimer" (*Journal of American Folklore*, 1958, p. 50f); H. C. Mercer, "The Zithers of the Pennsylvania Germans" (*Papers, Bucks County Historical Society*, v, 1926, 483–497).

(2) by E.C.K.

**Dulcina.** Same as *dolcino* [see Oboe family III].

**Dulcitone.** A variety of celesta, with tuning forks instead of steel plates.

**Dulzian** [G.]. Same as *dolcino* [see Oboe family III].

**Dumbarton Oaks.** Concerto for fifteen instruments by Stravinsky (1938), written in the style of a modern concerto grosso. The name refers to the residence of R. W. Bliss near Washington, D.C.

**Dumka** [Rus.; also *dumki*, *dumky*]. (1) A Slavic (especially Ukrainian) folk ballad, poem, or meditation describing heroic deeds. It is generally thoughtful or melancholy in character. (2) A type of vocal music, probably first introduced by K. Kurpiński in "Dumka włóscian Jabłonna" (Dumka of the Jabłonna Peasants; text by J. D. Minasowicz), which he published in his *Tygodnik Muzyczny* (Musical Weekly; 1821). (3) A type of instrumental music involving sudden changes from melancholy to exuberance. Well-known examples are Dvořák's piano trio op. 90 (1891; called *Dumky-Trio*), his *Dumka* (Elegy) op. 35 (1876), and his *Furiant with Dumka* op. 12 (1884).

**Dump, dump.** A type of English 16th-century music known through 15 examples, all instrumental, for keyboard (3), lute (9), or viol (3). The oldest and most celebrated example is "My Lady Careys Dompe" from c. 1525 [see *HAM*, no. 103], a series of continuous variations on a tonic-dominant harmony (T T D D). Nearly all the others show a similar structure, with ground patterns such as T T D T, D T D T, T S D T, etc., one of the exceptions being the "Irishe Dumpe" found in the Fitzwilliam Virginal Book [new ed. ii, 236]. There is no recognizable connection between these pieces and the dump mentioned in literary sources, usually as a lamenting song. See J. Ward, in *JAMS* iv.

**Duo** [F., G., Sp.]. \*Duet.

**Duodecuple scale.** See Dodecuple scale.

**Duodezime** [G.]. The interval of the twelfth.

**Duo imitation.** See Paired imitation.

**Duole** [G.], **duolet** [F.]. \*Duplet.

**Dupla** [L.]. In early musical treatises, the relation 2 : 1, hence, the octave. For *proportio dupla*, see Proportions.

**Duplet** [F. *duolet*; G. *Duole*; Sp. *dosillo*]. A group of two notes to be played in the time of three.

**Duplex instruments.** Instruments, usually of the brass family, that are a combination of two instruments. The two most important members of the class are: (a) The *double euphonium*, which has a wide euphonium bell and a narrow Sax-tromba bell, either of which may be used by manipulating a controlling valve that directs the windstream through one or the other of the bells; thus two different tone qualities are available on one instrument. (b) The *double horn* in F and B-flat, which combines two instruments of the same timbre but of different pitch. The change is effected by an additional valve. Numerous other combinations, mostly of an experimental nature and ephemeral importance, are mentioned in *SaRM*, p. 123f (also pp. 115–17). See also *LawE* ii.3, 1461f.

**Duplex longa.** A 13th-century name for the *maxima* [see Mensural notation I].

**Duplum.** In the organa and clausulae of the school of Notre Dame [see *Ars antiqua*], the part above the tenor. In 13th-century motets this part was called *motetus* because here the *duplum* was provided with *mots* [F., words, i.e., text]. *Triplum* and *quadruplum* are other parts above the tenor, frequently of the same range as the *duplum*. See Organum (2).

**Dur, moll** [G.]. Major and minor. C-*dur*, C major; A-*moll*, A minor; *Dur-* (*Moll-*) *tonart*, major (minor) tonality; *Dur-* (*Moll-*) *akkord*, major (minor) chord; *Dur-* (*Moll-*) *dreiklang*, major (minor) triad. Originally, the names *Dur* and *Moll* stemmed from two different forms of the letter b, the *b durum* (so called on account of its angular shape) and the *b molle* (round shape). Andreas Werckmeister (*Die nothwendigsten Anmerckungen und Regeln* . . . , 1698) seems to have been the first to use the terms *Dur* and *Moll* with their present-day meaning. See C. Dahlhaus, in *AMW* xii.

**Duramente** [It.]. Harshly.

**Durchbrochene Arbeit** [G.]. A technique of writing in which fragments of a melody are given to

different instruments in turn [see Ex.; Haydn]. This technique, which is frequently used in symphonies, quartets, etc., appeared first in the

works of the Mannheim school [see *RiHM* ii.3, 147ff]. A medieval version of this technique is the \*hocket. See also Antecedent and consequent.

**Durchführung** [G.]. The term is used with two different, almost opposite meanings according to whether it refers to sonata form or the fugue. In the former case it means development; in the latter, exposition. Thus, sonata form follows the scheme *Themenaufstellung* (exposition), *Durchführung* (development), *Reprise* (recapitulation), while the scheme of the fugue is *Durchführung* (exposition), *Zwischenspiel* (episode), *Durchführung*, *Zwischenspiel*, etc.

**Durchgangsnote** [G.]. Passing note.

**Durchimitation** [G.]. \*Through-imitation.

**Durchkomponiert** [G.]. \*Through-composed.

**Duret, duretto**. A dance mentioned in some English masque texts (e.g., *Masque of Flowers*,

1614) as well as in Michael Praetorius' *Terpsichore* (1612; p. x), where it is described as a courante named after its composer. The two durettos in *Terpsichore* (nos. 37, 103) and the one in Benjamin Cosyn's Virginal Book are the same composition (in different keys). In some 17th-century German sources *Durett* means \**durezza*.

**Durezza** [It.]. In modern music, *con durezza* means to play with an expression of harshness and determination. In the 17th century, *durezza* meant dissonance. Hence, *toccata di durezza e ligature* (Frescobaldi) meant toccata with dissonances and with tied notes, in a sense, a study in appoggiaturas. The earliest examples occur in the works of G. Macque (d. 1614) and his pupil G. Trabaci, both members of the early \*Neapolitan school of keyboard music.

**Dux, comes** [L.]. In imitative compositions (fugue, canon), the statement and answer of the theme, also called antecedent and consequent.

**Dynamic marks**. The words, abbreviations, and signs that indicate degrees of volume. The most common are: pianissimo (pp); piano (p); mezzopiano (mp); mezzoforte (mf); forte (f); and fortissimo (ff); crescendo (cresc., <) and decrescendo or diminuendo (decr., dim., >); sforzato (sf); forte-piano (fp). See the various entries. For the use of dynamic marks in music prior to 1750, see Expression marks.

## E

**E**. See Letter notation; Pitch names; Hexachord.

**Ear training**. An important field of elementary instruction designed to teach the student to recognize and write down musical intervals and rhythms. See Solfège.

**Ecclesiastical dances**. See Religious dances.

**Ecclesiastical modes**. See Church modes.

**Échappée**. See under Nonharmonic tones I.

**Échappement** [F.]. Escapement (of the piano).

**Echegiatta** [It.]. Baroque term for a composition using \*echo effects.

**Échelette** [F.]. Xylophone.

**Échelle** [F.]. \*Scale.

**Echiquier** [also *eschiquier*, *eschequier*, *eschaquier*, *escacherium*, *exaquir*]. An early stringed keyboard instrument mentioned in various literary sources of the 14th and 15th centuries. In a letter written by King John I of Aragon, who tried to obtain such an instrument from Duke Philip

the Bold of Burgundy (1387), it is described as an "instrument semblans d'orguens qui sona ab cordes" (similar to the organ but sounding with strings). The same instrument is probably meant by the English *chekker* and German *Schachtbrett* (i.e., *Schaftbrett*, quillboard, not chessboard as has frequently been suggested) which is mentioned in a poem, "Der Minne Regeln," by Eberhard Cersne (1404). Both the etymology of the name and the nature of the instrument are obscure. According to C. Sachs it was an upright harpsichord [see *SaHMI*, p. 336f], while F. W. Galpin identifies it with a 15th-century instrument called *dulce melos*, for which he readopts the theory advanced by Bottée de Toulmon (*Dissertation sur les instruments de musique*, 1840) that it was a clavichord with a hammer action anticipating that of the piano [see *GD*, Suppl. Vol., p. 118; *GDB* ii, 194-95]. In the original description, however, no hammers, only a checking device, are mentioned. See W. H. Grattan Flood, in *ML* vi, 151; G. Le Cerf, in *RdM* 1931, p. 1.

**Echo.** Echolike effects occur frequently in the polyphonic works of Josquin and his followers, as the result of a special technique called \*paired imitation. However, it was not until the end of the 16th century that the echo was exploited as a source of variety and of realistic effects. One of the earliest examples is Marenzio's madrigal "O tu che fra le selve," in which the line "Mi risponde, non son d'amanti esempio" is answered by the echo "Empio" ("... example," "empty"). Lassus, in his famous "O la, o che bon echo" (*Libro de villanelle*, 1581; F. X. Haberl and A. Sandberger, ed., *Orlando di Lasso. Säm(m)tliche Werke*, 21 vols. [1894-1926], x, 140ff) exploits the humorous effect of a constantly repeated echo in a most skillful manner. Echolike repetitions of short motifs, often marked *f* and *p*, are among the most typical devices of the organ style of Sweelinck, Tunder, Reinken, Buxtehude, Nivers, Gigault, etc. A number of unpretentious Echoes for organ are found in the *Liber fratrum cruciferorum Leodien-sium* of 1617 [\*Editions I, 10]. Of particular interest are the echo effects in 17th-century vocal pieces (operatic arias, cantatas) in which the personified Echo answers the laments of the deserted lover, the distressed fugitive, etc. A beautiful example is in Carissimi's oratorio *Jephthe* [see *SchGMB*, no. 198; also *RiHM* ii.2, 35ff]. A charming instrumental echo piece by J. K. F. Fischer is reproduced in *DdT* 10, p. 84.

For an echo effect in Bach, see the last movement (Echo) of his Partita in B minor (*Clavier-Übung*, vol. ii, 1735). Mozart wrote a very ingenious *Notturmo en Écho* (1777) in which four groups of players produce a quadruple echo. Numerous 19th-century opera composers used the echo repetition of military signals, hunting calls, etc. (Beethoven, *Fidelio*; Wagner, *Tristan*). See T. Kroyer, "Dialog und Echo in der alten Chormusik" (*JMP* xvi).

**Echo attachment.** A special valve attached to brass instruments (horns, trumpets, cornets) whereby a bell with a smaller opening is brought into use. The tones thus produced sound as if they were played from a great distance.

**Echos** [pl. *echoi*]. In ancient Syrian and Byzantine chant, a system of tonal classification that corresponds to the system of modes [see Church modes] of Roman chant. The *echoi* existed in the same number—eight—as the Western church modes and were collectively referred to as *oktoechos* (eight *echoi*). They differed from the modes in that they were not abstract scale formations but melodic formulas that included the characteristic features (tonic, cadential endings, typical progressions) of all the melodies written in one *echos*. Thus they are \*melody types.

The earliest mention of the *oktoechos* is found in a Syrian source of about 515 [see Syrian chant], 300 years before the earliest account of the eight church modes, which were probably derived from the Syrian (or Byzantine) *echoi*, possibly by amalgamation with the ancient Greek system of octave species (*tonoi*; see Greece II). Various other Eastern churches, e.g., the \*Armenian, \*Russian, and Serbian, still use a classification based on *echoi*, i.e., melodic formulas, rather than modes, i.e., scales [see *ReMMA*, p. 101f; *GD*, Suppl. Vol., p. 174f, 181; *GDB*, ii, 863f, 870].

It is believed that some traces of the early *echoi* are preserved in the *enechemata* of 12th- and 13th-century Byzantine MSS, which were sung as an intonation to the chant proper much as a pianist sometimes strikes a few chords in order to "establish the key." Each *enechema* was sung to certain syllables whose meaning is obscure; e.g., the *enechema* of the first plagal mode was d-f-e-d and was sung to the "word" *Aneanes* [see *ReMMA*, p. 87; see also *Anenaiki*; *Noeane*; *Solmization*].

Lit.: E. Werner, "The Oldest Sources of Octave and Octoechos" (*AM* xx); *id.*, "New Studies in the History of the Early Octoechos"

(CP 1952); E. Wellesz, "Die Struktur des serbischen Oktoechos" (ZMW ii); C. Høeg, "L'Octoechos byzantin" (CP 1950, p. 107); P. J. Thibaut, in RMC i; O. Strunk, "Intonations and Signatures of the Byzantine Modes" (MQ xxxi); *id.*, "The Antiphons of the Oktoechos" (JAMS xiii).

**Éclatant** [F.]. Brilliant, sparkling.

**Eclogue.** An idyllic poem in which shepherds converse (after the model of Virgil's ten *Bucolic Eclogues*). In the 16th century such poems were frequently written in the form of dramatic plays and performed on the stage, particularly in Spain. These presentations, which probably involved music, are believed to be among the precursors of opera. See A. Salazar, in PAMS 1938, pp. 98ff. Modern composers have used the term "eclogue" (eglogue) as a title for compositions of an idyllic, pastoral character.

**Eco** [It.]. Echo.

**École d'Arcueil.** A group of 20th-century French musicians (Henri Sauguet, Roger Desormière, Maxime Jacob, Henri Cliquet-Pleyel) named after Arcueil, the home of Erik Satie, whom they considered their leader. The group was founded in 1923 [see N. Slonimsky, *Music Since 1900* (1937), p. 236]. See also *Six, Les*.

**Écossaise** [F.]. A dance that, despite its name, has nothing in common with genuine Scottish dance music [\*reel, \*strathspey], but belongs to the category of English \*country dances. It appeared about 1780 in England and France and was very popular in the early 19th century. Beethoven as well as Schubert wrote collections of *écossaises*, all in quick 2/4 time. See Dance music IV.

**Ecphonetic notation.** Term for certain primitive systems of musical notation, consisting only of a limited number of conventional signs designed for the solemn reading of a liturgical text. Originally they were simply signs added to the text in order to clarify its sentence structure, comparable to present-day punctuation marks. Signs also were added to individual syllables or words of importance that were to be emphasized. Later these signs adopted a musical significance. The punctuating signs developed into more or less elaborate musical formulas whose exact nature is now obscure, while the accentuating signs became associated with a raising or lowering of pitch [see Neumes II]. Unlike the neumes of Roman, Byzantine, and Mozarabic chant, the ecphonetic signs do not indicate a continuous

melody of free design, since they occur only sporadically, usually at the beginning and end of a phrase. They probably represent a type of singing similar to Gregorian psalmody.

Ecphonetic signs occur in Syrian, Jewish, Byzantine, Armenian, and Coptic manuscripts from c. 600 to 1000 and later. In Jewish chant they developed into fuller musical notation, the *ta'amim*, which is used to the present day [see Jewish music]. Especially important are the Byzantine signs, e.g. / ~ \ +, whose meaning has been greatly clarified by C. Høeg [see the reproduction in *BeMMR*, p. 32]. See Notation II; Byzantine chant III.

**Ecuador.** The history of European music in Ecuador dates from the establishment in Quito of a Flemish Franciscan order (1535), where Fray Jodoco taught Indians how to play keyboard and various stringed and wind instruments, as well as giving instruction in mensural notation and plainchant. In 1555 the Franciscans founded the Colegio de San Andrés, where the first native musicians were trained. One of them was Diego Lobato (c. 1538–c. 1610), who became the musical director of the Cathedral of Quito in 1574. His *motetes* and *chanzonetas* are mentioned in some documents of the period but have not yet been found. In 1588 he was succeeded by Gutierre Fernandez Hidalgo (1553–c. 1620), who had previously served two years as musical director in Bogotá [see Colombia] and was re-engaged in 1590. After him a long series of organists, choirmasters, and composers occupied this position until 1682, when a distinguished composer, Manuel Blasco, was appointed. Blasco was the foremost figure of music in colonial Ecuador after Fernandez Hidalgo. His works include an *Officium defunctorum* (1681), *Laudate Dominum, a 12* (1683), *Magnificat*, *Sedet a dextris meis*, and two *villancicos*, preserved in Bogotá. José Ortuño de Larrea (d. 1722), member of a large family of musicians that had had a monopoly of the cathedral posts in Quito during the 17th century, succeeded Blasco in 1696.

During the 18th century Quito was replaced by Guayaquil as the center for church music. The 19th century was musically unproductive, with only a few exceptions, such as Agustín

Baldeón (d. 1847), the first Ecuadorian to write symphonic music. In 1870, a musician of German ancestry, Antonio Neumann (1818–c. 1890), wrote the national anthem and became the first director of the Conservatorio Nacional de Música at Quito, founded in the same year.

The first composer to employ native elements in art music was an Italian, Domenico Brescia, who was director of the Conservatory from 1903 to 1911. His works include a successful *Sinfonia Ecuatoriana*. Two of his disciples, Segundo Luis Moreno (b. 1882), who wrote numerous piano compositions, songs, and orchestral works inspired by native idioms, and Luis H. Salgado (b. 1903), composer of the symphonic suite *Atahualpa*, a concerto for viola and orchestra (1955), the operetta *Ensueños de Amor*, and many other works, are the leading figures of contemporary Ecuadorian music. A contemporary of theirs, Pedro Traversari (b. 1874), has written music in the romantic tradition, in some cases using subjects based on native legends, as in his melodramas, *Cumanda*, *The Prophecy of Huiracocha*, and *Kizkiz*. A representative of the younger generation is Mesías Maiguascha (b. 1938), who studied in Buenos Aires with Ginastera and has written a Suite for string quartet that is largely atonal and shows no use of folk elements.

The traditions of Indian music are well preserved in Ecuador. European influences have brought only slight modifications to the aboriginal scales and rhythms and to the choreography of dances as described by the first Spanish chroniclers. The *\*cachullapi*, *danzante*, and *santjuanito* (or *\*huaiño*) are highland dances that still preserve many elements of their original Indian models, namely, the use of short motifs in duple meter and the prevalence of the pentatonic scale. In the coastal areas the Hispano-Creole traditions are more often encountered in such forms as the *\*pasacalle*, *\*pasillo*, and *\*zamba*. They tend to use 6/8 meter in alternating divisions of two and three pulsations to a measure.

**Editio Medicea; Ratisbonensis; Vaticana.** See under Liturgical books II.

**Editions, historical.** Under this heading, which corresponds to the German term *Denkmäler*, is a list of important serial publications of early

music. Volume titles are in roman, but are in italics for books not containing music. Editorial information is found in brackets. For spellings of titles of works and composers' names, the sources themselves have been followed exactly. B indicates ballet; I, instrumental; K, keyboard; L, lute; M, masque; Op, opera; Or, oratorio; S, song (solo, cantata, duet, etc.); V, vocal.

17. R. Johnson, Ayres, Songs and Dialogues, ed. Ian Spink.
18. T. Greaves, G. Mason, J. Earsden, Songs (1604) and Ayres (1618), ed. Ian Spink.

**XVIII. *Das Erbe deutscher Musik*** [Continuation of *DdT*, various editors, 1935—; earlier volumes in the process of being reprinted. Two series: *Reichsdenkmale*, i.e., documents of general importance; *Landschaftsdenkmale*, i.e., documents of chiefly local importance, discontinued 1942].

*A. Reichsdenkmale* has two numbering systems: (1) by the consecutive numbering of the whole *Reichsdenkmale*. This numbering is listed first. (2) By 10 regular and one special series (orchestral music, Orch; motets and Masses, M-M; Middle Ages, MA; opera and song, Op-S; chamber music, Cham; oratorio and cantata, Or-Cant; polyphonic vocal music, Poly V; organ/keyboard/lute, O/K/L; early romantic, E Rom; selections of one composer, Select of; special or miscellaneous series, Sp Ser). The vols. of each series are numbered consecutively, though not always correctly. After volume 23, with the exception of 25, the name *Reichsdenkmale* is abandoned.

- 1 (Sp Ser 1). Altbachisches Archiv, erster Teil: Motetten und Chorlieder, ed. M. Schneider [V].
- 2 (Sp Ser 2). Altbachisches Archiv, zweiter Teil: Kantaten, ed. M. Schneider [S].
- 3 (Cham 1). J. C. Bach, Sechs Quintette/Op. 11, ed. R. Steglich [I].
- 4 (MA 1). Das Glogauer Liederbuch, erster Teil: deutsche Lieder und Spielstücke, ed. H. Ringmann [V, I].
- 5 (M-M 1). L. Senfl, Sieben Messen zu vier bis sechs Stimmen, ed. E. Löhner und O. Ursprung [V].

**Education.** See Music education.

**Eglogue.** \*Eclogue.

**Egmont.** Incidental music, op. 84, composed by Beethoven in 1810 for Goethe's play. The overture is often played alone.

**Egualé.** See Equale.

**Egypt.** Archaeological findings and pictorial representations (mainly tomb paintings and reliefs) provide a surprisingly complete story of Egyptian music for a period of several thousand years. As early as the 4th millennium B.C. clappers and rattles give evidence of a primitive ritualistic music that served primarily to exorcise evil spirits. During the Old Kingdom (3rd to 10th dynasties; c. 2778–c. 2160 B.C.) harps with small bow-shaped resonators, long vertical flutes (end-blown, without a fipple), and double clarinets appeared. Tomb reliefs and paintings show groups of players together with singers, dancers, and men making signs with their hands or fingers, to indicate either some melodic motion or rhythm, possibly in connection with a primitive type of polyphony. From the Middle Kingdom (11th to 17th dynasties; c. 2160–c. 1580 B.C.) evidence of barrel-shaped drums and asymmetrical lyres has been found, the former perhaps imported from sub-Saharan Africa, the latter from Asia. Studies of flutes dating from about 1800 B.C. suggest melodies moving in rather large intervals, e.g., d–f–a–b [see C. Sachs, in *AMW* ii]. Toward the end of this period the long-necked lute appeared. The New Kingdom (18th to 20th dynasties; c. 1580–c. 1085 B.C.) saw a great flowering of music. The older instruments appeared in new forms, often splendidly decorated. A wall-painting from the tomb of Paser (c. 1450) shows an upright harp as tall as a man as well as a \*kithara. Among the new instruments are double oboes, trumpets, short lutes, and the \*sistrum. Particularly famous are the silver and gold trumpets found in the tomb of Tut-ankh-amen (fl. c. 1350 B.C.). Melodies seem to have moved in smaller intervals than before. Evidence of antiphonal and responsorial singing, of men's and women's choruses, of strophic songs and of liturgical music has been found. During the so-called Late

Period (21st to 30th dynasties; 1085–332 B.C.) Egypt was dominated by foreign rulers—Libyan, Ethiopian, Assyrian, and Persian. There is relatively little information about the music of this period. Under Persian rule (525 B.C. and later) attempts were made to eliminate foreign influences and restore the old tradition, but they led merely to stagnation. Hieroglyphic inscriptions indicate the names and occupations of numerous musicians, one of the earliest being Chufu'Ankh, a singer, flutist, and director of court music c. 2500 B.C.

Following its conquest by Alexander the Great in 332 B.C., Egypt came under Greek domination. To what extent Egyptian music was influenced by Greek music is difficult to estimate. The Greeks, however, adopted a number of Egyptian instruments, notably the sistrum, when they took over the Isis cult. A notable event of the Ptolemaic period was the invention of the \*hydraulos, constructed by a Greek engineer working in Alexandria. From 30 B.C. to A.D. 395 Egypt was a Roman colony, and from A.D. 395 to 640 a part of the Byzantine Empire. In the early Christian era, Alexandria was an important center of Christian worship and psalm-singing (Clement of Alexandria, c. 150–c. 220). Eventually the \*Coptic Church was established. From 640 to 1517 Egypt was dominated by the Arabs, and from 1517 to 1873 by the Turks. During this long period Egyptian music was almost completely under Arab influence, but in time it developed certain indigenous traits, e.g., a scale consisting of 24 quarter tones (established about 1860 by M. Meschāqa in Damascus, introduced in Egypt in 1905 by Kamel al-Kholay). In 1871, the opening of Cairo's new Opera House was celebrated with the first performance of Verdi's *Aida*. In the 20th century Egypt's music came under the influence of Western Europe. However, a conservative group continues to cultivate the older Arab styles [see Arab music].

**El Amor Brujo.** See *Amor brujo*.

**Élargissent** [F.]. Broadening in speed.

**Electronic instruments.** Generic term for musical instruments in which the tone is produced, modified, or amplified by electronic circuits. Electronic instruments are a comparatively recent development. The first such instrument, the Telharmonium of Thaddeus Cahill, was made about 1904, and truly practical types only began to appear in the 1920's.

Electronic instruments may be divided into two groups: those in which the tone is generated by electronic circuits and those in which the tone is generated by such conventional means as strings or reeds and then subjected to modifications in loudness and timbre by electronic circuitry. A third group of instruments comprises those used in \*electronic music; since these devices generally are not played by performers but are employed by the composer in the creation of the music itself, they are discussed in that article rather than here. [See also Computer; Synthesizer.]

I. *Instruments using conventional tone generators.* The more familiar electronic instruments are mostly members of the second group. In some types, such as the electronic flute and electronic saxophone, a small microphone is mounted on the instrument. The output of this microphone is conducted by cables to an amplifier that increases its strength (and often modifies its character) and then to a loudspeaker that converts the electrical signal back into sound waves. In such stringed instruments as electric guitars, the vibrations of the strings are converted to electrical signals by either of two types of pickup. In the electromagnetic system, a tiny coil is mounted near the string, but far enough from it to prevent contact as the string vibrates. When the string is plucked, its vibrations generate alternating current in the coil. In the electrostatic system, the coil is replaced by a simple conductor and the string itself is charged. As the string vibrates, variation of the distance between it and the conductor generates alternating current. In both systems, the signal produced by the pickup is amplified and converted into sound waves in the manner described above.

Electronic amplification makes it possible not only to obtain great volume from a small instrument but also to control the characteristics of its tone. Harmonics may be altered in intensity or omitted altogether, thus changing the timbre of the original sound, and the dynamic envelope of the tone may be controlled to vary the apparent manner of generation and decay—e.g., the percussive impact of a finger or a piano hammer on the string may be eliminated so that the tone builds up gradually. By such means, a plucked string may be made to produce sonorities resembling those of a bowed string or even a wind instrument. In addition, the sustaining power of the instrument may be greatly increased.

Because the electromagnetic and electrostatic

pickup systems do not rely on the vibration of a conventional soundboard, electronic instruments can be built that are much smaller and less expensive than such conventional instruments as pianos and double basses. Electronic stringed instruments (violins, violas, cellos, basses) usually consist of skeleton frameworks just sufficient to support the fingerboard, bridge, and strings (and to afford some guidance to the player's hand), with nonmicrophonic (usually electrostatic) pickups attached to the bridge. In one type of electronic piano, struck reeds replace the strings. A chromatic kettledrum invented by B. F. Miessner consists of thirteen short bass viol strings that are stretched over a rectangular frame and tuned in semitones. When the strings are struck with ordinary kettledrum sticks their vibrations, picked up electrostatically and amplified through a suitable loudspeaker, produce sounds closely resembling those of conventional kettledrums.

Electronics makes it possible to obtain from small and inexpensive devices sounds resembling those produced by bells weighing many tons. One form of electronic carillon consists of a set of coiled steel reeds similar to those used in clocks. It is played in the same manner as the piano, and an amplifying system increases the volume to any degree desired. Another form utilizes loosely suspended lengths of piano wire. The latter has proved especially successful in reproducing the nonharmonic partials characteristic of bells.

II. *Instruments using electronic tone generators.* The purely electronic instruments, with only a few exceptions—of which the Hammond organ is the most important—use electronic oscillators (circuits capable of producing an alternating current of a given frequency) as tone generators. The instruments of this type may be divided into two subgroups, those in which there are a number of oscillators, which permit the performance of polyphonic music, and those in which the frequency of a single oscillator is varied to produce different pitches; the instruments of the second subgroup are capable only of performing monophonic music. Most of the instruments of both types have keyboards, and the *Ondes Martenot* (or *Ondes musicales*), a monophonic instrument, has, in addition, a sliding ribbon that permits glissandi and the sounding of intermediate pitches.

The *Hammond organ* generally resembles a spinet in size and shape but has two manuals and a pedal board. It generates electrical oscillations

by means of small, motor-driven rotary generators that produce alternating current at frequencies corresponding to those of the tempered scale. The instrument has harmonic controls that provide a very large number of timbres, some of which are preset.

The *novachord*, a single-manual instrument that also resembles the spinet in form, employs a purely electronic tone-generating system. Twelve vacuum-tube oscillators operate at the frequencies of the highest octave of the instrument. There is a separate oscillator for each note of the chromatic scale, and associated with each oscillator are five frequency-dividing circuits, each of which operates at one-half the frequency of the preceding tube. Thus one oscillator and the five dividers associated with it supply the six octaves of one note of the scale. Controls mounted on a panel above the keyboard provide different tone colors and vary the tonal envelope to produce either percussive effects, similar to those of the piano, or sustained tones, similar to those of stringed or wind instruments. The principles of the novachord are employed in a number of different electronic organs.

One of the first electronic instruments to attract public attention was the *Theremin*, invented about 1924 by the Russian scientist whose name it bears. This instrument uses a radio-frequency beat system of tone generation based on the interference between the outputs of two oscillators. One oscillator operates at a fixed frequency and the other at varying frequencies determined by the proximity of the player's hand to a short rod antenna, which is charged with alternating current from the second oscillator. The difference between the frequencies of the two oscillators produces a "beat"—i.e., a third frequency, which is the audio-frequency that operates the loudspeaker. The volume of sound is controlled in a similar manner by the player's other hand. A serious defect of this instrument in its earliest form was its inability to change from one pitch to another without an intervening glissando, but that defect was remedied to some extent in later models by means of an improved volume control. The *Ondes Martenot* operates on a similar principle, as does the *Trautonium*. Originally, the Trautonium was operated by the hands in the same manner as the Theremin, but later a metal string was placed over a metal rail having marks to indicate where the string should be pressed on the rail for the correct pitches of the tempered scale.

E.M.R.

**Electronic music.** Music made by producing, modifying, and recording sound, and reproducing it by electroacoustical means. Electronic music has become very important since World War II, both because of the new techniques it uses [see III below] and because its new resources are linked with new concepts of music and aesthetics.

Electronic music traditionally means music made up of sounds created exclusively by electronic means, as distinct from *musique concrète*, which is made by recording sounds that already exist. However, this distinction is not always clear, because today composers may combine the use of both natural and electronically produced sounds. [See *Musique concrète* for further differences.]

I. *History.* Electronic music in Europe grew out of research by the post-Webern generation in the years 1950–54 and was, at least in the beginning, closely tied to \*serial music. Its chief pioneers were the composers K. H. Stockhausen, H. Eimert, G. Ligety, and G. M. Koenig at the West German Radio studio in Cologne, L. Berio and B. Maderna in the Italian Radio studio at Milan, and H. Pousseur at both centers. The scholars W. Meyer-Eppler, F. Winckel, and A. Lietti contributed greatly, both technically and theoretically, to their research. The *musique*

*concrète* studio of the French Radio in Paris, although not involved with the concerns of the first electronic composers, nevertheless greatly assisted in the creation of electronic-music studios, not only because it preceded them (1948) but also because it had already examined some important problems relating to the new methods.

In the United States, after independent research that in the early 1950's was called "tape music," involving such pioneers as V. Ussachevsky, L. and B. Baron, J. Cage, and others, several studios were formed, the most important of which was at Columbia University in New York, directed by Ussachevsky and Otto Luening. This studio, which actually included three studios of complementary equipment, was open to all directions of research and composition, including serial music, notably that of M. Babbitt. Among the other important American centers are the studios of the University of Illinois at Urbana, the San Francisco Tape Center, and the studio of Brandeis University. In Europe, important studios are in Munich, Brussels, Warsaw, and elsewhere, and in Japan the electronic-music studio of the NHK in Tokyo is very active.

II. *Principles.* The reasons behind the use of electronic methods of composition are multiple, even divergent, and may be formulated in a new and different way with each work. In the beginning, however, a fundamental idea inspired electronic music, the idea of the unity of musical thought and musical material. It was then—and is now—a matter of the sounds themselves generating the structure of a composition. To go beyond fixed scales (notably the well-tempered scale) and create specific scales for each work, to compose sound spectra, thus giving a necessary structural role to the timbre, to realize with maximum precision the demands of a new musical syntax, especially with regard to the duration of intensities, the differentiation of which goes beyond the capabilities of the performer—these were some of the motives that at first justified recourse to the field of electronic music. This field in turn revealed latent resources that musical theory had to absorb and exploit, which in turn influenced the studios to the point of a radical revision. Today the need for going beyond static principles is making itself felt in most of the studios. It is only when automation is extended to all dimensions of sound and all stages of composition, made possible through the introduction of new electronic devices, that electronic music will reach a complexity com-

parable to that of nature. Some European and American studios are currently moving in this direction.

III. *Equipment and techniques.* Owing to considerable differences in concepts, equipment, and development among the studios throughout the world, the installations and basic techniques of electronic music can be described only in a very general way. They include, theoretically, three essential steps that correspond to the phases of creation of a composition: (1) generation of material; (2) transformation of material; and (3) recording. All these steps are, of course, simultaneous.

(1) The generation of electronic material (to which nonelectronic material may be added) is of two kinds: synthetic and analytic. The first uses sinus tones furnished by oscillators as wanted. The synthesis of the sinus tones, variable in number, duration, and intensity, allows the creation of more or less complex spectra. Different modifications can intervene at this stage. The second method, which can be combined with the first, calls for "white noise," a statistical mixture of all audible frequencies furnished by a white-noise generator. By means of electroacoustical filters, more or less wide frequency bands can be isolated from this spectrum, even to the selection of a single frequency; this process hence is the inverse of the first.

(2) The transformation of materials is of several kinds: variation of speed of the magnetic tape, simple (causing a variation in frequency of the recorded sound) or of the Springer type (without variation in frequency); filtering the frequency (filtering the octave, the third, the pass-band) and the amplitude; modulations (of frequency, of amplitude, etc.); reverberation (natural echo chambers or electronic ones), etc.

(3) Recording on tape recorders. The base speed of the output of the tapes in electronic studios today is virtually standard, at 15 inches per second. Tape recorders are synchronized at one, two, or four channels of independent amplification.

The techniques now in use tend more and more to bring about simultaneity in these three operations and to substitute automation for manual putting together of their results. One of the first attempts in this direction was made by the studio of Columbia University-Princeton in New York with the *synthesizer*, which uses a rudimentary system of programming on a perforated tape. Recent interest centers on the use of electronic computers for this purpose.

Electronic music poses important problems with respect to the listener. A traditional concert-hall performance appears inadequate to many composers. The new music seems to call for new listening conditions that are more appropriate to its stereophonic dimensions, and even more important, allow freer modes of audience contact in both time and space (permanent diffusion, free entry and exit, free movement of the audience inside the auditorium), conditions that have already been clearly expressed by numerous composers.

Mathews, "The Computer Music Record Supplement" (*Gravesaner Blätter*, ser. vi, xxvi, p. 117, and including a disk recording of musical examples). For additional bibl. see Electronic instruments. A.B.

**Electropneumatic action.** In organs, a system of key action, developed in the late 19th century and widely prevalent today, in which the pipe valves in the wind chest are opened by pneumatic motors actuated by electrical impulses from the keys. See Organ II, XI. C.B.F.

**Elegie für Junge Liebende** [G., Elegy for Young Lovers]. Opera in three acts by H. W. Henze (libretto by W. H. Auden and C. Kallman), produced (in German) in Schwetzingen, 1961. Setting: Austrian Alps, early 20th century.

**Elegy** [G. *Elegie*]. A plaintive poem; hence, a musical composition of a mournful character.

**Elektra.** Opera in one act by R. Strauss (libretto by H. von Hofmannsthal, based on Sophocles' tragedy), produced in Dresden, 1909. Setting: courtyard in royal palace of Mycenae, after Trojan War. Strauss has set this story of hate and murder to most brutal and violent music, a relentless piling up of intense orchestral effects from which there is only occasional relief, as in the scene of recognition between Elektra and Orestes.

**Elevation** [L. *elevatio*; It. *elevazione*]. (1) The music played during the Elevation of the Host. It consists of either a motet or an organ piece. A "Toccata per l'elevazione" and other similar pieces are in Frescobaldi's *Fiori musicali* (1635). See Offertory. (2) See Appoggiatura, double II.

**Eleventh.** See under Interval. Eleventh chord, see under Ninth chord.

**Elijah.** [G. *Elias*]. Oratorio by Mendelssohn to words from the Old Testament, produced in the English version at the Birmingham Festival, 1846, and in the German version at Hamburg, 1847.

**Elisir d'amore, L'** [It., The Elixir of Love]. Opera in two acts by Donizetti (libretto by F. Romani), produced in Milan, 1832. Setting: Italian village, early 19th century.

**Elmuahim, elmuarifa.** Terms used by 13th-century theorists [see CS i, 339, 341] to denote the *semibrevis*, which has the shape of a rhombus. They come from Arabic *al ma' luma* and *al ma' rufa*, "the known thing," terms meaning "rhombus" that were used in Arabic translations of Euclid. See J. Handschin, in *ZMW* xiv, 321, 322n; J. Chailley, in *CP Apel*; H. G. Farmer, in *Journal of the Royal Asiatic Society* (1925), p. 76.

**El Salvador.** Art music in El Salvador dates from the mid-19th century. The first composer trained in European music was José Escolástico Andrino, a native of Guatemala who came to El Salvador in 1845 and the next year organized the first symphony orchestra. During the second half of the 19th century a number of Italian-born musicians came to El Salvador, among them Juan Aberle, who wrote the music for the national anthem and in 1883 established a fortnightly music review, *Ilustración Musical Centro-Americana*.

The first native composer of importance was Wenceslao García, who wrote an opera, *Adela*. Many of his contemporaries and immediate successors wrote short instrumental dances,

most of them for piano, and popular songs and marches.

The most distinguished Salvadoran composers of the 20th century are Ciriaco Jesús Alas (1866–1952), composer of an *Obertura Patriótica* for band; Domingo Santos (1892–1951), who wrote six Requiem Masses, three piano sonatas, two overtures, and several instrumental marches; María de Baratta (b. 1894), an outstanding scholar of folk music whose numerous compositions of native inspiration include an opera-ballet (*El Fuego Nuevo*), and *Nahualismo* and *Danza Sagrada*, both for orchestra; and Esteban Servellón (b. 1921), who is also the conductor of the El Salvador Symphony Orchestra, established in 1922, and author of a Suite for strings, a symphonic poem, *Falton*, and several compositions for piano. An outstanding representative of the young generation is Gilberto Orellana (b. 1942).

Folk music in El Salvador is very much like that of the rest of Central America. The *danza*, *\*pasillo*, and *\*marcha* are the most popular forms. Also see under Latin America. J.O-S.

**Embellishment.** (1) Same as ornamentation. (2) Same as auxiliary tone; see Nonharmonic tones I.

**Embolada** [Port.]. A type of Brazilian folk singing that involves alliteration and onomatopoeias sung very fast and requiring enormous skill in diction. Each syllable of the text is set to one note in patterns of rapid sixteenth notes. Villa-Lobos frequently used the term as a title for instrumental pieces written in a fast toccata-like manner. J.O-S.

**Embouchure** [F.]. (1) The proper position of the lips in the playing of wind instruments (also called "lip," "lipping"). It is sometimes misspelled "embrochure." (2) The mouthpiece of a wind instrument, especially of the brass instruments and the flute.

**Emiola, emiolia.** See Hemiola.

**Emmeles** [Gr.]. Early medieval term of uncertain or at least variable significance. In the 10th-century *Alia musica* it is explained as a whole tone that may be sung below or above the octave, fifth, or fourth [see GS i, 129a]. This would include the use of the *subtonium* and formations such as d-a-b-a (beginning of many antiphons of the first mode). According to Engelbert of Admont, *emmeles* is the difference between two consonances, such as a fifth and a fourth [GS ii, 320]. Hugo Riemann's statement that *emmeles* is

a term for the fifth and fourth is without foundation [see H. Riemann, *Geschichte der Musiktheorie im IX.-XIX. Jahrhundert*, 2nd ed. (1918), p. 338; English translation by R. H. Haggh (1962), p. 289].

**Emperor Concerto.** Popular name for Beethoven's Piano Concerto in E-flat, op. 73 (1809), suggested by the grandeur of the work. The first movement opens with an unusual improvisatory introduction played by the pianist and has a written-out \*cadenza. Particularly noteworthy is the transitional passage linking the slow and the final movements.

**Emperor Quartet** [G. *Kaiserquartett*]. Haydn's String Quartet in C, op. 76, no. 3, so called because the slow movement consists of variations on the "Emperor's Hymn," formerly the national anthem of Austria, which was composed by Haydn (as a four-part chorus) in 1797.

**Empfindsamer Stil** [G.]. The North German style of the second half of the 18th century, represented by W. F. Bach, K. P. E. Bach, Quantz, G. Benda, Reichardt, and others who, in the period c. 1750–80, tried to arrive at an expression of "true and natural" feelings, to some extent anticipating 19th-century romanticism. A basic tenet of this school was to replace the baroque idea of maintaining an "affection" throughout a composition (or a sonata movement) by a constant change of affection or expression, together with changes of dynamics, etc. A piece such as K. P. E. Bach's Fantasia [*HAM* ii, no. 296] is especially characteristic of this style. Somewhat simpler manifestations are the \**Volkstümliches Lied* and \**Singspiel*. See P. H. Lang, *Music in Western Civilization* [1941], pp. 585ff; W. S. Newman, *The Sonata in the Classic Era* [1963]; *GrHWM*.

**Empfindung, mit** [G.]. With feeling.

**Empressé** [F.]. Hurrying.

**Ému** [F.]. With emotion, with feeling.

**Emyolia.** See Hemiola.

**Enchaînement** [F.]. Voice-leading, proper connection of chords and/or parts.

**Enchaînez** [F.]. Same as \**segue*.

**Enchiriadis, enchiridion** [Gr.]. Medieval terms for handbook, manual. Examples are the \*"*Musica enchiriadis*" of the 9th century and "*Enchiridion musices*" of the 10th century [see Theory II, A, 3, 5]. *Enchiridion* is the title

of several early publications of Protestant chorales, especially the so-called *Erfurt Enchiridion*, published in Erfurt, 1524.

**Enclume** [F.]. Anvil.

**Encore.** In a public performance, the repetition of a piece, or an extra piece played in response to applause by the audience. The practice of encores started in the 17th century with the rise of the operatic virtuoso singers. Haydn had turned against this practice by 1799; on the occasion of the first performance of his *Creation* (1798), in a note printed on the program, he begged the audience not to insist upon the repetition of any number. The French and Italian equivalent is *bis*.

**En dehors** [F.]. See *Dehors*.

**Endings.** See under *Differentiae*.

**Enechema.** See under *Echos*.

**Enfance du Christ, L'** [F., The Childhood of Christ]. Oratorio by Berlioz, op. 25 (1854), for solo voices, chorus, and orchestra.

**Enfant et les sortilèges, L'** [F., The Child and the Sorceries; sometimes trans. The Bewitched Child]. Opera in one act by Ravel (libretto by Colette), produced in Monte Carlo, 1925. Setting: contemporary French country house.

**Enfant prodigue, L'** [F., The Prodigal Son]. (1) Cantata (lyric scene) by Debussy (libretto by E. Guinand), composed in 1884 for the Prix de Rome; produced as an opera in London, 1910. (2) Ballet by Prokofiev, produced in Paris, 1929.

**Engführung** [G.]. Stretto of fugues.

**England.** I. Although English music history, like that of other nations, reflects the economic, political, religious and social life of the nation, certain tendencies do seem to have been peculiar to England. One constant factor has been the conservatism that preserved old traditions even in periods of experiment. When subjected to powerful foreign influences—e.g., during the formative period of the Elizabethan madrigal or the period of absorption of the Notre Dame repertory—the English conservative tradition was strong enough to transform borrowed styles and genres until they became suitable for genuine native expression.

The high points of English music history have generally coincided with the lifespan of one pre-eminent composer or school. They are the "Age

of Dunstable" (c. 1400–60); "Tudor Age" (i.e., that of Tallis, Byrd, and Gibbons, c. 1600); "Restoration" or "Purcellian period" (1660–1710); "Handelian Era" (1710–60); the period of T. A. Arne (1710–88) and W. Boyce (1710–79), overlapping Handel's and extending a few decades beyond; and the modern renaissance, dominated by Benjamin Britten (b. 1913), although the achievements of both his predecessors and the succeeding generation must not be discounted.

II. Gregorian chant was established in England by Pope Gregory himself, who in 596 sent to Canterbury his own emissary, Augustine of Kent, with 40 monks and priests, to introduce the Roman Catholic rite. Augustine, the first Bishop of Canterbury, re-established Christianity in southern England so successfully that by 664 Kentish Christians were able to defeat their Celtic colleagues at the Synod of Whitby, firmly establishing priority for the Roman Catholic liturgy. In 680 a skilled singer was brought from Rome to Wearmouth and Jarrow, where his teaching ensured authentic Gregorian practices, which were further strengthened by the Council of Clovesho in 747. The \*Sarum use, developed at Salisbury Cathedral, established an English variant of Gregorian chant, which in due course was to influence all English and some Continental music. Also, the art of organ building began to develop, especially in Anglo-Saxon areas, reaching an early climax with the construction c. 950 of an enormous organ at Winchester [see Organ XII]. Important contemporaneous developments at Winchester include the quasidramatic performance of the Easter \*trope, *Quem quaeritis* [cf. *Concordia Regularis* of Bishop Ethelwold], the copying of the Winchester fragments (Oxford Bodleian MS 775) and the first English experiments in polyphony in the form of two-voice organa.

With the Norman conquest (1066) England's musical and religious ties with northern France and the Low Countries became stronger. More and more cloisters and cathedrals in the new Norman style were built. Musical activity manifested itself in the Winchester Troper [see Troper], in the development of early polyphony, and in the "Musica" (c. 1100?) of John Cotton (possibly a Belgian). Important English theorists of the time include Johannes de Garlandia (b. c. 1195, active in Paris), Anonymous IV [see Anonymous], and Walter Odington (fl. early 14th century; "De speculatione musice"). Two of the most important achievements of this period were

the composition of \**"Sumer is icumen in"* and the earliest copying of portions of the Notre Dame repertory (from \**"Magnus liber organi"*) in MS Wolfenbüttel 677, which was prepared for the Priory of St. Andrews in Scotland. Like Brit. Mus. MS Harl. 978, this MS includes Notre Dame organa, but it also contains (facs. 11) some two-part tropes, sequences, and Offertories unique to English sources. The "English" or "peripheral" style of these is also reflected in a few motets in the Codex Montpellier that are notable for their use of \*voice exchange [see HAM i, no. 33a].

III. A recognizably "English" repertory began to take shape in several fragmentary sources, mainly originating at Worcester c. 1300. The pieces in these are polyphonic tropes, motets, conductus, and the like, a few borrowed from the Notre Dame repertory but many of English origin. On the whole they are in a simple, conductus-like style that seems very conservative compared to contemporary French compositions. A remarkable trait is the extensive use of voice exchange as a structural device. There also are several passages of "parallel six-three chords," foreshadowing the \*fauxbourdon of a later period. Perhaps related to an earlier improvisatory English practice of singing in thirds and sixths mentioned by Giraldus Cambrensis [see Gymel; Sixth-chord style; Discant (2)], this English penchant for imperfect consonances may have been one factor leading to the establishment of the \*third as a basic interval of counterpoint. Little music of the late 14th century has survived, but Chaucer and Lydgate refer frequently to a large variety of musical instruments, so very likely instrumental music was developing rapidly.

The early 15th century was a period of flourishing activity. Several MSS, of both native [Old Hall MSS, see Sources, no. 25] and Continental origin [see Sources, nos. 20, 22; also Trent Codices], survive. The two groups of sources represent different composers, different areas, and different musical styles, which gave rise to the assumption that there were two English schools, an insular school of strictly conservative trends (Sturgeon, Typp, *et al.*) and a Continental school of progressive tendencies (J. Dunstable, Lionel Power, J. Bedyngham, J. Benet, *et al.*). However, Bukofzer has shown that such a hypothesis is untenable. [See Editions XXXIV, 8.] Dunstable (c. 1370–1453) and Power (d. 1445) were clearly the most important composers. Dunstable's greatness was recognized in his own time, and

his invigorating influence on the French music of the 15th century (\*Burgundian school) is attested in a poem by Martin Le Franc, "Le Champion des dames" (c. 1441–42), which says that Dufay and Binchois "... ont prins de la contenance Angloise et ensuy Dunstable pour quoy merueilleuse plaisance rend leur chant joyeux et notable" (The English guise they wear with grace, they follow Dunstable aright, and thereby have they learned apace to make their music gay and bright; see *ReMR*, pp. 12–13). The most striking traits of this "English guise" are a fully consonant harmonic idiom and a beautiful style of melody based on the degrees of the triad [see Third]. Dunstable's contemporary, Lionel Power (d. 1445), wrote a *Missa Alma redemptoris mater* that is the earliest known example of the *cantus firmus* Mass [see Mass C II b]. After Dunstable, Walter Frye (fl. mid- to late 15th century) carried on the tradition, along with Robert Morton (c. 1440–75), who also was a member of the Burgundian school. Developments in England at this time are reflected in MS Egerton 3307 (c. 1450; also called Windsor MS), which contains, among other items, the two earliest known polyphonic \*Passions as well as a number of native English \*carols, twenty-two Latin \*cantilenas, and a goliardic drinking song set parodistically, in isorhythmic fashion [see *ReMR*, p. 764].

IV. The recently discovered Eton MS [\*Editions XXXIV, 10–12], dating from shortly after 1500, contains a large repertory of sacred compositions (Magnificat, "Salve regina," Marian motets) that apparently were used at St. George's Chapel, Windsor [*ReMMA*, p. 410]. Their most unusual feature is their many-voiced polyphony, generally for five or six but occasionally for as many as eight or even eleven parts. The very advanced "choral arranging" foreshadows the \*polychoral style of the late 16th century. Of the twenty-five composers represented in the collection, John Browne (b. 1452) stands out as the most important. Others are Walter Lambe (1452–c. 1500), Richard Davy (c. 1467–c. 1516), Robert Wilkinson (Master of the Choristers at Eton, 1500–15), Robert Fayrfax (1464–1521), and William Cornyshe (c. 1468–1523). Fayrfax, Cornyshe, and their royal patron, King Henry VIII (reigned 1509–47), wrote secular part songs to English or French texts that were frequently humorous or even satirical [see *HAM* i, no. 86].

After the Anglican Reformation (1534) there was a gradual change to compositions with English texts as the Sarum use became nation-

ally established under the leadership of John Marbeck (c. 1510–c. 1585) and the three "T's" of early Tudor music: John Taverner (c. 1495–1545), Christopher Tye (c. 1500–c. 1572), and Thomas Tallis (c. 1505–85) [see Editions LI]. Marbeck is noted chiefly for his *The Booke of Common Praier Noted* (1550), while Tye and Tallis were the most important composers of anthems and services with English texts. These men laid the groundwork for the golden age of Elizabethan music, brilliantly represented in the works of Tallis' pupil, William Byrd (1543–1623), and the English madrigalists [see under Editions XVI]. The 16th century also saw the rise of English keyboard music, the composers of which made original contributions in their patterned variations, suites, and some dances representing the earliest English use of the \*ground (in the strikingly advanced "Hornpype" by Hugh Aston, 1480?–1522?, and in "My Lady Carey's Dompe"). There is also a large repertory of liturgical organ music (settings of antiphons, hymns, offertories, psalm verses, etc.; see Felix namque; In nomine) by John Redford (d. 1547), Thomas Preston (c. 1564), William Blitheman (c. 1510–91) and many others [see the Mulliner Book in Editions XXXIV, 1]. In the equally impressive repertory of the English virginalists—William Byrd, John Bull (c. 1562–1628), Giles Farnaby (c. 1560–1640), John Munday (d. 1630), Peter Philips (1561–1628), and Orlando Gibbons (1583–1625)—the emphasis is on secular keyboard music, especially dances and variations. Their pavanes and galliards are among the most beautiful products of the 16th century. English Renaissance music, vocal as well as instrumental, achieved a subtle refinement in the works of Orlando Gibbons and the compositions of lutenist-songwriters like John Dowland (1562–1626) and poet-composer-theorist Thomas Campion (1567–1620) [see Editions XVII]. During this period English chamber music came to equal that of any in Europe. At first English composers and players were famous chiefly for viol consort music, as represented by the fancies of John Coperario (c. 1575–1626), Alfonso Ferrabosco II (c. 1575–1628), Tobias Hume (d. 1645), and Robert Jones II (fl. 1601–7) [see Browning; Fancy; "In nomine"; Consort]. But within a short time the English "broken consort" became equally popular (see Morley's *The First Booke of Consort Lessons*, 1599, and Adson's *Courtly Masquing Ayres*, 1611) as did the wind consort.

V. About 1625, with the death of nearly all

the Elizabethan composers, these promising developments in vocal and keyboard music slackened. Only chamber music continued to flourish, with such composers as John Jenkins (1592–1678), William Lawes (1602–45), Henry Lawes (1596–1662), William Young (d. 1671), and Matthew Locke (c. 1630–77). Roger North, in his interesting account of 17th-century English musical life ("Memoires of Musick," 1728; pub. 1846, ed. by E. F. Rimbault), tells us that Locke's consorts were "the last of the kind that hath been made."

During the early Caroline period Nicholas Lanieri (1588–1666), Henry Lawes, and William Lawes experimented with the new Monteverdian recitative style, and might have succeeded in adapting it to the English language had conditions permitted. John Jenkins and William Lawes modernized the style of instrumental "consort" music, as did Thomas Tomkins in his keyboard compositions. John Wilson (1595–1674) and the younger John Hilton (1599–1657), along with some of the above-named composers, also introduced new stylistic developments in English solo and part-song composition, while Charles Coleman, Hilton, the Lawes brothers, and Matthew Locke experimented with new "baroque" styles in church music composition.

With the rebellion and subsequent establishment of the Commonwealth in 1649, many of these developments were cut short. That is not to say that Cromwell suppressed music itself. Indeed, the reforms instituted by his government emphasized and enhanced the development of those kinds of music not proscribed by the Puritans. Vocal and instrumental chamber music prospered, and a new phase of musical activity, the public concert, made its first tentative beginnings. All tended to usher in a broader if more amateurish musical culture, which was to grow apace in the remaining decades of the 17th century.

The Restoration of Charles II and the Stuart monarchy introduced a vogue for new musical styles, forms, and media. During his travels on the Continent (1646–60), Charles had acquired a taste for the music performed at the court of Louis XIV, much of it directed by J.-B. Lully (1632–87). Here vocal and instrumental ensembles achieved standards of performance more splendid than any yet known in Europe. The "Vingt-quatre (24) violons du Roi" and "Mr. Baptist's vein" (as Lully's style of composition was referred to in England) became universally famous by the last quarter of the 17th century.

Charles soon established his own "Royal violins," modeling his court musical establishment after the French court's and even sending Pelham Humfrey (1647–74) and others to study in France and Italy. He placed in charge of his musical forces men like Captain Henry Cooke (c. 1615–72) and Nicholas Staggs (d. 1700), who had studied abroad, and he hired foreign musicians, such as Louis Grabu and G. B. Draghi (fl. 1667–1706), to fill important posts, often to the chagrin of capable British musicians, notably John Banister (1630–79) and Matthew Locke.

In the 1670's a new generation of native English composers—of whom the most important were John Blow (1648/9–1708) and Michael Wise (c. 1648–87)—adapted the Franco-Italian continuo styles and forms, paving the way for Henry Purcell (c. 1659–95), who was to demonstrate mastery not only of the new imported forms and styles (opera, cantata, oratorio, sonata, etc.) but of traditional English genres as well (fancy, anthem, catch, masque). After his highly successfully dramatic 17th-century opera, *Dido and Aeneas*, Purcell experimented with an English hybrid form, the semiopera, a combined opera, stage play, masque, and ballet, e.g., *Dioclesian* (1690), *King Arthur* (1691), *The Fairy Queen* (1692), and *The Indian Queen* (1695). Between 1680 and 1695 he also wrote incidental music, consisting of instrumental pieces, songs, and masques, for some 44 plays. His greatest achievement, however, was his masterful setting of the English language to music—a difficult feat most conspicuously achieved in his songs (e.g., in the posthumous collection *Orpheus britannicus*, 1698–1702). None of Purcell's successors, such as Daniel Purcell (c. 1660–1717), Jeremiah Clarke (c. 1673–1707), John Eccles (c. 1650–1735), or John Weldon (1676–1736), was of sufficient stature to check the decline that followed Purcell's death.

VI. Not until 1710, when G. F. Handel (1685–1759) arrived there, did England possess another outstanding composer. His efforts to establish an Italian operatic tradition failed, although his operas represent some of his most brilliant works. But his oratorios, organ concertos, St. Cecilia odes, and Chandos Anthems breathe the spirit of the English high baroque and at the same time establish Handel as the only composer of the late baroque who can be compared to J. S. Bach.

After Handel's death came a period of less brilliant activity, based on native forms such as

the \*ballad opera, \*glee, and \*voluntary. The more important composers of this era include Thomas Arne (1710–78; numerous operas, glees); William Boyce (1710–79; anthems, publication of *Cathedral Music*, 3 vols., 1760–78), Benjamin Cooke (1734–93; odes, glees, catches), and Samuel Webbe (1740–1816; glees, catches). Samuel Wesley (1766–1837), famous for his organ improvisation as well as his efforts on behalf of Bach's music, was a competent composer of anthems and services as well as Masses, motets (he joined the Roman Catholic Church in 1784), and organ music. His son, Samuel Sebastian Wesley (1810–76), who was influenced by Mendelssohn and Schumann, helped raise the low standard of English church music with his excellent anthems and services. Romanticism is more clearly represented by John Field (1782–1837; nocturnes) and William Sterndale Bennett (1816–75; piano and orchestral music). In 1880 English operetta found its outstanding representative in Arthur S. Sullivan (1842–1900).

VII. About the turn of the century began the modern renaissance of British music. The development from 1880 to 1966 may be divided into three main periods: that of German influence, that of nationalist and impressionist tendencies, and that comprising the three most recent generations of British composers.

To the first period belong C. H. Parry (1848–1918), C. V. Stanford (1852–1924), and Edward Elgar (1857–1934). Parry and Stanford were influenced by Schumann, Wagner, and Brahms, although individual traits are by no means absent, particularly in some works of Stanford, in which elements of his native Ireland are prominent. Elgar wrote in a rich, emotional style with strong native English associations. Though sometimes tending to be ostentatious, his music ushered in the modern flowering of English music. The second period was that of the "nationalist" composers, such as Frederick Delius (1862–1934), Ralph Vaughan Williams (1872–1958), Arnold Bax (1883–1953), Gustav Holst (1874–1934), the "impressionist" Cyril Scott (b. 1879), and Arthur Bliss (b. 1891), known particularly for his *A Colour Symphony* (1922; rev. 1932). Vaughan Williams took an active part in the revival of English folksong and in the efforts of the Purcell Society to publish the complete works of the *Orpheus britannicus*. From these he adapted archaic idioms for many of his compositions. Bax, part Irish, had a penchant for romantically colored mysticism and wistfulness that earned him the title of "Yeats in

music." Holst's earlier works (*The Planets*, perf. 1918) are notable for their brilliant orchestration, to which the austere linearity of his late compositions offers a striking contrast. Of the composers of the third group, the most outstanding are Alan Bush (b. 1900), Edmund Rubbra (b. 1901), William Walton (b. 1902), Michael Tippett (b. 1905), Alan Rawsthorne (b. 1905), and Benjamin Britten (b. 1913). The last in particular has become internationally known through his operas (*Peter Grimes*, 1945; *The Rape of Lucretia*, 1946; *Billy Budd*, 1951; *The Turn of the Screw*, 1954), written in an easy but technically reliable, eclectic and yet personal style. Equally famous are his choral works (*A Ceremony of Carols*, 1942; *War Requiem*, 1962), and perhaps best known of all his *Young Person's Guide to the Orchestra* (op. 34), variations and fugue on a theme by Purcell. The twelve-tone technique has been used by Elisabeth Lutyens (b. 1906) and Humphrey Searle (b. 1915).

Of the most recent generation of British composers, the most outstanding are Richard Rodney Bennett (b. 1936), Harrison Birtwhistle (b. 1934), Peter Maxwell Davies (b. 1934), Alexander Goehr (b. 1932), Alan Hoddinott (b. 1929), Nicholas Maw (b. 1935), Anthony Milner (b. 1925), Thea Musgrave (b. 1928), and Malcolm Williamson (b. 1931).

**English discant.** See under Discant.

**English flute.** An 18th-century name for the end-blown flutes (\*recorder or flageolet), as distinct from the side-blown type (transverse flute), which was known as German flute. See Whistle flute.

**English horn.** See under Oboe family I, B.

**English Madrigal School, The.** See Editions XVI.

**English School of Lutenist Song Writers, The.** See Editions XVII.

**English Suites.** Six suites for the harpsichord by Bach, composed in Köthen (1720?). Each opens with an extended prelude, often in the general style of the first movement of a concerto grosso. The name "English," not used by Bach himself, may stem from the fact that a manuscript in the possession of his son, Johann Christian, contained the inscription "fait pour les Anglais."

**English violet.** See under Viola d'amore.

**Enharmonic.** (1) In Greek music, a tonality (scale, tetrachord, genus) that includes quarter tones [see Greece II; see H. Husmann, in *JMP* xlv; C. del Grande, in *RMI* xxxv].

(2) In modern theory, tones that are actually

one and the same degree of the chromatic scale but are named and written differently, e.g., g $\sharp$  and a $\flat$ , c $\sharp$  and d $\flat$ , etc., according to the key in which they occur. Enharmonic intervals are intervals consisting of the same tones but "spelled" differently, e.g.:

A well-known example of "enharmonic equivalents" is the diminished seventh chord, which can be written in four or more different ways. Enharmonic change is the change of meaning of a tone or a chord (frequently a diminished seventh chord) from sharp to flat, or vice versa, as is frequently the case in modulations, e.g. (one of the earlier instances, from Handel's *Samson*):

Enharmonic tones are identical in pitch in the modern system of well-tempered tuning, but not in other systems of either theoretical or historical significance (Pythagorean system, \*just intonation, mean-tone systems; see Temperament). In just intonation, e.g., c $\sharp$  (upper third of a) is  $2\frac{3}{4}$  while d $\flat$  (lower third of f) is  $1\frac{1}{5}$ ; the difference between these tones is the enharmonic \*diesis,  $128/125 = 41$  cents (very near one-fifth of a whole tone). While pianists have fully adopted the view that enharmonic tones are identical in pitch, violinists and singers frequently insist that they differ and that this difference should be brought out in performance. Thus, in the example (a) below, the d $\flat$  would sound nearly a quarter tone

lower than the preceding c $\sharp$ . The main objection to this procedure is that it introduces an arbitrary adjustment [see Just intonation] into a performance that in all other respects is based

on equal temperament, e.g., in the intonation of the triad. Moreover, in an example like (b), the recommended distinction is obviously impossible since the "changeable" tone is tied over. Finally, it should be noted that the enharmonic change is by no means restricted to chromatic tones such as  $c\sharp$  and  $d^b$ , but that it may occur also on any of the diatonic degrees of the scale. For instance, example (a) in exact transposition a major third upward becomes example (c). However, even the most sensitive violinist would probably not think of playing this passage as it should be played in enharmonically correct intonation, that is, as indicated under (d).

(3) Enharmonic instruments are keyboard instruments that have separate keys and strings (pipes, etc.) for the different enharmonic tones. In this category was Bosanquet's harmonium, specially constructed (c. 1873) to produce 53 microtones to the octave [see R. H. M. Bosanquet, in *PMA* i, 139]. For a 16th-century construction, see Arcicembalo.

Lit.: M. Vogel, *Die Enharmonik der Griechen*, 2 vols. (1963); E. Seidel, *Die Enharmonik in den harmonischen Grossformen Franz Schuberts* (1963); R. P. Winnington-Ingram, in *MF* xviii, 60; W. Dupont, *Geschichte der musikalischen Temperatur* (1935).

**Enigmatic canon.** See under Canon II. Enigmatic scale, see *Scala enigmatica*.

**Enigma Variations.** Theme with variations for orchestra by Elgar, op. 36 (1899), so called because each variation depicts one of his friends, who are enigmatically indicated by their initials or by a nickname.

**Ensalada** [Sp.]. A term known mainly through a publication, *Las Ensaladas de Flecha* (1581), that contains six long four-part vocal compositions by Mateo Flecha (1481–1553), his nephew Mateo Flecha (1530–1604), and others. It has an essentially literary meaning, implying a humorous or satirical mixture of various texts, somewhat in the nature of the textual *quodlibet* [see *Quodlibet* III]. Musically these *ensaladas* are very similar to Janequin's program chansons. There seems to be no basis for the current opinion that the *ensalada* was necessarily a musical *quodlibet*. Flecha's *Ensaladas* (pub. by H. Anglés, 1954) include a "La Guerra" (The Battle), "El Fuego" (The Fire), and "La Bomba" (The Fire Pump). Aguilera de Heredia (b. c. 1560) used the designation for an extended organ composition of a playful character and of varied contents [see Editions XI, 14].

**Ensemble** [F.]. A group of musicians performing together. One speaks (1) of a "good" or "bad" ensemble with reference to the balance and unification attained in the performance of a string quartet, etc. (2) In opera, ensemble is a piece for more than two singers (duet) or for the soloists together with the chorus. Such pieces usually occur at the end of an act (finale).

(3) In early music (prior to 1600), a distinction between ensemble music (music for more than one performer) and solo music (music for a single performer) is of fundamental importance, since it explains many features of style and clarifies various problems of \*performance practice, e.g., the question of improvised coloraturas, which are possible only in solo music, either monophonic (e.g., the solo portions of Gregorian chant) or polyphonic (i.e., keyboard and lute music). Similarly, \**Freistimmigkeit* is restricted to (polyphonic) solo music, as was free variability of tempo [see Expression]. It may be noted, however, that the "soloist versus ensemble" viewpoint can also be applied to the question of how ensemble music should be performed. In fact, motets or chansons may be reproduced either in "ensemble performance," i.e., with more than one singer to each part, or in "solo performance," i.e., with only one singer to the part. While ensemble performance calls for strict adherence to the music as written, solo performance leaves the singer free to insert improvised coloraturas, particularly in the highest part. There is ample evidence to show that, toward the end of the 16th century, ensemble performance of motets was frequently superseded by solo performance (including improvised coloraturas), a procedure that evidently foreshadows the monodic style of the 17th century.

The distinction between ensemble and solo music is basic in the study of the notation of polyphonic music [see Notation V]. It also may be recommended to supplant the customary but unsatisfactory classification of early polyphonic music as "vocal music" and "instrumental music." This classification has several drawbacks: (a) Prior to 1550 (i.e., prior to the period of strict *a cappella* music), instrumental participation was frequently called for, or admitted, in the performance of "vocal" music; this admixture is particularly conspicuous in the accompanied songs (*ballades*, etc.) of the 14th century, and in the *frottole* of the early 16th century. (b) Several publications of the 16th century [e.g., A. Willaert, *Fantasia ricercari contrapunti a tre*

*voci* (1559)] contain the remark: "da cantare e suonare d'ogni sorte di stromenti," showing that such textless pieces could be sung (in \*vocalization) as well as played on any type of melody instrument (viols, recorders, cornettos). Evidently such pieces cannot be classified as either instrumental or vocal music; however, they are definitely "ensemble music." (c) The field of "instrumental music" includes such heterogeneous styles as that of a free-voice keyboard toccata and a lute prelude on the one hand, and, on the other, a *ricercar* by Willaert or Padovano strictly written in three or four voice-parts. This contrast of style is easily explained if it is recalled that the former types are solo music and the latter ensemble music. It may be noted in passing that ensemble music may well be changed into solo music, a method that was generally known in the 16th century as \*intabulation. This practice, however, does not invalidate the basic distinction between genuine ensemble music and genuine solo music, no more than the existence of 19th-century arrangements (e.g., of a Beethoven string quartet) invalidates the distinction between chamber music and piano music.

(4) In a large choral work or piano (violin, cello, etc.) concerto, "solo" refers to the soloist's part as opposed to the part of the chorus and/or orchestra (ensemble).

See *ApNPM*, p. xxif; L. Hibberd, in *MQ* xxxii, no.1.

**Enté** [F.]. *Motet enté* is a special type of 13th-century motet whose upper part is constructed by inserting a new text (and melody) between portions of a preexisting text (and melody). The "old material" is usually one of the numerous popular refrains taken from the *ballades*, *rondeaux*, etc., of the *trouvères* and split into two or more portions between which new words are interpolated. For instance, the refrain "E ai! Ke ferai! Je mur d'amouretes, comant garirai?" of a *trouvère ballade* [see F. Gennrich, *Rondeaux, Virelais und Balladen*, 2 vols. (1921, '27), i, 148f] leads to the following triplum of a motet: "He, ha, que ferais? Belle, je vous ai Tant amée... Et nuit et jour pens et chant: Je muir d'amouretes! Se vostre amour n'ai... ou je languirai, Et coument en garrai?" [see Y. Rokseth, *Polyphonies du xiii<sup>e</sup> siècle*, 4 vols. (1936-39), iii, 52]. For another example ("Hé amours... avoir merci") see *AdHM* i, 242. Obviously this method of textual amplification is derived from the identical procedure used in liturgical \*tropes. See Refrain III; Farce.

**Entführung aus dem Serail, Die** [G., The Abduction from the Seraglio]. Opera in three acts by Mozart (libretto by G. Stephanie, based on C. F. Bretzner's play), produced in Vienna, 1782. Setting: Turkey, 16th century. It is Mozart's first real opera in German and also the first German opera of significance. It was written as a wedding gift for Constanze Weber, whom he married a month after its production. See Janizary music.

**Entr'acte.** A piece (usually instrumental) performed between the acts of a play or opera, e.g., Beethoven's compositions for Goethe's play *Egmont*, or Bizet's entr'actes for his opera *Carmen*. The music of Lully's *comédie-ballets* is mostly in the form of entr'actes (*intermèdes*) for Molière's plays, e.g., *Le Bourgeois Gentilhomme*. Purcell's instrumental entr'actes are known as act tunes or curtain tunes. The term \*intermezzo is sometimes used for entr'acte.

**Entrada** [Sp.], **entrata** [It.]. See *Intrada*; *Entrée*.

**Entrée.** In Lully's operas and similar works, a marchlike piece that was played for the entrance of a dancing group or important personage. The term is also used for nonoperatic compositions of a similar character, e.g., in Bach's *Suite in A* for violin and harpsichord [see *Intrada*]. In French ballet of the 17th and 18th centuries, an *entrée* is a subdivision of an act, roughly corresponding to a "scene" in opera [see *Quadrille* (2)]. It also is used as equivalent to "act," e.g., in Rameau's *Les Indes galantes*; in these works, each *entrée* has its own plot, unconnected with that of any other *entrée*.  
D.J.G.

**Entremes** [Sp.]. The Spanish variety of the operatic \*intermezzo.

**Entremet** [F.]. In the French and Burgundian courts of the 14th and 15th centuries, a short entertainment performed between the courses of a banquet, often including dancing to vocal or instrumental accompaniment.

**Entry.** The "entrance" of the theme in the different parts of a fugue, at the beginning as well as in the later expositions, particularly if preceded by a rest, as is frequently the case.

**Entschieden, entschlossen** [G.] Determined, resolute.

**Enunciation.** A term occasionally used as a synonym for "exposition" in the sonata form.

**Envoi, envoy** [F.]. In strophic *trouvère* songs, a

short stanza added at the end as a "send-off." It corresponds to the second half of the full stanzas and is therefore sung to the closing phrases of the full melody [see, e.g., J.-B. Beck, *Le Chansonnier Cengé* (1927), ii, 109]. The Provençal (troubadour) term is *tornada*, while the Italian is *comiato*.

**Éoliphone** [F.]. \*Wind machine (e.g., in Ravel's *Daphnis et Chloé*).

**Epechema**. Same as *enechema*; see under *Echos*.

**Epidiapente, epidiatessaron**. See *Diapente*; *Diatessaron*.

**Epilogue**. Synonym for \*coda (in sonatas, etc.).

**Épinette** [F.]. Spinnet, harpsichord.

**Epiphonus**. See under *Neumes I* (table).

**Episema** [Gr.]. In some 9th- and 10th-century manuscripts that were written in chironomic neumes, a subsidiary sign in the form of a dash attached to a neume. It occurs most frequently in connection with the *virga* and the *clivis*, as illustrated in Ex. a. It indicates a prolonged note value and therefore is important in the study of Gregorian rhythm [see *Gregorian chant VI*]. In the modern Solesmes editions it is represented (though not consistently) as shown in Ex. b.

These editions also make extensive use of the "vertical episema" [Ex. c], which is meant to indicate the \*ictus. This does not exist in the medieval sources. The term "episema" is also occasionally used for other subsidiary signs of neumatic notation, e.g., those indicating quarter tones [see *WoHN i*, 45].

**Episode**. A secondary passage or section forming a digression from the main theme. The term is used mainly for a section of a \*fugue that does not include a statement of the subject and for the subsidiary sections of the \*rondo. Early examples of fugal episodes occur in some *ricercars* by Girolamo Cavazzoni. Giovanni Gabrieli was the first to employ contrasting material for episodes [see his *Ricercar del X. tono*, in *RiMB* no. 52 and in *TaAM* ii, 76]. Episodic form is another name for rondo form. However, this term is also used for loosely constructed pieces consisting "only of episodes," like the third movement of Franck's *Violin Sonata*.

**Epistle**. A selection, usually from the Epistles of the New Testament (especially those of St. Paul), read or sung between the Collect and Gospel of the Roman Mass (or the Anglican Communion). In the Roman liturgy a special Tone for the Epistle (*tonus epistolae*; see *LU*, pp. 104ff) is used, consisting of a simple recitation with inflections at the ends of sentences.

**Epistle sonata**. A 17th- and 18th-century instrumental piece designed to be played in church before or after the reading of the \*Epistle. Mozart composed several for organ and violin, etc. See R. S. Tangeman, in *MQ* xxxii.

**Epithalamium** [It. *epitalamio*]. In Greek poetry (Sappho), a poem to be sung by a chorus at weddings; hence music intended for use at weddings. J. J. Kuhnau's program composition "Jacob's Heyrat" (*Biblische Historien*, 1700) contains an *epitalamio*.

**Epitritus**. Greek for *sesquitertia*, i.e., the ratio 4 : 3; hence, name for the interval of the fourth [see *Acoustics III*].

**Epogdous, epogdoa** [Gr.]. Terms meaning *sesquioctava*, i.e., the ratio 9 : 8 [see *Sesqui-*]; hence, name for the Pythagorean whole tone [see *Acoustics III*].

**Equale** [*aequale, eguale*]. A composition for \*equal voices, i.e., all male or all female, or for equal instruments. In particular, a composition for four trombones, written for solemn occasions. Beethoven composed three such pieces (1812), which, arranged for male chorus, were performed at his funeral.

**Equal temperament**. See under *Temperament III*.

**Equal voices**. Indication for men's voices only or for women's voices only, as opposed to mixed voices. Less frequently, it is used to mean for soprano voices (or others) only. See *Equale*.

**Erbe deutscher Musik, Das**. See *Editions XVIII*.

**Ergriffen** [G.]. Deeply moved.

**Erhöhungszeichen, Erniedrigungszeichen** [G.]. Sharp, flat.

**Erlöschend** [G.]. Fading away.

**Ermattend** [G.]. Tiring, weakening.

**Ernani**. Opera in four acts by Verdi (libretto by F. M. Piave, after V. Hugo's play), produced in Venice, 1844. Setting: Spain and Aix-la-Chapelle, about 1519.

**Ernst, ernsthaft** [G.]. Serious.

**Eroica.** Beethoven's Third Symphony in E-flat major, op. 55, composed in 1803–4. It was written in homage to Napoleon, but Beethoven withdrew the planned dedication when Napoleon took the title of emperor, changing the work's title from "Sinfonia grande: Buonaparte" to "Sinfonia eroica composta per festeggiar il sovvenire d'un gran uomo" (Heroic symphony composed to celebrate the memory of a great man). The programmatic idea suggested by the title and the original dedication is realized only in the most general way, except for the slow movement, marked *Marcia funebre* (funeral march). The last movement is a series of free variations, also including fugal sections, all based on a dancelike theme that Beethoven had used in three earlier compositions: *\*Contredanses*, no. 7; *Die \*Geschöpfe des Prometheus* (a ballet); *\*Eroica Variations*.

**Eroica Variations.** Variations for piano by Beethoven, in E-flat major, op. 35 (1802), so called because the theme is the same as the one he employed later in the last movement of the *\*Eroica* Symphony. Another name is *Prometheus Variations*, after the ballet, *Die \*Geschöpfe des Prometheus*, in which the theme occurred for the first time.

**Eroticon.** A love song, or an instrumental piece portraying passionate love.

**Ersatzklausel** [G.]. Substitute clausula. See Clausula.

**Ersterbend** [G.]. Fading away.

**Erwartung** [G., Expectation]. Monodrama in one act by Schoenberg (libretto by M. Pappenheim), completed in 1909 but not produced until 1924, in Prague. Setting: the edge of a forest, timeless. The orchestral accompaniment is in the near *\*atonal* style the composer developed in this period.

**Erzähler** [G.]. Narrator.

**Erzlaute** [G.]. Archlute.

**Es, eses** [G.]. E-flat, e-double-flat; see Pitch names.

**Escapement.** See under Piano.

**Escape note.** Same as *échappée* [see Nonharmonic tones I].

**Eschequier.** See Echiquier.

**Esercizio** [It.]. Exercise, etude.

**Eskimo music.** Lit.: H. Thuren and W. Thalbitzer, *The Eskimo Music* (1911; repr. from *Meddelelser om Gronland* xl, avdeling I); E. Vogeler, *Lieder der Eskimos* (1931); W. Thalbitzer, *Légendes et chants esquimaux du Groenland* (1929); H. H. Roberts and D. Jenness, *Eskimo Songs. Songs of the Copper-Eskimos* (1925); D. Jenness, in *MQ* viii; W. Thalbitzer and H. Thuren, in *ZIM* xii, *BSIM* vii, 36–56; Z. Estreicher, in *Anthropos* xlv (1950), 659; *id.*, in *Bulletin de la Société neuchâteloise de géographie* liv (1948), 1–54. Also see under American Indian music; Ethnomusicology.

**Espinette** [F.]. A 16th-century term for a type of harpsichord; see Spinet.

**Espressivo** [It.]. Expressively; abbreviated *espr.*

**Espringale.** Medieval name for a jumping dance as distinguished from *\*carole*, a round dance.

**Esquinazo** [Sp.]. A Chilean type of serenade, most often sung at Christmas or at special celebrations such as a birthday or saint's day. It sometimes includes a short coda, called *cogollo*, in which words are improvised to dedicate the song to a particular person. J.O.S.

**Estampes** [F.]. A set of three piano pieces by Debussy (1903): "Pagodes" (Pagodas); "Soirée dans Grenade" (Evening in Granada); "Jardins sous la pluie" (Gardens in the Rain).

**Estampie, estampida, istanpitta, stampita.** The most important instrumental form of the 13th and 14th centuries. Similar to the (vocal) sequence [see Sequence II] from which it was evidently derived, it consists of four to seven sections called *puncta*, each of which is repeated: a a, b b, c c, etc. Different endings, called *ouvert* and *clos* [It. *aperto* and *chiuso*], are provided for the first and second statement of each *punctum*, as in the modern *prima* and *seconda volta*. In some cases the same two endings are used for all the *puncta*, so that the following scheme results: a + x, a + y; b + x, b + y; c + x, c + y; etc.

The earliest known example of this form is the troubadour song "Kalenda maya" (The Month of May; see *HAM*, no. 18d; *AdHM* i, 190), whose text supposedly was written by the troubadour Raimbaut de Vaqueiras (fl. 1180–1207) to the melody of an "estampida" played by two "joglar de Fransa" (French jongleurs) on their vielles. All the other existing examples are purely in-

strumental pieces. Eight monophonic *estampies* are contained in the 13th-century *Chansonnier Roy* [see Sources, no. 12], while the 14th-century MS Brit. Mus. Add. 29987 contains a number of "istanpittas," some with subtitles such as "Lamento di tritano," "La manfredina," "Salterello," "Isabella," "Tre fontane" [Ex. in *HAM*, nos. 40c, 59; *SchGMB*, no. 28]. These charming pieces are in the character of idealized dances, suggesting that the *estampie* originally was a true dance. The earliest source of keyboard music, the so-called Robertsbridge Fragment of c. 1320, contains three extended two-part compositions (one incomplete) in the form of an *estampie* [*HAM*, no. 58]. There also exist two-voice examples of *estampie* (or *ductia*) [*HAM*, no. 41].

Owing to the similarity of name and structure, the *estampie* is usually identified with the *stantipes*, a form described by Johannes de Grocheo (c. 1300) as consisting of from five to seven "puncta." This theory, however, has not remained unchallenged (C. Sachs). Grocheo distinguishes the *stantipes* from the \**ductia*, characterizing the latter as having four (or fewer) *puncta*. It may be noted, however, that the so-called *estampida* "Kalenda maya" has only three *puncta*. The problem is further complicated by the fact that two 14th-century treatises on poetry describe a "vocal" *estampie* that apparently lacked the *puncta* but possessed a refrain.

Lit.: P. Aubry, *Estampies et danses royales* (1906); C. Sachs, *A World History of the Dance* (1937), pp. 292ff; L. Hibberd, "Estampie and Stantipes" (*Speculum*, 1944); J. Wolf, "Die Tänze des Mittelalters" (*AMW* i); J. Handschin, "Über Estampie und Sequenz" (*ZMW* xii); H. J. Moser, "Stantipes und Ductia" (*ZMW* ii).

**Estey organ.** See under Harmonium III.

**Esthetics.** See Aesthetics of music.

**Estilo** [Sp.]. A typical song of the Argentine pampas consisting of an initial section in slow duple meter (2/4 or 4/4) and a fast section in triple meter (3/4 or 6/8), after which the first section is repeated. Its text is based on a stanza of ten eight-syllable lines and almost always deals with life in the Argentine plains. J.O.S.

**Estinto** [It.]. Barely audible.

**Estribillo** [Sp.]. See under *Villancico*.

**Éteint** [F.]. Barely audible.

**Ethiopian church music.** Lit.: J. M. Harden,

*The Anaphoras of the Ethiopic Liturgy* (1928); M. Cohen, *Chants éthiopiens* (1931); E. Wellesz, in *Oriens Christianus* (1920); L. Picken, in *AM* xxix, 41; *GD*, Suppl. Vol. p. 179f; *GDB*, ii, 868f; *AdHM* i, 138.

**Ethnomusicology.** A term coined by J. Kunst to replace "comparative musicology" (*G. vergleichende Musikwissenschaft*) on the ground that the comparative method is employed in every scientific discipline. Ethnomusicology is an approach to the study of *any* music, not only in terms of itself but also in relation to its cultural context. Currently the term has two broad applications: (1) the study of all music outside the European art tradition, including survivals of earlier forms of that tradition in Europe and elsewhere; (2) the study of all varieties of music found in one locale or region, e.g., the "ethnomusicology" of Tokyo or Los Angeles or Santiago would comprise the study in that locality of all types of European art music, the music of ethnic enclaves, folk, popular and commercial music, musical hybrids, etc.; in other words, all music being used by the people of a given area.

In the 18th and 19th centuries an interest in what was then termed "exotic music" led to studies in Chinese music (J. B. du Halde, 1735; J. M. Amiot, 1779) and Arab music (Andres, 1787; R. G. Kiesewetter, 1842). As early as 1768, the *Dictionnaire de musique* of Jean-Jacques Rousseau contained examples of Chinese, Canadian Indian, Swiss, and Persian music. It was not until the end of the 19th century, however, that a few writers began to realize that the musical cultures of the non-Western world merited the same serious scholarship that was being focused on the European art tradition (e.g., C. R. Day, *The Music and Musical Instruments of Southern India and The Deccan*, 1891, with an Introduction by A. J. Hipkins; F. T. Piggott, *The Music and Musical Instruments of Japan*, 1893; F. Bose in *AMW* xxiii, 239ff).

About the same time, two developments provided essential tools for the ethnomusicologist: the Ellis cent system and the phonograph. In 1884-85 the British mathematician and philologist, Alexander John Ellis, aided by A. J. Hipkins, demonstrated that there are a great variety of tuning systems and scales built on different principles from those known in western Europe. He showed that these are accepted by accustomed ears as normal and logical. His method in these studies was based on the arbitrary division of the tempered octave into 1,200 parts or

"cents" [see Cents]. The first phonographic field recordings were made in America by J. W. Fewkes in 1890 and transcribed by B. I. Gilman in 1891 ["Zuni Melodies," in *Journal of American Archaeology and Ethnology* i, 68]. In 1900 C. Stumpf and O. Abraham made the first German recordings of this kind when a court orchestra from Thailand and musicians from South Africa visited Berlin. Today innumerable collections have been amassed by universities, state-supported institutions, and centers for research all over the world, with the tape recorder having largely replaced the phonograph.

In Germany the term *vergleichende Musikwissenschaft* became associated with the systematic studies inspired by Stumpf and Abraham and subsequently led by E. M. von Hornbostel. The interest of German scholars was concentrated on acoustics, psychology, and physiology in an effort to understand principles of tuning systems, scales, and organology, leading to a number of speculative theories founded on the *Kulturkreislehre*. In the United States studies in comparative musicology, pioneered by Fewkes and Gilman and carried on by Frances Densmore and others, showed the influence of anthropological interest in the American Indian. The methods developed under Hornbostel's brilliant leadership were introduced in the United States in 1928 by one of his pupils, G. Herzog ("The Yuman Musical Style," *Journal of American Folklore* xli, 183-231). Both German and American scholars emphasized cross-cultural comparisons.

An early concern with comparative method, before the subjects under comparison could be understood, led to some imaginative theories but provided very little accurate information. Nonmusical standards relating to economic status, technology, and relative social isolation were responsible for the general use of such terms as "primitive music" and "exotic music." It was not until 1928 that M. E. Metfessel documented the need for a device that could register musical sounds objectively, independent of the aural prejudice of the transcriber, showing subtleties of pitch, duration, attack, release, and other details of performance style that resist transcription in Western music notation (*Photography in Folk Music*, 1928). Various approaches to this problem have been undertaken in Japan, Norway, Israel, and the United States.

In 1941 C. Seeger wrote that actual performance of music of another culture must carry far more weight than mere listening to it ["Music

and Culture," MTNA, *Proceedings*, 35th series, pp. 112-22], an observation made a few years earlier by P. R. Kirby [Preface, *The Musical Instruments of the Native Races of South Africa*, 1934; repr. Johannesburg, 1953]. Foreshadowed by Seeger and Kirby, a new kind of program that has had a profound effect on training and research elsewhere in the United States and abroad was begun in 1954 at the University of California, Los Angeles. The program includes training in basic musicianship of non-Western musical cultures in order to provide a firm foundation in the performance skills of specific African, Oriental, and other types of music. Also, as Manfred Bukofzer indicated in 1956 ["Observations on the Study of Non-Western Music," *Les Colloques de Wégimont*, Brussels, Elsevier, 1956, p. 35] and as practical studies in performance have borne out, the research methods of Western historical musicology are inadequate for non-Western studies. As a result, new field and laboratory methods are rapidly being developed. The basic elements of music—rhythm, melody, harmony, tone color—have developed differently and with varying degrees of emphasis in different cultures. In the Middle East, Africa, South and Southeast Asia, and the Far East, rhythm and melody are expressed in subtle, rich, and complex forms. Among the gong-chime cultures of Southeast Asia orchestras composed of bronze instruments have developed a rich harmonic texture founded on the principle of orchestration known as stratification. In Western music, the primary emphasis on harmonic development represents an entirely different utilization of the basic elements of music. A comparison of the rhythm and melody of India with those elements in European art music (or American jazz, for that matter) serving as models is no more enlightening than a comparison of Tamil with Latin and Greek.

Recent studies not only document Ellis' assertion regarding the "musical scale" but also indicate that the musical practices, cultural contexts, and value systems of cultures throughout the world are highly individual, varying often in principle and always in detail from region to region and locale to locale (e.g., see under Bali, Java, Thailand, Vietnam, etc.). A vast number of musical cultures of the non-Western world are yet to be studied systematically and the music of the European art tradition re-examined in the light of newly emerging concepts before comparative methods can "give musicology a truly world-wide perspective."

Hood, "Music, the Unknown," in *Musicology* (1963).

M.H.

**Ethos** [Gr.]. In ancient Greek music, the "ethical" character of the various scales. The (Greek) Dorian (similar to our Phrygian) was considered manly and strong, representing the ancient tradition; the Phrygian, ecstatic and passionate; the Lydian, feminine and lascivious; the Mixolydian, sad and mournful. Similar characterizations, doubtless influenced by the Greek ideas, are found in medieval and later discussions of the church modes. See Key characteristics.

Lit.: *ReMMA*, pp. 44ff; L. Harap, in *MQ* xxiv; E. M. von Hornbostel, in *CP Wolf*; C. Sachs, *The Rise of Music in the Ancient World* [1943].

**Et in terra pax.** See under Gloria.

**Étouffé** [F.]. Damped, muted (kettledrums, violins). *Étouffoir*, piano damper.

**Étude.** A piece designed to aid the student of an instrument in developing his mechanical and technical ability. An étude is usually devoted entirely to one of the special problems of instrumental technique, such as scales, arpeggios, octaves, double stops, trills, etc. Whereas études are written in the form of a complete piece, finger exercises are short formulas that have to be repeated many times, either on the same pitch or moving through the degrees of the scale. Many modern teachers prefer finger exercises because they are more efficient than études.

Finger exercises were already known in the early 16th century. The tablature of Oswald Holtzsch (1515, Univ. Bibl. Basel) contains sequential passages in sixteenth notes, entitled: "Lauffwerck, mit beiden Händen zu bruchen"

("running passages, to be used with both hands"). A similar piece is contained in Leonard Kleber's tablature (c. 1520, St. Bibl. Berlin). Toward the end of the 17th century the Italian toccata became a sort of étude, owing to the extended use of stereotyped passages and the deterioration of the musical quality (A. Scarlatti, B. Pasquini). A publication by F. Durante (1684-1755), *6 Sonate per cembalo divisi in studii e divertimenti*, contains six "sonatas," each consisting of a "studio" and "divertimento," the former being somewhat serious and difficult to play, the latter in the lighter vein of the "gallant style" [see Editions IX, 11]. The originator of the modern étude is Muzio Clementi (1752-1832), whose *Préludes et Exercices* (1790) and *Gradus ad Parnassum* (1817-26) mark the beginning of the enormous literature of the 19th-century étude. Outstanding collections of études for the piano were written by Cramer, Czerny, Moscheles, and Bertini, and for the violin by Kreutzer, Rode, Paganini, d'Alard, and Bériot. Chopin, in his 27 Études (op. 10, op. 25, and three single pieces), created the concert étude, which is designed not only for study but also for public performance and which combines technical difficulty with high artistic quality. His example was followed by F. Liszt (*Études d'exécution transcendante*, and others), Scriabin (op. 8, op. 42, op. 65), and Debussy (twelve *Études*, dedicated to the memory of Chopin, 1915). See E. Gork, "Die Entwicklung der Klavieretüde von Mozart bis Liszt" (diss. Vienna, 1930).

**Études d'exécution transcendante** [F., Transcendental Etudes]. Twelve concert études by Liszt, published 1852. The title refers to their great technical difficulty.

**Études symphoniques** [F., Symphonic Etudes]. A set of twelve piano pieces by Schumann, op. 13 (1834), in the form of a theme (by Fricken) with variations and a concluding finale. The term "symphonic" probably refers to the highly virtuosic treatment of the piano, occasionally with distinctly "orchestral" effects. The variation technique is extremely advanced for the time [see under Variations IV (3)], and some of the pieces have, at best, a very tenuous connection with the theme. This probably is the reason why Schumann discarded the original title, *Études en forme de variations*.

**Eugen Onegin** [Rus. *Yevgeny Onyegin*]. Opera in three acts by Tchaikovsky (libretto by K. S. Shilovsky and the composer, after a poem by

Pushkin), produced in Moscow, 1879. Setting: Russia, about 1820.

**Eunuch flute.** See Mirliton.

**Euouae.** In the liturgical books of the Roman rites, the usual abbreviation for "seculorum. Amen" (consisting of the vowels of these two words), the closing words of the "Gloria Patri" [see Doxology]. It is given at the end of introits and antiphons in order to indicate the proper ending (*\*differentia*), which leads back to the final repetition of the introit or antiphon. For more details, see Psalm tones. The spelling *Evovae*, frequently found in older books, has been confused by some writers (among them F. X. Haberl, in *Cäcilien-Kalender*, 1885, p. 32b) with the ancient Greek word *Evoe*, an interpretation that aroused surprise and indignation over the use in the Roman service of a bacchanalian exclamation of joy.

**Euphonium.** See under Brass instruments III (d).

**Euridice, L'.** Title of the two earliest extant operas, one by Peri (1600), the other by Caccini (1602), both produced at Florence and based on the same libretto (by O. Rinuccini), which relates the story of Orpheus and Eurydice. Setting: ancient Greece. The music consists almost entirely of recitative, which, although not free from monotony, is remarkable for its austere expressiveness, particularly in Peri's opera.

**Evangelary** [L. *evangelarium*]. See under Liturgical books I (9).

**Evangelist.** In a Passion, the narrator who recites the text of the Gospel.

**Evangelium** [G.]. Gospel.

**Evensong.** The sung form of the Evening Prayer of the Anglican Church, corresponding to the Roman Catholic Vespers. See Anglican church music.

**Evirato** [It.]. Same as *\*castrato*.

**Evovae.** See Euouae.

**Exaquir.** See Echiquier.

**Exchange of voice-parts.** See Voice exchange.

**Exequiae** [L.]. Exequies, i.e., music for funeral rites.

**Exotic music.** Archaic term for non-Western music. See Ethnomusicology.

**Exposition.** In the *\*sonata* form, the first section, containing the statement of the themes [G. *Themenaufstellung*]. In a fugue, the first as well as subsequent sections containing the imitative presentation of the theme [G. *\*Durchführung*]; see *\*Fugue* I (d), (f).

**Expression** [F.; G. *Ausdruck*; It. *espressione*; Sp. *expresión*].

I. *In composition.* Musical expression may be described as the quality that accounts for the peculiar emotional effect of music—much more than the other arts—on human beings. In fact, expression is usually regarded as a basic and universal attribute of music. However, while most music known and heard today is expressive, there are numerous compositions—generally from earlier periods—that are more notable for their formal organization, intricate design, fascinating figurations, playful elements [G. *Spielmusik*], and similar features resulting from a detached, objective, impersonal, and even intellectual approach to composition. To regard an organum by Perotinus, a conductus of the 13th century, a motet by Machaut, an echo-fantasia by Sweelinck, or even Stravinsky's octet for wind instruments as expressive would simply render the term meaningless. On the other hand, some early music is more or less expressive, e.g.; Gregorian chant, a *ballade* by Machaut, a motet by Josquin, a madrigal or an opera by Monteverdi, a lament by Froberger, a cantata by Buxtehude or Bach. Baroque vocal music is often highly expressive, while baroque instrumental music tends to appeal to present-day listeners because of its detached, nonexpressive character.

An important step toward expressiveness in instrumental music was taken by the members of the *\*Mannheim school* (c. 1750). It was in their symphonies that devices of dynamic expression such as sudden *ff* and *pp* and long crescendos and decrescendos were first exploited. While in these works the details of expression are not always justified by the music itself, often appearing as a somewhat extraneous addition, a complete amalgamation of "expression" and "composition" is achieved in the works of Haydn, Mozart, Beethoven, and Schubert. Here expression is in complete agreement with the musical substance, which has become expressive in itself. In the romantic movement, the possibilities of expression were exploited to the fullest. An immense array of shades of subtlety appeared, and composers invested vast ingenuity in the

invention of new nuances as well as words or signs to indicate them. Although this tendency has greatly enriched the musical palette, it has not always enhanced artistic quality. The anti-romantic movement of the 20th century brought a marked reversal of attitude. Erik Satie was probably the first to write intentionally unexpressive (dry) music, and to ridicule the romantic tendencies with ironic expression marks, such as: "corpulentus," "caeremoniosus," "devenez pâle," etc. Composers such as Poulenc, Stravinsky, and Hindemith also frequently wrote in an intentionally unexpressive style, using expression signs very sparingly and sometimes indicating their intentions through remarks such as "sans expression," "Mit wenig Ausdruck." Recent composers, especially Boulez and Carter, have provided their scores with an incredible number of novel signs to indicate minute details of performance.

II. *In performance.* Usually expression refers less to composition than to performance, as appears from statements such as "Expression [is] the creative element in musical performance [*GDB*, s.v. "Expression"] or "Ausdruck nennt man die feinere Nüancierung im Vortrage musikalischer Kunstwerke" [*Riemanns Musiklexikon*, s.v. "Ausdruck"]. It is the performer who must transform the composer's work from the printed page into vital communication. This process involves details of tempo, rhythm, dynamics, phrasing, accentuation, touch, and bowing as well as subjective interpretation. The ideal performer is one who succeeds in bestowing on the composition a personal and original expression within the stylistic frame of the work and in full compliance with the intentions indicated by the composer. Unfortunately, the second part of this postulate is not always realized, and it is the arbitrariness of so many virtuosos that has been partly responsible for the excess of expression marks found in the works of composers who thus hoped to forestall distortion and misinterpretation. Yet complete control over the performer is not only impossible but undesirable. The only remedy is to improve the education of performers in matters of musical style and taste. The most common fault is the application of a romantic, i.e., a highly expressive, treatment to nonromantic music, such as the works of Bach, Haydn, Mozart, and Beethoven. The deplorable result is an exaggeration of all nuances: the use of *prestissimo* instead of *allegro*, of *larghissimo* instead of *adagio*, of *fff* and *ppp* instead of *f* and *p*, of frequent crescendos

and decrescendos instead of an even level of sonority, of numerous rubatos, ritardandos, and accelerandos instead of strictly kept tempo, etc. Even more disastrous is the application of such methods to works of the Middle Ages or the Renaissance, works that demand clarity above all. See also Expression marks.

**Expressionism.** Term taken over from the visual arts and used, more or less metaphorically, for music written in a deeply subjective and introspective style. The composition of such music is roughly coeval and linked in inspiration with the German school of expressionist painters (Nolde, Kirchner, Ernst, Kokoschka, *et al.*), who worked in Munich, Berlin, Vienna, and other important German and Austrian centers from about 1905 to about 1930. These painters sought to go beyond the purely visual appearance and to depict the artist's subjective interpretation of reality, using distortion, exaggeration, symbolism, etc. This approach is opposed to that of the \*impressionist painters, who sought to depict the moving appearance of things in given settings of light and color as seen through a highly sensitive but objective eye, with total disregard for the psychological or emotional aspects of the subject.

Musical expressionism in the early 20th century is the result of a gradual development rather than an abrupt reaction (against impressionism). Its roots lie in romanticism, which continued to dominate the creative arts in Germany. Indeed, the "expressionist" music produced in Germany in the 1910's and 1920's may be considered the last desperate cry of romanticism in its decline.

The composers most often identified as "expressionists" are Schoenberg (who was also a talented painter) and Berg, to some extent Webern, and, in some of their works, Krenek, Hindemith, and others. Schoenberg's *Verklärte Nacht*, *Pierrot Lunaire*, and *Erwartung*, along with Berg's operas *Wozzeck* and *Lulu*, are the masterpieces of expressionist music. [Also see Atonality.] Whether musical expressionism ends where neoclassicism begins is open to question. Its actual end seems rather to coincide with the beginnings of Nazism in Germany and Austria.

The Nazi condemnation of so-called *entartete Kunst* (perverted art) was directed against those works of painting and music that are most representative of expressionism.

Schering, *Die expressionistische Bewegung der Musik*, in *Einführung in die Kunst der Gegenwart* (1922); T. W. Adorno, *Philosophie der neuen Musik* (1949); A. Berg, *Écrits*, ed. H. Pousseur [1957]. A.B.

**Expression marks.** Signs or words (sometimes abbreviated) used to indicate details of performance. The most basic types are \*tempo marks and \*dynamic marks. In addition there are signs for \*legato and \*staccato, for various kinds of \*bowing, for \*articulation and \*phrasing, for the use of the piano \*pedals, etc., and finally, numerous terms such as "passionate," "dolce," and "con brio" that are intended to describe the general character or mood of a composition, section, or passage.

No expression marks of any kind from before 1500 have been found. The earliest dynamic indication is a *tocca pian piano* (play very softly) in "Non ti spiaqua l'ascoltar" of the so-called Capirola lute book of c. 1517 (ed. by O. Gombosi, p. 85). Tempo indications first appear in the vihuela book *El Maestro* (1535) by Luis Milán, who prescribes for certain passages of his fantasias "apriessa" (quick), and for others "a espacio" (slow). It is significant that the earliest expression marks are found in music for a single player. About the end of the 16th century, the novel style of contrasting sonorities [see *Concertato*; *Echo*] led to the use of the terms *forte* and *piano*. The earliest compositions with these indications are G. Gabrieli's *Sonata pian e forte*, 1597 [see *SchGMB*, no. 148; *HAM*, no. 173], the upper part of a Kyrie published in the same year [see *ReMR*, p. 498], Adriano Banchieri's madrigal comedy *La Pazzia senile*, 1598 [\*Editions VI, no. 6] and some pieces in his *L'Organo suonarino* (1605–22). A little later the abbreviating letters must have come into use, since Domenico Mazzocchi, in the preface to his *Madrigali* (1638), says that the letters F. P. E. t.—for Forte, Piano, Echo, trill—are commonly known.

The monodic style of the early 17th century made musicians aware of the importance of subtly shaded expression. Caccini, in the preface of *Le Nuove musiche* (1601), illustrated the new style of singing through examples bearing remarks such as "Esclamazione spiritosa," "senza

misura quasi favellando," etc. Banchieri used a variety of tempo indications, such as *presto*, *più presto*, *prestissimo*, in addition to *allegro* and *adagio* [see *ApMfZ* i, 27ff]. At the same time, Frescobaldi gave detailed information regarding free tempo in the preface of his *Toccate e partite d'intavolatura di cembalo* [1615–16; see C. Sartori, *Bibliografia della musica strumentale italiana* (1952), pp. 206f, 218f]. In the second half of the 17th century such terms as *grave*, *largo*, *vivace*, and others were not uncommon. About 1720 François Couperin described the character of his harpsichord pieces with such subtly shaded expression marks as "gravement sans lenteur" or "gracieusement et légèrement."

Prior to the middle of the 18th century *crescendo* and *decrescendo* were used chiefly for the vocal performance of single sustained tones [see *Messa di voce*]. Mazzocchi seems to have been the first to indicate these effects with signs, a *V* for a *crescendo* (called by him *messa di voce*), and a *C* for a *crescendo* followed by a *diminuendo* (the *messa di voce* proper; see Harding, p. 91). The modern signs for *crescendo* and *diminuendo* appeared much later, the earliest known instance being in Geminiani's *Prime Sonate* of 1739. *Crescendos* and *diminuendos* extending over lengthy musical phrases were also known throughout the 17th century but were always indicated with prescriptions such as "forte, piano, pianissimo" (Mazzocchi), or "Lowd, Soft, Softer" (M. Locke), or "lowder by degrees" (M. Locke, *Curtain Tune* in *The Tempest*, 1675). The members of the Mannheim school were the first to use all dynamic effects in the modern way, for the purpose of orchestral coloring and climatic or anticlimatic effects.

Expression marks in Bach are in effect limited to a handful of pieces in which degrees of sonority are indicated by *f*, *p*, and *pp*. In view of the excessive number of expression marks found in modern editions of Bach, it should be noted that the entire manuscript of *The Well-Tempered Clavier* contains nothing but the notes and signs of ornamentation, except for some *f* and *p* (usually disregarded in modern editions) in the G♯-minor prelude of Part II.

Lit.: R. E. M. Harding, *Origins of Musical Time and Expression* (1938); D. Boyden, "Dynamics in Seventeenth- and Eighteenth-Century Music" (*CP Davison*); G. Langley, in *PMA* xxxviii; A. Heuss, "Die Dynamik der Mannheimer Schule" (*ZMW* ii); M. Brenet, "Sur l'Origine du 'crescendo'" (*BSIM*, 1910).

**Expressive organ** [F. *orgue expressif*]. See under Harmonium II.

**Exsultet**. See under *Praeconium paschale*.

**Extemporization**. See Improvisation.

**Extravaganza**. Term sometimes used for a musical caricature [see Satire]. Gilbert and Sullivan used it as a subtitle for *Trial by Jury*.

**Exultet**. See under *Praeconium paschale*.

**Eye music** [G. *Augenmusik*]. Certain 15th- and 16th-century compositions in which the affective meaning of the music is made visible to the eye by the use of special methods of notation. By far the most common device is the use of blackened notes for texts expressing grief or lament as well as for individual words such as "night," "dark," "shade," etc. An early instance is found in Ockeghem's *Missa Mi-Mi*, where black notation

is used at the end of the Credo for the word "mortuorum" (also, however, for the continuation: "et vitam venturi saeculi. Amen," which has the opposite connotation). A more striking example is Josquin's \*lament on the death of Ockeghem, *Nymphes des bois*, written entirely in black notes. Numerous examples occur in the madrigals of the second half of the 16th century, especially those of Luca Marenzio. Since the notational significance of blackened notes is a change from duple to triple rhythm [coloration; see Mensural notation V], the "dark" passages appear in modern transcription as triplet formations.

The term "eye music" is also applied to examples of \*word painting, particularly those that employ ascending or descending motion, thus giving to the reader or performer a visual impression of the meaning of words such as "heaven" or "dying." See A. Einstein, *The Italian Madrigal* (1949), i, 234ff; *id.*, in *ZIM* xiv.

## F

**F.** (1) See Pitch names; Letter notation; Hexachord. (2) Abbr. for forte; ff (fff), abbr. for fortissimo. (3) F clef, see Clef. F-hole, see Sound hole.

**Fa**. See Pitch names; Solmization; Hexachord. *Fa fictum* means, in systems of hexachord and mutation, the *fa* (fourth degree) of the *hexachordum molle* (beginning with f), i.e., b-flat; or, the same degree of the transposed hexachord starting on b-flat, i.e., e-flat'. Both tones belong to \**musica ficta*.

**Faberdon**. German 16th-century corruption of F. *fauxbourdon*. The term had no real significance but acquired a legendary connotation concerning Pythagoras, who is said to have "invented" music by listening to the sounds of smith's hammers of various sizes (L. *faber*, smith, and G. *Don* [Ton], sound; see Pythagorean hammers). The humanist Latinization *fabrisonus* also was used (e.g., in H. Buchner's "Fundamentum" of c. 1520–30).

**Fabordón**. Spanish 16th-century corruption of

F. *fauxbourdon*, used to denote four-part harmonization of the psalm tones [see *Falsobordone*]. See also Glosa.

**Faburden**. (1) A term used in an English MS of the early 15th century (Brit. Mus. *Lansdowne* 763) to describe a method of improvised sixth-chord harmonization; see *Discantus supra librum*. It involves the use of a derivative melody that is generally a third above but occasionally in unison with the *cantus firmus*. (2) In English organ music of the early 16th century (John Redford, *et al.*), a "verse on the faburden" is a polyphonic setting not of the original plainsong but of a derivative melody that is generally a sixth or occasionally an octave below the plainsong [see Redford's *O Lux*, on the *fabourden* in C. Pfatteicher's *John Redford* (1934), music section, p. 50; see Ex. a, original melody;

b, faburden melody. This faburden is the same as that described by the 15th-century anonymous writer who uses it transposed to the lower fifth, whereas in the example here it is transposed to the lower octave]. In other organ pieces by Redford the derivative melody is used untransposed, and in still others he uses a derivative melody forming lower thirds and occasional unisons with the *cantus firmus*. This modification is the same as in the *modus faulxbourdon* described by Guilielmus Monachus in his "De preceptis artis" of c. 1485 (CS, iii, 288); see *Discantus supra librum*. For the relationship between faburden and fauxbourdon, see Fauxbourdon. See H. Miller, in *MQ* xxvi. (3) See *Falsobordone*.

**Fackeltanz** [G.]. A traditional dance of Prussian court ceremonies of the 19th century, consisting of a slow torchlight procession [G. *Fackel*, torch]. Spontini, Flotow, and Meyerbeer have written music for such occasions.

**Fado, fadinho** [Port.]. The popular music par excellence of the cities of Portugal, frequently heard in cafés and on the streets. It consists of song and dance accompanied by the guitar. It originated in Lisbon, in time spreading to other cities, with noticeable differences in style and spirit. See G. Chase, *The Music of Spain* (1941), p. 241; R. Gallop, in *MQ* xix, xx, and in *ML* xiv, 222ff, 343ff.

**Fa fictum**. See under Fa.

**Fagott** [G.], **fagotto** [It.]. Bassoon. *Fagottino* [It.] is the tenor oboe (tenoroon), *fagottone* [It.] the contrabassoon. *Fagottgeige* [G.] is a large 18th-century viol whose strings were overspun with silk and therefore produced a buzzing sound reminiscent of the Fagott. *Fagottzug* [G.] is a stop mechanism of old pianos (c. 1800) that produced a buzzing effect by means of a paper strip rubbing against the strings.

**Fair of Sorochinsk, The** [Rus. *Sorochinskaya Yarmarka*]. Unfinished opera in three acts by Mussorgsky (to his own libretto, based on a short story by Gogol). Revised and completed by several composers, it is occasionally performed in a version by Nicolas Tcherepnin (1923). Produced (in concert form) in St. Petersburg, 1911. Setting: the Ukraine, mid-19th century.

**Fakes, musical**. See Spurious compositions.

**Fa-la, fa-la-la**. A special type of 16th-century

song in which the syllables "fa la la" or similar ones are used as a refrain, e.g.: "Now is the month of Maying, When merry lads are playing, Fa la la la . . . , fa la la la . . ." (T. Morley). An early example, with the refrain "tan tan tan tarira," occurs in Baldassare Donato's *Il Primo Libro di canzon villanesche alla napolitana* (1550?); numerous others are found in the works of G. Gastoldi, Lasso, Orazio Vecchi, and others. Through Gastoldi's *Balletti . . . per cantare sonare & ballare* (1591) the fa-la's became known in England (Morley, Weelkes, Hilton) and in Germany (H. L. Hassler, E. Widman, J. Staden, D. Friderici). Ex. in *HAM*, nos. 158, 159.

**Falsa** [Sp., Port.]. Dissonance. In 17th-century organ music, *obra* (or *tiento*) *de falsas* is a composition making deliberate use of dissonances, as in the Italian *\*durezze e ligature*. A large number of *falsas* were written by Aguilera de Heredia, Correa de Arauxo (*Libro de tientes*, 1626), Bruna, Joséph Jiménez, Cabanilles, and others. See Editions XI, 14; H. Anglés, in *CP Wagner*.

**Falsa musica**. See *Musica ficta*.

**False**. *False cadence*, same as deceptive cadence. *False fifth (triad)*, old term for the diminished fifth (triad). *False modulation*, see Modulation. *False relation*, see Cross relation.

**Falsetto**. [It.]. An artificial method of singing used by male singers, particularly tenors, to reach notes above their ordinary range. Actually falsetto is an action: the deliberate limitation of the tone-making apparatus. Since such tones are rather weak compared to the normal tones of a voice, falsetto is usually considered to be of inferior quality. In early music, however, falsetto singing was highly esteemed and was much used for the higher parts of polyphonic Masses and motets when boy singers were not available. In England, particularly, falsetto singing was widely practiced [see Alto]. In fact, a well-trained falsetto voice, though lacking the powerful volume and dramatic expressiveness of a tenor, has its own charm. It stands in the same relationship to the normal tenor voice as the recorder to the flute, the viol to the violin. See C. Anthon, in *Etude* lxiii, 615; R. S. Tatnell, *The Consort*, no. 22, 1965.

**Falsobordone** [It., from F. *fauxbourdon*]. A 16th-century term for simple four-part harmonizations of psalm tones or other liturgical recitatives (Magnificat, Lamentations, etc.). This style was cultivated particularly in Spain, where it was

called *fabordón*. A. de Cabezón (1510–66) wrote *fabordones* for organ, and F. Guerrero (1528–99) for chorus [see Editions XX, 2, 3]. These are settings of psalm or Magnificat verses that were used alternately with verses in plainsong [see Magnificat]. For an Italian example (from Cesare de Zaccaria, *Intonationes cum Psalmodiis*, 1594) see *ReMR*, p. 492. Heinrich Schütz, in the preface to his *Historie von der . . . Auferstehung* (1623), speaks of the instrumental accompaniment to the Evangelist's recitations as *falsobordone*. The use of *falsobordone* compositions (particularly in Palestrina's \*Lamentations) in alternation with Gregorian chant was authorized for special occasions by Pius X in his *Motu proprio* (1903).

For a plausible explanation of the transition from 15th-century fauxbourdon to 16th-century *falsobordone*, see E. Trumble, in *JAMS* viii, 71.

**Falstaff.** Opera in three acts by Verdi (libretto by A. Boito, based on Shakespeare's *Henry IV* and *The Merry Wives of Windsor*), produced at Milan, 1893. Setting: Windsor, early 15th century. Together with \**Otello* (1887), this opera represents the climax of Verdi's work. Influenced by Wagner's music drama, Verdi largely abandoned here the "number style" of his earlier works [see Number opera] and adopted something like Wagner's unending recitative. However, he remained completely untouched by the harmonic innovations of Wagner, whose chromatic harmonies (\**Tristan und Isolde*, 1865) are conspicuously absent in *Falstaff*.

**Familiar style** [It. *stile familiare*]. A term used for vocal music in which the voices (usually four) move uniformly in regard to note values as well as to syllables of the text, as in a church hymn. From the point of view of musical texture, familiar style is equivalent to note-against-note style (and other designations, e.g., homorhythmic), the only difference being that the latter term is not restricted to vocal music and hence carries no implication of textual treatment.

The term *stile familiare* probably originated in the 16th century. G. Baini, in his *Memorie . . . di Palestrina* (1828; ii, 415), speaks of "lo stile semplice di nota e sillaba, che fu denominato *familiare*" and mentions Josquin's Mass *D'ung aultre amer* as the first model. Actually there are much earlier manifestations of the same principle of composition; see Homorhythmic.

**Fanciulla del West, La** [It., The Girl of the Golden West]. Opera in three acts by Puccini

(libretto by G. Civinini and C. Zangarini, based on a play by D. Belasco), produced in New York, 1910. Setting: California during the Gold Rush (1849–50).

**Fancy (fantasy).** A 16th- and 17th-century term for certain lute, keyboard, and instrumental ensemble music of English origin. The fancy stems from the Italian fantasia [see Fantasia (5)]. Until the middle of the 17th century the contrapuntal style of the Italian fantasia was rather strictly adopted by the English musicians, but by about 1680 the influence of the new Italian melodic style (Carissimi) was strongly felt. The earliest type of fancy is described by Morley [*A Plaine and Easy Introduction . . .* (1597), p. 181; ed. R. A. Harman (1952), p. 296]: "The most principal and chieftest kind of music which is made without a ditty is the Fancy, that is when a musician taketh a point at his pleasure and wresteth and turneth it as he list . . ."

In general, fancies are fairly long compositions in which several themes (Morley's "point") are treated in imitation. Thus, they consist of several thematic sections, which, however, usually overlap, as in a *ricercar*. For an example of this type, by Byrd, see Editions XVI, 16, p. 71. Another composition by Byrd (*ibid.*, p. 166) shows more varied treatment, e.g., sections in triple meter. In the early 17th century the sections are often clearly separated, contrasting in character, and based on more specifically instrumental themes or motifs. Several examples by A. Ferrabosco, William Lawes, and J. Jenkins are reproduced in E. H. Meyer's *English Chamber Music* (1946; Appendix). Toward the middle of the 17th century the fancy acquired suitelike features by the inclusion of dance movements modeled after the pavane, galliard, allemande, sarabande, etc. This type is represented by the fancies of M. Locke and Purcell.

The most important composers of fancies were William Byrd (1543–1623), Thomas Morley (1557–1602), John Coperario (c. 1575–1626), Alfonso Ferrabosco (c. 1575–1628), Richard Deering (c. 1580–1629/30), Orlando Gibbons (1583–1625), Thomas Lupo (d. before 1628), Thomas Tomkins (1572–1656), William Lawes (1602–45), John Jenkins (1592–1678), and Henry Purcell (c. 1659–95). Their works constitute a treasure of early chamber music, which Roger North, in his *Musicall Gramarian* (c. 1728), aptly characterized: "If ye musick was not so Ayery, it was sound and good." Also see Fantasia.

Johnson, "The English Fantasy Suite" (*PMA* lxxxii); E. H. Walker, "An Oxford Book of Fancies" (*MA* iii); R. Erlebach, in *PMA* lix (W. Lawes); C. W. Hughes, in *MQ* xxvii (R. Deering); H. J. Sleeper, in *BAMS* iv (Jenkins); D. Stevens, in *ML* xxxiii (Purcell); \*Editions XXXIV 9, 21; Purcell, ‡*Fantazias and Other Instrumental Music (The Works of Henry Purcell* xxxi); E. Fellowes, ‡*Nine Fantasias . . . by Orlando Gibbons* [1924]; H. J. Sleeper, ‡*John Jenkins, Fancies and Ayres* (1950); P. Warlock and A. Mangeot, ‡*Six String Quartets by Matthew Locke* [1932]; *id.*, ‡*Purcell: Three, Four and Five Part Fantasias for Strings* (1927); E. H. Meyer, ‡*Englische Fantasien* (1934); A. Mangeot, ‡*Three Fancies for String Quartet* [1936].

**Fandango.** A Spanish dance in moderate to quick triple time with rhythms such as Ex. 1, danced by a couple to the accompaniment of guitar and castanets, in alternation with sung couplets. The fandango appeared in Spain in

the early 18th century. A popular melody [Ex. 2] was used by Gluck in his ballet *Don Juan* (1761), as well as by Mozart in *Le Nozze di Figaro* (1786; finale of Act III, section in 3/4 time). More recently, Rimsky-Korsakov (*Capriccio espagnol*, 1887) and E. Granados (*Goyescas*, no. 3, 1912) have written fandangos. Local varieties of the dance are the \**Malagueña* (from Malaga), the *Granadina* (from Granada), the *Murciana* (from Murcia), the *Rondeña* (from Ronda), etc.

**Fanfare.** (1) French term for a brass band, either military or civilian. (2) A short tune for trumpets, used as a signal for ceremonial, military, or hunting purposes. Since they are intended for natural instruments, they include the tones of the triad only. The various nations possess a large repertory of such melodies.

Fanfare-like motifs have been frequently used in art music. As early as the 14th century they occur in a *caccia* by Ghirardello (Gherardellus)

to the words "sounded his horn" [see Ex. a; see *HAM*, no. 52] and in a virelai "Or sus vous dormez trop" (Awake, you sleep too long; Ex. b).

A famous example is Dufay's *Et in terra* "ad modum tubae," a long canon accompanied throughout by fanfare motifs played by two trombones in alternation [Ex. c]. Later instances are found in Josquin's *Vive le roy* [*SchGMB*, no. 62a], in Janequin's program chanson "La Guerre" (c. 1528) and in other *battaglie*, in the introductory "toccata" of Monteverdi's *Orfeo* (1607), and in Bach's *Capriccio sopra la lontananza del suo fratello dilettissimo*. Various operatic composers have made highly effective use of the fanfare, e.g., Beethoven in *Fidelio* (Act II, arrival of the governor), Wagner in the horn-call scene of *Tristan* (introduction to the first scene of Act II).

Lit.: H. de la Porte, *Les Fanfares des équipages français*, rev. ed. (1930); K. Taut, *Die Anfänge der Jagdmusik* (1926); G. Schünemann, ed., ‡*Trompeterfanfaren, Sonaten und Feldstücke* (1936; see Editions XVIII A 7); *id.*, in *ZMW* xvii.

**Fantasia** [It.; F. *fantaisie*; G. *Fantasie*, *Phantasie*]. Generally speaking, a composition in which the "free flight of fancy" prevails over contemporary conventions of form, style, etc. Naturally, the term covers a great variety of types, which may be tentatively classified as five groups.

(1) Pieces of a markedly improvisory character; written records, as it were, of the improvisation technique of the various masters. Examples are Bach's Chromatic Fantasia and his lesser-known Fantasia in A minor for harpsichord (*BG* xxxvi, 81–87; ed. Peters, iv, 22–29), Mozart's Fantasia in D minor for piano, and Beethoven's Fantasia op. 77. The numerous *Fantasien* by K. P. E. Bach also belong to this category [see *HAM*, no. 296].

(2) \*Character pieces of the romantic era. Here, "fantasia" is one of the various titles used to indicate a dreamlike mood or some other fanciful whim. Examples are Brahms' *Fantasien* op. 116.

(3) Sonatas in freer form, or of a special character; e.g., Beethoven's op. 27, nos. 1, 2, both entitled "Sonata quasi una fantasia" and deviating in various respects from the conventional sonata form and style; Schubert's *Wanderer Fantasie* op. 15, in which a song of his ("Der Wanderer") is used as the main subject for all the movements [see *Cyclic*]; Schumann's *Fantasie* op. 17, which is a romantic hybrid of sonata form.

(4) Operatic potpourris of a free and somewhat improvisory treatment, as if written in remembrance of a performance; e.g., Liszt's *Réminiscences de "Don Juan"* (1841).

(5) In the 16th and 17th centuries, a term for instrumental music that was sometimes used interchangeably with *ricercar*, *tiento*, and even *praeambulum*. Fantasias were written for the lute, for keyboard instruments, and for instrumental ensembles. There is a large repertory of lute and vihuela fantasias in the music of Marco d'Aquila (1536; *SchGMB*, no. 94), Luis Milán (1535; *HAM*, no. 121), Francesco da Milano (1547; *SchGMB*, no. 115), Miguel de Fuenllana (1554), and others.

The great majority of 16th-century fantasias are for lute, vihuela, guitar, and other stringed instruments, but the keyboard fantasia has a considerably longer development. The term "fantasia" first appears c. 1520 in the tablatures of Hans Kotter and Leonhard Kleber. Kotter's *Fantasia* [see W. Merian, *Der Tanz in den deutschen Tabulaturbüchern* (1927), p. 58] is a prelude and fugue. Kleber's two fantasias employ various motifs in free imitation, sequential treatment, paired imitation, etc. One of them ("Fantasy in Fa," *Orgeltabulaturbuch*, fol. 56a, 1524) opens with a homophonic introduction and closes with an extended running passage over an F-pedal. Andrea Gabrieli's *Fantasia allegra* [\*Editions III, 3] shows a free mixture of imitation and figuration. A larger repertory of keyboard fantasias is preserved in English sources from c. 1600, especially in the Fitzwilliam Virginal Book, which contains fantasias by Byrd (4), Bull (2), Farnaby (10), Munday (2), Philipps (2), and others. Some of these are intabulated madrigals or chansons [Fuller Maitland-Squire ed., ii, 333, 340]. The majority are sectional compositions, beginning with a section in contrapuntal style and continuing with passagework, figurations, short imitations, dance movements, etc. In the 17th century the keyboard fantasia was cultivated mainly by Sweelinck, Frescobaldi, and Froberger. Each of these masters de-

veloped his own type, which differs considerably from the others. The meaning of the term instrumental (more properly, \*ensemble) fantasia, in publications such as *Fantasia et ricercari a tre voci* (1549) and *Fantasia ricercari contrapunti a tre voci* (1551), is not fixed, and the titles in these books (containing mostly compositions by Tiburtino and Willaert) seem to be used interchangeably. *Fantaisies* by Claude Le Jeune and F. E. du Caurroy (c. 1610; ed. H. Expert [1910?]) and by Charles Guillet (1610; see Editions XXVIII, 4) are strictly imitative. In the 17th century the ensemble fantasia was cultivated mainly in England; see *Fancy*.

Lit.: O. Deffner, *Über die Entwicklung der Fantasie für Tasten-Instrumente (bis J. P. Sweelinck)* (1927); E. H. Meyer, *Die mehrstimmige Spielmusik des 17. Jahrhunderts in Nord- und Mitteleuropa* (1934); H. Colin Slim, "The Keyboard Ricercar and Fantasia in Italy, c. 1500-1550" (diss. Harvard Univ., 1960); M. Reimann, "Zur Deutung des Begriffs Fantasia" (*AMW* x); P. Hamburger, "Die Fantasien in Emanuel Adriansens *Pratum musicum* (1600)" (*ZMW* xii). See also under *Fancy*.

**Fantasiestück** [G.]. See under *Fantasia* (2).

**Fantastic Symphony**. See *Symphonie fantastique*.

**Fantasy**. (1) See *Fantasia*; *Fancy*. (2) The development section (fantasy section) in \*sonata form.

**Farandole**. A Provençal dance performed by men and women who, holding hands, form a long chain and follow the leader through a great variety of figures to music played on the \*pipe and tabor. The dance seems to be of very ancient origin (symbolic celebration of Theseus' escape from the labyrinth?) and is still danced today. Similar dances are the \*branle and \*cotillon. The music of the farandole is usually in moderate 6/8 meter. The dance has been introduced into opera by Bizet (*L'Arlésienne*) and Gounod (*Mireille*). See G. Beaucaire, in *RMC* v.

**Farbenklavier** [G.]. \*Color organ.

**Farce** [It. *farsa*]. (1) Originally, an interpolation, as in a \*trope. (2) In plays and operas, chiefly of the 18th century, farcing means the introduction of alien elements, usually of a humorous, comical, or even lascivious nature [see *Intermezzo*]. This meaning persists in present-day usage, in which farce is a light comedy, sometimes vulgar, frequently a travesty of a serious model. About 1800, Italian comic operas in one

act were called *farsa*, e.g., Rossini's *La Cambiale di matrimonio* (1810).

**Farewell Sonata.** See *Adieux, Les*.

**Farewell Symphony.** See *Abschieds-Symphonie*.

**Fasola.** A system of \*solmization, much used in England and in America during the 17th and 18th centuries, in which only four of the six Guidonian syllables are used, the syllables *fa sol la* being applied to c–d–e as well as to the identical progression f–g–a, and the *mi* being used for the seventh degree, b. Before 1800 the fasola method was used in certain American tune books, the letters F, S, L, F, S, L, M being placed on a staff (e.g., in John Tuft's *An Introduction to the Singing of Psalm-Tunes*, 1721). In 1802 William Little (*The Easy Instructor*) introduced four different shapes of note for each of the syllables, a method known as buckwheat, four-shape, shape-note, or character notation [see Ex.], which proved very successful in the rural districts of the South.

Lit.: I. Lowens, *Music and Musicians in Early America* (1964), pp. 58–88; D. Horn, "Shape Note Hymnals and the Art Music of Early America" (master's thesis, Rochester Univ., 1942); G. P. Jackson, "Buckwheat Notes" (*MQ* xix); C. Seeger, "Contrapuntal Style in the Three-voice Shape-note Hymns" (*MQ* xxvi); K. P. Fuller, in *Etude* lvii, 501.

**Fastoso** [It.]. Pompous.

**Fausse relation** [F.]. False relation [see Cross relation].

**Faust.** Opera in five acts by Gounod (libretto by J. Barbier and M. Carré, based on Goethe's tragedy), produced in Paris, 1859. Revised version with accompanied recitatives and ballet produced in Paris, 1869. Setting: Germany, 16th century.

**Fauxbourdon** [F.]. (1) Historically and properly, fauxbourdon is a 15th-century French technique of composition in which a plainsong melody transposed to the upper octave is notated together with a contrapuntal part moving along at the lower sixth or occasionally at the octave, while a middle part is extemporized by a singer doubling the melody at the lower fourth through-

out [see Ex., from Dufay's "Juvenis qui puellam"; see *WoGM* ii, 57ff, and iii, 87]. According to recent studies (Besseler), fauxbourdon was invented by Dufay about 1428, its first use being in the Communion of his *Missa Sancti Jacobi*.

Cantus. Fauxbourdon.

Contratenor

(3) In present-day English usage, "a means of giving interest to hymn-singing by supplying the choir sopranos with a freely written part, which often soars above the hymn-tune as sung by the congregation" [see P. A. Scholes, *The Oxford Companion to Music* (1955), p. 342]. This would seem to be one of the various newer meanings of the term resulting from a misunderstanding of its proper connotation. A more appropriate name for this method of singing is \*descant.

Lit.: M. Bukofzer, *Geschichte des englischen Diskants und des Fauxbourdons* (1936); T. Georgiades, *Englische Diskanttraktate aus der ersten Hälfte des 15. Jahrhunderts* (1937); E. Trumble, *Fauxbourdon* [1959]; H. Besseler, *Bourdon und Fauxbourdon* (1950); *id.*, in *AM* xx, *MF* i, *AM* xxvi; R. von Ficker, in *AM* xxiii, *AM* xxv; M. F. Bukofzer, in *MQ* xxxviii; S. Clercx, in *RdM* 1957, p. 151; S. W. Kenney, in *MQ* xlv; B. Trowell, in *MD* xiii; F. L. Harrison, in *MD* xvi; E. Trumble, in *RBM* xiv. The etymology of fauxbourdon and faburden is discussed by H. M. Flasdieck in *AM* xxv and *Anglia* lxxiv, 188; G. Kirchner, in *AM* xxvi; N. L. Wallin, in *CP* 1953.

**Favola d'Orfeo, La.** [It., The Fable of Orpheus]. Opera in a prologue and four acts by Monteverdi (libretto by A. Striggio), produced in Mantua, 1607. Setting: ancient Greece. Combining the archaic style of the earliest operas [see *Nuove musiche*] with great expressiveness and dramatic impact, *Orfeo* is a landmark in the history of opera [see also under Orchestra]. It has been revived with considerable success.

**Feeders.** In organ building, small bellows employed to supply the large bellows with wind. See Organ I.

**Fe fa ut, Fefaut.** See under Hexachord III.

**Feierlich** [G.]. Solemn.

**Feldmusik** [G.]. A 17th- and 18th-century designation for brass music for open-air performance; such pieces were also called *Feldstücke*, *Feldsonaten*, *Feldpartiten*, etc. Originally these were fanfares in four-part harmony played by the *Feldtrompeter*, i.e., the military trumpeters as distinguished from the *Kammertrompeter*, who were members of the orchestra [see *SAHMI*, p. 328]. See Lit. under Fanfare. J. P. Krieger wrote a *Lustige Feld-Musik* (1704) and Haydn a number of *Feldpartiten*.

**Felix namque.** Title of numerous English organ compositions, mostly from the 16th century, so called because they are polyphonic elaborations

of the Offertory "Felix namque es," for certain feasts of the Virgin Mary [*LU*, p. 1271; a more accurate source is the Sarum Gradual]. Some settings omit the intonation "Felix" and begin with "namque" a-g-c'-d'-e'-d'-c'-e'-d'-c'. The "Felix namque" enjoyed great popularity in England, second only to the \**In nomine*. The earliest known setting is in a recently discovered fragment from c. 1400 [see T. Dart, in *ML* xxxv, 201]. A setting from the early 16th century (Brit. Mus., *Roy. App.* 56) is interesting because it is in \*quintuple meter. Others are by Redford, Preston, Blitheman, Shelby, Tallis, and T. Tomkins [see C. F. Pfatteicher, *John Redford* (1934); \*Editions XXXIV, 1; Fitzwilliam Virginal Book, see Virginal music (b)].

**Fellowships.** See Scholarships, fellowships, and prizes.

**Feminine cadence.** See Masculine, feminine cadence.

**Feria, ferial.** Any weekday in the calendar of the Roman Catholic Church on which no feast occurs. This meaning is the reverse of the original meaning of L. *feria*, i.e., festival day. The reversal came about by extending the use of the word from Sunday to the other days, Sunday being named *feria prima*, Monday *feria secunda*, Tuesday *tertia*, etc. Later, Sunday was called *Dominica*, whereas for Saturday the Hebrew name *Sabbato* was kept. It should be noted that the adjective "ferial" (days, rites) is used in a meaning closer to the original, i.e., including Sunday, provided no special feast occurs. The opposite is *festal* (days, rites), which refers to feasts on weekdays or Sundays.

**Fermata** [It.]. In Italian, pedal point. In American and German usage, *fermata* means pause [It. *corona*].

**Ferne, wie aus der** [G.]. As if from a distance.

**Fernwerk** [G.]. Echo organ.

**Fes** [G.]. F-flat. See under Pitch names.

**Festal.** See under *Feria*.

**Feste Romane** [It.]. See under Symphonic poem IV.

**Festivals.** The earliest instances of musical festivals are the French \**puy*s, which originated with the troubadours of the 13th century and continued until the 16th century. The *Sängerkriege* of the German minnesingers, of which Wagner gives a lively picture in his *Tannhäuser*

und der Sängerkrieg auf der Wartburg, were an imitation of the *pays*. Of similar age are the Eisteddfod of the Welsh bards.

I. *England*. A new development started in England in the 17th century with the *Festival of the Sons of the Clergy*, which was founded in 1655 and still continues, in the form of a musical service on grand lines. There followed, in 1724, the *Three Choirs Festival*, which combines the choral forces of Gloucester, Worcester, and Hereford and lasts several days. Others are the *Birmingham Festival* (1768–1912), *Norwich Festival* (1770—since 1824 triennially), and *Leeds Festival* (1858, since 1874 triennially), all of which are held for the benefit of local charitable institutions. The *Handel Festivals* in the Crystal Palace began in 1857 but ended in 1936, when the Palace was damaged by fire. Also notable is the *Glyndebourne Opera Festival*, Sussex, founded in 1934 by A. and J. Christie.

II. *United States*. The earliest American festivals on record are those of the Handel and Haydn Society of Boston (triennial; 1857–83) and at Worcester (1858). In 1869 P. S. Gilmore organized his huge festival *Peace Jubilee*, as a celebration of the conclusion of the Civil War, employing an orchestra of 1,000 and a chorus of 10,000. In his *World's Peace Jubilee* of 1872 he doubled these forces and added electrically fired cannons, chimes, and powerful organs. The *Worcester Festivals* became an established annual institution in 1869, and Cincinnati followed with its biennial *Cincinnati Music Festival*, commonly called May Festivals, in 1873 (founded by T. Thomas). The *Ann Arbor May Festivals* of the University of Michigan were founded in 1893. At Bethany College in Lindsborg, Kansas, annual performances of *The Messiah* were begun in 1882 and have developed into a festival week. The *Bethlehem Bach Choir* of Bethlehem, Pa. was founded in 1898 and has given numerous festivals, each including a performance of Bach's B-minor Mass. At Northwestern University festivals were established in 1909 as the *Evanston North Shore Festival* and, after a lapse in 1932, were revived in 1937. In the same year (1909) began the *Spring Festivals of Cornell University*, now held at irregular intervals. Outstanding among subsequent developments are: *Berkshire Festival of Chamber Music* at Pittsfield, Mass. (established 1918 by Elizabeth Sprague Coolidge, transferred to the Library of Congress after 1924 and also known as *Coolidge Chamber Music Festival*, which featured numerous first performances of chamber works); *Westchester*

*County Music Festival* (1925, now at White Plains, N.Y.); *Eastman School Festival of American Music* at Rochester, N.Y. (1930, founded by Howard Hanson); *Westminster Festival* at Princeton, N.J. (1936; programs of American music); *Berkshire Symphonic Festival* at Lenox, Mass. (founded by Henry K. Hadley at Stockbridge in 1934, since 1936 in connection with the Boston Symphony Orchestra; since 1940 held at Tanglewood); and *Marlboro Music Festival* at Marlboro, Vt. (founded by A. Busch and R. Serkin in 1951; offers instruction and concerts).

For detailed information on these and other festivals, see Pierre Key's *Music Year Book* and the *Calendar of Music Activities in the United States of America* published by the President's Music Committee of the People-to-People Program.

III. *Other countries*. Outside the United States and England, music festivals are found mainly in Germany and Austria. Among these the *Niederrheinische Musikfeste* (founded 1817; held alternately in Cologne, Düsseldorf, and Aachen) are most like the American or English choral festivals. More important from the artistic point of view were the *Tonkünstlerfeste* of the *Allgemeiner deutscher Musikverein*, founded by F. Liszt in 1861 and held annually in different cities, the last (1932) in Zurich. Celebrations of great German composers are frequently held in their native cities, e.g., the *Beethovenfeste* in Bonn, the *Bachfeste* in Eisenach, the *Mozartfeste* in Salzburg, Austria. Most famous among these are the *\*Bayreuther Festspiele*, devoted to Wagner's operas. The *Kammermusikfeste* at Donaueschingen, founded in 1921, have been very important in the development of modern music [see *Gebrauchsmusik*]. Similar in purpose are the festivals of the *International Society for Contemporary Music*, held since 1923 in various places all over the world (complete programs are given in Slonimsky's *Music since 1900*). More recent festivals that have attracted much attention are the *Maggio musicale Fiorentino* of Florence (since 1933) and the *Internationale Musikfestwoche* in Lucerne (since 1938).

Lit.: D. Stoll, *Music Festivals of Europe* (1938); G. Gavazzeni, *Le Feste musicali* (1944); J. Feschotte, *Les Hauts Lieux de la musique* (1949); W. A. Fischer, *Music Festivals in USA* (1933); F. Ghisi, *Feste musicali Medicee* (1939); H. M. Schletterer, in *MfM* xxii, 181–96 (16th century).

**Festoso** [It.]. Festive.

**Festschrift** [G.]. General designation for publications (not necessarily German) usually presented as a tribute to outstanding scholars on the occasion of their 60th, 70th, etc. birthday. They contain contributions from colleagues, pupils, scholars in the same (or an allied) field, etc. Many musicologists, and occasionally composers and conductors, have been honored in this way. The *Festschriften* referred to in this dictionary are listed in the Abbreviations under Collective Publications. Others have been published (under various titles) for: J. Écorcheville (1916), C. Engel (1943), W. Fischer (1956), M. Friedländer, (1922), J. Handschin (1962), K. Jeppesen (1962), Z. Kodály (1953, 1957), I. Krohn (1927), R. Lach (1954), R. Münnich (1947, 1957), E. Newman (1955), F. Pedrell (1911), P. Raabe (1942), A. Schoenberg (1924, 1934), A. Schweitzer (1946), J. Smend (1927), and F. Weingartner (1933). See W. Gerboth, "Index of Festschriften and Some Similar Publications" (*CP Reese*).

**Festspiel** [G.]. See under Festivals III; also *Bühne*.

**Ff.** Abbr. for fortissimo.

**F fa ut.** See under Hexachord III.

**F-hole.** See Sound hole.

**Fiato** [It.]. Breath. *Stromenti da fiato*, wind instruments.

**Fiddle.** Colloquial for the violin and stringed instruments resembling it, particularly the folk varieties used to accompany dancing. Also, the primitive ancestors of the violin, as found in many Oriental cultures. See Violin II.

**Fidelio** [G.]. Opera in two acts by Beethoven (libretto by J. Sonnleithner and G. F. Treitschke after Bouilly), first produced in Vienna in 1805 as *Fidelio oder die eheliche Liebe* in three acts, rev. 1806 as *Lenore* in two acts, final rev. 1814. Setting: a state prison in Spain, 18th century. For the various overtures, see *Lenore Overtures*. See also under Melodrama.

**Fidicen** [L. *fides*, string]. Humanist (16th-century) name for a string player.

**Fidel** [G.]. (1) Colloquial for violin and the like. (2) Generic term for medieval violins (*vielle*, *fidula*) and modern imitations thereof.

**Fiero** [It.]. High-spirited, bold.

**Fife.** A small flute with six to eight finger holes and usually no key, used chiefly in military

bands. It has been replaced in the drum corps by the piccolo. For ill. see under Flute.

**Fifre** [F.]. Fife.

**Fifteenth.** In organs, name for foundation stops sounding two octaves (fifteen notes) above normal. Hence, 2-foot stops.

**Fifth.** See under Intervals. Also Blown fifth; Consonance; Circle of fifths; Parallel fifths; Organum (2) I; Triad. Concerning the relative importance of the fifth and the fourth, see under Fourth.

**Figaro, The Marriage of.** See *Nozze di Figaro, Le*.

**Figlia del Regimento, La.** See *Fille du Régiment, La*.

**Figura** [L.]. (1) In medieval theory, generic name for the notational signs. Franco (*CS i*, 119) distinguishes the *figurae simplices*, i.e., the single notes (*longa*, *brevis*, *semibrevis*), from the *figurae compositae*, i.e., the ligatures. *Figura obliqua* means the oblique form of \*ligatures. (2) See Figures, doctrine of.

**Figural, figurate, figured** [G. *figuriert*]. The terms are rather indiscriminately used with two different though related meanings. (1) As a translation of L. *musica figurata*, a 15th- and 16th-century term for any polyphonic music as opposed to *musica plana*, plainsong. In particular, the term figural music or style [G. *Figuralmusik*, *figurierter Stil*] denotes the highly florid polyphonic style of the early Flemish composers, such as Ockeghem and Obrecht, as distinguished from the less complex style of Josquin and his successors [see *Musica reservata*]. (2) Applied to 17th- and 18th-century music, the terms mean the use of stereotyped figures or motifs, particularly in variations or in the accompanying parts of organ chorales [see Figuration; Figured chorale]. The ambiguous and inconsistent use of these terms is to be deplored, particularly since "figured" has still another meaning in the term \*figured bass. Tentatively the following distinctions are recommended: Figurate = florid [see Webster]; figural = using musical figures; figured = provided with numerals. Hence: figurate melody; figural variation or chorale; figured bass. See the subsequent articles.

**Figuralpassion** [G.]. Same as motet Passion; see Passion music B.

**Figuration.** The use of stereotyped figures, particularly in variations on a theme. See Figural (2); Variations III [Ex. var. 1].

**Figure.** See under Motif.

**Figured bass.** A bass part provided with figures (numerals) to indicate harmonies [see Thorough-bass].

**Figured chorale** [G. *Figurierter Choral*]. A species of \*organ chorale (chorale prelude) in which a certain figure (i.e., a short and characteristic group of notes) is used consistently, in one or several of the contrapuntal parts, against the plain notes of the chorale, which usually is in the soprano. Most of the chorales in Bach's *Orgelbüchlein* belong to this category, e.g., "Alle Menschen müssen sterben," "Der Tag, der ist so freudenreich," and "Jesu, meine Freude." "Ich ruf' zu dir" is an especially good example. A more appropriate term would be "figural chorale" [see Figural].

**Figured melody.** Ornamented or florid melody. A more appropriate term would be "figurate melody" [see Figural].

**Figures, doctrine of** [G. *Figurenlehre*]. A 17th- and 18th-century theory of musical composition based on the idea that music is an art analogous to rhetoric, i.e., the art of speech and literature. This idea is carried out mainly through an elaborate system of *figurae* (established in rhetoric by Aristotle and Quintilian), i.e., standard devices that differ from ordinary speech and are introduced to render oratory more expressive and impressive. Examples are *anaphora* (repeating the same word at the beginning of successive sentences), *aposiopesis* (sudden stopping, silence), *pathopoeia* (expression of hate, wrath, pity), *hypallage* (mixture of two constructions), *hypotyposis* (use of illustrative examples), *noëma* (reference to something generally known), etc. Among the numerous writers who applied these "figures" to music were Joachim Burmeister (1599, 1606), Johannes Nucius (1613), Joachim Thuringus (1625), Christoph Bernhard (c. 1660), Johann Gottfried Walther (1708, 1732), and Johann Mattheson (1739). While some of the rhetorical figures could be adopted with the same or a very similar significance (e.g., *aposiopesis*, *pathopoeia*, the latter in the general meaning of expression of passions, hence also chromaticism), others could be applied to music only with a more or less different meaning. Thus, *hypallage* was used as a term for imitation by inversion (mixture of theme and inverted theme), *noëma* as a designation for chordal style, and *hypotosis* as a generic term for word painting. Others were interpreted

differently by various writers. Thus, *anaphora* is explained by Burmeister as a sort of fugal imitation, by Thuringus as a repeat of the bass (*basso ostinato*?), and by Nucius and others as repeat in general, while Mattheson comes closest to its proper meaning by saying that it means the use of the same formula (e.g., g-a-b-c') at the beginning of several successive melodic phrases [see Lit., Lenneberg, p. 203]. In addition to terms borrowed from rhetoric, the above-mentioned writers also introduced into "musical rhetoric" numerous *figurae* of purely musical significance, such as *anabasis* (ascent), *catabasis* (descent), *circulatio* (turning motion, f-g-a-g), *saltus* (jump), *diminutio*, *fuga*, *syncopatio*, etc. Together with the others they formed a veritable "vocabulary of musical speech."

Another aspect of musical rhetoric is represented by the *loci topici*. In rhetoric these are conventional topics (arguments) used by the orator or writer to argue his case and prove his point. Examples are the *locus notationis* (argument derived from the name, e.g., "Music"), *locus oppositorum* (contrasting "Music" and "Science"), *locus exemplorum* (argument by means of examples), etc. In music these became devices to stimulate and facilitate invention. Mattheson, who treats this matter at length, interprets the *locus notationis* to include devices suggested by musical "notation" (use of different time values, inversion, fugal answer, etc.), the *locus oppositorum* as the category of contrast (change of meter and tempo, use of high and low notes), and the *locus exemplorum* as imitation of other composers.

Dreger, in *BJ* 1934 (Bach); K. Ziebler, in *ZMW* xv; A. Schmitz, in *CP* 1950a (Bach).

**Filar il tuono** [It.], **filer le son** [F.]. An 18th-century term, properly a synonym of \**messa di voce*. Modern writers and singers, however, frequently interpret it as calling for sustained

notes without the crescendo and decrescendo implied by *messa di voce*.

**Fille du Régiment, La** [F., The Daughter of the Regiment; It. *La Figlia del Regimento*]. Opera in two acts by Donizetti (libretto by J. F. A. Bayard and J. H. Vernoy de Saint-Georges), produced in Paris, 1840. Setting: Bologna, early 19th century. It is Donizetti's first opera in French, and one of his most popular.

**Film music.** In the early days of silent films, music, played by a pianist, was considered mainly a means to drown out the noise of the projector. A pianist would play well-known melodies or improvise. Often he was assisted by a percussion man who would produce tonal effects appropriate to the action: gunfire, bird-song, railway, airplane, thunderstorm, etc. By about 1920 orchestras appeared in theaters in larger cities, and various film companies began to provide them with music suitable for the action on the screen. A great many short descriptive pieces were written under titles such as "Help, Help," "The Slimy Viper," "Love's Response," or "Broken Vows." A. Schoenberg contributed to this repertory his *Begleitmusik zu einer Lichtspielszene*, op. 34 (1930), consisting of "Drohende Gefahr," "Angst," and "Katastrophe." From about 1925 on it became customary to have music composed expressly for individual films. The earliest example on record is the music M.-F. Gaillard wrote for *El Dorado* in 1921. At this time some important composers of reputation became interested in writing music for the movies, e.g., Satie (*Entr'acte*, 1924) and R. Strauss (*Rosenkavalier*, film version, 1925). Honegger wrote film music in 1922 that later became his orchestral work, *Pacific 231*. The 1920's were the era of the great movie orchestras, often led by well-known conductors. Nevertheless, the majority of theaters did not have orchestras capable of performing such ambitious scores. The decisive change came with the introduction, about 1929, of the soundtrack. Originally the music was recorded simultaneously with the picture, but this method proved unsatisfactory. The common practice now is to make a separate soundtrack that is then played back on the camera film.

The composer's approach to the peculiar demands and problems of the medium varies greatly. In the great majority of so-called commercial American films, the music is late romantic in style (Rachmaninoff, Strauss, Delius) and frankly descriptive in purpose, regarding physical situations (forest, mountains, desert, sunset)

as well as psychological ones (love, distress, fright). Often extensive use is made of leitmotifs. The music is continuous (or nearly so), accompanying the picture from the beginning to the end and thus automatically relegating itself to a background role.

In contrast to such routine works there are numerous film scores of intrinsic musical interest or value, written by well-known composers. Many of these, it should be noted, were not written for the entertainment industry (feature films), but belong to the nonfiction field (documentaries, here abbreviated as "Doc"), an area that tends to be less circumscribed in its tastes and range of styles. Among the notable scores are: A. Copland, *The City* (1939; Doc), *Our Town* (1940), *The Heiress* (1949); V. Thomson, *The River* (1938; Doc), *Louisiana Story* (1948; Doc); W. Walton, *Spitfire* (1942; Doc), *Henry V* (1944), *Hamlet* (1948); S. Prokofiev, *Lieutenant Kijé* (1934), *Alexander Nevsky* (1938), *Ivan the Terrible* (1945); R. Vaughan Williams, *Coastal Command* (1942; Doc), *Scott of the Antarctic* (1948; incorporated in his *Sinfonia Antarctica*), *Vision of William Blake* (1958; Doc); H. Villa Lobos, *Green Mansions* (1959); L. Bernstein, *On the Waterfront* (1954); G. Auric, *À Nous la liberté* (1931), *Le Sang d'un Poète* (1931), *Moulin Rouge* (1953), *Les Mystères de Picasso* (1957; Doc); A. Honegger, *L'Idée* (1934; Doc), *Pygmalion* (1938); D. Milhaud, *L'Hippocampe* (1934; Doc), *Dreams That Money Can Buy* (1948; with Hindemith, Cage, Varèse, P. Bowles, L. Applebaum); G. Kubik, *Memphis Belle* (1944; Doc), *Gerald McBoing Boing* (1950; cartoon); R. Vlad, *Leonardo da Vinci* (1952), *Romeo and Juliet* (1954); and J. Cage, *Works of Calder* (1950; Doc). Although it is no longer fashionable to use existing musical works as background for films, a striking impression was achieved in Jean Cocteau's *Les Enfants terribles*, with the music of Vivaldi.

In the 1960's film music entered a new stage. Financially, the cinema felt increasingly the competition of television, and the majority of serious composers, ranging in age from Stravinsky to Boulez, tended to complement their composing activities by conducting rather than by writing film music. Recent film scores tend to use more and more such devices as \**musique concrète*, \*electronic music, etc., and the widespread use of the magnetic tape may in time mean the death of the large studio orchestra, conducted by a studio musical director, performing scores for a conventional symphony orchestra.

F.W.S.

**Final, finalis.** See under Church modes I.

**Finale** [It.]. (1) The last movement of a sonata or any of the related forms, i.e., symphony, quartet, etc. In the classical sonata it is usually a fast movement in either rondo or sonata form; occasionally it is written as a theme with variations (Beethoven, piano sonata op. 111; Brahms, clarinet quintet op. 115). While Haydn and Mozart planned their finales as a "happy ending," Beethoven frequently gave his a character of final triumph and apotheosis. In this respect, Bruckner followed and even surpassed him. (2) The last piece of an operatic act. Operatic finales are usually longer and more elaborate than the other pieces (arias), since a good deal of the dramatic action is likely to take place at the end of an act. They frequently include various sections of contrasting character [e.g., the finales in Mozart's *Figaro*]. Alessandro Scarlatti is considered the originator of the dramatic finale. Niccolò Piccinni (1728–1800) introduced the sectional construction, including change of tempo, key, etc.

**Fin' al segno** [It.]. "As far as the sign," indicating repetition from the beginning to the sign §.

**Fine** [It.]. End, close.

**Fingerboard.** In stringed instruments, a long strip of hardwood (ebony) fixed to the neck, over which the strings are stretched. The fingerboards of older instruments, such as the lute, guitar, viola da gamba, lyra, etc., were provided with frets, as are the present-day guitar and ukulele.

**Finger exercise.** See under Etude.

**Fingerfertigkeit** [G.]. Agility of the fingers, virtuosity.

**Fingering** [F. *doigté*; G. *Fingersatz*, *Applicatur* (obs.); It. *diteggiatura*, *tocco*; Sp. *digitación*]. The methodical use of the fingers in playing instruments. More than any other instrument, the piano has what might be called a "natural system of fingering," owing to the natural conformity between the arrangement of the fingers and the keys. There are three chief types of fingering: (1) normal fingering. This applies to passages involving no more than five keys, e.g.,

c e g d f e c  
1 3 5 2 4 3 1

(2) contracted or expanded fingering, e.g.,

g' g a b c' a f g c  
5 1 3 4 5 4 2 3 1

This fingering usually leads to a "shift of position," that is, the thumb does not return to its original key. It is very common in extended passages of "zigzag" design (bent figures) that have no more than five tones in either direction (e.g., in Chopin's etude op. 10, no. 1); (3) passing fingering, i.e., the thumb passes under a finger (second, third, fourth) or one of these fingers passes over the thumb. This fingering must be used whenever there are more than five tones in the same direction, as in scales.

The modern principles of fingering are relatively new, their definite establishment by M. Clementi (1752–1832) being practically simultaneous with the replacement of the harpsichord and clavichord by the piano. The earlier fingering is distinguished from the modern method chiefly by the very sparing use of the thumb and fifth finger in scale passages. Throughout the 16th and 17th centuries, scales were played with a fingering such as:

c d e f g a b a g f e d c  
2 3 2 3 2 3 4 3 2 3 2 3 2

[see Ex.; also A. Guilmant, "La Musique d'orgue," in *LavE* ii.2, 1149ff, and Weitzmann-Seifert, *Geschichte der Klaviermusik* (1899), pp. 11, 13, 70, 82, 84, 160, etc.]. This method of passing one finger over the other, which from the modern point of view appears extremely clumsy, was entirely appropriate on the old instruments, whose keys had a smaller "fall" than those of the piano and required a much lighter touch. Particularly on the clavichord, passages sound

more even if played without the thumb. The normal position of the hand was with the middle fingers lying almost flat on the keys and with the thumb hanging down in front of the keyboard. However, as early as 1565 Thomás de Sancta María, in his *Libro Lamado Arte de tañer fantasia*, indicates the fingering 4 3 2 1 4 3 2 1 4 for the descending scale [see O. Kinkeldey, *Orgel und Klavier in der Musik des 16. Jahrhunderts* (1910), p. 36]. The modern fingering for the descending scale (5 4 3 2 1 3 2 1) occurs in the keyboard works of A. Scarlatti with each finger represented by a special symbol, \*, /, etc. [see the modern edition by Shedlock]. J. S. Bach was one of the first to make systematic use of the thumb and to develop more modern methods of fingering [see his *Klavierbüchlein für Friedemann Bach*, new ed. H. Keller (1927), pp. 15, 23]. He played with curved fingers and brought the thumb to the surface of the keyboard. An interesting document is Johann Kirnberger's *Klavierübungen mit der Bachischen Applikatur* (1762–63). Another step toward modern fingering was taken by Bach's son K. P. E. Bach [see his *Versuch über die wahre Art das Klavier zu spielen* vol. i, 1753]. The next in line was Clementi.

Until recently, English musicians used an older method of numbering the fingers, known as English fingering, x 1 2 3 4, i.e., with an "x" for the thumb and with 1 for the index finger (as in violin playing). This has now been almost completely abandoned for the "German fingering" 1 2 3 4 5. Oddly enough, the "English system" was widely used in Germany as well as in other countries during the 18th century, while the first record of "German fingering" is in English virginal books (c. 1600). Purcell used English fingering but in reverse order for the left hand, i.e., with the x for the fifth finger. For the system of fingering for stringed instruments,

see Positions. See H. Gleason, "Organ Instruction before Bach" (*BAMS* iv).

**Finland.** Finland possesses a large wealth of folksongs, ancient and modern. The earliest type, called *joiku*, is a kind of improvised lament. Next follow the *runot* (sing. *runo*; sung to traditional legendary verses), which are melodic and rhythmically vigorous, often employing a 5/4 meter. Between 1835 and 1849 Elias Lönnrot worked these narrative folksongs into a full-length epic, *Kalevala*, which has been used by numerous Finnish composers as a basis for songs or symphonic poems (Sibelius). There is also a considerable body of folksong originating in the Swedish-speaking districts of Finland and closely related in verse and melodic forms to the folksong of the Scandinavian peninsula. The traditional Finnish folk instrument is the kantele, a \*psaltery shaped like a bird's wing, originally with 5 but today with 20 to 30 strings.

Medieval liturgical MSS in the Helsinki University Library testify to the spread of Gregorian chant in the diocese of Åbo (Turku) during the period 1100–1500. Some of the religious songs of the Swedish *Piae cantiones* of 1582 [\*Editions XLIII, 10] may be of native Finnish origin. The earliest Finnish composer of general renown was B. H. Crusell (1775–1838), who was a virtuoso on the clarinet and wrote concertos for it. A continuous development started about 1850 with the activity of German musicians, e.g., Fredrik Pacius (1809–91; born in Hamburg; professor of music at Helsingfors University from 1834; composer of the opera *Kung Karls jakt*, 1852, and of the Finnish national anthem "Maamme") and Richard Faltin (1835–1918; professor at Helsingfors Conservatory, 1871–96; compiler of a collection of Finnish folksongs). A native-born composer was Martin Wegelius (1846–1906), who in 1882 became director of the new Helsingfors Conservatory (now Sibelius Academy) and who wrote a number of theoretical books (in Swedish). Robert Kajanus (1856–1933) used Finnish coloring in his symphonic poems *Aino* and *Kullervo*, but it was Jean Sibelius (1865–1957) who established the national Finnish style and gave Finnish music international importance. His symphonic poems (*Finlandia*, 1899; *Pohjola's Daughter*, 1906; *Tapiola*, 1926, etc.; see Symphonic poem IV), seven symphonies, and violin concerto have become part of the standard repertory, particularly in America and England. Contemporaries of Sibelius include Ilmari Krohn (1867–

1960; opera, oratorios, Passion; also author of textbooks and editor of hymns and folksongs), Oskar Merikanto (1868–1924; opera, part songs, organ music), and Armas Järnefelt (1869–1958; symphonic poems *Korsholma*, *Luwattu maa*, and the popular orchestral *Praeludium* and *Berceuse*). There followed Erkki Melartin (1875–1937; opera *Aino*; symphonies, symphonic poems, chamber music, etc.); Selim Palmgren (1878–1951; opera *Daniel Hjort*; five piano concertos including "The River" and "Metamorphoses"; numerous lyrical piano pieces); Leevi Madetoja (1887–1947; symphonies, numerous symphonic poems; operas *Pohjalaisia* and *Juha*); Armas Launis (b. 1884; operas, orchestral and piano music; also scholar and writer; see Lit.); and Toivo Kuula (1883–1918; orchestral works, chamber music). Representatives of a later generation, influenced by the trends of 20th-century music, are Yrjö Kilpinen (1892–1959; songs), Aarre Merikanto (1893–1958; much symphonic and chamber music), and Väinö Raitio (1891–1945; ten symphonic poems, five operas, some chamber music). Prominent Finnish composers born in the 20th century include Uno Klami (1900–61; symphonies, concertos, and various orchestral works); Sulho Ranta (1901–60); Tauno Pytkänen (b. 1918); Ahti Sonninen (b. 1914); Lauri Saikkola (b. 1906); Erik Bergman (b. 1911); Einar Englund (b. 1916); Einojuhani Rautavaara (b. 1928); and Joonas Kokkonen (b. 1920).

Lit.: A. Launis, *Über Art, Entstehung und Verbreitung der estnisch-finnischen Runenmelodien* (1913); I. Krohn, *Über die Art . . . Geistliche Volksmelodien in Finnland* (1899); *AdHM* ii, 1122ff; *LavE* i.5, 2586f; V. Helasvuo, *Sibelius and The Music of Finland* (1952); J. Horton, *Scandinavian Music* (1963); K. Flodin, "Die Erweckung . . . in der Finnischen Musik" (*DM* 1903/04); F. Bose, "Typen der Volksmusik in Karelien" (*AMF* iii); O. Andersson, "The Introduction of Orchestral Music into Finland" (*CP* 1911); H. Pudor, in *SIM* ii; B. Wallner, "Scandinavian Music after the Second World War," in *LBCM*, also *MQ* li. rev. J.H.

**Finlandia.** See under Symphonic poem IV.

**Fioritura** [It.]. Embellishment, either written out or improvised. See Ornamentation.

**Fipple flute.** \*Whistle flute.

**Firebird, The.** See *Oiseau de feu*, L'.

**First-movement form.** Same as \*sonata form.

The term is unfortunate, since the same form frequently also occurs in the slow and in the final movement of a sonata.

**Fis, fisis** [G.]. F-sharp, f-double-sharp. See Pitch names.

**Fistelstimme** [G.]. Falsetto.

**Fistula** [L.]. Medieval name for flute and, particularly, organ pipe (*fistula organica*). Several treatises (Notker Labeo, *GS* i, 101f; "Alia musica," *GS* i, 147f; Odo, *GS* i, 303; Bernelinus, *GS* i, 329f; Aribo, *GS* ii, 222ff; Eberhard von Freising, *GS* ii, 279ff) give detailed instructions for making organ pipes. Of particular interest is the point that originally they all had the same diameter ("eiusdem amplitudinis omnes esse debent"; Notker) and hence a variable scaling [see Organ XII]. *Fistula panis*, *f. anglia*, *f. germanica* are humanist names for panpipe, English flute (recorder), German flute (transverse flute) respectively.

**Fitzwilliam Virginal Book.** See under Virginal music.

**Five, The.** Designation for a group of five Russian composers who, about 1875, united their efforts in order to create a truly national school of Russian music. The original name, coined in a newspaper article in 1867, was *Moguchaya Kuchka* (The Mighty Handful). They were César A. Cui (1835–1918), Alexander P. Borodin (1833–87), Mily A. Balakirev (1837–1910), Modest P. Mussorgsky (1839–81), and Nicolay A. Rimsky-Korsakov (1844–1908). See Russia II. See M. O. Zetlin, *The Five* (1959).

**Five-three chord.** The common triad, so called because in figured bass it is indicated by the figures  $\frac{5}{3}$  (third and fifth) above the root.

**Fixed-do(h).** See under Movable do(h).

**Flagellant songs.** See *Geisslerlieder*.

**Flageolet.** See under Whistle flute. For ill. see under Flute. Flageolet tones, see *Flageolet-töne*.

**Flageolet-töne.** German term for the \*harmonics of stringed instruments. The English term "flageolet tones" is rarely used.

**Flam.** See under Percussion instruments B, 1 (side drum).

**Flamenco.** A south Spanish (Andalusian) type of song, midway between folk and art music, performed by specially trained singers to the

accompaniment of a guitar. Characteristic traits are an E-minor tonality vacillating between f and f-sharp and g and g-sharp (sometimes including the g $\sharp$ -f-e progression of \*Gypsy music), narrow range, absence of strict meter, expressive ornamentation, repetition of short phrases,

melancholy mood, etc. The songs often begin with the plaintive exclamation "Ay."

The *cante flamenco* is believed to have developed from an early 19th-century *cante hondo* (*jondo*, deep song), a highly emotional and tragic song cultivated among prisoners (*carcelera*), which in turn may have had an Oriental (Arab? Hindu? Jewish?) background. Late in the 19th century the *cante hondo* was adopted, under the name *cante flamenco*, by the Gypsies, who made it even more expressive and florid. See D. E. Pohren, *The Art of Flamenco* [1962]; D. Duff, in *MM* xvii, 214; M. de Falla, in *LRM* xi; M. G. Matos, in *AnM* v.

**Flat** [F. *bémol*; G. *Be*; It. *bemolle*; Sp. *bemol*]. The sign  $\flat$ , which indicates the lowering of the pitch of a note by a half-step. See Accidentals; Pitch names. The term is also used to indicate incorrect intonation on the underside.

**Flatté, flatterement** [F.]. In French 17th-century viol music, an *agrément* equivalent to the *pincé* of the clavecinistes [see Mordent]. After the middle of the 18th century the term is occasionally applied to the *Schleifer* [see Appoggiatura, double II], probably due to a mistaken translation.

**Flatterzunge** [G.]. Flutter-tonguing. See Tonguing.

**Flautando, flautato**. See Bowing (1).

**Flautino** [It.]. A small flute, either the flageolet or the descant flute.

**Flauto** [It.]. Flute. *Flauto a becco*, *flauto diritto*, *flauto dolce*, \*recorder; *flauto d'amore*, see Flute II (b); *flautone*, alto flute or bass flute; *flauto piccolo*, piccolo (flute). Until the middle of the 18th century, e.g., in Bach, *flauto* always meant

the recorder, the flute being called *flauto traverso* [see Flute III]. In the same period, *flauto piccolo* meant not the transverse piccolo but a small recorder.

**Flaviol**. A small, one-handed Spanish flute, used for dance music. See Pipe (2).

**Fledermaus, Die** [G., The Bat]. Operetta in three acts by Johann Strauss, Jr. (libretto by C. Haffner and R. Genée, derived from a French farce, *Le Reveillon*, by H. Meilhac and L. Halévy after R. Benedix's *Das Gefängnis*), produced in Vienna, 1874. Setting: Bad Ischl, Austria, 1874.

**Flemish school**. I. The leading school of the Renaissance period, active c. 1450–1600, after the \*Burgundian school. It includes a long succession of outstanding composers—many of them the undisputed leaders of their day—who came from the southern Netherlands, approximately present-day Belgium (Antwerp, Bruges—the Flemish north; Liège, Mons—the Walloon south) and the adjoining region of northern France. It is often called the Second and Third Netherlands school [see Netherlands schools]; in English-speaking countries the designation "Flemish" is usually connected with the history of painting, referring to the northern part of Belgium. A further semantic problem is raised by the fact that in present-day Belgium, the Dutch and French languages are spoken, the former by people known as Flemings (Flemish) and the latter by Walloons (Walloon; see R. B. Lenaerts, in \*Editions XXXIX, 22). Some writers feel that it is misleading to apply the term "Flemish" to Renaissance music, in which composers from Flanders, southern Belgium, and northern France all played a role. Nevertheless, it is preferable to Franco-Flemish or Franco-Netherlandish [see *ReMR*, p. 9]. Although its members came from the same area, the Flemish school, as it will be called in this dictionary, is not a national one in the proper sense of the word—as, e.g., the French or the Italian *ars nova*—but an international movement of extraordinary dimensions. This characteristic is due to the fact that the composers in question seldom stayed in their homeland but emigrated to other countries, where they held high positions in church choirs and in the chapels of princes. In the 15th century they were the leaders of the musical development in France. In the first half of the 16th century their influence stimulated the rise of national talent in France, Germany, Austria, Italy, England, Spain, Poland, and Hungary.

The second half of the 16th century saw both rivalry and cooperation between the Flemish teachers and their "foreign" pupils.

II. The earliest known composer of Netherlands extraction is Johannes Ciconia (born in Liège; c. 1335–1411), who was active not only in his native city but also in Padua, thus foreshadowing the typical wanderlust of his 16th-century compatriots. Other early Flemish composers were Johannes de Limburgia, Reginald Liebert (?), Arnold and Hugo de Lantins (Lantin, province of Liège), and Hayne van Gizeghem. However, the Flemish school (as understood here) begins with the great master Johannes Ockeghem (born in Hainaut; c. 1430–95), who created a musical style entirely different from that of his predecessors (Dufay, Burgundian school). His approach to problems of polyphonic texture, form, and expression was so novel that scholars have tried to trace its "origin" but without success. Very possibly, it was truly original.

Following is a list of the most important Flemish composers, arranged according to generations; some "Franco-Flemish" composers (marked Fr.) are included.

1425: Johannes Ockeghem (1430–95); Antoine Busnois (Fr.; d. 1492); Jacques Barbireau (c. 1408–91); Philippe Basiron (?).

1450: Jacob Obrecht (a Netherlander, b. Bergop-Zoom; 1452–1505); Gaspar van Weerbeke (c. 1445–after 1514); Heinrich Isaac (c. 1450–1517); Josquin des Prez (c. 1450–1521); Pierre de la Rue (Fr.; d. 1518); Loyset Compère (Fr.; c. 1455–1518).

1475: Jean Mouton (c. 1470–1522); Antoine de Fevin (Fr.; 1474–1512); Adrian Willaert (c. 1490–1562); Nicolas Gombert (c. 1490–1556); Jean Richafort (c. 1480–1548).

1500: Jachet Berchem (?–?); Jachet of Mantua (Fr.; c. 1495–1559); Jacques Buus (d. 1565); Jacob Arcadelt (c. 1505–c. 1560); Jacobus Clemens (Clemens non Papa; c. 1510–c. 1556); Philippe Verdelot (d. c. 1550).

1525: Cipriano de Rore (1516–65); Philippe de Monte (1521–1603); Jacobus de Kerle (1531/32–91); Orlando di Lasso (1532–94); Giaches de Wert (1535–96).

1550: Jacob Regnart (c. 1540–99); Charles Luython (c. 1556–1620); Giovanni (Jean de) Macque (c. 1550–1614).

The great contribution of the Flemish masters was the establishment of a new polyphonic style characterized by (ideally) the equality of all the parts and, beginning with Josquin, the consistent use of imitation as the chief means to achieve this

equality. This tendency appears even in those compositions in which a *cantus firmus* stands apart from and in balance to the contrapuntal web of the other voices (tenor Masses and motets of the 15th century). Masses and motets are the backbone of the vast repertory of Flemish composers; to these were gradually added the various "national" types of secular music, the (French) \*chanson, the (Italian) \*madrigal, the (German) \*lied, and finally the many popular forms of \*villanella, \*canzonet, \*balletto, etc., that indicate approaching decadence.

III. Following is a brief account of the development within this general framework. The main difference between the Burgundian school (Dufay) and the first Flemish masters (Ockeghem, Obrecht) is the change from three-part writing to four-part writing; from a relatively high and narrow range to a considerably lower and fuller range (first appearance of the bass); from a medieval timbre (\*sound ideal) of contrasting sounds to a full vocal sonority, probably *a cappella*; from clear phrases and cadences to an "unending melody"; from an early manifestation of the major mode to the somber colors of modal harmonies; from a (decorated) chordal style, frequently of the melody-accompaniment type, to a truly polyphonic style with highly embroidered lines in all the parts; from aristocratic subtlety and refinement to pious devotion and mystic expression.

Although Ockeghem and Obrecht are usually named in one breath, the difference between their styles is considerable. Of the two, Ockeghem is by far more purely Flemish and presents a much stronger contrast to Dufay than Obrecht, who frequently introduced chordal passages, full cadences, and sectional treatment. In fact, these two attitudes can be traced throughout the entire development of Flemish music: the former (strictly polyphonic, continuous, noncadential, uniform sonority) being represented by Ockeghem, Isaac, La Rue, Gombert, de Monte; the latter (partly chordal, sectional, cadential, using contrasting sonorities) by Obrecht, Josquin, Willaert, and G. Gabrieli [for the use of chordal style in Flemish music, see Familiar style]. Although the Flemish composers occasionally used proportional complications and canonic riddles [see Proportions; Canon III] in their Masses, it is misleading to emphasize this feature as the principal distinguishing characteristic. Almost to the present day, books have been published in which Ockeghem is represented only by a 36-voice canon (probably not his) or

his *Missa cuiusvis toni* [see *Catholicon*], and Josquin by his early canonic *Missa L'Homme armé*. Actually, English composers of the mid-15th century far surpassed their colleagues from the Low Countries in devising canonic enigmas, and the notational complications in the works of Ockeghem, Isaac, and Josquin are only a modest remainder of those encountered in French music of the late 14th century. See also *Imitation*; *Mass*; *Motet*; *Musica reservata*.

**Flex, flexa.** (1) See under Psalm tones. (2) Same as *clivis* (also *punctus flexus*); see *Neumes* I, table.

**Flick-kanzone** [G.]. \*Quilt canzona.

**Flicorno** [It.]. An Italian variety of Flügelhorn.

**Fliegende Holländer, Der** [G.]. The Flying Dutchman. Opera in three acts by Richard Wagner (to his own libretto after Heine's *Memoiren des Herrn von Schnabelewopski*), produced at Dresden, 1843. Setting: medieval, legendary time. One of Wagner's earliest works, it is allied, through its supernatural subject, with the romantic opera of Weber (*Der Freischütz*) and Marschner. The music shows similar antecedents, both in the broad melodic style and in the rich and colorful orchestral accompaniment. Wagnerian features such as the use of \*leitmotifs, continuous melody, and symphonic treatment of the orchestra are not yet evident.

**Fliessend, fliessender** [G.]. Flowing, more flowing.

**Florid.** Ornamented, embroidered, decorated, figured, etc., chiefly with reference to contrapuntal music in which the lines move largely in relatively quick notes from one beat to the next.

Thus, the works of the early Flemish masters (Ockeghem, Obrecht, Isaac) are said to be in florid style [see *HAM*, no. 73b; *SchGMB*, nos. 52, 55]. Florid counterpoint specifically means the use of ornamented lines in teaching counterpoint.

**Florilège du concert vocal de la renaissance.** See Editions XIX.

**Flos** [L.]. A 13th-century term for embellishments, somewhat like the trill, mordent, or vibrato. Jerome of Moravia (*CS* i, 91) likens the *flos harmonicus* to the rippled surface of water moved by a gentle wind.

**Flöte** [G.]. Flute.

**Flötenuhr** [G.]. See under Mechanical instruments III.

**Flott** [G.]. Briskly, without hesitation.

**Flourish.** (1) A trumpet call or fanfare. (2) A somewhat showy decorative passage, often one added by the performer.

**Flue pipes (stops, work).** See under Organ VIII, IX.

**Flügel** [G.]. The grand piano.

**Flügelhorn.** See under Brass instruments III (b).

**Flüssig** [G.]. Flowing.

**Flute.** For the general characteristics of the flutes, see under Wind instruments. I. *Present forms.* (a) Flute [F. *flûte*; G. *Flöte*; It. *flauto*; Sp. *flauta*]. The modern flute is a cylindrical tube closed at the upper end. At this end is a side hole (embouchure) across which the player blows, thus making the column of air inside the tube vibrate. The lowest octave of the fundamental scale is overblown by increased wind pressure, thus providing the second octave. The remainder of its three-octave range is produced by further overblowing and by \*cross fingering. The modern flute was largely developed by T. Böhm [see Böhm system], who devised the instrument described above. It is generally made of silver, though older instruments were of wood, and gold is occasionally used. The timbre varies considerably at different levels, the lowest tones being thick and breathy, the higher ones becoming brighter and more penetrating. The flute is extremely agile. Trills are possible on nearly every note, and rapid reiterations of a pitch are easily executed by means of \*tonguing. Its range is shown in Ex. 1, although some instruments

Flutes: 1. Shakuhachi. 2. Keyed flageolet. 3. Fife. 4. Panpipes. 5. Piccolo. 6. Metal flute. 7. Wooden flute. 8. Flute (18th century). 9. Alto recorder. 10. Bass recorder.

seem to have had the low B $\flat$ , and the high C $\sharp$  and D are occasionally written. (b) Piccolo [F. *petite flûte*; G. *kleine Flöte*, *Pickelflöte*; It. *flauto piccolo*, *ottavino*; Sp. *flautín*]. A small flute, pitched an octave above the flute. Its written range is shown in Ex. 2, sounding an octave higher. It is one of the brightest, most penetrating instruments of the orchestra, and its upper register must be used with care. (c) Alto flute [F. *flûte alto*; G. *Altflöte*; It. *flautone*; Sp. *flauta bajo*], sometimes called bass flute. An instrument built in G, i.e., a perfect fourth lower than the normal flute, with a range from g to c'''. It is notated as a transposing instrument, a fourth above its actual sound (c' to f'''). (d) Bass flute, sometimes called contrabass flute. An instrument built an octave below the regular flute. Another kind of flute is the *Albisiphone* (invented by A. Albisi, 1911). This instrument is held vertically, the extension being shortened by means of a double U-tube between the embouchure and the tuning slide. The mouth part is bent horizontally to form the top of a T. The fingering is that of the regular Böhm system. The compass is from B to f'' $\sharp$ . See also Giorgi flute.

II. *Obsolete forms.* (a) *Terzflöte* [G.; Third flute]. So called from being built in E $\flat$ , a minor third higher than the standard instrument. (b) *Flûte d'amour* [G. *Liebesflöte*; It. *flauto d'amore*; Sp. *flauta de amor*]. A flute built a third lower than the regular flute. The alto flute [see I (c)] is sometimes called by this name.

III. *History.* Flutes are among the most ancient and widespread of all instruments. They existed in Sumeria, Egypt, and Palestine, as well as in Mexico and South America, where they were frequently made from clay. In Europe, the first evidence of the transverse flute is a miniature in the *Hortus Deliciarum*, an encyclopedia from the end of the 12th century, where it is called *swegel* [see Schwegel]. Throughout the Middle Ages, Renaissance, and early baroque period, the transverse flute was mainly a military instrument (fife) associated particularly with Germany, so it was generally known as the German flute. For artistic purposes, the end-blown flute, or \*recorder, was preferred. About 1650 the instrument, which formerly had a cylindrical bore, was provided with a conical bore, a change that made for a much smoother

tone. Before 1750 the *flûte traversière* became, for the first time, an important solo instrument, as shown by the appearance of Quantz's epochal treatise, *Versuch einer Anweisung die Flöte traversière zu spielen* (1752). It may be noted that in Bach and Handel the plain name *flauto* still invariably meant the recorder, the transverse flute being called *flauto traverso* or *traverso*. Lully was probably the first composer to use the flute in the orchestra, but not until the time of Haydn did the flute become a permanent member. Beginning c. 1800, attempts were made to improve the instrument, chiefly to compensate for the position of the side holes, which were cut to conform to the reach of the fingers rather than the laws of acoustics. The final step in this development was the system of Böhm, who also changed the bore back to its earlier cylindrical shape. This change made the pitch more accurate but detracted from the "sweet sound" of the conical flute. See also Fife; Whistle flute (flageolet); Panpipes; Japan VI (*shakuhachi*).

Outstanding compositions for the flute include J. S. Bach's unaccompanied Sonata in A and 6 sonatas for flute and accompaniment; K. P. E. Bach, numerous sonatas; Handel, sonatas; Mozart, concerto (K. 285c); Schubert, Introduction and Variations on "Ihr Blümlein alle," op. 160; Debussy, *Syrinx* (1912); Prokofiev, Sonata in D, op. 94; Hindemith, sonata (1936) and *Acht Stücke* (1927) for flute solo; Honegger, *Danse de la chèvre* (1932); and Varèse, *Density 21.5*.

**Flutter-tonguing.** See Tonguing.

**Flying Dutchman, The.** See *Fliegende Holländer, Der*.

**Folia, follia, folies d'Espagne.** (1) A dance, probably of Portuguese origin, mentioned in

Portuguese documents of the late 15th century. In all probability it was a "fool's dance" similar to the \**moresca*. No music from this early period survives. (2) A harmonic pattern related to the \**passamezzo antico* and the \**romanesca*, used by a great many composers in the 17th and 18th centuries, and by a few in the 19th and 20th centuries, as the skeletal structure for continuous variations. As is true of the \**bergamasca* and the \**romanesca*, one discant melody became attached to the skeletal bass in the 17th century and is found in many of the compositions written on the pattern.

*Folia* variations were written by Farinelli [see Playford's *The Division Violin*, 1685], D'Anglebert (for harpsichord, 1689; see *TaAM* vii, 122), A. Scarlatti (for harpsichord; see *TaAM* ix, 112), M. Marais (for viola da gamba; *Pièces de viole*, 1681), J. P. Förtsch (in the opera *Die grossmächtige Thalestris*, 1690), Corelli (for violin, op. 5, no. 12, 1700), Keiser (overture to *Der lächerliche Prinz Jodelet*, 1726), J. S. Bach (*Bauernkantate*, 1742), K. P. E. Bach (for piano, 1778; see K. von Fischer, in *RBM* vi, 206f), Grétry (in the opera *L'Amant Jaloux*, 1778), Cherubini (overture to *L'Hôtellerie portugaise*, 1798), Liszt (*Rapsodie espagnole*, 1863), Carl Nielsen (opera *Maskarade*, 1906), and Rachmaninoff (*Variations on a Theme by Corelli*, op. 42, 1932).

As with all the Renaissance harmonic patterns (\**passamezzo antico* and *moderno*, \**romanesca*, \**bergamasca*, etc.), the isometric form developed over a long period. Adumbrated forms of the *folia* appear in late 15th- and early 16th-century MSS in Spain and Italy (e.g., "Cancionero musical de Palacio," in Editions XXXII, 10, p. 171; "Adorámoste, Señor Dios," by F. de la Torre; and "Dindiri din," Montecassino MS 871 in *RBM* ii, 14). In the 16th century, many variants developed. The most popular was the one known as "La Cara Cosa" or "La Gamba" in Italy (e.g., D. Bianchini, *Intabolutura de lauto*, 1546, no. 4), "Mes Pas semez" in France (e.g., arr. for voice and guitar by A. Le Roy, *Second Livre de guitte*, 1555, f. 8), "Blame not my lute" in England

(a song by Wyatt, in Washington, D.C., Folger Shakespeare Library MS 448.16, f. 4), and simply "Pavana" in Spain (e.g., E. Enriquez de Valde-rábano, *Libro de música, Silva de Sirenas*, 1547, ff. 94v and 95v; D. Pisador, *Libro de música de vihuela*, 1552, f. 4; and L. Venegas de Henestrosa's *Libro de cifra nueva*, 1557; ed. H. Anglés, 1944, p. 191, in musical examples). D. Ortiz, in his *Tratado de glosas* (1553), used "La Cara Cosa" as the basis of two "recercada" (ed. M. Schneider, 1913, pp. 117, 130).

**Folk music, folksong.** I. The musical repertory and tradition of communities (particularly rural), as opposed to art music, which is the work of musically trained composers. It generally develops anonymously, usually among the uneducated classes, and originally was (and may still be) transmitted aurally, thereby becoming subject to modification. Folk music exists in practically every part of the world and constitutes a vast body whose study often requires special methods [see Ethnomusicology]. By far the greatest part of this repertory involves singing and thus is known as folksong. The present article is confined to a consideration of the tradition of folksong in Western culture.

Western folksong developed together with artless poems dealing with various aspects of daily life: work songs, love songs, cradle songs, drinking songs, patriotic songs, dancing songs, mourning songs, narrative and epic songs, etc. Folksongs of different nations have certain characteristic features that, although difficult to describe, are clearly felt to represent the general national traits of the people. The examples here, showing an Anglo-American (1), Italian (2), German (3), Russian (4), and Hungarian (5) folksong, demonstrate this point. On the other hand, numerous examples of melodies found among widely separated nations show a striking similarity of melodic or rhythmic design. Certain Hungarian folksongs, for example, have been found to be almost identical to melodies sung in Anatolia, Scotch folk tunes have been said to be similar in some respects to those of Arabia, and Russian Gypsy songs are surprisingly like Brazilian melodies. While in many cases such similarity may be coincidental, it may point to a common origin of such melodies, which are thought to date from before the time

when the peoples involved migrated to different places. In this way (applicable in the case of Hungary and Anatolia, but certainly not in the case of Scotland and Arabia or Russia and Brazil), it has been possible to establish the age of certain folksongs. This point is particularly important in view of the fact that nowhere have guesswork and even pure fancy been given such free rein as in some studies of folk music, where melodies that show unmistakable traces of 17th-

1. A version of the "Cherry Tree Carol." 2. Example of Italian folksong.

or 18th-century origin are ascribed to pre-Christian times. Actually, most of the folk melodies of the Western nations are of relatively recent origin. For instance, practically all the folksongs in current use in Germany date from about 1800. Those of Italy are still more recent, while the English ones frequently show traits of a somewhat earlier origin (16th, 17th centuries).

II. The great majority of Western folksongs as they exist today belong to what might be termed "civilized" folksong, i.e., folksongs that show the influence of art music. This becomes clear by comparing any of them to a truly "aboriginal" folksong, such as those found in primitive cul-

3. German folksong. 4. "The Bridegroom's Plea," a Russian wedding song, a variant of which was used by Stravinsky in *L'Oiseau de feu*. 5. "Tiszán innen Dunán túl" (Hungarian).

tures and occasionally in remote regions, such as parts of the Balkan peninsula, Finland, Scotland, etc. Strict meter and measure, clear and regular phrases, well-defined tonality (sometimes with traces of modality), definite form, triadic intervals, etc., are features that have their origin in the rationalized vocabulary of art music and that have, in the course of one or two centuries, reached the lower classes in a characteristic process of seepage [G. *abgesunkenes Kulturgut*]. (An interesting example illustrating the "city influence" on Spanish folksong is given by H. Anglés in *AMF* iii, 350.) The recognition of this influence as "from above to below" is, of course, in diametrical opposition to the still largely current opinion that folksong is the "foundation" of all music, an opinion reflected in many books on music history that begin with

an introductory chapter on folksong. Such a procedure would have some justification if examples of really primitive folk music were discussed instead of folksongs that clearly date from the 17th and 18th centuries.

The process of seepage has had much more effect on the texts than on the melodies of folksongs. Numerous texts of folksongs have been shown to be merely modified or distorted versions of art poems. Similar examples are rare, however, where the melodies are concerned. Here the influence "from above" is of a more general nature, establishing the general framework of style and design only, but admitting original creativity within this frame.

Regarding the question of authorship, modern scholars take a much more sober view than earlier writers who surrounded the folksong with an aura of "divine origin," mystic "self-conception," or "collective creation." Each folksong is, of course, the product of an individual, and the "collective" point of view is justifiable only in so far as the "original" song has, in the course of decades, centuries, or millennia, been modified by others.

III. Perhaps the earliest true folksongs traceable in written form are Icelandic songs and the Polish war song *Bogurodzica*, which are preserved in 13th-century MSS [see Iceland; Poland I]. While the melodies in 15th-century monophonic sources (Lochamer Liederbuch, MS of Bayeux) are too elaborate to be considered folksongs, a number of true folk (or, at least, popular) melodies are probably preserved in the tenors (occasionally upper parts) of polyphonic compositions, e.g., "La Belle se siet" (Dufay), "L'Homme armé," "T'saat een meskin" (Obrecht; *HAM*, no. 78), "T'Andernaken" (Obrecht), "Es leit ein Schloss in Österreich" (Glogauer Liederbuch; see Editions XVIII, 4, p. 16) and "Ich stund an einem Morgen" (H. Finck). Other interesting sources of 15th- and 16th-century folksongs are the \**quodlibets* and \**Souterliedekens*. Some early (14th-century?) Spanish melodies are recorded in Salinas' *De musica libri septem* (1577), among them "Calvi vi calvi calvi arabi" (Arabic "Qalbi bi qalbi, qalbi arabi," "Heart, oh my heart, 'tis the heart of an Arab"; see *ReMMA*, p. 375). One of the most beautiful German folksongs of the present day, "Innsbruck ich muss dich lassen," is a composition by Heinrich Isaac (c. 1450–1517). Particularly interesting is a Hungarian melody preserved in Tinodi's *Cronica* of 1554 because it is the earliest folksong showing unmis-

takable "national" traits [see *LavE* i.5, 2615f]. A number of charming English folk tunes ("Goe from my window," "John come kisse me now") are preserved in the Fitzwilliam Virginal Book (c. 1600), where they are used as themes for variations. Most of the English folk melodies date from the 16th century, while those of Germany originated mostly around and after 1800. Many of the most popular "folksongs" are of traceable authorship, e.g., the "Lorelei" (German; text by Heine, music by F. Silcher, 1789–1860), "Dixie" (Daniel D. Emmett, 1859), or "Estrellita" (Mexico; Manuel Ponce, 1913). For the folksongs of the United States, a clear line of distinction must be drawn between the melodies of the American Indians and the folksongs of the white settlers and Negroes. For the former, see American Indian music; for the latter, Shanty; Negro music.

**Follia.** See *Folia*.

**Fonds d'orgue** [F.]. Foundation stops of the organ.

**Fontane di Roma.** See under Symphonic poem IV.

**Foot.** (1) In versification, see Poetic meter.

(2) In organ building, terms such as eight-foot (written 8-ft. or 8'), four-foot (4'), sixteen-foot (16'), thirty-two-foot (32'), etc., are used to differentiate stops that sound at the pitch indicated by the corresponding key from others sounding higher or lower octaves or even other intervals. If, e.g., the key *c'* is touched, an 8'-stop sounds *c'*, while a 4'-stop sounds *c''* and a 16'-stop sounds *c*. The terminology is derived from the fact that, in a normally pitched flue stop, such as 8'-principal, the length of the pipe sounding *c* measures about 8 feet (the other pipes of the same stop being, of course, correspondingly shorter), whereas, in a stop of the 4'-class, the pipe sounded by the same key is only half as long, etc. [see Organ V]. In mutation stops, i.e.,

stops designed to reinforce the harmonics of the unison stops [see Organ VI, IX(e)], still other foot-measurements occur. For instance 2½' is a pipe of one-third ( $2\frac{1}{2}' = \frac{1}{3}$ ) the length of the normal pipes; it therefore produces the third partial, i.e., the twelfth (*g''* for the key *c'*); 5½' ( $= \frac{1}{6}$ ) sounds the lower octave of this, *g'*, and 1½' ( $= \frac{1}{3}$ ) the higher one, *g'''*. Similarly, 1¾' ( $= \frac{1}{4}$ ) gives the fifth partial, i.e., the third two octaves above the fundamental, *e'''*, while multiples of this fraction, such as 3½' ( $= \frac{1}{2}$ ) and 6½' ( $= \frac{3}{2}$ ) give lower thirds, *e''*, *e'*, and ¾', ¾' still higher ones, *e''''*, *e'''''*. The seventh partial appears in stops such as 1¼' ( $= \frac{1}{8}$ ), etc. This terminology has been borrowed for similar distinctions in other fields, e.g., for the designation of octaves (8-ft. octave, 4-ft. octave) or of instruments, e.g., 4-ft. instrument for the piccolo flute, etc.

**Forefall.** See Backfall, forefall.

**Forgeries.** See Spurious compositions.

**Forlana, furlana.** A dance from northern Italy (*Friuli*). In dance collections of the 16th century (Phalèse, *Chorearum molliorum Collectanea*, 1583) it is similar to the *passamezzo* (in duple meter), whereas in the baroque period it is a gay dance in triple meter (6/4, 6/8) with dotted rhythms and characteristic repeats of motifs. It became associated with festive activities in Venice, e.g., in the ballets of Campra (*L'Europe galante*, 1697; *Le Carnaval de Venise*, 1699; *Les Fêtes Vénitiennes*, 1710). Bach's orchestral Suite in C major includes a *forlane*. In 1914 attempts were made (ostensibly under the auspices of the Pope) to revive the *forlana* in place of the “offensive” tango, although the *forlana* was far from “innocent.” See J. Écorcheville, in *BSIM* x; P. Nettl, in *RM* xiv, 191–95.

**Form.** A term that has different meanings depending on whether it refers to “form in music” or “form(s) of music.” The former has a very general and loose meaning, simply expressing the basic fact that music, like all art, is not a chaotic conglomeration of sounds but consists of elements arranged in orderly fashion according to numerous obvious principles as well as a still greater number of subtle and hidden relationships. In this sense, form is so essential to music that it is difficult to imagine how it could be avoided. Even the simplest melody shows relationships of pitch (intervals), time values (rhythm), grouping (phrases), etc., in other

words, has "form." "Forms of music," however, refers to the existence of certain schemes that govern the over-all structure of a composition and were traditionally used in various periods of music history, e.g., the fugue or the sonata.

As might be expected, the ambiguity of the term "form" has led to numerous misunderstandings and futile argument. Much of this could be avoided if, in speaking of a specific composition, a clear distinction were made between the "form in this composition" and the "form of this composition." The question of "form vs. content" is a good example. Consider, e.g., a typical statement such as: "In the last analysis form and content cannot be wholly independent of each other." This is entirely correct if form here means "form in a composition." In fact, in this case one might say "the form in a composition is entirely dependent on its content." If, however, form here meant "form of a composition," the almost exact opposite would be correct, i.e., "the form of a composition (if it has a 'form') is essentially independent of its content." If we conceive of sound as a somewhat amorphous substance comparable to the flesh and cells of a body, then form might be said to be the support that holds and shapes this substance. This support is of two kinds, one forming a highly complicated inner structure comparable to the bones and muscles (form in a composition), the other determining its outer contour, somewhat like the skin (form of a composition).

"Form in music" includes practically all the theoretical and compositional principles of music, i.e., tones, intervals, scales, tonality, consonance and dissonance, meter, rhythm, phrase, theme, motif, repetition, variation, modification, transposition, modulation, sequence, inversion, and all the higher devices of counterpoint. There are separate entries for most of these categories. For "forms of music," see Forms, musical. See K. Westphal, *Der Begriff der musikalischen Form* (1935). Also see bibl. under Forms, musical.

**Formant.** See under Tone color.

**Formes fixes** [F.]. Collective designation for the three chief forms of late medieval French poetry and music: \*ballade, \*virelai, and \*rondeau. Their main period was the 14th century, under the poet-composer Guillaume de Machaut (c. 1300–77) and his literary successors, Eustache Deschamps, Charles d'Orléans, Alain Chartier, and Christine de Pizan (d. 1430). After 1450 they gradually declined in importance, being replaced

by freer and more varied forms [see Chanson]. All three forms have a \*refrain, which, however, has an entirely different function in the rondeau (inner refrain) from that in the two other forms (final refrain). The presence of a refrain as well as etymological considerations (*ballare*, to dance; *vire*, to turn around; *rond*, round) suggest that originally they may have been dancing songs. F. Gennrich has tried to establish a morphological genealogy, rondeau → virelai → ballade [see, e.g., *ReMMA*, pp. 221ff], a construction that involves a good deal of arbitrary manipulation. See F. Gennrich, *Rondeaux, Virelais und Balladen*, 3 vols. (1921–63); *id.*, *Grundriss einer Formenlehre des mittelalterlichen Liedes* (1932); G. Reaney, in *MD* vi; W. Apel, in *JAMS* vii; R. H. Perrin, in *JAMS* viii, 77.

**Forms, musical.** The general principles and schemes that govern the over-all structure of a composition [see under Form]. In other words, a musical form is the structural outline—comparable to an architect's ground plan—in the composer's mind when he sets out to write, say, a fugue or a sonata. In almost every period of Western music (much less so in Oriental music) certain formal schemes have become traditionally established and have been used by the composers as molds, setting the general frame for their creative imagination. The most important—at least, the most clearly defined—forms may be classified as follows:

#### I. Single forms

##### A. Repeat forms

- (1) a a' a'' . . . \*Variation form.
- (2) ||: a :|| b :|| \*Binary form.
- (3) ||: a :|| b a :|| Rounded binary form.
- (4) ||: a :|| b a \*Sonata form.
- (5) a b a Ternary form.
- (6) a b a c a Five-part form (also called \*rondo form)
- (7) a b a c a b a \*Rondo form (rondo-sonata form)
- (8) a b a c a d . . . a Rondeau [see Rondeau (2)]
- (9) Medieval forms: see *Ballade*; *Rondeau* (1); *Virelai* (*Ballata*)

For the forms (2) to (5) see Binary and ternary form; also *Bar* form. The forms (3) to (7) have a structure similar to an arch ("arch form" or "bow form"; G. *Bogenform*), while (1) and the \*sequence resemble the structure of a chain ("chain form"; G. *Kettenform*, *Reihenform*). Forms such as (8) combine both structures.

- B. Continuation forms
  - (1) *Cantus firmus* forms: \*organum; 13th-century \*motet; chorale compositions
  - (2) Imitative forms: 16th-century \*motet; \*ricercar; \*fugue
- II. Compound forms (consisting of various "movements")
  - A. Instrumental: \*sonata; \*concerto; \*suite; \*toccata
  - B. Vocal: \*cantata; \*Mass; \*Passion; \*oratorio; \*opera

Naturally this list is not complete nor without some unavoidable defects, and it should be regarded only as a general outline of the subject. There are a large number of "hybrids" that do not fit into the classification or that represent borderline cases. For instance, the fugue, which is classified above as a continuation form, might also be considered a kind of repetition form, owing to the characteristic alternation of expositions and episodes. In other cases—in fact, in most of them—historical development must be taken into account. For instance, the toccata, which in Bach's time was a compound form consisting usually of five distinct movements, began, about 1550, as a single continuation form (A. Gabrieli), and gradually acquired sectional character (Merulo, c. 1600), which finally led to the breaking up into movements.

The interpretation above of "forms of music" as a composer's ground plan does not claim to be a generally accepted definition. In fact, it would be impossible to find a definition likely to meet with the universal approval of musicians and scholars. Many writers use the term in a wider sense, including in it what might more properly be termed "stylistic types," e.g., the chaconne and the passacaglia (which are stylistic types of variation form), or the allemande, courante, etc. (which are stylistic types of binary form). Others prefer to use it in a narrower sense, restricting its application to the schemes based on the principle of repetition [see I, A, in the classification above]. Such restricted usage has a certain advantage. No doubt the repetition forms are not only more clearly defined than the continuation forms but also conform more fully to the general notion of form as a "pre-existing mold." For the continuation types, the name "procedure" has been suggested and indeed might be appropriate. Thus, in the case of a fugue, one would speak of "fugal procedure" rather than "fugal form."

Although with the fugue one might argue

whether it is a form or a procedure (or both combined), the appropriateness of the latter term is more clearly indicated in many types of vocal music, namely those in which the text provides the sole "ground plan" of the composer, as in the recitative, the through-composed song, in Wagner's "unending melody," etc. A similar situation exists with regard to the "compound vocal forms" [II, B, above] and the symphonic poem, in which the composer "proceeds" on the basis of the programmatic idea.

There is a widespread tendency among modern composers and writers to deny, or at least minimize, the importance of musical forms, the view being that each composition creates not only its own inner form (form *within* the composition; see under Form) but also its outer structure (form *of* the composition). As far as the repertory of classical music and the greater portion of early music are concerned, such a statement is obviously wrong. It finds justification mainly in the numerous examples of 19th- and 20th-century program music, and in the attempts of recent composers to modify, particularly in their symphonies, the traditional scheme of the sonata. Nonetheless, even such compositions as the symphonies of Sibelius and Shostakovich or the piano sonatas of Hindemith clearly show that the composers, in writing them, were thinking in terms of the traditional principles of sonata writing.

Macpherson, *Form in Music* (1908); M. H. Glyn, *Analysis of the Evolution of Musical Form* (1909); R. Stöhr, *et al.*, *Formenlehre der Musik* (1933); R. von Lobel, *Die Formenwelt der klassischen Instrumentalmusik* (1935); W. H. Hadow, "Form and Formalism in Music" (*PMA* xxiv); E. J. Dent, "Binary and Ternary Forms" (*ML* xvii, 309); A. Lourié, "The Crisis in Form" (*MM* viii, no. 4); R. Ficker, "Formprobleme der mittelalterlichen Musik" (*ZMW* vii); "Form in Baroque Music" (*BuMBE*, pp. 351ff); M. Bauer, "Formprobleme des späten Beethoven" (*ZMW* ix); H. Mersmann, "Zur Geschichte des Formbegriffs" (*JMP* xxxvii). See also under Sonata; Fugue.

**Forte** [It.], abbr. *f*, loud; *fortissimo*, abbr. *ff* (*fff*), very loud; *più forte*, louder; *forte-piano*, abbr. *fp*, loud followed by soft; *mezzoforte*, abbr. *mf*, medium loud. For the history, see Expression marks.

**Fortepiano** [It.]. (1) See under *Forte*. (2) Older name for piano.

**Fortspinnung** [G.]. In melodic construction, the process of continuation, development, or working out of material, as opposed to repetition in a symmetrical arrangement. Modern writers on melodic analysis (W. Fischer) frequently distinguish between *Fortspinnungstypus* and *Liedtypus*, terms that might be translated "continuation type" and "repetition type." A melody of the latter type is symmetrical in design and structure, whereas one of the former proceeds differently, often from longer phrases to shorter ones. These types are illustrated by the two themes given here [Ex. a, last movement of

Mozart's Symphony in G minor; Ex. b, scherzo of Beethoven's Fifth], which are usually cited as an example of "identical material" (even of plagiarism) but are more noteworthy as an example of "contrasting treatment of the same material," the former in repetition, the latter in continuation. Other terms for the same two types are "static" and "dynamic" melody (E. Kurth). See W. Fischer, in *StM* iii.

**Forty-eight, The.** Popular name for the 48 preludes and fugues of Bach's *\*Well-Tempered Clavier* i and ii (24 in each).

**Forza del Destino, La** [It., The Force of Destiny]. Opera in four acts by Verdi (libretto by F. M. Piave), produced in St. Petersburg, 1862. Setting: Spain and Italy, 18th century.

**Forzando, forzato** [It.]. Forcing, forced, accented.

**Foundation stops.** Designation for the unison- and octave-sounding (8', 16', 4', 2') ranks of the organ, especially those of the diapason chorus. See Organ VI.

**Fountains of Rome** [It. *Fontane di Roma*]. See under Symphonic poem IV.

**Furniture** [F.]. Mixture stop of the organ.

**Four Saints in Three Acts.** Opera in four acts by Virgil Thomson (libretto by Gertrude Stein), produced in Hartford, Conn., 1934. Setting: Spain, 16th century. There being more than a dozen saints and four acts, the title is a bit of whimsy. The text is in stream-of-consciousness style, the juxtaposition of interesting word sounds being a primary objective. The music, which includes a number of ballets, is in a clear, crisp rhythmic style somewhat reminiscent of jazz, with simple harmonies and a great deal of monotone recitation of the text.

**Four-shape note.** See Fasola.

**Fourth.** The interval of the fourth was of basic importance in Greek music [see Tetrachord] and in early medieval polyphony, which was essentially an *\*organum* of the fourth, not of the fifth. As late as c. 1030, Guido of Arezzo ruled out the fifth (together with the semitone) from what he called *nostra mollis diaphonia*, "our sweet diaphony." In the 12th century, however, the fifth began to take priority over the fourth, and in the late 15th century Tinctoris said that "the fourth was considered by the ancients the foremost of all consonances, but actually, taken by itself, it is not a consonance but an intolerable dissonance, which can be used only with the third or the fifth" [CS iv, 85]. In the 15th century there existed a harmonic style in which the fourth was completely avoided [see *ReMR*, p. 103f]. The fourth has once more acquired basic importance in modern harmony [see Fourth chord].

**Fourth chord.** Any of various chords consisting of superimposed fourths, e.g., c-f-b<sup>b</sup>, c-f<sup>#</sup>-b-e', or of fourths in dissonant combinations with other intervals. These chords play an important role in the harmonic idiom of modern composers (Scriabin, Casella, Hindemith, Bartók), replacing the traditional harmonies resulting from the superimposition of thirds (triad, seventh chord, ninth chord). Scriabin was the first to make deliberate use of fourth chords. Several of his compositions are based on a single fourth-chord combination, e.g., the so-called *\*mystic chord*, c-f<sup>#</sup>-b<sup>b</sup>-e'-a'-d''. See Quartal harmony; Harmony II (9). See O. Beer, in *DM* xxii.2.

**Fox trot.** An American ballroom dance dating from about 1915 that became the basis for most subsequent dance steps in duple time with the

exception of such importations as the rumba, tango, etc. Varieties are the \*Charleston, black bottom, and \*shimmy.

**Fp.** Short for forte-piano [see under *Forte*].

**Française.** See *Contredanse*.

**France.** The history of French music includes three periods of particular importance: an early one (1150–1450), during which France was the undisputed leader in musical development; another of about 100 years, during the baroque era (Chambonnières, Lully, Couperin, Rameau); and a third one, that of modern French music, beginning with Berlioz.

I. During the 5th, 6th, and 7th centuries there existed in France a special branch of Christian worship, the Gallican rite, which had special music known as \*Gallican chant. After the establishment of the Roman rite (by Pepin, 714–68) the Cathedral of Metz became the leading French center of Gregorian chant, known particularly for its neumatic manuscripts written in a special type of neume, the Messine neumes [see Neumes II]. Possibly, what is known today as Gregorian chant developed in the Franco-German empire of Pepin, Charlemagne (742–814), and his successors [see Gregorian chant VII]. In the 9th and 10th centuries the Monastery of St. Martial in Limoges played a leading part in the early development of the \*trope and the \*sequence, a development that reached its culmination in Adam de St. Victor (d. 1192). Also preserved from the 9th century are a number of songs in Latin, which, of course, can be claimed with equal right as “French” or “German” (e.g., the “Planctus Karoli”; see *GD* v, 1; *AdHM* i, 160). The oldest song in the Provençal language is a “Hora vos dic vera raizun” of the 10th century [see P. Aubry, *Les Plus Anciens Monuments de la musique française* (1905), pl. I]. Of later date is the *Sponsus* play with a mixed Latin and Provençal text, and the northern French Daniel play (from Beauvais).

II. The great period of medieval French music began about 1100, developing along two parallel lines of equal importance: monophonic secular music, represented by the \*troubadours and \*trouvères, and polyphonic music, represented by the anonymous composers of the schools of Chartres (c. 1100) and \*St. Martial (c. 1150), by the school of \*Notre Dame with Leoninus and Perotinus (before and after 1200), by the composers of the \*ars antiqua of the 13th century, and by the \*ars nova of the 14th century

(Philippe de Vitry, 1291–1361; Guillaume de Machaut, c. 1300–77). After a transitional period (late 14th century: Solage, Selesses, Cordier, et al.; early 15th: Carmen, Césaris, Tapissier, et al.) came the final culmination of medieval music in the work of the \*Burgundian school, with Dufay (c. 1400–74) and Binchois (c. 1400–60). In the second half of the 15th century, French composers such as Busnois (d. 1492), Barbireau, Regis, Caron, and Faugues came under the influence of the \*Flemish school. A happy fusion of Flemish and French elements characterizes the music of the great Renaissance composer, Josquin des Prez (c. 1450–1521), and his contemporaries, Pierre de La Rue (d. 1518), Compère (d. 1518), and Brumel (fl. 1483–1520).

The so-called Parisian \*chanson—as opposed to the Netherlands type of the late 15th century—originated with a group of composers active in and around the French capital during the first half of the 16th century. Chief among these were Claude de Sermisy (c. 1490–1562) and Clément Janequin (c. 1485–c. 1560). If the witty, often frivolous chanson of this school established France’s leadership in the field of amorous and worldly music, it also marked the end of her artistic eminence. An interesting although short-lived product of the academic movement in France was the *musique mesurée* of Claude Le Jeune (1528–1600), Jacques Mauduit (1557–1627), and others, written for the \*vers mesurés of Antoine Baïf and his associates of the *Académie de Musique et de Poésie*. A large repertory of 16th-century French lute music (mostly dances and arrangements of chansons) exists in the lute books of Attaignant (1530), Morlaye (c. 1550), Adrian Le Roy (c. 1550), and others [see Lute music], and a few remnants of 16th-century French organ music have been preserved in the organ books published by Attaignant about 1530.

III. In the 17th century, French music was entirely under the patronage of the royal court (Louis XIII, reigned 1610–43; Louis XIV, reigned 1643–1715), whose pomp and splendor were enhanced by the ballet (Cambefort, 1605–61; Lully, 1632–87; Campra, 1660–1744) and opera (Cambert, c. 1628–77; Lully; Campra; Rameau, 1683–1764; see Opera IV). Here originated the \*minuet, \*gavotte, \*bourrée, and numerous other dances that later became part of the suite. Of great artistic significance is the French lute music of the 17th century, represented chiefly by Denis Gaultier (c. 1600–72), and the harpsichord music that leads from the

reserved dignity of Chambonnières (c. 1602–72) and Louis Couperin (c. 1626–61) over the baroque peak of D'Anglebert (c. 1628–91) to the rococo worldliness of François Couperin (1668–1733), coming to its close in the masterpieces of Rameau (1683–1764), with their remarkable traits of ingenious characterization and dramatic surprise. French organ music of the baroque started with J. Titelouze (1563–1633), an important composer with traditional leanings; continued with N. Gigault (c. 1625–1707), G.-G. Nivers (1632–1714), N.-A. Lebègue (1631–1702), A. Raison (c. 1645–1714), J. Boyvin (c. 1653–1706), and others whose work is more notable for ventures in registration than for artistic achievement; and culminated with Nicolas de Grigny (1672–1703). Music for viols was cultivated by Marais (1656–1728) and for violin by Leclair (1697–1764). Less known but important contributions were made in the fields of the motet (Charpentier, Lully, and others; see Motet C) and cantata (Campra and others; see Cantata II). French song literature of this period includes the *\*air de cour*, *\*brunette*, and other types; see *Chanson*.

The invasion of the Italian *opera buffa* (1752; *\*War of the Buffoons*) marked the end of the French baroque opera and the beginning of the less significant *opéra comique*. For a hundred years, from 1750 to 1850, the history of French music was practically restricted to efforts to build up a new “grand opera,” efforts in which the German Gluck (1714–87), the Italians Cherubini (1760–1842) and Rossini (1792–1868), and the German Meyerbeer (1791–1864) participated along with French composers such as Grétry (1741–1813), Méhul (1763–1817), Boieldieu (1775–1834), Auber (1782–1871), and Halévy (1799–1862).

IV. Much more important than these operas is the symphonic work of Hector Berlioz (1803–69), heir to the tradition of Beethoven and perhaps the greatest figure in 19th-century French music. With all their “flaws,” his compositions show an originality, passion, and vigor rarely encountered in French music. César Franck (1822–90) amalgamated the classical forms of the symphony, quartet, variations, etc., with a romantic vocabulary of harmonies and elements derived from a thorough study of counterpoint. Charles Gounod (1818–93) and Georges Bizet (1838–75) are known mainly for their operas, *Faust* (1859) and *Carmen* (1873–4). Camille Saint-Saëns' (1835–1921) numerous works, in a late classical style, are distinguished

by technical mastery but are somewhat lacking in inspiration. *Danse macabre* (1874), *Le Carnaval des animaux* (1886), and the Third Symphony (with organ, 1886) are his best-known compositions. Academic and dogmatic leanings are present in the work of Vincent d'Indy (1851–1931), who, with others, in 1896 founded the *\*Schola cantorum*, devoted to the tradition of Franck and the study of Gregorian chant and 16th-century counterpoint.

A tendency toward greater subjectivism, more lyrical expressiveness, a richer orchestral palette, and a typically French exquisiteness of taste appear in the works of Gabriel Fauré (1845–1924), creator of the modern French song (*mélodie*), and of Henri Duparc (1848–1933), Ernest Chausson (1855–99), and Paul Dukas (1865–1935). Unfortunately, each of them produced only a few works of importance. To the foregoing may be added Florent Schmitt (1870–1958), who, more than any other French composer, was influenced by the emotional exuberance of German romanticism. Modern French music found its most characteristic expression in *\*impressionism*, which was foreshadowed by Édouard Lalo (1823–92) and Emmanuel Chabrier (1841–94) and brought to full flowering in certain works of Claude Debussy (1862–1918) and Maurice Ravel (1875–1937). Debussy may be considered among the founders of modern music in the same sense as Stravinsky and Schoenberg. He emancipated harmony and created a new kind of sound based on the sonorities themselves.

The revolutionary tendencies of the postwar period brought a strong reaction against the refinements of the impressionist style, a reaction that found its clearest formulation in the words of Cocteau: “After the music with the silk brush, the music with the ax.” In this movement Erik Satie (1866–1925) was the spiritual leader of the group known as *Les Six* [see *Six*], which included the most prominent contemporary French composers, notably Darius Milhaud (b. 1892), Arthur Honegger (1892–1955), Francis Poulenc (1899–1963), and Georges Auric (b. 1899). A separate place must be reserved for Albert Roussel (1869–1937) who, though influenced successively by D'Indy, Debussy, and Stravinsky, developed a highly personal style, basically contrapuntal but greatly varying from one composition to the next.

Highly diversified trends appear in the works of the composers born after 1900. André Jolivet (b. 1905) writes in a sort of neoprimitive style;

Olivier Messiaen (b. 1908) tends toward a religious mysticism influenced by Scriabin, Oriental music (Hindu rhythms), bird song, and serial techniques, which he was the first to apply to all elements of music (duration, intensity, etc.). René Leibowitz (b. 1913) writes twelve-tone music; the music of Jean Françaix (b. 1912) is precise, clever, and frankly amusing. In 1936 Jolivet, Messiaen, Yves Baudrier (b. 1906), and Daniel Lesur (b. 1908) formed a group known as "La Jeune France." Today's avant-garde is represented by Pierre Boulez (b. 1925) who, influenced by Webern, has introduced twelve-tone techniques in France. \**Musique concrète* and electronic music are represented by Pierre Schaeffer, Jean Barraqué (b. 1928) and others.

**Franco-Flemish school.** See Flemish school.

**Fraudulent compositions.** See Spurious compositions.

**Frauenchor** [G.]. Women's chorus.

**Frauenliebe und Leben** [G., Woman's Love and Life]. A cycle of eight songs by Schumann, op. 42 (1840), based on a group of poems by Adalbert von Chamisso (published under the same title). It was composed shortly after Schumann married Clara Wieck.

**Frau ohne Schatten, Die** [G., The Woman without a Shadow]. Opera in three acts by R. Strauss (libretto by H. von Hofmannsthal), produced in Vienna, 1919. Setting: fairy tale.

**Fredon** [F.]. A rather indefinite term applied by 17th-century French musicians to a trill or a short \**roulade*. In the 18th century it was generally used in a derogatory sense for excessive ornamentation.

**Freemason music.** The Freemason movement began with the foundation of the Grand Lodge of London in 1717. From England it spread to France, Germany, America, and many other countries. Among the Freemasons have been numerous composers, e.g., Boyce, Arne, Wesley, Haydn, Mozart, Löwe, Spohr, Cherubini, Liszt, Irving Berlin. Music played an important role in the Masonic meetings, which often included performances by outstanding artists. Essential to the Masonic rites is the singing of songs, many of which were published in collections such as *Recueil de chansons des Franc-Maçons* (1750), *La Lire maçonne* (1763), *A Selection of Masonic Songs* (by Smollet Holden; 1796), and *The Masonick Minstrel* (Dedham, U.S.A., 1816). Most of the songs are popular tunes, dance tunes, or operatic melodies provided with a suitable text and thoroughbass accompaniment. The most important composer of Masonic music was Mozart, whose works include at least four written specifically for the Freemasons of Vienna: *Gesellenreise* (1785; K. 468); *Die Maurerfreude* (1785; K. 471); *Maurerische Trauermusik* (1785; K. 477); and *Freimaurerkantate* (1791; K. 623). His *Die Zauberflöte* contains numerous elements borrowed from Masonic rites: the Egyptian background, the priests, the ordeal by fire and water, the evil Queen of the Night, the serpent, etc.

Lit.: P. Nettl, *Mozart and Masonry* (1957); *id.*, *Mozart und die königliche Kunst* (1932); *id.*, in *MQ* xvi; O. E. Deutsch, *Mozart und die Wiener Logen* (1932); M. Friedländer, *Das deutsche Lied im 18. Jahrhundert* (1902).

**Frei** [G.]. Free, with freedom.

**Freischütz, Der** [G., The Freeshooter]. Opera in three acts by Weber (libretto by F. Kind), produced at Berlin, 1821. Setting: Bohemia, after the Seven Years' War. *Der Freischütz* marks both the beginning and the peak of German romantic opera. Folklore, nature, and superstition are the subjects given a musical setting that is admirable for the charm of its folklike melodies.

and dance tunes as well as touches of dramatic tension and excitement. Particularly remarkable is the bold use of wind instruments: the horns that capture the atmosphere of the "German forest"; the trombones that accompany the hermit; the clarinet that characterizes Agathe; and the low register of the flute, which portrays Samiel. See also under Melodrama.

**Freistimmigkeit** [G.]. Modern German term, sometimes translated as "free voice-leading," for a pseudocontrapuntal style in which there is no strict adherence to a given number of parts, i.e., voices are free to enter or drop out, and chordal elements also occur. The natural idiom for such a style lies in music for keyboard instruments or for the lute. Indeed, *Freistimmigkeit* is a characteristic of solo music as opposed to ensemble music [see Ensemble (3)]. The earliest keyboard pieces (Robertsbridge Fragment, c. 1320; *Fundamentum organisandi*, 1452) are in two parts but occasionally include single chords or short passages in three parts. More typically *freistimmig* are the organ compositions in the collections of Attaignant (c. 1530; \*Editions XLIX, 1) and in the publications of Marco Antonio (da Bologna) Cavazzoni (1524; \*Editions X, 1) and of Girolamo Cavazzoni (1542; \*Editions IX, 6). *Freistimmigkeit* is highly characteristic of the keyboard style of Frescobaldi [see Ex.] and Froberger. Unfortunately, modern editors have shown a tendency to "correct" this flexible idiom by the insertion of rests, use of double-stemmed notes, and similar devices. As late as about 1700, fugues and ricercars were written without strict adherence to a given number of parts [see, e.g.,

Krieger, in *HAM*, no. 249a]. Naturally, the contrapuntal writing in 19th-century compositions, such as Beethoven's sonatas, is always more or less *freistimmig*. Lute music is almost of necessity *freistimmig*. See also Texture.

**French chanson.** See under Chanson (2).

**French harp.** Older name for the mouth organ.

**French horn.** The horn, as opposed to the English horn, which is a member of the \*oboe family. See Horn.

**French overture.** See under Overture I; Suite V.

**French sixth.** See Sixth chord.

**French Suites.** Six suites for harpsichord by Bach, composed about 1720 (in Köthen). The name "French" (not by Bach) has little significance, since French elements are present here to the same extent as in all the suites of Bach and his German predecessors (Pachelbel, Froberger). See under Suite.

**Frequency.** See under Acoustics I.

**Fret** [F. *touche*; G. *Bund*, pl. *Bünde*; It. *tasto*; Sp. *traste*]. A thin strip of material placed across the fingerboard of certain instruments (lute, guitar, viols, balalaika, banjo, and various Indian and Arab instruments) that marks the position for stopping the strings. Formerly frets were made from pieces of catgut that were tied tightly around the neck. In more modern instruments they are narrow strips of wood or metal fixed on the fingerboard. On European instruments the frets are always arranged so as to give a succession of semitones [see Tablature III].

**Frettoloso** [It.]. Hurried.

**Fricassée** [F.] French name for \**quodlibet*. Examples including many textual and musical quotations are found in various 16th-century collections of chansons. A *Fricassée* by Henri Fresneau (in J. Moderne, *Le Parangon des chansons*, iii, 1538) contains almost one hundred quotations. See J. Jacquot, ed., *†Musique et poésie au XVIe siècle* (1954), pp. 174, 179.

**Friss, friszka.** See *Csárdás*; *Verbunkos*.

**Frog.** A slightly raised ridge fastened to the upper end of the neck of stringed instruments (violin, etc.). It serves to raise the strings over the fingerboard. The British term for frog is *nut*. Also see Bow.

**Fröhlich** [G.]. Joyful.

**From My Life.** Smetana's name for each of his two string quartets, in E minor (1876) and in D minor (1882), both of them autobiographical. Today the name is used particularly for the E-minor quartet, which describes the happy experiences of his youthful life but contains in the finale a long-drawn high note that he heard for many years before he became deaf.

**From the New World.** See New World Symphony.

**Frottola** [It.]. (1) Generic name for various types of Italian secular song of the late 15th and early 16th centuries. The most important source consists of the eleven books of *frottole* published by Petrucci (1504–14; book X is lost). The *frottole* are often in a simple, essentially chordal style in three or four parts, with the upper part standing out as a melody. Since only the upper part has a text, they were probably performed as accompanied songs, the lower parts being played on instruments (viols, lute, harpsichord, etc.). However, purely vocal performance cannot be ruled out, particularly for the numerous examples written in a strictly homorhythmic style. The *frottola* developed under the aegis of the courts of northern Italy, particularly at Mantua, where the two most outstanding composers of *frottole*, Marco Cara (d. after 1525) and Bartolomeo Tromboncino (d. after 1535), worked under the patronage of Isabella d'Este. The prevailingly chordal style and the simple harmonic idiom (V–I, IV–I) of the *frottole* probably account for the appearance of similar traits in the works of contemporary Flemish composers (Obrecht, Isaac, Josquin). The late *frottole* are of interest as forerunners of the \*madrigal.

(2) Specifically, *frottola* is one of the various poetic-musical types represented in Petrucci's collections, also known as \*barzelletta. Others are the \*capitolo, \*villota, canzona [see Canzona (4)], \*oda, and \*strambotto. The *frottola* is a late offspring of the 14th-century \*ballata. Similar to this form (and even more so to the Spanish \*villancico of c. 1500), it frequently consists of an initial four-line stanza and several six-line (occasionally eight-line) stanzas between which the first half of the initial stanza is repeated as a refrain. The most common musical form is the following (each letter represents two lines of the poem; refrain in capital letters):

A b a a b A— a a b A—...

The music as printed consists of two sections, one for the first stanza (A b), the other for its first half as used as a refrain (A—). A— is essentially the same as A but includes a codalike extension. Frequently the second half of A (music for the second single line) is similar or identical to the first half of b (music for the third single line; see the examples in *HAM*, no. 95). Although the scheme described above is the one most frequently encountered, there are many other but related formal patterns.

**Fuga** [L.; It.]. (1) Italian for fugue. In earlier practice, also for fugal theme, e.g., [*Ricercar del*] *Primo tono con tre fughe* (Trabaci, *Ricercate*, 1603). (2) The original meaning of *fuga* [L.] is not fugue but what today is called canon. In this sense the term occurs in the "Speculum musicae" of c. 1330 (*in conductis, motettis, fugis, cantilenis, rondellis*; see *CS* ii, 395a), in the *Fugae* of Oswald von Wolkenstein, in Buchner's "Fundamentum" of c. 1525 (*cantus fugat in alto et tenore*), in Glareanus' *Dodecachordon* (1547; p. 445; *iiii vocum fuga ex unica*; see *ApNPM*, p. 180f), in Antonio de Cabezón (\*Editions XX, 7, p. 20), in Vincenzo Galilei [\*Editions XXIII, 4, p. 12], etc. About 1600 the word *fuga* took on its present meaning as a generic term for pieces in the fugal style, either *canzonas* [see B. Schmid, *Tabulaturbuch* (1607): "Fugen oder wie es die Italiäner nennen, Canzoni alla Francesce"], extended *ricercars* [S. Scheidt, *Tabulatura nova* (1624); see *DdT* i, 99], or any of the precursors of the fugue proper.

**Fugato.** A passage in fugal style that is part of a primarily nonfugal composition. Such passages frequently occur in the development sections of symphonies, sonatas, and quartets.

**Fuge tune, futing tune.** A form of hymn or psalm tune developed in New England during the late 18th and early 19th centuries. It commonly begins with a homophonic section, usually cadencing in the tonic and followed by a phrase in which the voices enter in succession (the order varies), which is in turn followed by a concluding homophonic phrase. Two misconceptions are that it represents a crude attempt to write a real fugue, and that it is a native American form originating with Billings. It is, in fact, based on an English form common in

the 17th and early 18th centuries, of which Tye's "Laudate nomen Domini" is perhaps the best-known example. English futing tunes are found as early as 1592 (in T. East's *The Whole Booke of Psalmes*), and 17th-century Scottish psalters contained similar pieces called "reports" (from F. *rapporter*, to carry back). The American futing tunes thus are a last manifestation of an old form, and are generally somewhat freer in style. Aside from this, the only significant difference is that the English examples "fuged" on the last line, and the American ones on the next-to-last line. Futing tunes were written for and extensively used in the singing schools organized toward the end of the 18th century in an attempt to improve the bad state of singing in the non-liturgical churches, the writers almost always being singing masters. Among the most gifted of these were William Billings (1746–1800), Daniel Read (1757–1836), Jeremiah Ingalls (1764–1828), Timothy Swan (1758–1842), and Andrew Law (1749–1821).

See also United States I; Hymn, English; Tune book.

B.J.O.

**Fughetta** [It.]. A short fugue.

**Fugue** [F. *fugue*; G. *Fuge*; It., Sp. *fuga*]. The latest and most mature form of imitative counterpoint, developed during the 17th century and brought to perfection by J. S. Bach.

I. *Structure*. The main characteristics of a fugue are: (a) It is always written in contrapuntal style, i.e., with a texture consisting of a number of individual voices, usually three or four. (b) It is based on a short melody, called *subject* or *theme*, which is stated at the beginning of the fugue by one voice alone, being taken up ("imitated") by the other voices in close succession and reappearing throughout the entire piece in all the voices at different places according to principles explained below. (c) In each voice the space between one statement of the subject and the next is filled in by a freely invented counterpoint, which, however, is usually unified by the use of recurrent motifs. These motifs are derived either from the subject itself, or, more usually, from its continuation, which forms the counterpoint to the first imitation (second statement) of the subject, near the beginning of

the fugue. Frequently, but not always, this continuation takes a rather definite form, almost equal to the subject in individuality and importance. In such cases it is called *countersubject* and reappears throughout the fugue in a manner similar to the main subject, though less rigidly. (d) A section in which the theme appears at least once in each voice is called *exposition*. The exposition may include one more statement than the number of parts, e.g., four in a three-voice fugue, the subject being stated again by the voice in which it first appeared. However, this does not usually happen in the first exposition, which in other respects as well is the most rigid in structure. Sometimes the term exposition is restricted to the first exposition, without any special name being applied to later sections of similar construction. The accompanying example (J. K. F. Fischer, *Ariadne Musica*, c. 1700) illustrates the

beginning of a fugue. (e) A section of the fugue that does not include a statement of the subject is called an *episode*. The episodes are based chiefly on short motifs derived from the subject or its continuation (countersubject). They frequently use sequential treatment [see Sequence I]. (f) The over-all structure of a fugue is an alternation of expositions and episodes. The episodes, although still in strict counterpoint, are somewhat freer and "lighter in weight." A fugue may have three, four, or more expositions, separated from one another by episodes. The middle expositions usually involve modulations into other keys, such as the relative minor, dominant, or subdominant, with return to the main key in the last exposition. (g) While in the first exposition the statements of the subject follow in rather close succession, in the later expositions they usually are more widely spaced, separated by what might be called secondary episodes. For instance, the first fugue from the second book of Bach's *Well-Tempered Clavier* has two secondary episodes within its second exposition (see the accompanying diagram, which shows the basic structure of the fugue). The three subjects of the initial expo-

sition are designated S<sub>1</sub> and S<sub>2</sub> in order to indicate that they appear in two keys, tonic (S<sub>1</sub>) and dominant (S<sub>2</sub>). Because of this tonal relationship they are referred to as "subject and answer," or "antecedent and consequent," or "*dux* (leader) and *comes* (follower)." Usually the answer is not an exact transposition but involves the modification of certain steps, e.g., the replacement of a fifth (c-g) by a fourth (g-c', instead of g-d') [see Tonal and real]. The fugue usually closes with a \*coda, which often has a pedal point.

It must be noted that the scheme above represents a "student's fugue" rather than a "composer's fugue," such as those by Bach, few of which fit the theoretical description in every detail. Interestingly enough, Bach treated the fugue much more freely than Mozart, Haydn, and Beethoven treated the sonata. The question may well be raised whether there really is such a thing as the "fugue form" and whether it would not be more proper to speak of "fugal procedure" rather than "fugal form" [see Forms, musical]. At any rate, the statement of numerous authors that "a fugue is a three-part form" is rather misleading.

While the explanations above describe the basic principles of the fugue, fugal style includes many special devices of lesser or greater complexity, which contribute interest, variety, and intensity. Most of these are found under separate entries [see Augmentation and diminution; Inversion (2); Stretto; Double fugue; see also *Art of Fugue*].

**II. History.** The principle of imitative counterpoint, which is the basis of the fugue, can be traced back as far as c. 1200 [see Imitation]. However, it was not until the late 15th century that composers became fully aware of the importance of imitation as a structural element of polyphonic music (Obrecht, Isaac, Josquin). The style and form of Josquin's and Gombert's motet, characterized by many relatively short "expositions" (points), each based on a different subject and following one another in a dovetailing fashion, were imitated in the organ \*ricercar (Cavazzoni, c. 1540). However, the ricercar had modifications that foreshadow future tendencies, e.g., reduction of the number of points (i.e.,

themes) and expansion of each point into a well-defined section including a greater number (up to 15 or more) of statements of the subject. Besides these "polythematic" ricercars, which are quite long, there also are shorter "monothematic" ricercars (e.g., by A. Gabrieli; see W. Apel, in *MD* iii). Another important forerunner of the fugue is the organ \*canzona, which is similar in form to the polythematic ricercar but livelier and freer. The ricercar style persists in slow fugues, such as nos. 4 and 22 of the *Well-Tempered Clavier* i, and the canzona type in the more flexible and individual subjects of the faster fugues [see *Soggetto*].

The details of the development leading from the ricercar and canzona of about 1600 to the fugue of Bach have never been thoroughly investigated and clearly outlined. The problem is difficult indeed, owing to the enormous wealth of material and the variety of trends and schools. Restricting ourselves to the keyboard fugue (i.e., omitting the fugal compositions in instrumental and vocal music), it can be said that this development took place chiefly in Germany ("fugues" by Frescobaldi, which have been frequently reprinted in modern collections, e.g., L. Oesterle, ed., ‡*Early Keyboard Music* i, p. 59, are definitely spurious) and that slowly and gradually the typical features of the Bach fugue appeared, such as adherence to a given number of parts, relative shortness, restriction to one theme, consistent alternation of expositions and episodes, modulatory principles, I-V-I-V entries in the first exposition [see the Ex. by Fischer above, which has I-V-V-I entries], etc. This process is illustrated by the following examples, contained in A. Ritter, *Zur Geschichte des Orgelspiels*, vol. ii (1884): Simon Loher, c. 1550-1611 (p. 106); Wolfgang Carl Briegel, 1626-1710 (p. 206); Georg Caspar Wecker, 1632-95 (p. 120); Johann Christoph Bach, 1643-1703 (p. 172). See also *HAM*, nos. 195b (Scheidemann), 215 (Tunder), 234 (Buxtehude), 237 (J. C. Bach), 247 (J. K. F. Fischer), 249b (Krieger), 251 (Pachelbel). The fugues in Johann Krieger's *Anmuthige Clavier-Übung* (1699; new ed. in *DTB* 18) contain practically all the elements of fugal style used by Bach.

The excellence of Bach's fugues compared

to those of his predecessors lies in various factors: greater contrapuntal skill, clarification of the formal structure, more advanced methods of harmonic treatment, etc. While all these traits represent progress by degrees, one trait puts Bach's fugues into a class of their own, namely, the incomparable artistic quality of the themes [see Melody III]. The great master of the fugue after Bach was Beethoven, who in various movements of his latest piano sonatas (op. 106, 110), quartets, and other works showed that the potentialities of the form had by no means been exhausted by the baroque masters. Composers after Beethoven seldom used the fugue as a serious art form. Recently, however, the \*neo-classical tendencies of the 20th century have stimulated a new creative interest in this form (Hindemith and others).

Ghislanzoni, "La Genesi storica della fuga" (*RMI* xlviii).

**Fugue tune, fuguing tune.** See Fuge tune.

**Füllstimme** [G.]. A mere "filling" part, without independent importance.

**Functional harmony** [G. *Funktionslehre*]. A relatively new system of harmonic analysis, developed chiefly by H. Riemann, that attempts both to simplify traditional methods and to give clearer insight into the essentials of harmonic progressions. It is based on the idea that in a given key there are only three "functionally" different chords, namely, tonic (I), dominant (V), and subdominant (IV). All other chordal com-

binations, even the most complex and chromatic, are variants of one of these three chords, i.e., they have a tonic-function, dominant-function, or subdominant-function. The chief substitute for each of the three principal triads is its relative minor; thus VI stands for I; III for V; II for IV. However, the "upper relative" may also serve as a substitute: III for I; VII for V; VI for IV. The resulting ambiguity in meaning of, e.g., III (which may appear in tonic-function or in dominant-function) is an essential feature of the system in which a chord is determined not as an isolated phenomenon by its degree (as in the current system of harmonic analysis) but by its function within a series of progressions. The subdominant in particular has many substitutes; among these is the \*Neapolitan sixth, which in functional harmony is simply a (doubly altered) S, while in the orthodox system it is the first inversion of the lowered supertonic. Another example of functional interpretation is the six-four chord of the first degree ( $I_4^6$ ), which functionally is nearly always a plain dominant (V) involving a double appoggiatura.

Riemann's system has hardly gained a foothold outside Germany. Although one might argue about the advisability of its full acceptance, it certainly deserves more recognition as a corrective of the traditional system with its somewhat dogmatic method of labeling, which is not always conducive to an understanding of harmony. The accompanying example (Schumann) illustrates the traditional and "functional" methods.

B<sup>b</sup>:V    V<sup>2</sup>    IV    I    I<sup>#</sup>I

G<sup>b</sup>:V<sup>7</sup>    V<sup>2</sup>I<sup>6</sup>    D<sup>b</sup>:V<sup>6</sup>    E<sup>b</sup>:V<sup>6</sup>    F:V<sup>6</sup>    I

I    IV    V

Lit.: H. Riemann, *Vereinfachte Harmonielehre* (1893); E. Kirsch, *Wesen und Aufbau der Lehre von den harmonischen Funktionen* (1928); H. Distler, *Funktionelle Harmonielehre* (1941); H. Moser, in *ZMW* i.

**Fundamental, fundamental tone.** The lowest tone, i.e., the bass note of a chord. Also, the first harmonic.

**Fundamental bass** [F. *basse fondamentale*]. In J. P. Rameau's theory, *basse fondamentale* is a fictitious bass line that consists of the roots of the chords occurring in a succession of harmonies. Only if a chord is in root position does the *basse fondamentale* coincide with the real bass. Rameau used the *basse fondamentale* in order to demonstrate his then novel theory of inverted chords.

**Fundament-instrument** [G.]. In the \*thorough-bass period, all instruments used for playing the bass part, either the written part only (violone, viola da gamba, cello, bassoon, etc.), or with accompanying chords (organ, harpsichord, chitarrone, theorbo, etc.).

**Fundamentum.** Title used by 15th- and 16th-century German composers for collections of pieces designed to teach composition of keyboard music. They consist of theoretical *cantus firmi* (*ascensus* and *descensus*, i.e., ascending and descending scale formations) to which figurate counterpoint is added. For early examples, dating from c. 1440–50, see Editions XI, 1, pp. 13, 24, 25. The most famous example (for organ) is Conrad Paumann's "Fundamentum organisandi" of 1452 [fac. ed., together with the Lochamer \*Liederbuch, by K. Ameln, 1925; transcr. in *JMW* ii and in Editions XI, 1, p. 32]. The \*Buxheim Organ Book contains four or five greatly enlarged collections, including pieces in three-voice counterpoint. Hans Buchner's (1483–1538) "Fundamentum" of c. 1520–30 gives instruction in three- and four-voice counterpoint as well as in imitation [see C. Päsler, in *VMW* v]. In the organ tablature of Johannes de Lublin (c. 1540) the same techniques are illustrated by almost 800 examples.

**Funktionslehre** [G.]. See Functional harmony.

**Fuoco, con** [It.]. With fire.

**Furiant.** A rapid and fiery Bohemian dance, in 3/4 time, with frequently shifting accents. It has been used repeatedly by Dvořák [op. 12, *Dumka and Furiant*; op. 42, *Two Furiant*s; also in his chamber music] and by Smetana [*The Bartered Bride*; *Czech Dances*]. An early description of a "Furie" is found in Türk's *Klavierschule* (1789; p. 400).

**Furlana.** See *Forlana*.

**Furniture stop.** Same as mixture stop.

**Fusa** [L.; G. *Fusela*, *Fusel*]. See under Mensural notation I.

**Futurism.** The term *futurismo* was introduced by the Italian writer Marinetti in 1909 to describe extreme radicalism in literature and in all the arts. His ideas were applied to music at least theoretically by Francesco Pratella, in his *Musica futurista* (1912), which contains the following characteristic sentences: "To present the musical soul of the masses, of the great factories, of the railways, of the transatlantic liners, of the battle-ships, of the automobiles and airplanes. To add to the great central themes of the musical poem the domain of the machine and the victorious kingdom of Electricity" [see the full text in N. Slonimsky, *Music Since 1900*, rev. ed. (1949), pp. 642ff]. Pratella also gives a detailed description of a composition for an "orchestra" consisting of machine guns, sirens, steam-whistles, etc. His music, however, is not more than a mild Debussyism, mingled with Puccinian idioms. Another champion of futurism was the painter Luigi Russolo, who actually is the author of the description quoted above. See W. Austin, "The Idea of Evolution in the Music of the 20th Century" (*MQ* xxxix, esp. 30ff).

**Fz.** [It.]. Abbr. for *forzando*, *forzato*, same as \**sforzando* (*sf*, *sfz*).

## G

**G.** See Pitch names; Letter notation; Hexachord. For G clef, see Clef.

**Gabelgriff** [G.]. \*Cross fingering.

**Gagaku** [Jap.]. The orchestral music of the Japanese court, founded in the 8th century and preserved to the present day with little change. It also includes vocal pieces, e.g., *saibara*

and *rōei* [see Japan III]. The term *gagaku* is also used for a type of orchestral music of continental Asia, particularly China and Korea, which is the predecessor of the Japanese *gagaku*.

The frequent visits of foreign musicians to Japan, particularly Koreans and Chinese, during the 5th to 8th centuries culminated in 701 in the establishment of *Gagaku-ryō*, the Imperial Music Bureau. During the 8th century, repertoires of different origins were blended and modified into a Japanese style, resulting in *gagaku* as it is known today. It reached its height in the Heian Period (894–1192). After the 12th century the tradition was barely continued by the musicians at the Imperial Court and at a few shrines and temples but was revived after World War II.

*Gagaku* performed alone is called *kangen*; when it accompanies a dance it is called *bugaku*. Both types are further divided into left music and right music (or dance). The left music is of Chinese or Indian origin or reflects their influence, while the style of right music is like that of Korea and other northern countries. The left and the right use different sets of instruments. An orchestra of the left music consists of *ryūteki* (or *wōteki*, a 7-holed flute), *hichiriki* [see Oboe family III], and *shō* (a mouth organ); *biwa* (a lute derived from the \**pyiba*) and the *gakusō* (of the \**koto* family); and *taiko* (a big drum), *shōko* (a metal drum), and *kakko* (a horizontal drum with two side surfaces). The right music substitutes *komabue* (a 6-holed flute) for *ryūteki*, and *sanno-tsuzumi* for *kakko*, and omits the *shō*, which provides a “harmonic” background for the left music. [See Ex.] [For the scale system in *gagaku*, see Japan IX.]

Except in some free-rhythm passages (introduction or postlude), percussion instruments indicate strong (S) and weak (w) beats throughout the piece. The chief patterns are S w w w, S w w w w w w w, S w S w, S w S w w w, and S w S w w. Two winds, *ryūteki* (or *komabue*) and *hichiriki*, play melodic parts and often create a \*heterophonic effect. Sometimes, in the right music, the two may play entirely different melodies. The strings have a percussive function rather than a melodic one.

The most frequently found form for a *bugaku* is in three sections: *jo* (a slow introduction), *ha* (moderate tempo), and *kyū* (a fast ending). This form is also found in various types of Japanese music in later periods. See Japan.

Lit.: R. A. Garfias, *Gagaku* (1959); ‡*Score of Gagaku*, transcr. by S. Shiba, 2 vols. (1955, '56); E. Harich-Schneider, in *MQ* xxxix, 49–74; S. Kishibe and L. Traynor, in *Tōyō Ongaku Kenkyū* (Tokyo) ix, 26–53. M.K.

**Gagliard, gaillarde.** See Galliard.

**Gaita.** See Bagpipe.

**Gaitilla.** A Spanish 17th-century organ stop with a nasal sound, in imitation of the gaita. Also (rarely), a composition whose solo part was played on this stop.

**Galanterien** [G.]. An 18th-century name for short entertaining pieces in homophonic (nonfugal) style, including airs, variations, dances. The term is used particularly for the more recent dances in the optional group of the suite, such as the bourrée, passepied, gavotte, etc., which are composed in a lighter style than the traditional allemande, courante, saraband, and gigue. Note the title of the first part of Bach's *Clavier-Übung*: “. . . Sarabanden, Gigueen, Menuetten und anderen Galanterien.” See Gallant style.

Lit.: W. Dahms, “The ‘Gallant’ Style of Music” (*MQ* xi, 356); P. Gradenwitz, “Mid-Eighteenth-Century Transformations of Style” (*ML* xviii, 265); E. Bücken, “Der galante Stil” (*ZMW* vi, 418); see also under Rococo.

**Galerón** [Sp.]. A ballad form in octosyllabic quatrains popular in the Colombian plains. Its melody has a limited range, and its rhythm follows the text in a recitative-like manner. At the end of each stanza, refrains in slightly quicker tempo and contrasting with the predominantly narrative character of the stanzas are interpolated. J.O-S.

**Gallant style** [F. *style galant*; G. *galanter Stil*]. In the 18th century, the light, elegant style of the rococo, as opposed to the serious, elaborate style of the baroque. The appearance of this style accompanied the shift from church to salon as the cultural center, from fugal treatment (polyphonic) to accompanied melody (homophonic), from church music to secular music. This change is already evident in the harpsichord compositions of J. K. F. Fischer, F. Couperin, Telemann, and G. T. Muffat, as well as in the optional dances (minuets, bourrées, gavottes, etc.; see

*Galanterien*) of Bach's suites [also the (spurious?) dances—minuets, marches, polonaises—in the *Notenbüchlein der Anna Magdalena Bach*]. The gallant style is clearly present in the violin concertos and sonatas of Tartini [see *HAM*, no. 275] and in Pergolesi's *La Serva padrona* (1733). The adoption of the new style led, about 1750, to a deterioration in musical quality, notably in some works of Italian composers such as Rutini, Paganelli, and Pescetti, and in England. In the second half of the 18th century, Bach's sons Wilhelm Friedemann and Karl Philipp Emanuel endowed the gallant style with a new expressiveness [see *Empfindsamer Stil*], so that the word "gallant" was no longer applicable. The same was true of Mozart's works, which are directly derived from the gallant style of the Italians (including Johann Christian Bach). See *Rococo*; *Haffner* collection.

Lit.: W. Dahms, "The 'Gallant' Style of Music" (*MQ* xi); P. Gradenwitz, "Mid-Eighteenth-Century Transformations of Style" (*ML* xviii); E. Bücken, "Der galante Stil" (*ZMW* vi). See also under *Rococo*.

**Gallarda** [Sp.]. A 17th-century Spanish type of continuous variations based on a theme of 8, 10, or more measures in 4/4 time. There are five examples in the works of Cabanilles (ed. H. Anglés, ii, 62ff). The *gallarda* also was a dance. Its movements are described in a late 17th-century *Libro de danzar* [see *AnM* v, 193].

**Galliard** [F. *gaillarde*; It. *gagliarda*; Sp. *gallarda*]. A gay, rollicking 16th-century dance of Italian origin. The music is characterized by a predominantly compound duple (6/8) meter interspersed with hemiola (3/4) measures. The dance step of the galliard is similar to that of the 16th-century *\*saltarello*. Both use variations of the same basic five steps (*\*cinquepace* or *cinq pas*). The only difference is in the execution. The galliard is danced more vigorously, and the leap on the fifth beat of the measure is higher for the galliard than for the *saltarello*. The music for both dances is indistinguishable in style. Either dance is frequently coupled to a *\*pavane* or a *\*passamezzo*. Early examples are preserved in Attaignant's *Six Gaillardes et six pavaues* [1529]; his *Quatorze Gaillardes, neuf pavaues* [1531]; in J. Abondante's *Intabolatura sopra el lauto* (1546); and in A. Rotta's *Intabolatura de lauto* (1546).  
L.H.M.

**Gallican chant.** The French branch or "dialect" of plainsong of the medieval Western Church

[see *Chant*]. It was in use in France until the introduction of the Roman chant and rite under Pepin [see *France* I]. Its liturgical structure has much in common with *\*Mozarabic* and *\*Ambrosian* chant. The chants of the Mass consisted of the following items (Gregorian equivalents in parentheses): *Praelegendum* (Introit); *Aius* (*Trishagion*, Gloria); *Kyrie*; *Benedictus* (canticle of Zachary); *Responsorium* (Gradual); *Preces*; *Laudes* (Alleluia); *Sonus* (Offertory); *Confractio* [see *Confractorium*] and *Trecanum* (Communion). Unfortunately, only a few melodies survive in manuscripts of the 11th century. Certain portions of the Gallican chant were incorporated into the Roman liturgy, e.g., the *\*Improperia* and the hymns "Crux fidelis" and "Pange lingua . . . certamen" (*LU*, p. 742).

Lit.: A. Gastoué, *Histoire du chant liturgique à Paris* (1904); *id.*, *Le Chant gallican* (1939; also pub. in *RCG* xli–xliii; H. Anglés, in *NOH* ii, 75ff. For additional bibl. see *ReMMA*, p. 436.

**Galop.** A quick round dance of the mid-19th century (c. 1825–75) with rhythms such as those

shown in the illustration. It was executed with many changes of steps and hopping movements. Offenbach parodied it in his *Orphée aux Enfers* (1858). Liszt wrote a *Grand Galop Chromatique* (1838) and a *Galop de Bal* (c. 1840). See *Dance music* IV.

**Galoubet.** See under *Pipe* (1).

**Gamba, gambe** [G.]. Abbr. for *\*viola da gamba*.

**Gambang (saron).** An Indonesian idiophone, consisting of a number of wood, bamboo, or metal bars resting on a large trough resonator. See J. Kunst, *Music in Java*, rev. ed., 2 vols. (1949). Also see under *Java*. For ill. see under *Percussion*.

**Gambenwerk** [G.]. An 18th-century name for bowed keyboard instruments. Same as *Geigenwerk*. See *Sostenente piano*.

**Gamelan.** Generic term for an Indonesian orchestra. See under *Bali*; *Java*.

**Game of Cards, The.** See *Jeu de cartes, Le.*

**Gamma** [Gr.]. In medieval theory, the lowest tone of the scale, G of the modern scale. In Guidonian terminology it was called *gamma-ut*

[see Hexachord III]. Later, the term was metaphorically used for "all the tones from gamma," i.e., the entire scale. This meaning persists in the Italian *gamma* and the French *gamme* for scale, as well as in the English *gamut* for scale or range.

**Gamme** [F.]. \*Scale. See under Gamma. *Gamme des physiciens* (i.e., of the physicists), the "natural" scale derived from just intonation.

**Gamut**. See under Gamma.

**Ganze Note, ganze Pause** [G.]. Whole note, whole-note rest. See Notes.

**Ganzton** [G.]. Whole tone. *Ganztonleiter*, whole-tone scale.

**Ganzschluss** [G.]. Full cadence.

**Gapped scale**. A scale that is derived from a more complete system of tones by omitting some of them. Thus, the pentatonic scale is a gapped scale of the diatonic system, and this in turn can be considered a gapped scale of the chromatic system. Another selection of notes from the chromatic system results in the chromatic scale of ancient Greek theory. Most of the scales of Oriental music are gapped scales, since the tones used in actual music are only a small selection from a more complete system that is designed only for theoretical demonstration (e.g., the 22 *sruti* and the 7-tone scales, *sa-grama* and *ma-grama*, of \*India).

**Garbato, con garbo** [It.]. Graceful, elegant.

**Gaspard de la nuit** [F.]. A set of three piano pieces by Ravel (1908) inspired by the collected poems of Bertrand, which were published under the same title (literally, Caspar of the Night, a nickname for Satan): (1) *Ondine*, a water nymph; (2) *Le Gibet* (gallows); (3) *Scarbo* (clown of the Punch and Judy show).

**Gassenhauer** [G.]. In present German usage, a vulgar street song. In publications of the 16th century, e.g., in Egenolff's *Gassenhawerlin* and *Reutterliedlin* (1535; fac. ed. by H. J. Moser, 1927), it simply means popular song, without any implication of vulgarity. In fact, these collections include some of the most beautiful songs of Isaac, Hofhaimer, and Senfl.

**Gathering note**. In hymn singing, a note sounded by the organist as a signal to the congregation, to give them the correct pitch of the hymn.

**Gato** [Sp.]. One of the most important rural dances of Argentina, generally danced in circular

movements by two couples, who emphasize its lively rhythms by finger-snapping, shoe-tapping, and the so-called *escobilleo* (i.e., swinging each foot in turn, back and forth). The music, which is sung to the accompaniment of the guitar, follows rhythmic patterns alternating between 6/8 and 3/4 meter.

J.O-S.

**Gaukler** [G.]. See Minstrel.

**Gavotte**. A French dance of the 17th century whose name is said to be derived from "Gavots," the inhabitants of the Pays de Gap in Dauphiné. The dance is in moderate 4/4 time, with an upbeat of two quarter notes, and with the phrases usually ending and beginning in the middle of a measure. Earlier examples, however, are frequently notated without upbeat [see Ex.,

D'Anglebert, *Pièces de clavecin*, 1689]. The dance is mentioned in Arbeau's \**Orchésographie* (1589) as a *recueil de branles*. Several examples (for lute) are contained in the *Trésor d'Orphée* (1600) by Antoine Francisque, but apparently the dance did not come into vogue until the middle of the 17th century, when Lully introduced it into his ballets and operas. From here it found its way into the *ordres* of D'Anglebert and F. Couperin and the German suites of Pachelbel and J. K. F. Fischer. Bach often used it as one of the optional dances in his instrumental and keyboard suites. See Dance music III.

**Gebrauchsmusik** [G.]. A term originated in the 1920's (by Hindemith?) meaning "music for use," i.e., music intended for practical use by amateurs, in the home or at informal gatherings, as opposed to music written "for its own sake" (*l'art pour l'art*) and intended chiefly for concert performance by professionals. Characteristic

traits of *Gebrauchsmusik* are: forms of moderate length; simplicity and clarity of style; small ensembles; avoidance of technical difficulties; parts of equal interest and so designed that they can be played on whatever instruments are available; soberness and moderation of expression; emphasis on "good workmanship." The rise of *Gebrauchsmusik* is typical of the neoclassical reaction against the exaggerated individualism and *fin de siècle* refinement of late romanticism and impressionism. The movement, which was begun by Hindemith and others in the festivals of Donaueschingen [see Festivals III], was supported by the socialist elements in post-war Germany and by the revival of interest in early music, particularly Bach's. In fact, Bach's cantatas were frequently cited as the earliest examples of *Gebrauchsmusik* in the sense of "music written for immediate consumption or on commission" (Bach had to write a cantata for every Sunday). While 19th-century composers would have regarded such a demand as interfering with the artist's free creative inspiration, musicians such as Hindemith and Krenek adopted the less aloof attitude that was natural to the masters of earlier periods. Hindemith's introductory notes to his *Plöner Musiktag* (1932) and to *Wir bauen eine Stadt* (1931) contain many pertinent remarks on *Gebrauchsmusik*. See J. Willett, *The Theatre of Bertolt Brecht* [1959]; *DM* xxi.6 and xxiv.3; H. Closson, "The Case against *Gebrauchsmusik*" (*MM* vii).

**Gebrochener Akkord** [G.]. Broken chord.

**Gebunden** [G.]. Legato.

**Gebundener Stil** [G.]. The strict contrapuntal style of the 17th and early 18th centuries (fugues), as opposed to *freier Stil* (free style), i.e., either accompanied melody or \**Freistimmigkeit*.

**Gedackt** [Old G.], **gedeckt** [G.]. Stopped. The former term is used for an organ register consisting of stopped pipes, the latter for the modern "stopped" instruments, such as the clarinet. See Stop; Wind instruments III.

**Gedämpft** [G.]. Muted, muffled.

**Gedehnt** [G.]. Stretched out, slow.

**Gefährte** [G.]. The answer of a fugal subject.

**Gefühlvoll** [G.]. With feeling.

**Gegenbewegung** [G.]. Contrary motion (between two voices); sometimes used as synonym of inversion (of a subject).

**Gegenfuge** [G.]. Counterfugue.

**Gegensatz** [G.]. Contrast. In older writings, a countersubject or second theme.

**Gegenthema** [G.]. Countersubject (of a fugue) or second theme (of a sonata movement).

**Gehalten** [G.]. Held out, sustained.

**Gehend** [G.]. Moving, andante.

**Gehender Bass** [G.]. Running bass.

**Geige** [G.]. Violin; see under Gigue (1). *Geigenwerk*, see under Sosteneute pianoforte.

**Geisslerlieder** [G.]. German 14th-century songs that were sung during the penitential processions of the flagellants, particularly in the year of the Black Death, 1349. Melodically and structurally they anticipate to some degree the Lutheran chorale. See P. Runge, *Die Lieder und Melodien der Geissler des Jahres 1349* (1900); *ReMMA*, p. 239.

**Geisstriller** [G.]. \*Goat's trill.

**Geistlich** [G.]. Sacred, religious, spiritual. *Geistliche Konzerte* (Schütz) are pieces (vocal and instrumental) for church use; see Concerto III.

**Gekkin**. A Japanese guitar; see under Guitar family.

**Gekoppelt** [G.]. Coupled.

**Geläufigkeit** [G.]. Technical fluency.

**Gelassen** [G.]. Quiet, calm.

**Gemächlich** [G.]. Comfortable, leisurely.

**Gemässigt** [G.]. Moderate.

**Gemeindelied** [G.]. Congregational hymn, chorale.

**Gemell**. Same as \*gymel.

**Gemendo** [It.]. Lamenting.

**Gemessen** [G.]. Restrained.

**Gemischte Stimmen** [G.]. Mixed voices.

**Gendèr**. A Javanese metallophone, consisting of thin bronze slabs over resonating bamboo tubes [see Java; Bali].

**Genera**. Plural of L. *genus*. See Greece II.

**Generalbass** [G.]. Thoroughbass.

**Generalpause** [G.], abbr. *G.P.* In orchestral works, a rest for the entire orchestra, coming unexpectedly after a climactic passage. This

effect was one of the startling innovations of the \*Mannheim school.

**Generalprobe** [G.]. Dress rehearsal of orchestra concerts, usually open to the public.

**Genus** [L.; pl. *genera*]. See under Greece II.

**German flute.** An 18th-century name for the transverse (cross) flute, as distinguished from the English flute, i.e., the recorder.

**German Requiem, A.** See *Deutsches Requiem, Ein.*

**German sixth.** See Sixth chord.

**Germany.** The development of music in Germany, compared to France, England, and Italy, began quite late. In the field of polyphonic music in particular, it was not until the middle of the 15th century—that is, when the great period of medieval French music was coming to a close—that Germany came to the fore. From then on, however, German music progressed in a continuous line that, even aside from its many outstanding summits, maintained an exceptionally high level to the present day, thus making Germany the leading nation in the more recent era of music history.

I. *Prehistory and Middle Ages.* The \*lurer, beautiful long trumpets of the Nordic Bronze Age [see Denmark], are evidence of a high standard of bronze founding rather than of "prehistoric German music," as has occasionally been claimed. Late Roman and early medieval writers often commented unfavorably on the musical ability of the ancient Germans, particularly about their singing. In the 9th century the monastery of St. Gall (founded by Irish monks) became one of the most important centers of cultivation of Gregorian chant, particularly remarkable for its contribution to the development of the \*sequence (Notker Balbulus, c. 840–912; Tuotilo, d. 915; Wipo of Burgundy, c. 1000–50) and musical theory (Notker Labeo, d. 1022; Hermannus Contractus, 1013–54). The oldest surviving song in the German language is the 9th-century *Petruslied*, "Unsar trohtin" [see Müller-Blattau, in *ZMW* xvii, 129ff; O. Ursprung, in *MF* v]. In the 12th century the Provençal troubadour movement spread to Germany, leading to a first flowering of German secular song among the \*minnesingers, among whom Neithart von Reuenthal (c. 1180–c. 1240) was outstanding from the musical point of view. Toward the end of the 15th cent. their tradition was continued by the \*Meistersinger, with Hans Sachs (1494–1576) as the main representative.

Meanwhile, polyphonic music had made a late and slow start in the primitive pieces (written in the style of 11th-century organum) of the 14th-century Codex Engelberg 314 [see F. Ludwig, in *KJ* xxi, 48–61, and in *AMW* v, 305ff], and in the slightly less archaic pieces of the Münch von Salzburg (fl. c. 1375) and Oswald von Wolkenstein (1377–1445; see *BeMMR*, p. 180; *SchGMB*, no. 46; complete works in *DTO* 18). Three MSS of c. 1460–70, the Lochamer, Münchner (Schedel'sche), and Glogauer \*Liederbuch, preserve, besides Flemish, French, and Italian compositions, a number of German compositions, polyphonic *Lieder*, attractive ensemble dances, \**quodlibets*, etc. Closely related to the Lochamer MS is the \*"Fundamentum organisandi" (1452) of Conrad Paumann (1410–73), an important source of German organ music, preceded by the tablature of Adam Ileborgh (1448; see W. Apel, in *ZMW* xvi) and followed by the \*"Buxheim Organ Book" of c. 1470.

II. *Renaissance.* The late 15th century saw the rise of the first important school of German polyphonic music, represented by Adam von Fulda (c. 1445–1505; see W. Niemann, in *KJ* 1902), Heinrich Finck (1445–1527; see Editions VIII, 9, 21, 32), and Alexander Agricola (c. 1446–1506). The Flemish master Heinrich Isaac (c. 1450–1517) played a leading role in this development, particularly in the field of the German part song ("Innsbruck ich muss dich lassen"), to which Paul Hofhaimer (1459–1537), court organist to Maximilian I, Thomas Stoltzer (c. 1480–1526), and Ludwig Senfl (c. 1490–1543), a Swiss, also contributed many examples of great beauty [see H. J. Moser, *Paulus Hofhaimer* (1929); *DTO* 72; *DdT* 34]. Senfl's \**quodlibets* are an interesting source for the study of early German folksong. Of particular importance is the German organ music of the early 16th century, represented by the great master Arnolt Schlick (c. 1460–after 1517), Hofhaimer, H. Buchner (1483–1538), and others [see Organ music I]. Schlick's *Tabulaturen etlicher Lobgesang und Lidlein* [1512] also contain some compositions for the lute (the earliest lute songs). Among the numerous other German lutenists, Hans Judenkünig and Hans Newsidler deserve special mention [see Lute music]. About the middle of the 16th century the autochthonous development of German music was interrupted somewhat by the great influx of Flemish composers who held key positions in all the musical centers (De Monte in Prague; Le Maistre and Scandellus in Dresden; Lasso in Munich), until their German pupils, such as Jacobus Gallus

(Handl, 1550–91), Leonhard Lechner (c. 1550–1606), and Hans Leo Hassler (1564–1612), were ready to take up the tradition. Gallus and Hassler, together with Hieronymus Praetorius (1560–1629) and Michael Praetorius (1571–1621), also cultivated the Venetian polychoral style. Toward the end of the century a number of musicians known as \*colorists were active in the field of keyboard music.

III. *Baroque*. The 17th century found German composers active in practically every field of vocal and instrumental music and soon leading in church music (particularly cantatas, Passions) and organ compositions. Here the Lutheran chorale provided a basis of tradition as well as progress, which largely accounts for the spiritual integrity and, as a result, the high artistic quality of German baroque music. An idea of the scope of German baroque music can be gained by glancing through the list of German *Denkmäler* [see Editions XIII, XIV, XV]. The most outstanding figures were (arranged in groups of contemporaries):

Schütz, Schein, Scheidt (b. c. 1585, 100 years before Bach)

Tunder, Froberger, Rosenmüller (b. c. 1615)

Buxtehude, Georg Muffat, Biber (b. c. 1640)

Johann P. Krieger, Fischer, Pachelbel (b. c. 1650)

Böhm, Bruhns, Kuhnau (b. c. 1660)

Telemann, Walther, Handel, J. S. Bach (b. c. 1685).

The beginning of the 17th century saw interesting developments in the instrumental dance and \*suite, represented by Johann Hermann Schein (1586–1630), Valentin Haussmann, Isaac Posch, and Paul Peuerl. Simultaneously Heinrich Schütz (1585–1672) brought vocal church music (\*Passion, \*oratorio) to an artistic height comparable to Bach's, while Hieronymus Praetorius (1560–1629), Michael Praetorius (1571–1621), and Samuel Scheidt (1587–1654) laid the foundation for the development of German organ music [see Organ music II A; Organ chorale; etc.]. The next generation saw the rise of harpsichord music under Johann Jacob Froberger (1616–67; see Suite III), and about 1650 the church cantata emerged as an exclusively German product [see Cantata III]. Lute music reached an artistic climax in the works of Esajas Reusner (1636–79) and Sylvius Weiss (1686–1750), while violin music was cultivated by Johann Schop (c. 1590–1667), Nicolaus Adam Strungk (1640–1700), and Heinrich Biber (1644–1704), masters whose virtuosity paved the way

for Bach's pieces for solo violin. In orchestral music Johann Rosenmüller (c. 1620–84) stands out as an early master, while later composers such as Georg Muffat (1653–1704) and Philipp Erlebach (1657–1714) incorporated elements of the Italian and French orchestral styles. The German baroque lied found an outstanding master in Adam Krieger (1634–66; see Lied III), and only in opera did German musicians fail to compete successfully with other countries. In all these fields except the last two, the development reached a climax with J. S. Bach (1685–1750).

IV. *Rococo*. Contemporaries of Bach, such as Georg Philipp Telemann (1681–1767), Johann Valentin Rathgeber (1682–1750), and Gottlieb Muffat (1690–1770), were quick to embrace the novel style of the \*rococo, and "progressive" writers such as Johann Mattheson (1681–1764) helped overthrow the last vestiges of a tradition that they considered oldfashioned and useless. After a comparatively short period of low ebb, German music took a new start in two directions: one toward a novel type of expressiveness, the \**Empfindsamer Stil*; the other toward the exploitation of modern orchestral resources and the formal development of the classical sonata, symphony, and string quartet. In the former field Bach's sons Wilhelm Friedemann Bach (1710–84) and Karl Philipp Emanuel Bach (1714–88) are outstanding; in the latter were the numerous musicians of the \*Mannheim school. Concomitant with this development is the rise of the \*Singspiel, and of the \**volkstümliches Lied* [see also Berlin school].

V. *Classicism, romanticism, and modernism*. The man who molded the formal and stylistic elements of the late rococo into a new art, thus laying the foundation for \*classicism, was Franz Joseph Haydn (1732–1809). From 1770 on, his symphonies and string quartets, as well as those of Mozart (1756–91), show more and more the full mastery and maturity that led to the designation "classical." No less immortal are Haydn's oratorios and Mozart's operas. Beethoven (1770–1827) brought this development to its acme and, in his latest works, prepared for \*romanticism, side by side with Franz Schubert (1797–1828), the great master of the lied. The romantic spirit is more patent still in the operas and piano works of Carl Maria von Weber (1786–1826) and was wholeheartedly embraced by Robert Schumann (1810–56), who more than any other composer represents romanticism with all its novel wonders as well as its inherent flaws.

The history of German music from 1830 to

1930 follows in the form of a chronological list of the important compositions produced in each decade:

1830–40: The romantic decade *par excellence*, including practically all the important works of Schumann and Mendelssohn.

1840–50: Schumann's last works (Piano Concerto), and Wagner's (1813–83) first operas: *Der fliegende Holländer*, *Tannhäuser*, *Lohengrin*.

1850–60: Wagner's *Rheingold*, *Walküre*, *Tristan*. Liszt (1811–86) establishes the \*symphonic poem (*Faust* and *Dante* symphonies, *Mazeppa*, *Hunnenschlacht*) and writes his *Études d'exécution transcendante* and most of the Hungarian Rhapsodies. Brahms (1833–97) produces his piano sonatas (op. 1, 2, 5) and D-minor Concerto, op. 15.

1860–70: Wagner and Brahms still dominate the scene, the former with *Siegfried* and *Meistersinger*, the latter with op. 18–50, including the Handel Variations, the Magelone Songs, and the *Deutsches Requiem*.

1870–80: Wagner's *Götterdämmerung*, the last music drama of the *Ring des Nibelungen*. Brahms writes his first two symphonies and chamber music (up to op. 86). Bruckner (1824–96) appears with his symphonies nos. 2–6.

1880–90: Wagner produces his final music drama, *Parsifal*; Bruckner and Brahms produce their symphonies nos. 7–9 and 3–4 respectively. Brahms writes his last chamber works and the Piano Concerto in B-flat. Richard Strauss (1864–1949) brings new life to the symphonic poem with *Don Juan* and *Tod und Verklärung*. Hugo Wolf (1860–1903) writes most of his songs.

1890–1900: The last works of Brahms (op. 114–121). High point of Strauss' symphonic poems: *Till Eulenspiegel*, *Zarathustra*, *Don Quixote*. Gustav Mahler's (1860–1911) symphonies nos. 2–4.

1900–10: The romantic movement comes to a close with Mahler's symphonies nos. 5–10 and *Das Lied von der Erde*, Strauss' operas *Salome* and *Elektra*, and the chamber music of Max Reger (1873–1916). Arnold Schoenberg (1874–1951), after his impressionist *Pelleas und Melisande*, writes the atonal *Drei Klavierstücke* (1909), the first examples of a radical break with the past.

1910–20: Vestiges of the romantic tradition in Strauss' *Rosenkavalier* and *Alpensinfonie*, in Pfitzner's opera *Palestrina*, and in Schreker's

1878–1934) operas *Der ferne Klang* and *Der Schatzgräber*. Schoenberg's *Pierrot Lunaire* and the completely atonal *Sechs kleine Klavierstücke*. Ferruccio Busoni (1866–1924) writes the first \*neoclassic pieces (sonatinas and *Fantasia contrappuntistica*).

1920–30: The heterogeneous post-war decade with its experiments in twelve-tone technique, jazz idioms, primitive rhythms, neoclassic forms, etc., brings to the fore a group of composers striving toward new means of expression, notably Alban Berg (1885–1935) with his two \*expressionist operas *Wozzeck* (1914–25) and *Lulu* (1928–34); A. von Webern (1883–1945) with his \*serial techniques; Paul Hindemith (1895–1963) with neoclassical sonatas, string quartets, and the song cycle *Das Marienleben* (1924); Ernst Krenek (b. 1900) with highly dissonant piano and chamber music, as well as the jazz opera *Jonny spielt auf* (1925–26); and Kurt Weill (1900–50) with his highly successful *Dreigroschenoper* (1928).

Side by side with these composers were others, most of them under the influence of the "back-to-Bach" idea: Heinrich Kaminsky (1886–1946) with "neo-Gothic" compositions filled with expression of religious ecstasy and mysticism; J. Nepomuk David (b. 1895), who reverted to the Flemish polyphony in works such as *Ricerca in C minor* (1927), *Fantasia super L'Homme armé* (1929), organ chorales, toccatas, etc.; and Hugo Herrmann (b. 1896), who used a linear style approaching atonality.

This development was suddenly interrupted by Hitler's coming to power in 1933. Schoenberg, Krenek, Hindemith, and Weill fled to the United States, and for the next twelve years musical activity and production in Germany were determined by a totalitarian regime hostile to all progress in the arts. Among the composers who pursued their work secretly was Anton von Webern (1883–1945), who developed Schoenberg's twelve-tone technique into a highly sensitive idiom of fragmentary sounds [see Serial music] that foreshadows the techniques of \**musique concrète* and \**electronic music*. After World War II there emerged a new generation of great vitality and wide scope of activity. The neoclassical group comprises Ernst Pepping (b. 1901), Wilhelm Maler (b. 1902), Kurt Thomas (b. 1904), and also Wolfgang Fortner (b. 1907), whose more recent compositions show influence of serial techniques. Werner Egk (b. 1901) and Gottfried von Einem (b. 1918) have been suc-

cessful in the field of opera, the former with *Zauberkeige* (1935, *Peer Gynt* (1938) and *Circe* (1948), the latter with *Dantons Tod* (1947). Boris Blacher (b. 1903) has written music strongly influenced by novel dance rhythms (variable meters). Carl Orff (b. 1895) has written the highly successful *Carmina burana* (1936), a scenic oratorio presenting pseudomedieval melodies in a clever, attractive garb. Giselher Klebe (b. 1925) is a leading twelve-tone composer, and Hans Werner Henze (b. 1926) has produced notable works for the stage (*König Hirsch*, 1956; *Undine*, 1959). Karl Heinz Stockhausen (b. 1928) is a pioneer of electronic music.

**Ges, geses** [G.]. See under Pitch names.

**Gesamtausgabe** [G.]. Complete edition. Most of the German *Gesamtausgaben* have been published by Breitkopf and Härtel, Leipzig.

**Gesang** [G.]. Song.

**Gesangbuch** [G.]. Hymn book, either of the Roman Catholic or of the Protestant Church. For the earliest publication of Protestant hymn books, see *Chorale*.

**Gesangvoll** [G.]. Songlike, cantabile.

**Geschöpfe des Prometheus, Die** [G.]. The Creatures of Prometheus. Ballet by Beethoven (choreography by S. Vigano), produced in Vienna, 1801. It is remembered chiefly for its overture and for a theme in the finale that Beethoven used in three other compositions [see under *Eroica*].

**Geschwind** [G.]. Quick, nimble.

**Gesellschaftslied** [G.]. Musicologic term for a song that belongs to the middle classes, as opposed to *Hoflied* (court song) or *Volkslied* (folk-song). The term is used particularly for the German 16th-century polyphonic songs of Hofhaimer, Senfl, and others, but it may also be used for the Italian madrigal, French chanson, etc.

**Ge sol re ut, gesolreut.** See under Hexachord III.

**Gesteigert** [G.]. Increased.

**Gestopft** [G.]. The stopped notes of the horn. See *Horn* I.

**Geteilt** [G.]. Divided. See *Divisi*.

**Getragen** [G.]. Sustained, slow.

**Gewandhaus** [G.]. See under *Orchestras* III.

**Ghimel.** See *Gymel*.

**Ghironda** [It.]. \*Hurdy-gurdy.

**Gianni Schicchi.** See under *Trittico*.

**Gigelira** [It.]. \*Xylophone.

**Gigue.** (1) Medieval name for stringed instruments, perhaps specifically the rebab [see *Rabab*], whose pear-shaped form is similar to a *gigot* [F., leg of lamb]. In the late 13th century a French poem mentions the “gigueours de l’Allemagne,” i.e., the gigue players of Germany [see *GéHM*, p. 400]. Probably the German *Geige* [Old G. *gige*], violin, is derived from the French *gigue*.

(2) In the suites of 1650–1750 the gigue [It. *giga*] is one of the four constituent dance movements, usually the final one [see *Suite*; *Dance music* III]. The gigue evolved from the 16th-century Irish or English \*jig, which on the Continent developed differently in France and in Italy. The French type (Gaultier, Chambonnières) is characterized by compound duple time (6/8, 6/4), dotted rhythm, wide intervals (sixths, sevenths, octaves), and fugal writing, usually with the inverted subject [see *Inversion* (2)] used for the second section. [See *Ex.*, from Bach, French suite, no. 4.] The less common Italian type, the *giga*, is much quicker (*presto gigue*) and nonfugal, with running passages over a harmonic basis [for a similar case, see *Courante*]. This type occurs in the works of G. B. Vitali [*Balletti, corrente, gighe, allemande, e sara-bande* 1668–71], Corelli, and Zipoli [see *Editions*

IX, 36]. It survives in the 6/8-presto pieces of the 18th century [see a gigue by K. H. Graun, 1701-59, in W. Niemann, *Alte Meister des Klaviers*], which in turn are the model of such movements as the presto finale of Beethoven's Piano Sonata op. 2, no. 1.

The giges in the suites of Froberger, Handel, and Bach are usually of the French type. However, a number of giges by Froberger are in 4/4 meter, and some of Bach's suites (e.g., in the Partita no. 1 and English Suite no. 2) are modeled on the Italian type.

Lit.: W. Danckert, *Geschichte der Gigue* (1924); F. Pulver, in *PMA* xl.

**Gimel.** See Gymel.

**Gioconda, La.** Opera in four acts by A. Ponchielli (libretto by A. Boito, based on V. Hugo's play), produced in Milan, 1876. Setting: Venice, 17th century.

**Giocoso** [It.]. Jocose, humorous.

**Gioioso** [It.]. Joyous, cheerful.

**Giorgi flute.** A flute invented by Giorgi (1888) that has finger holes for each chromatic tone, thus making cross fingering unnecessary. It was blown at the end rather than across the bore. See *SaRM*, p. 158; H. Standish, in *PMA* xxiv.

**Gipsy music.** See Gypsy music.

**Giraffe piano** [G. *Giraffenklavier*]. An early 19th-century variety of piano, somewhat like the grand piano but with the wing-shaped part of the case put upright, thus vaguely resembling the neck of a giraffe.

**Girl of the Golden West.** See *Fanciulla del West, La.*

**Giro** [It.]. \*Turn.

**Gis, gisis** [G.]. G-sharp, g-double-sharp. See Pitch names.

**Giselle.** Ballet by Adolphe Adam (choreography by Jean Corali, based on a story by H. Heine), first produced in Paris, 1841.

**Gitana, alla** [It.]. In the \*Gypsy style.

**Gittern.** See under Guitar family.

**Giulio Cesare in Egitto** [It., Julius Caesar in Egypt]. Opera in three acts by G. F. Handel (libretto by N. Haym), produced in London, 1724. Setting: Egypt, 48 B.C.

**Giustiniana.** See under Villanella.

**Giusto** [It.]. Just, right. *Tempo giusto*, fitting tempo or strict tempo.

**Glass harmonica** [G. *Glasharmonika*]. An instrument that Benjamin Franklin invented in 1763 and called "armonica." It consists of a series of glass basins of graded sizes fixed on a horizontal spindle, which is made to revolve by a treadle operated by the player's foot. The spindle is fitted into a trough filled with water so that the glasses are kept wet. [For ill. see under Percussion.] The sound is produced by delicate rubbing of the fingers against the glasses [ill. in *SaRM*, p. 159]. The instrument was extraordinarily popular, particularly in Germany and Austria where, together with the \*Aeolian harp, \*nail violin, and other "ethereal" instruments, it became a characteristic vehicle of *Empfindsamkeit*. Among various compositions for the glass harmonica, Mozart's Adagio in C major (K. 356) and Adagio and Rondo (K. 617) for harmonica, flute, oboe, viola, and cellō, both composed in 1791, are the most interesting [see comp. ed., x]. They seem to require an instrument equipped with a keyboard mechanism such as that constructed in 1784. Beethoven used the glass harmonica in a melodrama, *Leonora Prohaska*, composed in 1814 [suppl. vol. of B. and H. ed.]. Other composers who wrote for the instrument were J. G. Naumann, Padre Martini, Hasse, Galuppi, and Jommelli. About 1830 the instrument fell into oblivion but was reintroduced by R. Strauss in his opera *Die Frau ohne Schatten* (1917).

The use of glass as a sound-producing material is quite old. Musical glasses were known in Persia in the 14th century. About 1743 Richard Pockrich (Puckeridge), an Irishman, constructed an "angelick organ" consisting of a number of drinking glasses that were tuned by being filled with varying amounts of water. There is a report from 1760 saying that "Pockrich played Handel's Water Music on the glasses." In 1746 Gluck played in London on "twenty-six glasses filled with spring water." In 1761 in London Benjamin Franklin attended a recital on musical glasses, and subsequently he invented the glass harmonica.

A newer glass instrument is the glass harp [G. *Glasharfe*] constructed by B. Hoffmann in 1929. Similar to the musical glasses of England, it consists of 46 individually tuned glasses fixed on a resonant table.

Lit.: H. W. Geissler, *Die Glasharmonika* (1953); C. F. Pohl, *Cursory Notices on the Origin and History of the Glass Harmonica* (1862); A. H.

King, "The Musical Glasses and Glass Harmonica" (*PMA* lxxii, 97); B. Hoffmann, "Glas-harmonika und Glasharfe" (*Schweizerische Musikzeitung*, 1951).

**Glee.** An 18th-century genre of English choral music, unaccompanied, in three or more parts, for solo men's voices (including a male alto), comparatively brief, sectionally constructed, and homophonic (chordal) rather than polyphonic. The glee was one of two wholly English 18th-century forms (the other being the \*ballad opera). In the latter part of the century societies including both amateur and professional members devoted themselves to composing and performing glees. Among these were the Noblemen's and Gentlemen's Catch Club, the Anacreontic Society, the Glee Club, and the Concentores Sodales. During the first half of the 19th century glee singing was much in vogue, but in time its best qualities merged with the part song while the glee's artistic virtues were reduced to a shadow by Victorian composers of the shorter choral forms. Among the most celebrated glee writers were Benjamin Cooke (1734–93); Samuel Webbe (1740–1816), perhaps the most typical glee composer, who wrote more than three hundred glees and whose "Glorious Apollo" invariably opened the programs of the glee clubs; Stephen Paxton (1735–87); and John Callcott (1766–1821). Representative glees are in Novello's *Standard Glee Book, A Collection of the most favorite Glees* [n.d.]

The term "glee" is derived from the Anglo-Saxon *gliw* or *gléo* (entertainment, fun), especially as connected with minstrelsy—playing, singing, dancing, and perhaps even acrobatic feats. Until fairly recent times it was in this spirit that American college glee clubs, with rare exceptions, interpreted the term. About 1918, after a few years in which programs were made up of a mixture of popular, college, and classical music, the Harvard Glee Club began to devote itself to classical music exclusively, at the same time severing its connection with the Instrumental Clubs made up of banjos and mandolins. This step initiated a wave of interest in the singing of serious music by college choral organizations and also had a marked effect on the quality of music sung by secondary-school glee clubs. See also Catch.

Lit.: W. A. Barrett, *English Glees and Part-songs* (1886); D. Baptie, *Sketches of the English Glee Composers* (1896); J. Spencer-Curwen, "Regarding English Glees" (*ZIM* vi); J. M. Knapp,

"Samuel Webbe and the Glee" (*ML* xxxiii, 346); B. F. Wright, "The Glee" (*The Monthly Musical Record* lxxxix, 226).  
A.T.D.

**Gleemen.** See under Minstrels.

**Gleichmässig** [G.]. Even.

**Gli Scherzi.** See *Scherzi*, *Gli*.

**Glissando** [It.]. The execution of rapid scales by a sliding movement. In piano playing, the nail of the thumb or of the third finger is drawn rapidly over the white keys. The same technique can also be used on the black keys. A much more difficult feat is the glissando in parallel thirds, sixths, or octaves, which is performed by a sliding movement of the hand with two fingers held rigid. Surprisingly enough, Mozart already used a glissando in parallel sixths in the cadenza of his piano variations "Lison dormait." It should be noted, however, that the glissando was much easier to perform on the old keyboard instruments with their light action. This fact also explains the octave glissandi in the last movement of Beethoven's Waldstein Sonata, which are almost impossible to perform on modern instruments. The first example of glissando is in a publication by Moyreau, *Pièces de clavecin . . . Œuvre I<sup>er</sup>* [n.d.]. Glissando is much used in the playing of the harp. On the violin the glissando is a difficult virtuoso effect produced by a rapid succession of minute distinct movements of the hand. This effect should not be confused with the \*portamento, which is easily produced by a continuous movement of the hand.

**Glocke** [G.]. Bell.

**Glockenspiel.** The modern celesta [see Percussion instruments A, 4]. The portable glockenspiel of military bands consists of steel bars fixed on a frame in the shape of the ancient Greek lyre; hence the name "bell lyre" [G. *Lyra*]. In German the word *Glockenspiel* [lit. bell-play] is also used for a set of bells, i.e., a \*carillon. In the late 18th century some glockenspiels were played from a keyboard, similar to the modern celesta. This is probably the instrument called for in Mozart's *Die Zauberflöte* by the name *strumento d'acciaio* (steel instrument).

**Glogauer Liederbuch.** See under Liederbuch.

**Gloria (in excelsis).** The second item of the Ordinary of the Mass, also known as Greater \*Doxology. See Mass A. C III. In plainsong the first phrase, "Gloria in excelsis Deo," is sung by the officiating priest, and the chorus enters at

"Et in terra pax." Early (15th-century) polyphonic settings of the Gloria therefore begin with the latter phrase and are usually indexed under *Et in terra* in modern editions. See D. Bosse, *Untersuchung einstimmiger mittelalterlichen Melodien zum "Gloria in excelsis deo"* (1954); *ApGC*, pp. 409ff.

**Gloria patri.** See Doxology.

**Glosa** [Sp.]. A 16th-century name used for diminutions [see Ornamentation I]. Diego Ortiz' *Trattado de Glosas sobre clausulas* (1553; repr. by M. Schneider, 1913, '36) contains many instructive examples of methods of ornamenting a cadential formula (clausula). Cabezón (*Obras de música*, 1578) uses the term for simple figurative variations of harmonized psalm tones (*fabordon y glosas*; see *ApMZ* ii, 18), while more elaborate variations are called *\*diferencias*.

**Glückliche Hand, Die** [G., The Lucky Hand]. Monodrama in one act by Schoenberg (to his own libretto), published in 1913, first performed in Vienna, 1924. Only one character sings (baritone), supported by a chorus of six men and women whose heads appear through holes in a backdrop and who comment on the action in *\*Sprechstimme*.

**G.O.** In French organ music, abbr. for *grand orgue*.

**Goat's trill** [F. *chèvrolement*; G. *Bockstriller*, *Geisstriller*; It. *trillo caprino*; Sp. *trino de cabra*]. Generally, a poorly performed trill, reminiscent of a goat's bleating. J. F. Agricola, in his *Anleitung zur Singkunst*, 1751 (trans. of Tosi's *Opinioni de' cantori*, 1723), says a trill is called a *Bockstriller* if its two tones are less than a semitone apart or if they are sung with unequal speed or force. L. Mozart, in his *Versuch einer gründlichen Violinschule* (1756, p. 221), warns against performing the trill too fast, lest it become "unverständlich, meckerend [bleating] oder ein sogenannter Geisstriller." Later (Spohr, *Violinschule*, 1832) the *Bockstriller* was described as a trill at the unison, i.e., a *\*tremolo*.

**Goldberg Variations.** A series of 30 variations by J. S. Bach, commissioned by the Russian Count Kayserling and named after Bach's pupil, Johann Gottlieb Goldberg (c. 1727–56), who was in the count's service as a harpsichordist. Bach published them in the fourth part of the *\*Clavier-Übung* (1742). The work, which is among the greatest of its kind, is written according to a special plan: two variations in free style

(frequently of a highly virtuoso character) are always followed by a canonic variation (nos. 3, 6, 9, etc.). The latter are unsurpassed masterpieces of canon technique, being canons at different intervals within the same harmonic frame. The final variation is a *\*quodlibet*.

**Golden Cockerel, The** [Rus. *Zolotoy Pyetushok*]. Opera-ballet in three acts by Rimsky-Korsakov (libretto by V. I. Byelsky, based on a fairy tale by Pushkin), produced in Moscow, 1909, one year after the composer's death. A well-known selection is the "Hymn to the Sun."

**Golden sequence.** Popular name for the *\*sequence Veni Sancte Spiritus*.

**Goliard songs.** Latin poems of the 10th to 13th centuries written by goliards, wandering students or young ecclesiastics who played an important part in the cultural life of that period. The most famous collection is the *Carmina Burana* (named after the monastery of Benedictbeuren in southwest Germany, where the manuscript was preserved). Some of these poems are provided with staffless neumes that cannot be deciphered. However, c. 40 melodies can be read with the help of other sources (e.g., the St. Martial MSS). The oldest known melody is that for the 10th-century poem "O admirabile Veneris ydolum" [*BeMMR*, p. 72]. See *ReMMA*, p. 200; H. Spanke, in *ZMW* xiii; W. Lipphardt, in *AMW* xii; *id.*, in *CP Besseler*; A. Machabey, in *Cahiers de civilisation médiévale*, Université de Poitiers, vii, 257.

**Gondola song** [G. *Gondellied*; It. *gondoliera*]. See Barcarole.

**Gong.** See under Percussion instruments B, 7. See also under China; Java.

**Gopak, hopak.** A lively dance of Byelorussia (Little Russia), in duple time. A well-known example is in Mussorgsky's unfinished opera *The Fair at Sorochinsk*.

**Gorgia** [It.]. Generic term for the art of improvised ornamentation, particularly as practiced c. 1600 in the performance of madrigals, motets, etc. (L. Zacconi, *Prattica di musica*, 1592; see F. Chrysander, in *VMW* vii, ix, x). Detailed explanations of the *gorgia* practice with its various types of ornamentation (*passaggi, accenti, esclamazione, trillo, groppo*) are given by Caccini in the preface to his *Nuove Musiche* of 1601 [see *SSR*, pp. 377ff]. *Gorgheggio* is a modern term for very rapid vocal passages.

**Gospel** [L. *Evangelium*]. In the Roman Catholic rites, a passage from one of the four Gospels, chanted at Mass in monotone with inflections (*Tonus Evangelii*; see *LU*, p. 106). Gospel canticles are the three major \*canticles. For Gospel hymn, see Hymn, English. Texts from the Gospels have often been set to music, in motets (Gospel motet, *Evangelienmotette*), Passions, oratorios, and cantatas. See H. J. Moser, *Die mehrstimmige Vertonung des Evangeliums* [1931].

**Gothic music.** A term used by various modern writers to denote music contemporary with or culturally related to the Gothic era in architecture, sculpture, and painting. It is usually understood to embrace the period from 1150 (Perotinus) to 1450 (Dufay), that is, before the beginning of the Renaissance [see History of music]. The term also has a geographical connotation, referring to north European cultures (northern France, England, the Netherlands, Germany) rather than those of the south. In fact, the music of the Italian \**ars nova* is perhaps too "earthy" and "lively" (too "proto-Renaissance") to be termed Gothic.

Metaphorically, the word Gothic is also applied to later works showing traits suggestive of Gothic spirituality and otherworldliness, for instance, the "transcendental" organ toccatas of Buxtehude or Bach. Modern works showing similar traits have been called neo-Gothic (Hindemith, Kaminsky).

**Götterdämmerung.** See *Ring des Nibelungen*.

**Goyescas.** Two sets of piano pieces by Enrique Granados (1911), inspired by etchings of Francisco Goya (1746–1828). Granados also wrote an opera *Goyescas* (1916) that includes material from the piano pieces.

**G.P.** In German orchestral scores, abbr. for \**Generalpause*. In French organ music, abbr. for *grand positif*, i.e., great and choir organ coupled.

**G.R.** In French organ music, abbr. for *grand récitatif*, i.e., great and swell organ coupled.

**Grace.** Term used by early English musicians for any musical ornament, whether written out in notes, indicated by sign, or improvised by the performer. In lute and viol playing a distinction was made between smooth graces, produced by sliding the finger along the fingerboard (*appoggiaturas*, slides, and *Nachschläge*), and shaken graces, for which the finger is shaken, producing several repercussions of the same tone (trills, relishes, and beats). Another distinction is that

between open graces, which involve a whole fret (semitone), and closed graces, which involve a smaller interval (*vibrato*). P.A.

**Grace note.** A note printed in small type to indicate that its time value is not counted in the rhythm of the bar and must be subtracted from that of an adjacent note. Large groups of grace notes sometimes represent an exception to this rule in that together they fill up the time value of a single note that has been omitted from the score (as in the so-called "cadenzas" by Chopin and other romantic composers), in which case the rhythm of the grace notes is flexible and not subject to a strict beat. Most grace notes are used to represent \*graces, or musical ornaments. P.A.

**Gradatamente** [It.]. Gradually.

**Gradevole** [It.]. Pleasant, pleasing.

**Gradual** [L. *graduale*]. (1) The second item of the Proper of the \*Mass. The Graduals are responsorial chants, consisting of respond and verse [for the full form, see Psalmody II]. They have highly florid melodies, usually including long melismas in the respond as well as in the verse. They are almost entirely limited to the four authentic modes, except for a group of closely related melodies, usually designated as "gradual-type Justus ut palma" and assigned to mode 2 [see *ApGC*, pp. 344ff]. The name "gradual" is thought to be derived from L. *gradus*, step, the explanation being that the chant was a *responso-rium graduale*, i.e., a responsory sung from the steps of the altar. However, early treatises have the form *gradale*, which could mean "graded," "distinguished" (the *Alia musica* of c. 900 also has the term *antiphona gradalis* for the Introit; see *ApGC*, p. 24). (2) The \*liturgical book containing the musical items of the Mass, as distinguished from the \*antiphonal. Originally such a book was called *antiphonale missarum*, and *graduale* may have had the meaning of *cantatorium*, i.e., a book containing only the responsorial (solo) items of the Mass, i.e., Graduals, Alleluias, and Tracts. The six earliest graduals (8th–9th centuries), which contain only the texts of the Mass chants (without neumatic notation), have been published by Dom R. J. Hesbert under the title *Antiphonale missarum sextuplex* (1935).

**Gradus ad Parnassum** [L.]. Title of two publications designed to lead to the highest perfection in their fields: a treatise on counterpoint by J. J. Fux (1725) and a collection of piano etudes by M. Clementi (1817).

**Grail.** English name for \*Gradual, used in the Anglican Church.

**Gramophone** [G. *Grammophon*]. See under Phonograph and recorded music.

**Gran cassa, gran tamburo** [It.]. Bass drum.

**Grand** [F.]. *Grand jeu, grand orgue*, full organ; *grand opéra*, an opera (always serious) with fully composed text, as distinct from *opéra comique*.

**Grandezza, con** [It.]. With grandeur, grandiose.

**Grandsire.** See under Change ringing.

**Grave** [It.]. Grave, solemn.

**Gravicembalo** [It.]. Italian 17th-century name for the harpsichord, possibly for a large variety used especially for orchestral accompaniment. The name may be a corruption of clavicembalo, or it may refer to the presence of a "grave" 16-foot stop.

**Great antiphons.** Same as \*O antiphons.

**Greater perfect system.** See under Greece II.

**Great Fugue.** See *Grosse Fuge*.

**Greece.** Of ancient Greek music, only some twenty written pieces survive, mostly fragmentary and widely scattered in date. An incomplete treatise by Aristoxenus (c. 320 B.C.) contains a valuable analysis of some basic principles of music as he knew it. Other theoretical treatises are preserved, but while they use certain terms and schematic figures derived from musical practice, their actual subject is the science of "harmonics," a mathematical discipline concerned with acoustical phenomena as such and studied independently of the art of music [see H. I. Marrou, *History of Education in Antiquity*]. Their relevance to music history is therefore limited and indirect. On the other hand, there is considerable direct source material from the composers themselves, for in archaic and classical Greece the poet was his own composer, and the term *mousikē* (*musica*) comprised both the music and the verse. Lyric and choric poetry shows the rhythmic patterns of the music, which followed the verse exactly. The poet-composers sometimes describe musical performances, occasionally their own style or orchestration. In particular, the comedies of Aristophanes are full of musical criticism and parody, which the words can often convey even though his music is lost. Plato's writings contain penetrating observations about contemporary musical change.

Greek vase-painters contribute many scenes of music in social life—school lessons, solos, concerts, dances, wine and song parties. The vases yield especially important evidence about Greek instruments, of which very few specimens have been discovered, none of them intact.

I. *History.* Four stages can be roughly distinguished. (a) The archaic music, as first seen in Homer (8th century B.C.), was already a sophisticated art, although primitive or rustic forms also existed. Some Oriental influence may be surmised but cannot be assessed; in general, Greek music was unlike Eastern: it was not bound by liturgical formulas; new works were composed for every public performance; composers were highly competitive and individual in style. In Homer's world every class practiced music, on almost every social occasion. Epics of war and adventure were intoned by professional bards and by high personages, to their own accompaniment on the lyre (phorminx; the \*kithara was a later and larger type). Homer also knew wedding hymns, maiden songs, dirges of keening women, shanties for harvest or vintage, pipings of shepherds on the \*syrinx (panpipes), dances of boys and girls accompanied by lyre or \*aulos, or simply by their own hand-claps or castanets. The lyric forms continued, with songs of love and hate, drink and politics. In the 7th century B.C. Sparta was the great center, drawing musicians from elsewhere—the semilegendary Terpander of Lesbos (c. 675 B.C.), Alcman, and Tyrtaeus, the composer of marching-songs. Then the primacy passed to Sappho and Alcaeus of Lesbos (b. c. 620 B.C.). Religious festivals often included musical competitions for larger works, e.g., the Pythian *nomos*, a genre celebrating Apollo the dragon-slayer, or the dithyramb, a choral song with aulos accompaniment, dedicated to the god Dionysus.

(b) The classical music proper was perfected in the 5th century B.C. by Pindar in variously orchestrated odes (among other lyric forms) and by the new Athenian dramatists, both tragic and comic, using a chorus of amateur citizens supported by an aulos. At Athens the vast production of new music was balanced by private repetition of the old, learned by ear at school and sung at home to one's own lyre or at wine-parties with a hired aulos-girl. Aristophanes' audience could recognize his quotations and parodies of music, ancient or modern; its best memorial is his *Frogs* (405 B.C.), staging a competition in Hades between the early classical composer Aeschylus and the modernist Euripi-

des. Different poetic forms were served by different musical idioms and tunings (*harmoniae*), called by ethnic names (Dorian, Phrygian, Ionian, Lydian, etc.), but by the end of the century only the Dorian and Phrygian are attested in serious music. In the Dorian, a clear-cut precision of tuning was associated with music of a sober and disciplined character (*ethos*); the Phrygian manner, assimilated to the unstable intonation of the aulos, was especially used for the emotional and ecstatic dithyramb.

(c) Later in the 5th century B.C. a musical revolution started from a school of dithyrambists and culminated, after the fall of Athens (404 B.C.), in Philoxenus and Timotheus of Milet (447–357 B.C.), who rejected all tradition and broke the old associations of poetic and musical forms. Instrumental improvisations, with sound-effects imitating nature, overshadowed the vocal part that had dominated Greek music; modulation, coloratura, and wobbly tuning so undermined the old tonality that by 320 B.C., according to Aristoxenus, few musicians knew or understood the classics. Instead, the talented and deliberately popular works of Philoxenus and Timotheus were repeated for two centuries, never rivaled by later composers. Music, though widely enjoyed, lost its cultural prestige and its place in higher education (above children's schooling); it was left to professional virtuosos of high technical skill—judging from their enormous fees—but low intellectual standards. Two surviving Delphic Hymns, of the later 2nd century B.C., seem to be samples of the music of this epoch in decline.

(d) Music continued not as a creative art but as an adjunct to rites, ceremonies, theatrical shows, or banquets. Only Mesomedes of Crete, at Hadrian's court, had any pretensions as a composer; generally, musicians ranked as craftsmen, well paid and encouraged by public prize competitions but socially despised. Extant fragments tell little of this later Greco-Roman music. The hypothesis that it passed into the medieval traditions of Europe or Byzantium is now discarded.

II. *Elements of music.* The fundamental tetrachord was bounded by the “fixed notes” of the perfect fourth; between them, two “movable

notes” were placed in three *genera*, roughly as in the example above. Thus, the highest of the three intervals of the tetrachord was widened from a whole tone, a–g [Ex. c, diatonic], into an interval of three semitones, a–f# [Ex. b, chromatic], or four semitones, a–f [Ex. a, enharmonic]. The remaining interval (f#–e, or f–e) was halved, a procedure that, in the latter case, produced two quarter tones.

In all three the notes were called, in descending order, *Mese(a)*, *Lichanos*, *Parhypate*, *Hypate*. Above was placed another tetrachord either “disjunct” (e' to b, leaving the whole tone a to b between tetrachords; notes named in descending order *Nete*, *Paranete*, *Trite*, *Paramese*) or “conjunct” (d' to a; notes in descending order named *Nete*, *Paranete*, *Trite*—without *Paramese*). All the “fixed notes” had functional priority; there was no paramount “tonic.”

A two-octave “Greater Perfect System” was formed, as in the illustration below, of two pairs of conjunct tetrachords with a disjunctive tone between and an added bottom tone (*Proslambanomenos*).

Nete hyperbolaeon	a'	I. Tetr. hyperbolaeon
Paranete hyperbolaeon	g'	
Trite hyperbolaeon	f'	
Nete diezeugmenon	e'	
Paranete diezeugmenon	d	II. Tetr. diezeugmenon
Trite diezeugmenon	c	
Paramese	b	
Mese	a	
Lichanos meson	g	III. Tetr. meson
Parhypate meson	f	
Hypate meson	e	
Lichanos hypaton	d	
Parhypate hypaton	c	IV. Tetr. hypaton
Hypate hypaton	B	
Proslambanomenos	A	

Judging from the names of the tetrachords, III was the nucleus of the system; the name of II (“disjunct”) refers to the fact that its lowest tone lies above the highest of the other. The name “hypaton” (highest) for IV is probably explained by the fact that the kithara players tilted their instrument so that the strings lowest in pitch were in the highest position (an analogous phenomenon exists in the 16th-century Italian lute tablatures; see under *Tablature III*). The names for the single tones also show that the whole system developed from the playing of the

kithara: *nete* (*chorde*) means lowest strings (actually the highest in pitch); *paranete*, next to the lowest; *trite*, the third, etc.

Modulation was typified by a "Lesser Perfect System" of three conjunct tetrachords, but these were abstract theoretical constructions. The tetrachord added conjunctly above is called *synomenon*, "hooked," and provides the tones (a), b<sup>b</sup>, c' and d'. In the tetrachord of practical music the enharmonic *genus* (often called the "*harmonia*") was for Aristoxenus the tuning of the best classical music and may represent the old Dorian. Its essential feature was not the pair of microtones but the progression from *Mese* to a *Lichanos* tuned a whole ditone below it. In the 4th century *Lichanos* was tuned higher, within the chromatic *genus*. The Delphic Hymns are in one of these two *genera*; later extant pieces are diatonic. The old variety of modal idioms (*harmoniae*) disappears in the 4th century.

Modulation within a fixed vocal register, a fashion of 4th-century music, became a preoccupation for harmonic theorists. They calculated it by transposing their standard scale to other degrees of its own tonal sequence. A sample is given here, using the diatonic *genus* favored by theorists.

I (Dorian)	a' g' f'	e' d' c' b'	a g f e	d c B A
		T T S T T T S	T T S T T T S	
II (Phrygian)	a' g' f#'	e' d' c#'	b a g f# e	d c B A
		T S T T T S T	T S T T T S T	

Within the octave e'-e, between the bars—symbolizing the melody in its fixed vocal register—scale I presents the sequence of tones (T) and semitones (S): T T S T T T S. The same sequence, at f#'-f#, is the core of the identical but transposed scale II. The transposition automatically places a different sequence, T S T T T S T, in the central register; and similar transposed scales at each diatonic degree will produce the seven segments, or "species," of the octave. These octave species and their corresponding double-octave scales (*tonoi*) were named:

- a'-a: Hypodorian (Hyperphrygian, Aeolian, Locrian)
- g'-g: Hypophrygian (Hyperlydian, Ionian, Iastian)
- f'-f: Hypolydian
- e'-e: Dorian
- d'-d: Phrygian
- c'-c: Lydian
- b-B: Mixolydian (Hyperdorian)

They can be indicated in modern notation by the addition of various key signatures to the scale on e:

Some theorists inferred that the species were the obsolete *harmoniae*; they were interpreted as musical "modes" by medieval scholars, and some still hold this opinion. It should have been refuted by correct understanding of Ptolemy. The scale of melodic function (*dynamis*) is always the Dorian. The other species are merely artificial redistributions of the Dorian octave T T S T T T S; e.g., in scale II the top tone is transferred to the bottom of the central register, and functional *Mese* is transposed from a to b, without modal change. The species serve to define the relative position (*thesis*) of the *tonoi* in the mathematical system, which is abstract and pitchless.

Some scholars, while admitting that Ptolemy's *tonos* system is pitchless, believe that other sets of *tonoi*, placed on each semitone, represented real pitch-keys. But Ptolemy, arguing that the extra *tonoi* are a logical error, presupposed that they, too, were abstract theoretical figures. Two of the old *harmoniae* were associated with relatively high or low voices (of either sex), but for the hypothesis that an absolute pitch-standard was recognized the evidence is inadequate.

In Greek music the voice was paramount, except in the revolutionary phase, and only the vocal part was transmitted to memory. Instrumental accompaniments were sometimes heterophonic improvisations, but harmony and counterpoint were unknown, though choirs occasionally doubled at the octave. Instrumental solos were rare, and the role of instruments in the development of the music should not be exaggerated.

III. *Notation and documents.* On the two notations (called by late writers "vocal" and "instrumental," but not consistently so used), see *WoHN* i, and C. Sachs in *ZMW* vi, vii. Sachs' hypothesis that they were tablatures for the kithara, pentatonically tuned, has been criticized by R. P. Winnington-Ingram in *The Classical Quarterly*, new series vi (1956), and rests on the unwarranted assumption that written music was used by performers. Some in-

ferior theorists employed notation, but musical compositions were seldom written down; transmission was oral and precarious. Of the few written pieces extant, one of the two earliest (c. 250 B.C.) contains words from Euripides, but the music may be a later setting. The two hymns to Apollo from Delphi (one dated to 127 B.C.) are long fragments of prize compositions, academic in manner. The undated Seikilos Song is rhythmically alien to any known Greek music. Two hymns to the Muse, and the hymns to Nemesis and the Sun (ascribed to Mesomedes) may be ancient, but a Byzantine origin is possible.

See also Aulos; *Chroai*; *Chronos*; Dithyramb; Enharmonic; Ethos; Hydraulos; Hyporchema; Kithara; Lyra; Magadis; Pyknon; Pythagorean scale.

IV. *Modern*. Nothing is known of Greek music between c. 200 and 1800 of the Christian era, when Greece was dominated successively by Rome, Byzantium, and, from 1456 to 1830, by the Turks. Of interest is the fact that c. 1000 many elements of Greek theory were incorporated into Arab music. On the other hand, Greek folksong seems to have been greatly influenced by the music of the Near East.

The development of modern Greek music began about 1850 under the influence of Italian opera. The first composer of modern Greece was Nikolaos Mantzaros (1795–1872), who is now chiefly remembered for his setting of the Greek national anthem. He was followed by Spyridon Xyndas (1812–96) and others. Particularly successful was Spyros Samaras (1861–1917), a pupil of Delibes, with the opera *Flora Mirabilis* (1886). A national movement started with the songs of George Lambelet (1875–1945) and found more definite expression in the works of Manolis Kalomiris (1883–1962), whose opera *Protomastoras* (1916) has been compared to Glinka's *A Life for the Czar*. The national element is also prominent in the works of Mario Varvoglis (b. 1885) and some of the younger composers, e.g., M. Theodorakis (b. 1925) and Manos Hadjidakis (b. 1925), who cultivate a sort of neofolk music. Neoclassical influences characterize the works of Petro Petridis (b. 1892) and Georges Poniridis (b. 1892). Of the composers born after 1900, Nikos Skalkottas (1904–49) is by far the most important. A pupil of P. Jarnach and A. Schoenberg, he introduced serial music into Greece, an idiom that has also been adopted in varying degrees by Yiannis Papaioannou (b. 1910), Yorgos Sisilianos (b. 1922), Yannis

Xenakis (b. 1922; see his *Musique Formelles; Nouveaux Principes Formels de Composition Musicale* [1963]; also articles in *RM* no. 257 [1963]); Arghyris Kounadis (b. 1924), and Janis Christou (b. 1926; see J. G. Papaioannou, in *Greek Heritage* i, no. 2, 52–54 [1964]).

For Greek church music, see Byzantine chant.

I–III by I.H.

**Greghesca** [It., pl. *Greghesche*]. See under Villanella.

**Gregorian chant**. The liturgical chant of the Roman Catholic Church. It is named after Pope Gregory I (reigned 590–604), who was believed to have developed it. Between 750 and 850 the chant probably reached its final form as preserved in MSS of the 10th and subsequent centuries. The term "Gregorian chant" has the

disadvantage of excluding, strictly speaking, the early development leading up to the Gregorian period, as well as the additions and changes introduced afterward. Moreover, Gregory's alleged role in the formation of the chant is now generally considered more or less legendary [see VII]. Another common name is plainsong [*L. cantus planus*]; this, however, originally had a different meaning [see *Cantus planus*] and is now frequently used in a wider and more technical sense [see Plainsong]. A more appropriate name is "Roman chant," because it indicates the chant's age-long connection with the Church of Rome, as distinct from other bodies of Western chant in Milan (\*Ambrosian), Spain (\*Mozarabic or Visigothic), and ancient Gaul (\*Gallican). Recent investigations, however, have led to the theory that the Roman chant received its final form in France during the 8th and 9th centuries (hence the designation "Franco-Roman chant") and that from the historical point of view the name "Roman" would be more correctly applied to yet another repertory, now usually called \*Old Roman chant. Therefore the term Gregorian chant ought to be retained.

Whereas some former musicians disdained Gregorian chant, particularly because it lacked harmony, it is now more and more fully recognized as an unsurpassed treasure of purely melodic music. Its freely flowing rhythm, far from being chaotic, shows subtleties of structure and organization that are superior to the hackneyed rhythmic devices of some harmonized music, with its meter, measures, beats, regular phrases, etc. The current repertory of Gregorian chant consists of nearly 3,000 melodies, all monophonic, rhythmically free, and sung partly both chorally (by the \**schola*, i.e., choir) and solo (by the \**cantor*). The following will be considered below in this order: I. Liturgical categories; II. Text; III. Style; IV. Forms; V. Tonality; VI. Rhythmic interpretation; VII. Historical development.

I. *Liturgical categories*. The calendar of the Roman Church includes a large number of holy days. These fall into three categories: (a) feasts of the Lord (Proper of the Time, *Proprium de tempore*, also *Temporale*), i.e., all Sundays and the special occasions commemorating Jesus' life, such as the Nativity, Easter, Ascension; (b) feasts of individual Saints (Proper of the Saints, *Proprium Sanctorum*), e.g., of the Virgin Mary, St. Andrew, St. Peter, St. Paul; (c) feasts of special groups of Saints (Common of Saints, *Commune Sanctorum*), such

as Apostles, Martyrs, Confessors, etc. Categories (b) and (c) form the *Sanctorale*. The services on a given day consist of the \*Office and the \*Mass. The chants for the former are found in the \*antiphonal, those for the latter in the \*gradual [see also Liturgical books]. Both are conveniently combined (with many omissions and additions) in the *Liber usualis* [*LU*]. Within the entire repertory a division is made between \*Ordinary and \*Proper chants. The main sections of *LU* are: Ordinary chants of the Mass (pp. 11–111; this includes what is commonly called the Mass Ordinary: Kyrie, Gloria, Sanctus, Credo, Agnus Dei); Ordinary chants of the Office (pp. 112–316; this includes mostly the Office Psalms); Proper of the Time (pp. 317–1110); Common of Saints (pp. 1111–1272); and Proper of the Saints (pp. 1303–1762). The three last-named sections include the Proper chants for the respective categories of feasts [see under Proper].

II. *Text*. By far the greater part of the chants are based on prose texts, and of these the great majority are taken from the Book of \*Psalms. Entire Psalms sung to a \*psalm tone form a regular part of the Office; single Psalm verses are used in the "verses" (V.) of the Introits, Graduals, Alleluias, and Tracts, as well as in the opening antiphons and responds of these chants and in the Communions and Offertories [see Psalmody]. Nonpsalmodic scriptural texts occur in the \*canticles and in the \*responsories of Matins; many of the latter take their texts from the historical books of the Old Testament, such as Genesis, Kings, etc. In the liturgical books, *Ps.* (in the Introits) always denotes a verse from the Psalms, while *V.* indicates a verse either from the Psalms or from other scriptural texts. The outstanding nonscriptural prose texts are those of the Ordinary of the Mass. The chants based on poetic texts (medieval) are the \*hymns and the \*sequences. A semipoetic text occurs in the four Antiphons B.M.V., particularly in the "Ave regina." An invaluable help for the study of the Gregorian texts is C. Marbach, *Carmina Scripturarum* (1907), which gives many of the sources for the scriptural texts of the Gregorian chant.

III. *Style*. Three melodic styles of the prose chants are usually distinguished by modern writers: (a) syllabic style; (b) neumatic or group style; and (c) melismatic style. (a) Chants in *syllabic style* [Ex. a] have one note to each syllable of the text; occasionally a group of two or three notes will be sung to one syllable. To this type belong the various recitation tones of the Office (psalm tones, lesson tones) and of the

Mass, as well as numerous antiphons of the Office, the hymns, and the various melodies for the Credo. The recitation tones are inflected \*monotones, whereas the other chants have fully developed melodies. (b) In the chants in *group style* [Ex. b] there is more frequent use of groups of two to four or more notes to one syllable. The most important chants of this kind are the Introits and the Communions; also the melodies for the Sanctus and Agnus Dei, the Marian antiphons, etc. (c) The chants in *melismatic style* [Ex. c] include one or more melismas, groups of ten to twenty or more notes sung on

one syllable. Here we find most of the Kyries, Graduals, Alleluias, Offertories, Tracts, and responsories.

The rather strict adherence to a given style in any of the liturgical categories is one of the most remarkable traits of Gregorian chant. According to a carefully laid out plan, each type of chant receives the treatment that conforms to its liturgical position and significance. Even the same text is set to music in totally different styles according to whether it is used as an antiphon, a Gradual, or for some other purpose. A famous example is the psalm verse *Justus ut palma*, for which more than 20 different melodies exist, ranging from the simplest to the most ornate.

IV. *Forms*. Structurally, the chants can be roughly divided into three categories: (a) *Through-composed chants*. In this category are the Glorias, Sanctus, and Credos of the Ordinary of the Mass, as well as the Offertories and Communions of the Proper of the Mass [for the last two, see Psalmody II, III]. Naturally, to classify these chants as through-composed does not preclude the occasional repetition of motifs or longer phrases (see, e.g., the passages "Benedici-

mus te," "Adoramus te," "Glorificamus te" in the *Gloria X* [LU p. 43f]; such reiterations are a peculiarity of the individual chants, not of the category to which they belong). (b) *Strophic chants*. To this class belong mainly the hymns, and also the Psalms, every verse of which is sung, with minor modifications, to the same melody. (c) *Repetitive forms*. Simple repetitive structures are used for the \*Kyries, \*Agnus Dei, and \*sequences. All these are chants of the late Middle Ages (11th to 13th centuries). More interesting and more typical of Gregorian art are the various repeat forms found in the Introits, Alleluias, Graduals, and responsories, and formerly also in Offertories and Communions. All these are reductions of the rondolike structure of early psalmody, responsorial or antiphonal. They are discussed separately under Psalmody. Particularly intricate repeat structures are found in the \*Tracts.

V. *Tonality*. The tonal basis of Gregorian chant is the system of the eight \*church modes. In the modern liturgical books, the mode of each chant is indicated at the beginning, e.g., *Grad. 7* (Gradual in mode 7; similarly in the index). The most frequently used modes are 1 and 8, the least used 5 and 6. Among the most notable aspects of Gregorian tonality is the fact that the Tracts are limited to modes 2 and 8, and the Graduals to the four authentic modes except for a special group in mode 2, usually referred to as the "Gradual-type Justus ut palma." Although the great majority of Gregorian melodies conform to the general requirements of their respective modes, some do deviate from the normal scheme. Deviations are: (a) The use of the b-flat. This is often introduced in order to avoid the tritone (f-g-a-b) or the major sixth (d-a-b-a). It should be noted, however, that numerous flats given in the modern editions are not authentic. This remark applies particularly to the formula d-a-b-a, which occurs at the beginning of many chants of mode 1. The chants of modes 3 and 4 often include cadential formations with the general outline f-b-e, which, it will be noted, results in a tritone whether or not the b is flat-ted. (b) Transposed chants. A number of chants close on one of the \*affinales (a, b, c'), instead of on one of the four finals (d, e, f, g). Most of these were transposed, not to bring them into a more convenient range but because they included chromatic pitches (e-flat or f-sharp) that could only be represented in this way within the plain-song system. For instance, d-e-f-e<sup>b</sup>-f could only be represented in a transposition to the upper

fifth as a-b-c'-b<sup>b</sup>-a, and e-f-g-f<sup>#</sup>-e only in transposition to the upper fourth as a-b<sup>b</sup>-c'-b-a, because b and b-flat was the only "chromatic pair" available in the medieval scale. (c) Excessive range. This category includes chants whose range exceeds the authentic as well as the plagal ambitus. An example is the Gradual "Time-te Dominum" [LU, p. 1726], which closes on d and extends from A to c'. Later theorists (e.g., Marchetto da Padua, in his *Lucidarium* of c. 1318; see Strunk, in *La Rassegna Musicale* xx [1950], 314) accounted for this phenomenon by introducing various kinds of "mixed modes" combining the range of the authentic (d-d') with that of the plagal (A-a). The best way of dealing with this problem is to renounce the distinction between authentic and plagal and classify the chant only according to its final, as *protus*, *deuterus*, *tritus*, or *tetrardus* [see Maneria]. This is also advisable in the case of chants with a limited range, e.g., the Communions "Amen dico" [LU, p. 1206] and "Dominus Jesus" [LU, p. 679]. Although both have the range c-a, the former is assigned to mode 1 and the latter to mode 2. It must be noted, however, that in the case of antiphons a decision has to be made, because the mode of the antiphon determines the psalm tone to be used for the subsequent Psalm. (Originally this was true of the Communions as well.)

An interesting phenomenon in a number of chants is a certain tonal instability. This occurs particularly in the chants of the *deuterus*, which often begin and continue with phrases suggestive of various other tonal realms, until they finally and quite unexpectedly close on e. Recently much attention has been given to the "pentatonic background" of the Gregorian melodies. Although the sweeping contention that all these melodies are essentially "pentatonic melodies with ornamental \*pien tones" [see the reference in *ReMMA*, p. 160] is without foundation, the fact remains that a considerable number of chants are clearly pentatonic [see Ex. 2, from the Communion "In splendoribus"; LU, p. 395]. Such examples deserve mention

because they may indicate an earlier stage in the evolution of the complete modes.

VI. *Rhythmic interpretation.* This remains the most disputed area of Gregorian chant. It arises from the fact that the notation of the chants contains no clear indication of temporal values [see Neumes; also Monophonic notation] and that, by the 13th century, the oral tradition of the rhythmic performance had been lost. Unsuccessful attempts at reconstruction were made in the 19th century when in reprints of the "Editio Medicea" [see Liturgical books II] the neumatic signs of plainsong were wrongly interpreted as mensural notes and ligatures (*longa*, *brevis*, *semibrevis*, etc.; see Notation; also Square notation). The result is illustrated in Ex. 3. Still more distorted is the interpretation of H. Riemann,

who applied his principle of *\*Vierhebigkeit* to Gregorian melodies [see *RiHM* i.2, 39]. Today, scholars agree that Gregorian rhythm belongs to the category termed "multimetric" [see Rhythm II (b)], in particular to the *\*chronos protos* variety. There are, however, two sharply divided schools of thought, one of which maintains that in Gregorian rhythm there exists practically only one time value, say, the eighth note, while the other admits the existence of two time values, the eighth note and its double (quarter note), and possibly also its triple (dotted quarter note).

To the former school belong the *accentualists* (Dom Pothier), who consider the textual accent and, in melismas, the first note of a neume the organizing factors within the succession of uniform time values. Their interpretation is called "free oratoric rhythm." In opposition to Pothier, Dom Mocquereau developed what has become known as the *\*Solesmes system* or "free musical rhythm." He completely discards the text and the neumatic notation as a basis of interpretation, and also opposes the idea of accent. Instead, he regards the melody as a motion consisting of *élan* and *repos* (rise and fall), dividing it into an irregular succession of groups of two and three notes [see *Ictus*]. Occasionally, a slight lengthening of certain notes (*nuance*) is indicated by a horizontal stroke (horizontal *episema*). Doubled values, indicated by a dot (*punctum-mora*) occur, with rare exceptions, only at the end of a phrase.

Among the adherents of the second school (generally called *mensuralists*), the admission of two time values naturally leads to considerable disagreement as to which notes of the chants are long and which short. Here the various scholars (A. Dechevrens, P. Wagner, J. Jeannin, E. Jammers, W. Lipphardt, J. W. A. Vollaerts) differ mainly concerning the correct interpretation and relative importance of early theorists as well as of certain special signs found in the early neumatic manuscripts, such as the \**episema*, the \**Romanus* letters, the *virga* and *punctum* [see *Neumes*], etc. Ex. 4 illustrates some of the various methods of interpretation (a. Solesmes; b. Wagner; c. Jeannin). See also *ReMMA*, p. 148.

The mensuralists "have an impressive amount of historical evidence on their side" [*ReMMA*, p. 146], while the Solesmes interpretation seems to derive its main justification from results in actual performance and recordings that, so far at least, have not been challenged by similar attempts on the part of the mensuralists. Regarding the historical accuracy of the Solesmes interpretation, it has been said that it probably stands in the same relation to its medieval counterpart as a Romanesque church of 1880 to its 11th-century model [*BeMMR*, p. 15]. A recent study by J. W. A. Vollaerts [see *Lit.*] has been widely recognized as an important step in the right direction.

VII. *History*. There has been extensive controversy regarding the origin of Gregorian chant. Formerly opinion was divided among those who traced it to Greek roots and those who pointed to the tradition of the Jewish synagogue. Today the latter view prevails, and the theory of Greek origin has been almost completely discarded. The very fact that practically all the early texts of the Roman Church are taken from the Psalms points to a strong Jewish influence; also, the Office Hours of the Church are modeled after

the prayer hours of the Jewish synagogue. This point of view gained considerable support in the investigations of A. Idelsohn [see *ZMW* iv, 515], who showed that melodies still sung today by Jewish peoples living in isolated places (South Arabia, Iran) are strikingly similar to lection tones of the Roman Church.

Early development of Gregorian chant took place in the East, particularly in Jerusalem and Antioch (Syria). A report from c. 385, known as the "*Peregrinatio ad loca sancta*" (pilgrimage to the holy place), contains detailed information about the liturgy at Jerusalem and also about the singing of hymns and Psalms. With Pope Damasus I (reigned A.D. 366–84) the center of development shifted to Rome. He was the first of a line of Popes who are reported to have instituted a *cantus annalis*, a cycle of chants for the liturgical year. The list also includes Gregory I (reigned 590–604), who certainly played an outstanding role in the organization of the Roman chant. However, the idea that the melodies as preserved in MSS of the 10th and 11th centuries are "Gregorian" in the proper sense of the word is generally considered untenable today. According to recent research (H. Huckle, W. Apel), what is known now as Gregorian chant received its final form under the Frankish rulers Pepin the Short (714–68) and Charlemagne (742?–814), mainly at Metz. In Rome there developed a different repertory, the so-called \**Old Roman chant*. From the 14th through 19th centuries the history of plain-song is one of increasing deterioration, first in rhythmic interpretation, later also in the melodies themselves [*Editio Medicea*, *Ratisbonensis*; see under *Liturgical books*; see also *Machicotage*; *Plain-chant musical*]. Simultaneously, the monophonic chants were increasingly replaced by polyphonic settings, first by the 13th-century organa, clausulae, and motets (compositions for portions of the Proper of the Mass), later by compositions for the Ordinary of the Mass (14th and subsequent centuries), for the hymns (15th century, Dunstable, Dufay, and successors), and for the psalm tones (16th century; see *Falsobordone*; *Verset*). The return to the medieval tradition of unaccompanied chant is largely the work of the monks of \**Solesmes*.

**Gropppo** [It.]. See *Gruppetto*.

**Gross, grosse** [G.]. Large, great. *Grosse Flöte*, the ordinary flute. *Grosses Orchester*, full orchestra. *Grosse Trommel*, bass drum. *Grosse Sext (Terz)*, major sixth (third); *Grosse Quinte (Quarte)*, perfect fifth (fourth). *Grosse Oktave*, great octave.

**Grosse caisse** [F.]. Bass drum.

**Grosse Fuge** [G., Great Fugue]. Beethoven's long and complex fugue for string quartet, op. 133. It was composed in 1825 as the last movement of his String Quartet op. 130 but later was published as a separate composition. It is remarkable for the boldness of its theme and for the treatment, which is "tantôt libre, tantôt recherchée" (partly free, partly studied).

**Ground, ground bass**. A short melodic phrase (normally four to eight measures) that is repeated over and over again as a bass line, with varying music for the upper parts. The resulting composition is also called a "ground." The contrast between the fixed scheme of the bass and the free display of imagination in the upper part or parts lends particular charm to this form. However, the bass melody is not always entirely "fixed," but may occur with modifications or in another key. The ground bass or *basso ostinato* [It.] may vary from such simple formations as the descending tetrachord: a–g–f–e (one note to

the measure; see Ex. under Chaconne) to full-length melodies, as in the accompanying example (Purcell). The ground is a characteristic form of baroque music and was cultivated especially in England, frequently with improvisation of the upper parts [see Division]. The name was first (?) used in keyboard composition by William Byrd. For earlier manifestations of the same principle, see Ostinato.

The ground belongs to the general category of continuous variations [see Variations I]. In particular, all the passacaglias (as defined under Chaconne and passacaglia) can be considered grounds, even if their ostinato motif is occasionally transferred to an upper voice-part, as in Bach's passacaglia. For a somewhat different type of reiterated bass, see Strophic bass.

Marburg, 1928); L. Walter, "Die konstruktive und thematische Ostinatotechnik des 17. und 18. Jahrhunderts" (diss. Würzburg, 1939); H. Rie-

mann, "Basso ostinato und basso *quasi* ostinato" (CP *Liliencron*); *id.*, in *SIM* xiii; H. Shaw, "Blow's Use of the Ground Bass" (MQ xxiv); O. Gombosi, "Italia: Patria del basso ostinato" (LRM vii); W. Greenhouse Allt, "The Treatment of Ground" (PMA lxxii, 73); H. M. Miller, "Henry Purcell and the Ground Bass" (ML xxix, 340).

**Grund-** [G.]. *Grundlage*, root position. *Grundstimmen*, the 8-foot registers of the organ. *Grundton*, root of a chord. *Grundtonart*, main key.

**Gruppetto, gruppo, groppo** [It.]. Italian 16th-century names for an ornament like a \*trill. See Ornamentation I.

**G.S., GS.** Abbr. for Gerbert's *Scriptores*. See under *Scriptores*.

**G sol re ut (G solreut).** See under Hexachord III.

**Gsp.** Abbr. for *glockenspiel*.

**Guajira** [Sp.]. Term derived from *guajiro* ("hill-billy"), name given to people of the interior of Cuba, which more properly applies to a rural style of song of prevailingly Spanish influence than to a definite type of folk expression. Many devices of Latin American music are characteristic of the *guajira* style, among them the alternate use of 3/4 and 6/8 meter, use of the guitar or *tiple* (high-pitched guitar without the lower strings) to accompany the solo voice, harmonies centering around the dominant seventh chord, etc. The *punto* is one of the most typical present-day forms of *guajira*. J.O-S.

**Guaracha** [Sp.]. Cuban folksong originating from a sequence of quatrains sung alternately by a chorus and a solo voice. Improvisation and topical allusions were included in the solo sections. This older form of *guaracha* developed into the present-day two-section form, consisting of an introduction followed by a faster section. Symmetrical rhythms as well as syncopation are employed within either 3/4 and 6/8 or 2/4 meter. The most characteristic feature is the use of mischievous, equivocal texts. J.O-S.

**Guaraní** [Sp.]. Paraguayan ballad in slow waltz tempo and usually in a minor mode, created by José Asunción Flores in the late 1920's [see Paraguay] in an attempt to promote a new popular song form of native character. This form soon became popular and is now regarded as part of the country's folk music. J.O-S.

**Guárdame las vacas** [Sp.]. Title of 16th-century Spanish variations (L. de Narváez, 1538; A. Mudarra, 1546; Enriquez de Valderrabano, 1547; A. de Cabezón) on a theme that is identical to the \**romanesca*. The title (Let us watch over the cows) suggests that it was a popular Spanish song. In the *Libro de tientos . . . Facultad Organica* of F. Correa de Araujo (1626; new ed. by S. Kastner, ii, 213) it is designated as *seculorum del primero tono*, obviously because the melodic outline a-g-f-e-d is also the termination formula of the first psalm tone.

**Guasa** [Sp.]. Satirical Venezuelan folksong based on many different poetical structures. Musically, almost every *guasa* is binary in form, in 6/8 meter, and based on the following rhythmic pattern:

J.O-S.

**Guatemala.** In 1554 the Spanish-born composer Hernando Franco (1532-85) arrived in Guatemala and remained there until 1573, when he moved to Mexico City [see Mexico]. From 1534, when the Guatemala Cathedral was provided with an organist and precentor, European music had played an important role in the conversion of Guatemalans. Despite the scarcity of information about colonial Guatemala's musical life, there is evidence enough to show that Guatemala was not far behind Mexico and Peru in 16th- and 17th-century music. Nine 16th- and early 17th-century codices containing works by outstanding Spanish and Flemish composers of the Renaissance have been assembled in Huehuetenango, near Guatemala City. Two of them, compiled before 1600, contain *coplas* and *villancicos* in Spanish, signed by Tomas Pascual and Francisco de Leon.

One of the most important composers of a later period was Vicente Sáenz (1756-1841), who wrote *Villancicos de Pascua* that were very popular in his day. His son, Benedicto Sáenz (d. 1831), was at one time the organist of the Cathedral of Guatemala City, and his son, also named Benedicto Sáenz, had several compositions published in France. José Escolástico Andrino, a noted violinist from Guatemala, lived in El Salvador from 1845 on. Of his compositions, two symphonies, three Masses, and an opera (*La Mora Generosa*) are preserved.

Luis Felipe Arias (1870-1908), who received his musical training in Europe, wrote short piano pieces and songs inspired by Guatemalan folk idioms. His immediate follower, Jesús Castillo

(1877–1946), a noted scholar of Indian music, wrote two operas based on folk idioms, *Quiché Vinak* (1924) and *Nicté*, as well as a ballet (*Guatemala*), an *Obertura Indígena* and *Obertura Tecum*, and a collection of piano pieces published in France under the title *Popol Buj*. His half-brother, Ricardo Castillo (b. 1894), studied in France, where he lived for ten years. He has written incidental music for various native plays, two ballets, a *Sinfonietta*, several orchestral works, and piano compositions. Of the same generation are José Castañeda (b. 1898), an experimenter in modern trends of composition, conductor, and theoretician; Franz Ippisch (b. 1883), an Austrian-born composer; José Molina Pinillo (b. 1889), who studied in Mexico and Berlin; and Raúl Paniagua (b. 1898), composer of a well-known orchestral composition, *La Leyenda Maya*.

In the succeeding generation the most important figures are Miguel Sandoval (1903–53), a pianist and composer, mainly of film music; Salvador Ley (b. 1907), a noted pianist, director of the Conservatorio Nacional de Música in Guatemala (1934–54), and composer of a number of orchestral, piano, and chamber works; and Enrique Solares (b. 1910), a pianist, diplomat, and composer who writes in the neoclassical vein.

Best known among the youngest generation of composers are Manuel Herrarte (b. 1924); Joaquín Orellana (b. 1935), who has written chamber music, incidental pieces for orchestra and choral compositions; and Jorge Sarmientos, who is also a conductor.

Jesús Castillo, in his valuable study *La Música Maya-Quiché* (1941), classifies native Guatemalan melodies as following six clearly differentiated scales, some of which, he claims, are imitations of the song of a Guatemalan bird, the *cenxontle*. The only native dance that is largely free of European influences is the \**Son Chapin*, also known as *Son Guatemalteco*.

J.O.S.

**Guerre des bouffons** [F.], **guerra dei buffoni** [It.]. See War of the Buffoons. The preferred French designation is *querelle* (quarrel) *des bouffons*.

**Guida** [It.]. (1) Subject (*dux*) of a fugue. (2) A \*direct. (3) An abbreviated orchestral score [see *Conducteur*].

**Guidon** [F.]. A \*direct.

**Guidonian hand.** A sketch of the human hand with the notes from G to e'' in various parts of the skeleton, intended as an aid for memorizing the scale and its solmization syllables. It acquired an almost supernatural significance as the symbol of the complete mastery of the medieval system of \*hexachord and mutation—indeed, of the entire system of church modes. Thus, for instance, chromaticism was strongly objected to as late as the 16th century because it was not contained “in the hand” (*non est in manu*). In the accompanying sketch the tones are indicated by the modern pitch names instead of the composite solmization names (Gamma ut, A re, B mi, etc.; see Hexachord II) that are used in the early treatises.

The Guidonian hand is not present in the works of Guido d'Arezzo (c. 990–1050), nor is the complete system of \*solmization. It is found for the first time in treatises of the late 13th century (Engelbert, Elias Salomon, Hieronymus de Moravia; see *GS* ii, 292, iii, 22; *CS* i, 21). Until the end of the 15th century it was called *manus musicalis*. The name *manus Guidonis* appears in the *Musica practica* of B. Ramos de Pareja (1482; ed. by J. Wolf, p. 13).

**Guillaume Tell** [F., William Tell]. Opera in four acts by Rossini, produced in Paris, 1829. Setting: Switzerland, early 14th century. The overture was a popular orchestral concert selection until made banal by association with various radio programs and motion pictures.

**Guimbarde** [F.]. \*Jew's-harp.

**Guïro**. See under Percussion instruments B, 8.

**Guitar**. [F. *guitare*; G. *Gitarre*; It. *chitarra*; Sp. *guitarra*]. A plucked stringed instrument, similar to the lute but with a flat back and built-up, inward-curved ribs, somewhat like the violin. [For ill. see Guitar family.] The modern guitar has metal frets and six strings tuned E A d g b e'. The music is notated one octave higher than it sounds. Today the guitar is chiefly a popular instrument used to provide a simple chordal accompaniment to a dance or a song, especially folksong, the chords being indicated in a manner similar to the principles that are followed in 16th-century lute tablatures. Most of the great guitar virtuosos have been Spanish: Dionisio Aguado (1784–1849), who established the principles of modern guitar playing in a method written in 1825 and still used today; Fernando Sor (1778–1839), who aroused the admiration of Méhul, Cherubini, and Fétis, and who wrote numerous brilliant compositions for the guitar; Francisco Tárrega (1852–1909), the greatest of all guitar players, who initiated the present-day revival of the instrument; and the noted Andrés Segovia (b. 1893), who has made the instrument known all over the world and who has contributed much to a revival of old (16th-century) guitar (*vihuela*) music. Modern composers for the guitar include Manuel de Falla, Joaquín Turina, Rodolfo Halffter, Albert Roussel, Alexander Tansman, and others. Percy Grainger has used it in several compositions [see C. Forsyth, *Orchestration*, rev. ed. (1936), p. 480].

In 16th-century Spain at least three types of guitar were in use: (1) the six-course \**vihuela*, an instrument equal in artistic importance to the contemporaneous lute and for which seven books of tablature were published, one each by L. Milán, L. de Narvaez, A. Mudarra, E. Enriquez, de Valderrábano, D. Pisador, M. de Fuenllana, and E. Daza, containing a great many fantasias, variations (*diferencias*), duets, songs (*villancicos*, *romances*), a few dances, and many intabulations; (2) the four-course *guitarra*, a popular instrument for which Mudarra and

Fuenllana composed a few pieces; and (3) the five-course *guitarra española*, whose vogue at the end of the century and throughout the 17th century was in part responsible for the eclipse of the lute and whose music usually consisted of chordal accompaniment only. G. Montesardo, in his *Nuova Inventione d'Intavolatura per sonare li Balletti sopra la Chitarra Spagnuola* (1606), invented a new notation (stenographic indication of the chords), which was broadened by other guitarists, such as Pietro Milioni (1627), Caliginoso (1626), and Lucas Ruiz de Ribayaz (1677; see *WoHN* ii, 174, 175, 201).

In the 17th century, when lute music reached the height of artistic perfection under Denis Gaultier, Esaias Reusner, Robert de Visée, and others, the guitar rose to prominence as an instrument much easier to play and, consequently, of greater popular appeal. In the late 17th century the instrument came into vogue in French court circles, and fashionable painters like Watteau depicted it in the hands of beautiful ladies and clowns. Boccherini used the guitar in some of his chamber music, as did other composers of the 18th century. Schubert's so-called Guitar Quartet, however, is only an adaptation of a trio for flute, violin, and guitar by a Bohemian, W. Matiegka, published in 1807. See also Guitar family; Electronic instruments I.

Brondi, "Il Liuto e la chitarra" (*RMI* xxxii, xxxiii).

**Guitar family**. This category is here understood to include instruments that have the general characteristics of the lute family but have the flat body of the guitar. Like the lute, the guitar is of Oriental origin. It appears in various shapes in the famous miniatures of the 13th-century

Guitars: 1. Yuehchyn. 2. Bandurria. 3. Banjo. 4. Ukulele. 5. Balalaika. 6. Chitarra battente. 7. Cittern. 8. Guitar.

Cantigas MS of the Escorial. Several such instruments existed in the 16th and 17th centuries under different names. The most important of these was the *cittern* (also *cithren*, *cister*, *cistre*, *cither*, *cithara*, *cetera*, *cistola*, *citole*), which had an oval belly and back, similar to that of the lute, and wire strings. The *Cythingen* (*Cithrinchen*) on which the miller Veit Bach, J. S. Bach's great-great-grandfather, is reported to have entertained himself while grinding flour, was a smaller instrument of this type. In the 18th century the cittern was much used in England under the name *English guitar*. See T. Dart, "The Cittern

and Its English Music" (*GSJ* i). A direct derivative of the cittern is the *bandurria* and its larger variety, the *bandolon* [see *MaMI*]. The name of these instruments (probably also that of the modern \*banjo) comes from the 16th-century \**bandora* (sometimes called *pandora*). The *gittern*, which had gut strings, is another early member of the guitar family, but the name *quinterne* (probably from *gitterne*) was applied to other instruments as well. A Portuguese guitar, much used in the Azores, is the *machete*, which is the ancestor of the modern \**ukulele*. The *chitarra battente* is an Italian form of guitar. Of the vari-

ous guitar instruments of Russia only the *\*bala-laika* survives today. A circular guitar with a short neck is used in China under the name *yuehchyn* and in Japan under the name *gekkin* [see *MaMI*]. The Japanese *shamisen* (*samisen*) is sometimes considered a guitar, but is more closely related to the lute [see *Lute*, Japan VI]. See also *Vihuela*.

**Gurre-Lieder** [G.]. A song cycle ("Great Cantata") by Schoenberg to poems (originally in Danish) by J. P. Jacobsen, for 5 solo voices, 3 four-part male choruses, 1 eight-part mixed chorus, narrator, and large orchestra, begun 1901–02 but not finished until 1911. The musical style represents the climax of late romanticism.

**Gusle.** A primitive one-stringed instrument, played with a primitive bow. It is used almost exclusively to accompany and support the chanting of the epic poems of the southern Slavs (Serbs, Montenegrins, Macedonians, and, less frequently, Bulgarians). Pear-shaped, it is covered with skin and has a long neck ending with a decorative carving, usually in the shape of an animal's head. The single string usually is made of twisted horsehair, which also is used for the bow. [For ill. see *Violin*.] A two-stringed variant is known in Bosnia. In Macedonia it may have three strings and resembles the Bulgarian *gadulka* as well as the Byzantine *lyra*, a variant of which is still in use in southern Dalmatia, where it is known as *lijerica*. The gusle player is called *guslar* and is regarded as the carrier of traditional epic poems. The Russian *gusli* is a zitherlike instrument [see *Psaltery*] quite unrelated to the Balkan gusle. See W. Wunsch, *Die Geigentechnik der südslawischen Guslaren* (1934); *id.*, in *MGG* v.

M.V.

**Gusto, con** [It.]. With style, with zest.

**Gymel, gimel, gemell.** (1) A late medieval term for two-part polyphony based on thirds, sixths, and tenths. The term is derived from the Latin *gemellus*, meaning twin. Guilelmus Monachus described it (c. 1480) as a style used in England

and employing upper as well as lower thirds ("habet consonantias tertias tam altas quam bassas . . ."; see *CS* iii, 289a). This would require a crossing of parts, e.g., e–d–c–d–e as counterpoint to c–d–e–f–g. A number of English compositions from c. 1300 are in this style, e.g., *Jesu Cristes milde moder* (*ReMMA*, p. 389), *Edi beo* (*NOH* ii, 342), and *Foweles in the frith* (*NOH* ii, 343; here the two voices are an octave apart, so that the upper and lower third become tenths and sixths). The term is also used for two-part polyphony in parallel thirds. A famous example of this style is the 13th-century hymn "Nobilis humilis" written in praise of St. Magnus, the patron saint of the Orkneys (*HAM*, no. 25c). It should be noted, however, that parallel thirds were used in France as early as c. 1150 [see *Third*]. Perhaps the "crossing" gymel may more properly be considered to be of English origin than the "parallel" variety. See M. Bukofzer, "The Gymel, the Earliest Form of English Polyphony" (*ML* xvi, 77); *ReMMA*, p. 388. (2) In English musical sources of the 15th century, "gymel" means *\*divisi*, i.e., to indicate that a part is temporarily divided into two.

**Gypsy music.** Whether the Gypsies ever possessed a musical tradition of their own is a matter of doubt. What is generally called Gypsy music actually is Hungarian music of fairly recent origin, composed by Hungarians of the upper middle class but performed by Gypsies (according to Bartók). The so-called Gypsy scale, c–d–e<sup>b</sup>–f<sup>♯</sup>–g–a<sup>b</sup>–b–c' [see *Scale I*], with two augmented seconds, is probably of Indian origin and was introduced by the Gypsies into eastern Europe, particularly into Hungary, where it became a pseudonationalist feature [see *Hungary*]. It also is common in modern Turkish and Jewish music as well as in Greek church music. The Gypsies have also played a role in the cultural and musical life of Spain [see *Flamenco*]. See *LavE* i.5, 2646ff; B. Bartók, "Gypsy Music or Hungarian Music?" (*MQ* xxxiii); W. Starkie, "The Gipsy in Andalusian Folk-Lore and Folk-music" (*PMA* lxii).

# H

**H.** See Pitch names; Letter notation. Abbr. for horn (in orchestral scores). *H dur (moll)*, German for B major (minor).

**Habanera** [Sp.]. A Cuban dance of Spanish origin that is rarely performed today despite its considerable historic importance. It is the ancestor of many new dance forms, e.g., the Argentine \*tango. At the time of the Spanish-American War, the *habanera* was the most popular dance of the New World. Examples were sung in music halls throughout Europe, often modified according to the traditional styles of each country. At the time Bizet wrote his famous *habanera* (*Carmen*, 1875) the form was already well known outside Cuba. Many other European composers were inspired by its rhythm, among them Debussy, Albéniz, Auber, Chabrier, De Falla, and Ravel. Always in 2/4 meter in moderate tempo, the *habanera* uses a variety of rhythmic patterns, the two most common being

**Hackbrett** [G.]. See Dulcimer.

**Haffner collection.** An important collection of early piano (harpsichord) sonatas, published by Johann Ulrich Haffner from 1755 to 1766. The complete collection consists of three publications entitled *Oeuvres mêlées*, *Raccolta musicale*, and *Collection récréative*. It contains 114 sonatas by K. P. E. Bach, Bertoni, Galuppi, Marpurg, L. Mozart, Paganelli, Rutini, Scheibe, Schobert, Wagenseil, and others. Eighteen sonatas from the *Raccolta musicale* have been republished by G. Benvenuti under the title *Cembalisti Italiani del Settecento* (G. Ricordi). See Sonata B III (a) and (b).

**Haffner Serenade.** Mozart's Serenade in D [K. 250], composed in 1776 for a wedding in the family of Sigmund Haffner, burgomaster of Salzburg. His Haffner Symphony in D [K. 385] was composed in 1782 for another festive occasion.

**Haiti.** Music during the early Spanish colonization of what is now the Republic of Haiti developed along the same lines as in the rest of the island of Hispaniola [see Dominican Republic]. Not until the end of the 17th century, when the

French colonized the western third of the island, did an independent development begin.

Art music in Haiti dates from the beginning of the 20th century. Most Haitian composers have written works using some native elements but lacking the forceful expression of their original models. Occide Jeanty (1860–1936) is the earliest Haitian-born composer. He studied in Paris and in 1886 returned to Haiti as musical director of the Republic. Ludovic Lamothe (b. 1882) devoted himself to the study of folk music and then became a noted pianist and composer, especially of songs and short piano compositions. Justin Elie (1883–1931) also studied in Paris, and from 1922 until his death he lived in New York. He wrote a well-known *Aboriginal Suite* for orchestra and numerous compositions for piano, violin, and voice.

The traditional music of Haiti is largely a mixture of African, French, and Spanish elements, since the original Indian population disappeared under Spanish rule and none of its influences remains clearly traceable. Most Haitian songs and dances are dominated by the religious and social framework of the *vodoun* or \*voodoo and are characterized by freedom of measure and rhythm. This is true of the *baboule*, *bamboche*, *bumba*, *salongo*, *monsondi*, and many other types mentioned by Courlander [see Lit.].

Lit.: L. Bowman, *The Voice of Haiti* (1938); H. Courlander, *Haiti Singing* (1939). Also see under Latin America.

J.O.-S.

**Hakenneumen** [G.]. Hook neumes; see Neumes II.

**Halb, halbe** [G.]. Half. *Halbe Note (Pause)*, half note (-rest). *Halbinstrument*, half-tube instrument. *Halbschluss*, half-cadence. *Halbsopran*, mezzosoprano. *Halbton*, semitone.

**Half.** Half-close, imperfect cadence. Half-fall, see Appoggiatura. Half-shift, the first shift on the violin. Half-step, semitone. Half-stop, see Divided stop. Half-tube instruments, see Wind instruments II.

**Hallelujah.** A Biblical word, expressing joyful praise of God. For its use in Gregorian chant, see Alleluia. The original spelling is retained in Ambrosian chant. In choral compositions of the

17th and 18th centuries the word "Hallelujah" frequently serves as the text for an extensive final movement in fugal style. Famous examples are the Hallelujah choruses in Bach's cantata *Christ lag in Todesbanden* and in Handel's *Messiah* (close of Part II). See E. Gerson-Kiwi, "Halleluia and Jubilus in Hebrew-Oriental Chant" (*CP Besseler*).

**Halling.** A fast, lively Norwegian folk dance in 2/4 or 4/4 meter. It is a strenuous solo dance for men in which one person in the middle of the room holds a man's hat on a long pole. Several men in turn try to kick the hat off the pole. Grieg has used the dance in several of his *Lyric Pieces*. See T. Knudsen and A. Sommerfelt, ed., *Norsk riksmålsordbok i* (1937).

**Hammerklavier** [G.]. Early 19th-century name for the piano. Beethoven used it for his sonatas op. 101 and 106 (the latter is widely known as the Hammerklavier Sonata), probably for no other reason than to avoid the Italian word *pianoforte*.

**Hammers, Pythagorean.** See Pythagorean hammers.

**Hammond organ.** See under Electronic instruments II.

**Handel Variations.** Twenty variations (and a fugue) for piano by Brahms, op. 24 (1861), based on a theme by Handel (the "Air" from his harpsichord suite in B-flat). The fugue is based on a theme freely derived from the initial notes of the tune.

**Hand horn.** See under Horn II.

**Hand organ.** Term for two mechanical instruments similar in construction but different in purpose: the English barrel organ, formerly used in small churches, and the street organ of the Italian organ grinders.

**Handstück** [G.]. Late 18th-century name for an instructive piano piece.

**Handtrommel** [G.]. Tambourine.

**Hänsel und Gretel.** Opera in three acts by Humperdinck, produced in Weimar, 1893. The libretto, written by his sister, Adelheid Wette, is based on one of Grimm's *Fairy Tales*. Setting: the Hartz Mountains, Germany. Although lacking in originality, the music provides a suitable background for the plot with its folklike simplicity and warmth of feeling.

**Hardingfele, Hardanger fiddle.** A Norwegian folk instrument shaped somewhat like the violin but slightly smaller and with a flatter bridge. [For ill. see under Violin.] It has four gut strings above four or five metal sympathetic strings in various tunings, such as a-d'-a'-e'' or a-e'-a'-c''# for the former, b-d'-e'-f'-a' or c'-d'-e'-f'-a' for the latter. The music is highly ornamented and generally is in two voice-parts in addition to the drone effect produced by the sympathetic strings. Dissonances of the second, augmented fourth, seventh, and ninth are common. The instrument probably was modeled after the ancient Norwegian *gigja* and *fidla* as well as the viola d'amore (probably brought from the British Isles). It is used to accompany folk dances such as the \**halling*, *ganger*, and *springar*. See O. Gurvin, ed., ‡*Norsk folkemusikk*, 4 vols. (1958-63).

**Harfe** [G.]. Harp.

**Harmonia.** A Greek word, whose original meaning is "a fitting together," often implying the combination and unification of diverse elements (Plato). The Greeks used it for music in general, for scale formations (*harmoniae*; see Greece II), and for a well-ordered melody, but also in the sense of "harmony of the world" or "harmony of body and soul." In medieval treatises on music the term usually means "beautiful music" in a general sense, without specific reference to chords or simultaneous sounds. The definition given in the *Musica enchiridiadis* ("Harmonia est diversarum vocum apta coadunatio"; GS i, 159a) is not found in the discussion of organum and therefore probably refers to monophonic music. It is quoted in Marchettus' *Lucidarium* (GS iii, 81a), which is devoted exclusively to plainsong. Walter Odington distinguished between an *armonica simplex* (plainsong), and an *armonica multiplex* (diaphony; CS i, 212b). The meaning *harmonia* = harmony appears clearly in Gafurius' *Practica Musice* (1496), where *harmonia* is said to consist of a high, a low, and a middle sound (*conficitur ex acuto gravi et medio*).

**Harmoniae.** See under Greece II.

**Harmonic.** See under Acoustics IV; Harmonics.

**Harmonica.** (1) The \*glass harmonica. (2) The mouth harmonica or mouth organ [F. *harmonica à bouche*; G. *Mundharmonika*; It. *armonica a bocca*; Sp. *armónica*]. A popular instrument that consists of a small, flat metal box with slitlike

openings on one of its long sides. Each slit leads to a pair of reeds of the same pitch inside the box, one of which works by means of pressure and the other by means of suction. The player places the instrument against his lips and, moving it back and forth according to the notes desired, blows into or inhales against the slits. For ill. see under Wind instruments. Many harmonica bands have been formed in the United States and elsewhere, and some players have achieved a remarkable degree of virtuosity. One modern form of the instrument was invented by F. Buschmann in 1821 [see *SaHMI*, p. 406]. Sir Charles Wheatstone is also mentioned as the inventor (his was called *Aeolina*, 1829; see *GDB* v, 919). (3) In French and German the name is also used for a variety of instruments of the xylophone type, i.e., consisting of tuned strips of wood (*harmonica de bois*, *Holzharmonika*), steel (*harmonica à lames d'acier*, *Stahlharmonika*, i.e., \*glockenspiel), stone (*harmonica à lames de pierre*, e.g., the Chinese *bian-ching*), etc. The *Ziehharmonika* [G.] is the accordion.

**Harmonic analysis.** I. *General.* Harmonic analysis is the study of the individual chords or harmonies in a piece of music, together with their use in succession to form larger units of phrases, periods, sections, or whole compositions. It is applicable to all Western music that has a harmonic aspect. Although such study is necessary to understand music of other periods, it is particularly applicable to the tonal music of the 18th and 19th centuries; in this area it still forms the initial basis of training for the young musician.

II. *Triads.* The basis of tonal harmony is the triad. Each of the seven degrees of the major and minor scale can serve as the \*root of a \*triad. The triads on the "tonal" degrees of the scale, I, IV and V, are the most important for establishing the tonality of a piece, and occur more frequently than those on the "modal" degrees, II, III, and VI. The triad on VII tends to be used least of all. The four kinds of triad (major, minor, diminished, augmented) possible in the major and minor mode are illustrated in Ex. 1.

Besides the practice of exchange of chords from one mode to the other, which in itself makes the two modes practically identical, certain other changes have come into use that further color, and therefore confuse, the two modes; in the late 19th century practically any note of any chord could be sharpened or flattened,

Chords written in white notes are used in the major key; those in black notes are used in the minor key, with the following exceptions: those marked 1 are common to both modes; those marked 2 are often borrowed from the minor mode to be used in the major; that marked 3 is used only under certain circumstances even in the minor; that marked 4 is sometimes used as a final chord in pieces in the minor, in which case the chord is said to have a Picardy third; and those marked (2), which can be borrowed from the minor for use in the major, were mostly so used in the 19th century.

and if this were done judiciously the feeling of a central tonality could still be preserved, although it might not be possible to determine whether the resulting tonality was major or minor.

III. *Seventh and ninth chords.* Besides the triads illustrated above, music of the 18th and 19th centuries makes much use of seventh chords. These chords are triads with still another diatonic third superposed. Ninth chords, used more commonly in the 19th century than previously, are seventh chords with yet another diatonic third superposed. Seventh chords and ninth chords are designated by adding the Arabic figure 7 or 9 to the Roman numeral indicating the root, thus:  $I^7$ ,  $I^9$ . The symbol  $I_7^9$  means a tonic ninth chord with the seventh degree flattened. [See Ex. 2.] For more details see Seventh chord; Ninth chord.

IV. *Root position and inversion.* When any chord built of superposed thirds stands in its original position it is said to be in root position, since the note on which the structure is built, the \*root, lies in the bass or lowest part. Thus a chord built on C, whether it be a triad, a seventh, a ninth chord, or even greater, is in root position so long as C remains in the bass, no matter how the notes above are arranged or how many notes there are in the chord. All the chords in Ex. 1 and Ex. 2 are in root position.

If the third of the chord, E in the examples above, lies in the bass, the chord is said to be in first inversion; if the fifth, G in the examples above, is in the bass, the chord is in second inversion; and if the seventh is in the bass, it is in third inversion. In harmonic analysis the Arabic figures indicate the characteristic intervals between the lowest note (bass note, not the root) and those above it. Thus, the designation for the first inversion, known as sixth chord, is  $I^6$  (properly  $I^{\flat}_6$ ) and for the second inversion, known as six-four chord,  $I^{\flat}_4$ ; similar symbols are used for the inversion of the seventh chord [Ex. 3]. See Inversion; Sixth chord; Six-four chord; Seventh chord.

V. *Altered chords.* These are chords in which one or more notes are chromatically altered by accidentals foreign to the key. (The sharpening of a note often serves to give that note a tendency to rise; the flattening of a note tends to make it descend.) The mutual borrowing of chords between the major and minor modes cannot rightly be said to involve alteration (see Ex. 1); nor does the formation of \*secondary dominants constitute alteration, but rather momentary borrowing.

The most common altered chords with their usual resolutions are illustrated in Ex. 4. They are: (a) the Neapolitan sixth, built on II; (b) the augmented sixths, built on II and IV; (c) altered II and VI. For purposes of illustration each is reckoned in the key of C.

VI. *Modulation.* Modulation, one of the most valuable devices in tonal music, is accomplished by means of pivot chords. The C-major triad, for instance, is not only I in the key of C major, but also IV in G, V in F, III in A minor, VI in

E minor, the Neapolitan II in B, and VII in D minor. Treated as a secondary dominant, its functions are wider yet, since it can be considered V of III in D minor, V of III in D-flat, V of V in B-flat, and so on. The diminished seventh and the augmented sixth chords are also valuable as pivots since enharmonically each can be found in a variety of keys. These pivot chords serve as connections or hinges between different keys, and it is by means of them that modulation is effected. See Modulation.

VII. *Nonharmonic tones.* These are tones dissonant to the harmonies with which or after which they are sounded; they usually serve the purpose of providing smoothness of melodic flow and embellishment as well as color. They are of two main types, accented and unaccented. The unaccented nonharmonic tones include (1) passing tones, (2) auxiliary tones, (3) anticipations, (4) échappées, and (5) cambiatas, while the accented ones are (6) appoggiaturas and (7) suspensions, although the last has no rhythmic accent on the note itself at the moment it causes dissonance. All the nonharmonic tones may be found either ascending or descending, and in any voice part. See Nonharmonic tones.

VIII. *Harmonic rhythm.* Harmonic rhythm is the rate of speed with which harmonies change in the course of a phrase or series of phrases. In some phrases the harmonies change more quickly than in others, and certain parts of single phrases likewise have faster-moving harmonies than other parts. The tendency in single phrases is to have faster harmonic change in the latter part than in the first, but this depends on the structure of the piece as a whole and the effect the composer wishes to convey. See Harmonic rhythm.

A.T.M.

**Harmonic inversion.** See under Inversion (1).

**Harmonic mean.** See Arithmetic and harmonic mean.

**Harmonic minor (scale).** See Major, minor.

**Harmonice musices odhecaton.** See Odhecaton.

**Harmonic rhythm.** The rhythmic pattern provided by the changes in harmony. The pattern of the harmonic rhythm of a given piece of music, found by noting the root changes as they occur, reveals important and distinctive features of style and texture. For example, there may be no change of harmony over several measures of music, as in the opening of Beethoven's Ninth Symphony. A contrast to this is a rapid succession of root changes, a different chord appearing with each note of the melody, as in Ex. 1 (Chopin, Mazurka op. 59, no. 2). Between these extremes all variations can be found. In general, contrapuntal music uses fewer chord changes than do other types.

The pattern of harmonic changes is made up of strong and weak rhythmic quantities. Certain root progressions, such as II to V, are regarded as strong progressions, that is, having the rhythmic effect of weak to strong. Others, like III to V, are weak progressions, with strong to weak, or even static rhythm [Ex. 2]. Usually, however, a pattern contains several root progressions, so that evaluating their comparative rhythmic values involves consideration of other factors. The most important influence on the rhythmic

## HARMONIC RHYTHM

stress is the element of time. Long time values are generally accepted as being heavy, or strong, in comparison with shorter values [Ex. 3]. A dissonant chord with its resolution may constitute either a weak or a strong progression [Ex. 4]. Dynamic indications usually underline the natural rhythm of the music but are sometimes used by composers in a contrary sense, to give an accent where one would not normally occur.

The strong beats of the harmonic rhythm are commonly in agreement with the first beats of the measures, thus coinciding with what one feels to be the pulse of the music, although this is by no means always the case. The pattern of harmonic changes may be quite independent of the meter and of the various melodic rhythms for which it forms the background. Ex. 5 (Beethoven, Sonata op. 31, no. 3) serves as an illustration. In this example it should be noted that the harmonic rhythm, while it is the product of the combination of the melodic lines, is unlike any one of the melodic rhythm patterns and does not agree with the regularity of the meter.

The resource of harmonic rhythm has been largely abandoned by some 20th-century composers who have been inclined toward purely contrapuntal music. This accounts for a certain static quality in some modern music. Increased

## HARMONICS

melodic and contrapuntal rhythmic complexity and the use of irregular and changing meters are in some instances a compensation for the loss in rhythmic interest and vitality due to the absence of harmonic rhythm. See Harmonic analysis VIII.

**Harmonics.** The term is used with two different though related meanings: (a) a general acoustical phenomenon [see Acoustics IV]; (b) its application to stringed instruments.

The harmonics of the violin (and other stringed instruments), sometimes called flageolet tones [G. *Flageolett-Töne*; F. *sons harmoniques*], are high tones of a flutelike timbre that are produced by lightly touching the string at one of its nodes (exact fractional points) instead of pressing it down as in ordinary stopping. Touching a string lightly at its half-way point will produce a harmonic an octave higher than the open string. Ex. 1 shows the vibration of (a) an open string, (b) a stopped string, and (c) a lightly

touched string. If the open string sounds *g*, stopping at *P*, in our example at one-third of the entire length, produces the fifth *d'* (vibrating length  $\frac{2}{3}$ ), while light touch will produce the harmonic *d''* (vibrating length  $\frac{1}{2}$ ). The formula for the determination of the harmonics is  $\frac{1}{h} = 1 - \frac{1}{t}$ , *h*

and  $t$  being the relative frequencies of the harmonic and the normal tone produced at the same point. For instance, in determining the harmonic obtained by lightly touching the  $c$  of the  $g$ -string,  $t$  is  $\frac{2}{3}$  (relative frequency of the fourth; see Intervals, calculation of); therefore,  $\frac{1}{h} = 1 - \frac{2}{3} = \frac{1}{3}$ , and  $h = 3$ , i.e., the frequency of the second octave; hence, the harmonic is  $g''$ . In Ex. 2 the lozenges indicate, as customary, the point of touch, and the black notes the pitch of the resulting harmonic. The practical results do not always agree with the theory. For example, if the  $g$ -string is touched at  $e$ , the harmonic  $b'$  is less likely to be heard than its first overtone,  $b''$ .

## HARMONIOUS BLACKSMITH

Stopping and light touch can be used simultaneously. The tones thus obtained are called "artificial harmonics," the others "natural harmonics." In compositions for violin (or cello), the latter are indicated by a small circle placed over the desired tone, while for the artificial harmonics the method shown in Ex. 3 is used, where the position of the fingers as well as the resultant tones are indicated.

The introduction of harmonics has been variously ascribed to Domenico Ferrari (1722-80), a pupil of Tartini, and to Jean de Mondonville (1711-72). The latter seems to have made the first practical application of harmonics in his six sonatas, *Les Sons harmoniques*, op. 4 [c. 1735]. See also Chyn; Tromba marina; Harp I. See W. Kirkendale, "Segreto comunicato da Paganini" (*JAMS* xviii).

**Harmonic (minor) scale.** See under Major, minor; Scale I.

**Harmonic series.** The series of the acoustical harmonics [see Acoustics IV].

**Harmonie** [F., G.]. Harmony. In French usage the term also means the wind section of the orchestra, or a special wind band. *Cor d'harmonie*, French horn.

**Harmonie der Welt** [G., Harmony of the World]. (1) A symphony by Hindemith, composed in 1951. As in the case of *\*Mathis der Maler*, the three movements were derived from the composer's opera of the same title before the opera was finished and performed. The titles of the movements are "Musica Instrumentalis," "Musica Humana," and "Musica Mundana." (2) Opera in five acts by Hindemith (to his own libretto), produced in Munich, 1957. Setting: Central Europe, between 1608 and 1630.

**Harmonika** [G.]. Either the *Mundharmonika*, mouth harmonica [see Harmonica (2)], or the *Ziehharmonika*, i.e., \*accordion. B. Franklin's harmonica is called *Glasharmonika*. See also Harmonica (3).

**Harmonious Blacksmith.** Air with variations from Handel's Harpsichord Suite No. 5, in E

(1720). There is no plausible explanation for the name, which is spurious.

**Harmonium.** I. A keyboard instrument that sounds by means of thin metal tongues being set in vibration by a steady current of air, which is provided by a pair of pedal-operated bellows. The metal tongues act as free reeds [see Reed]. The harmonium was long considered a popular substitute for the organ, which it resembles in some features, e.g., the wind supply, keyboard, *ad libitum* sustained tones, and stops that provide a variety of timbre. Properly used, however, the modern harmonium is an instrument in its own right. It can produce "expressive" gradations of sound by means of the expression stop, which puts the pressure in the bellows under direct control of the player's feet. This device, though unsuitable for the works of Bach, lends itself well to rendering many organ compositions of the 19th century (Mendelssohn, Schumann, Liszt, Reger) as well as pieces written especially for the harmonium (Karg-Elert, Dvořák, Reger, César Franck).

II. The harmonium was developed in the 19th century from Grenié's *orgue expressif* (1810) and a number of more or less experimental instruments (Organo-violine, c. 1814; Aeoline, c. 1818; Physharmonica, 1818; Aeolodicon, c. 1820; Aérophone, c. 1829; Séraphine, 1834; Mélophone, 1837; and many others) to the first real harmonium (A. Debain, 1840), which combined numerous useful devices found separately in the earlier instruments. Important improvements made afterward are: the *percussion* (small hammers like those of the piano, acting upon the tongues and causing a quicker and more precise "start" of the sound); the *prolongement*, by which single tones can be automatically prolonged (pedal points); the *melody attachment*, which puts the highest notes in relief over the others; the *pedal substitute*, by which the lowest note of a chord can be made to stand out; the *double touch* (1855), which permits a certain gradation of sound by a slighter or greater depression of the key; and the *expression* (invented by Mustel, 1854), by which the volume of sound is controlled directly by the player's feet—a delicate device that calls for considerable skill to operate. The *Mustel organ* is very popular in France and England.

III. An important variety of harmonium is the *American organ*, in which the wind is not forced out through the reeds by compression but is drawn in by evacuation of the air in the

bellows. The reeds of this instrument are smaller and more curved than those of the harmonium. All these devices produce a softer, more organ like tone that lacks, however, the expressive quality of the harmonium. Modern instruments have an electric wind supply, leaving the feet of the player free to operate a pedal-keyboard like that of the organ. The principle of the American organ was invented about 1835 by a workman in the harmonium factory of J. Alexandre, Paris, who subsequently emigrated to America. Here his ideas were put into practical form by Estey of Brattleboro, Vt. (*Estey organ*, 1856), and by Mason and Hamlin of Boston (1861). For a 16th-century type of harmonium, see Regal.

Lit.: A. Mustel, *L'Orgue expressif ou l'harmonium*, 2 vols. (1903); LavE ii.2, 1375ff; L. Hartmann, *Das Harmonium* (1913; bibl.).

**Harmony.** The chordal (or vertical) structure of a musical composition, in contrast to counterpoint, i.e., the melodic (or horizontal) structure [see Texture]. The principles of harmony predominant in the 18th and 19th centuries are explained under Harmonic analysis. In this article the subject is treated historically.

I. Harmony came to be appreciated considerably later than counterpoint. Although even in the early days of counterpoint (9th–12th centuries; see Organum) it was apparent that certain intervals sounded better simultaneously than others and although the ensuing progress of counterpoint necessarily entailed an increased consideration of harmony, it was not until the mid-16th century that musicians began to think of harmonies as a primary building material of music. In fact, it was not until the early 18th century that Rameau (1722), Fux (1725), and others formally recognized them as structural and compositional elements. This late recognition is all the more striking in view of the extensive use of simple chordal progressions in various periods of early music history [see Familiar style] and, particularly, in view of the 17th-century practice of \*thoroughbass, which is essentially harmonic in nature. Actually, the recognition of the harmonies as building elements depended on another concept that did not evolve until after 1650, namely, \*tonality, which superseded polyphonic modality and made possible an over-all conception of a piece of music from the harmonic point of view. Only when tonality was firmly established could the relative importance of chords built on the different degrees of the scale be determined in rela-

tion to a key center or tonic; only when this was accomplished could a logical departure from this tonic into other keys and return from those keys to it—modulation—be achieved.

When chords came to be conceived as entities it became possible to enlarge the small chords, such as the triad with its inversions, to bigger ones with three or more thirds (seventh chords; ninth chords). For the sake of color, moreover, it was possible to raise or lower the various notes of these chords without allowing them to lose their identity and their relationship with the central tonic. From the beginning of the 18th century on, the beauty of melodic lines depended largely on the effective arrangement of the harmonies underlying them.

But the very concept of tonality contained the seeds of its own weakening. In time, with the increasing boldness of composers in modulating to ever more distant keys and in coloring, or altering, the notes of their chords more and more, the strength of the single tonal center became diluted. In addition, the 19th-century composers tended increasingly to fuse the major and minor modes, using chords typical of one mode in the other (Schubert), and to avoid strong tonal cadences and to substitute for them all kinds of deceptive cadences that in turn veiled contours of phrases (Liszt and Wagner), giving their music a far less definite feeling of tonality than the compositions of the 18th century possessed. Another practice undermining the strength of classical tonality was the use by certain late 19th-century nationalist composers of a preponderance of modal degrees of the scale in the harmonization of the folk or folklike melodies in their compositions (Dvořák, Musorgsky). This, with its logical complement of writing consecutively a number of chords on adjacent scale degrees (\*parallel chords; Debussy), led harmony back in many respects to the paths it had followed in the period of modality. Some 20th-century composers have abandoned tonality altogether and once again depended on the conjunction of melodic lines to form their harmonies (\*atonality; Schoenberg), while others retain only the triad as the basic chord with which phrases must begin and end, and allow varying combinations of notes to form the harmonies in the course of the phrases, so long as they are arranged logically in regard to increasing and decreasing dissonance as the phrase proceeds, an arrangement called "harmonic fluctuation" (Hindemith).

II. Regarding the triad as the most important

chord, harmonic music may be divided into three main periods: a central period in which the third (triad) is sovereign (period of tertian harmony, c. 1450–1900); an earlier period in which the potentialities of the triad have not yet been exploited (period of pre-tertian harmony, c. 900–1450); and a period in which, after the exhaustion of the triad, new combinations were sought after (period of post-tertian harmony, c. 1900—).

#### A. *Pre-tertian harmony* (900–1450).

(1) 900–1050: Parallel fourths or fifths; also unisons, seconds, and thirds at the beginning and end of phrases. See *Organum*, Ex. 1, 2.

(2) 1050–1200: Unisons, octaves, fifths, and fourths as chief consonances of two-part writing in contrary and in parallel motion, interspersed with seconds, thirds, and sevenths, hardly ever with sixths. See *Organum*, Ex. 3, 4.

(3) 1200–1300: Open triads (1–5–8), including those with a diminished fifth, as the main consonances in three-part writing; full triads (1–3–5) in weak positions, and occasionally also "dissonant concordances" such as 4–5 or 1–4–7 [see *Counterpoint II*]; harsh dissonances (consecutive seconds, etc.) freely admitted as passing notes. Ex. 1 (motet, c. 1250).

(4) 1300–1450: Open triads continue as the main harmony; full triads more frequent, also at the beginning and end of (inner) phrases; first appearance of the sixth chord, as single harmony (De Vitry, Machaut), successively in cadential motion (Landini), or as the prevailing harmony (in England, also Dufay, Binchois; see *Sixth-chord style*). Frequent use of the \*Lydian

cadence with a leading tone before the fifth and the octave. Dissonances between consonant "pillars" occur often in Machaut and even more in the works of late 14th-century French composers. See also Landini cadence; Ex. 2 (Machaut, "Plourez dames"); Ex. 3 (Landini, "El mio dolce sospir").

**B. Tertian harmony (1450–1900).**

(5) 1450–1600: Full triads and first inversions in four or more parts; dissonances used sparingly in an essentially panconsonant idiom; the roots of the triads moving preferably in modal sequence (I–II, I–III, I–VI) except at cadential points, where IV–I and V–I are commonly used. Ex. 4 (Ockeghem, the "Christe" of *Missa L'Homme armé*); Ex. 5 (Palestrina, "Adjuvo vos").

(6) 1600–1750: Triads and seventh chords with all their inversions, in four parts or in free chordal style; increasing predominance of the first, fifth, and fourth degrees as the central chords (tonic, dominant, subdominant), leading to the establishment of the major and minor tonality in all the keys (*The Well-Tempered Clavier*, 1722) and to modest modulations; appearance of altered chords such as the diminished seventh and Neapolitan sixth; occasionally extensive use of chromatic progressions;

enharmonic change. Ex. 6 (M. Weckmann, *Symphonia* from the "Motetto concertato 'Weine nicht'"); Ex. 7 (J. S. Bach, *Organ Fantasy and Fugue in G minor*.)

(7) 1750–1825: Reduction of the harmonic vocabulary of the late baroque to its bare “essentials,” the tonic, dominant, and subdominant, which are used functionally as the carriers of extended melodies and as the vehicle of development (\*Mannheim school; Viennese classics). Distant modulations, with or without pivot chords. Ex. 8 (Schubert, Piano Sonata no. 13 in C minor).

(8) 1825–1900: The period of romantic harmony; fullest exploitation of the triadic system to its farthest limits; extensive use of chromatic alterations, of unprepared and—toward the end of the century—unresolved appoggiatura chords; free modulation into distant keys [see under I]. Gradual disintegration of tonality. Ex. 9 (Chopin, Nocturne no. 17); Ex. 10 (Wagner, *Tristan*).

The image contains three musical excerpts, each consisting of a piano and violin part. Excerpt 8 (top) is from Schubert's Piano Sonata no. 13 in C minor, showing a piano part with a low register and a violin part with a high register. Excerpt 9 (middle) is from Chopin's Nocturne no. 17, showing a piano part with a low register and a violin part with a high register. Excerpt 10 (bottom) is from Wagner's Tristan, showing a piano part with a low register and a violin part with a high register.

### C. Post-tertian harmony.

(9) 1900—: Deliberate violation of the harmonic system by the use of \*parallel chords (Debussy), \*fourth chords (Scriabin), etc., leading to the complete abandonment of harmonic

restrictions, i.e., \*atonality (Schoenberg; c. 1910) and to a period of unlimited experimentation that produced numerous novel practices, frequently of a contrapuntal kind, such as \*bitonality, \*serial techniques, and \*pandiatonicism. The recent development known as \**musique concrète* indicates a trend toward methods of composition in which harmony no longer enters into consideration.

III. The theoretical treatment of harmony began with Zarlino's *Le Istitutioni harmoniche* of 1558. Zarlino was the first to analyze music on the basis of full chords (“corpo pieno di consonanze e di harmonie”) instead of consonant intervals, which led him to recognize the basic importance of the major and minor triad [see Arithmetic and harmonic mean]. Rameau's main contribution was the recognition of sixth chords and six-four chords as \*inversions of the triad, together with the seventh chord and its inversions. Gottfried Weber, in his *Versuch einer geordneten Theorie der Tonsetzkunst* (3 vols., 1817–21), seems to have been the first to use the present-day system of designating chords by Roman numerals, with traditional figured-bass symbols to indicate inversions.

### Harmony of the spheres [G. *Sphärenharmonie*].

The Pythagorean concept of the cosmos as consisting of separate spheres, one each for the planets, moon, and sun, which move around the earth at different velocities, producing different sounds. Later the seven spheres (Moon, Mer-

cury, Venus, Sun, Mars, Jupiter, Saturn) were thought to produce the seven notes of the scale (Cicero and others). This concept persisted through the Middle Ages under the name *musica mundana* (music of the world): "The music of the world is that produced by the concordance of sounds caused by the motion of the heavenly bodies" (Boethius). A different interpretation of cosmic harmony was given by Johannes Kepler (1571–1630), who found that the aphelions and perihelions of the six planets (moving around the sun in elliptical orbits) are in the same ratios as the basic musical intervals:  $\frac{4}{3}$  (major third) for Saturn;  $\frac{5}{4}$  (minor third) for Jupiter;  $\frac{3}{2}$  (fifth) for Mars;  $\frac{1}{16}$  (half-tone) for the earth;  $\frac{2}{25}$  (*diesis*) for Venus;  $\frac{5}{12}$  (octave plus minor third) for Mercury. See A. Moberg, in *Svensk Tidskrift for Musikforskning*, 1937; M. Schneider, in *AM* xxxii.

**Harold en Italie** [F., Harold in Italy]. A program symphony by Berlioz, op. 16, written in 1834 at the request of Paganini, who wanted a work that would feature an exceptional viola he had just acquired. The symphony, which has a prominent viola part, is in four movements, after portions from Byron's *Childe Harold*: (1) Harold aux Montagnes (Harold in the Mountains); (2) Marche de Pélerins (Pilgrims' March and Prayer); (3) Sérénade (Serenade of an Abruzzi Mountaineer to his Sweetheart); (4) Orgie de Brigands (Orgy of the Brigands).

**Harp** [F. *harpe*; G. *Harfe*; It., Sp. *arpa*]. Generic name for chordophones in which the plane of the strings is perpendicular to the soundboard (not parallel as in, e.g., the zither and piano); see Instruments IV, D. It is nearly always plucked.

1. *The double action harp*. The double action (or double pedal) harp used in modern orchestras was introduced about 1810 by Sébastien Érard. It has a large triangular frame that consists of an upright pillar, a hollow tapered back (with the soundboard), and a curved neck. The strings are attached to the neck and extend down to the soundboard. It has a range of six octaves and a fifth, with seven strings to the octave, tuned normally in the key of  $C^b$  major, i.e., from  $C_1^b$  to  $g'''^b$ . At the foot of the instrument are seven pedals, one controlling all the C-strings, one all the D-strings, etc. Each pedal can be depressed to two notches—"double action"—and each time the corresponding strings are shortened to sound one semitone higher than normally. Thus, the C-pedal in high position gives the tone  $C^b$ , in the first notch the tone C, and in

the second notch the tone  $C^\sharp$ . With all the pedals in the first notch the tuning of the instrument is C major; with all in the second,  $C^\sharp$  major. Operation of single pedals makes all the major and minor keys available as well as altered chords so long as they do not involve "cross-relations," i.e., the simultaneous use of  $C^\flat$  and  $C^\sharp$ , or  $E^b$  and  $E^\flat$ . Special effects can be obtained by enharmonic substitutions. For instance, the tuning  $c d^\sharp e^b f^\sharp g^b a b^\sharp c$  makes it possible to produce the diminished seventh chord  $c-e^b-f^\sharp-a$  in a rapid glissando over all the strings. Of special charm are the harmonics of the harp, which are produced by resting part of the hand on the middle of the string while plucking with the thumb. The resulting tone is, of course, the higher octave of the normal tone, but with a different, mysterious timbre. Still another timbre can be obtained by plucking the strings close to the soundboard.

II. *The chromatic harp*. This harp was introduced in 1897 by the Parisian firm of Pleyel. It abandons the pedal mechanism entirely, substituting a string for each semitone of the octave. Despite certain advantages (there is no restriction with regard to the simultaneous use of natural and chromatic degrees, so that anything playable on the piano is playable on the chromatic harp) it has not been generally accepted and has only a small repertoire of music.

III. *History*. Harps are among the oldest instruments. In \*Mesopotamia they are documented as far back as c. 3000 B.C., and a great variety of forms existed there as well as in \*Egypt. In spite of many Biblical references to King David's "playing the harp," it is not certain whether the Hebrews had a harp. King David's instrument, the *kinnor*, was not a harp but a lyre, similar perhaps to the Greek kithara [see *SaHMI*, p. 106f]. In Greece there were various types of harp, such as the *pektis* and the \**magadis*.

In Europe, harps made their first appearance in Ireland, which still uses the Irish harp (*clarsach*) as its heraldic symbol. Whether the instruments represented on Irish stone crosses of the 9th and 10th centuries were harps or lyres is still a matter of controversy among scholars [see *SaHMI*, p. 262; N. Bessaraboff, *Ancient European Musical Instruments* (1941), p. 215; also p. 418, 460n, 461n. On the other hand, the ancient English *rotta* probably was a harp. In Wales harps (*telyn*) were known before A.D. 1000. In the 12th century the harp spread to the Continent, where it was held in high esteem by the troubadours, trouvères, and minnesingers. In

1

1. Irish harp. 2. Harp.

the 16th and 17th centuries harp playing was cultivated particularly in Spain and Italy. Harps of the late 17th century had hooklike gadgets in the neck whereby the pitch of the strings could be raised a semitone. In 1720 C. Hochbrucker introduced five pedals to operate the hooks, each pedal altering the tuning of a string and its octaves.

IV. *Repertory.* The earliest extant sources for harp music are the *Libro de cifra nueva* published by Venegas des Henestrosa (1557) and Antonio de Cabezón's *Obras de música* (1578). Both bear the remark "para tecla, harpa, y vihuela," indicating that the compositions (\**tientos*, liturgical pieces, variations) could be played on keyboard instruments, harps, or lutes. Compositions written expressly for the harp are found among the keyboard works of the Neapolitan composers Trabaci and Mayone [see Neapolitan school II]. Mayone's *Secondo libro di diversi capricci* of 1609 contains a "Ricercar sopra il Canto Fermo di Costantio Festa, et per sonar all'Arpa" [see Spagna]; Trabaci's *Il Secondo Libro de Ricercate* of 1615 a "Toccata . . . per l'Arpa" and "Ancidetemi pur, Per l'Arpa." All these pieces show a high degree of virtuosity; probably they were written for Giovanni Leonardo dell'Arpa, who belonged to the group of musicians around Gesualdo. A much later and artistically rather inferior repertory of solo pieces for the harp begins with the compositions of J. B. Krumpholtz (1745–90) and M.-M. de Marin (1769–1861). Harp virtuosos of the early 19th century, such as Martin-Pierre Dalvimare (1772–1839), Robert-Nicolas Bochsa (1789–1856), and Elias Parish-Alvars (1808–49), obligingly tendered to the demands of the harp-playing ladies in the salons of Paris and London. It was not until the end of the 19th century that music of artistic merit was written for the harp, mainly by French composers such as Saint-Saëns (*Fantaisie* for violin and harp), Debussy (*Sonata* for flute, viola, and harp), Ravel (*Introduction et Allegro* for harp, string quartet, flute, clarinet), Roussel (*Serenade* for flute, violin, viola, cello, and harp), Florent Schmitt (*Andante et Scherzo* for harp and string quartet), and Engelbrecht (*Sonatina* for flute and harp; *Quintet* for strings and harp). Other chamber works calling for the harp are by D. G. Mason (3 pieces for flute, harp, string quartet), Bax (*Sonata* for viola and harp), and Carlos Salzedo.

The harp was occasionally used in Italian opera of the early 17th century (Monteverdi, *Orfeo*, 1607; see *Orchestration II*, *Orchestra II*),

and then almost disappeared from the orchestra. Occasionally it was employed for the rendition of thoroughbass. Handel and Gluck used it a few times, the former in *Esther* (1720), the latter in *Orfeo* (1762). Mozart wrote a Concerto for flute and harp (K. 299) and Beethoven used the harp in *Prometheus*. Berlioz, Liszt, Wagner, and most later composers included the harp in their orchestral scores, and composers such as Debussy and Ravel used it prominently as a vehicle of impressionist coloring, often writing parts for two harps.

I-II by W.D.D.

**Harpa** [It.]. \*Harp.

**Harp lute.** (1) An early 19th-century instrument combining features of the guitar (rather than the lute) and harp. It looks like a guitar that, instead of the neck, has a harplike structure attached to the top of the body, thus providing space for a greater number of strings. Similar constructions were the *Dital harp* and *Harp-lute guitar*. See ill. in *GD* ii, opp. 70, 542; *GDB* viii, opp. 146, iv, opp. 90. (2) Name for a small harp built by Pleyel in the early 20th century and used by De Falla in his *El Retablo de Maese Pedro*.

**Harp Quartet.** Popular name for Beethoven's Quartet in E-flat op. 74, so called on account of some pizzicato arpeggios in the first movement.

**Harpsichord** [F. *clavecin*; G. *Cembalo* (*Clavicimbel*, *Kielflügel*); It. *clavicembalo*; Sp. *clavicémbalo*]. I. A stringed keyboard instrument in use from the 16th through 18th centuries and similar in shape to the modern grand piano, the strings being roughly parallel to the long side of the

case. Each string was plucked by a plectrum of a crow quill mounted in the pivoted tongue of a fork-shaped jack, which stood on the rear end of the key lever. Depressing the key raised the jack until the horizontally projecting plectrum plucked the string. Upon release of the key, the jack fell back until the underside of the plectrum touched the string, causing the tongue to rotate on its pivot. As the jack continued to fall the plectrum was tilted upward and back until its point passed below the string. A string of boar's bristle mounted at the rear of the jack then returned the tongue to its original position so that the jack was again ready to pluck. A damper made of woven woolen cloth was inserted into a slot sawed in one tine of the forked jack, its bottom edge just above the level of the plectrum. When the key was at rest the damper touched the string, but the slightest depression of the key raised the damper, leaving the string free to vibrate. Thus the string of the harpsichord, like the pipe of an organ, could continue sounding only so long as the player held a key down.

Each rank of jacks was carried in a pair of mortised battens mounted vertically over one another. The lower batten (lower guide) was fixed, but the upper batten (slide or register) was movable, usually by means of hand stops. Thus each rank of jacks could be moved slightly toward or away from its choir of strings, engaging or disengaging the plectra. In this way "stops" or ranks of jacks could be silenced or added to the ensemble.

*Harpsichord action.*

The typical 18th-century harpsichord had three choirs of strings, two of which were tuned to 8' pitch and one an octave higher at 4' pitch [see Foot]. (Very rarely a fourth choir at 16' pitch might be added.) Such a harpsichord would ordinarily have three ranks of jacks, one for each choir. Frequently there were two keyboards, the upper of which might have only one 8' stop. The lower manual usually sounded the other 8' stop and the 4' stop. The upper manual normally could be coupled to the lower, making all three stops available from the lower keyboard.

The choirs of strings were used singly or in various combinations to provide variations in loudness and timbre, much as the stops of the organ are employed. The more nasal sound of a string plucked near one end is noticeable in the upper manual (front) 8' stop of the typical harpsichord as compared to the darker, more center-plucked sound of the lower manual 8'. Sometimes a special rank of jacks was provided to pluck the upper manual choir of 8' strings at its extreme end to produce an even more nasal timbre (lute stop). Buff leather pads were used to partially damp one choir of strings, giving a harplike effect (buff stop).

Many modern harpsichords do not resemble their antique prototypes in the most essential details. Especially during the first years of the 20th-century revival of the harpsichord, there was a tendency to employ concepts of design and aesthetic more germane to the piano or organ than to the harpsichord. The ability of the harpsichord to vary its timbre has been exploited more than in earlier centuries, and for many years nearly all harpsichords seen in concert halls had several pedals provided to change the stops. Recently, however, several players of the first rank have returned to hand stops. The 16' stop for a time was almost universally fitted to concert instruments despite the fact that in early times it was found only in Germany during the 18th century, and even there only rarely. Most of these modern instruments were constructed far more heavily than the early instruments, with longer treble strings and shorter bass strings, often overspun in the manner of the bass strings of the piano. Plectra were of leather instead of the quill almost invariably found in early times. All of these changes tended to produce a more sustained but weaker tone of less harmonic complexity than that typical of antique instruments.

Since about 1950 many makers in several countries have returned to the early principles,

and harpsichords are now being made that not only closely resemble those for which the keyboard music of the Renaissance and baroque was composed, but which to their enthusiasts seem to have solved many of the performance problems that seemed insurmountable to harpsichordists of the first half of the century. At present the field is still being contested by the proponents of the modern and antique styles of instrument.

Throughout the baroque period the harpsichord was the chief instrument for the realization of \*thoroughbass accompaniment, always in chamber music and occasionally (in place of the organ) in church music. Its ability to blend with other instruments while providing a slight impulse at the moment of ictus makes it unsurpassed for this purpose. Although the harpsichord cannot produce a gradation of sound by lighter or stronger touch, this limitation is not felt in the context of baroque style. For contrapuntal music it is definitely superior to the piano, since the middle and lower parts of a composition stand out with amazing clarity.

II. *History*. The earliest records of what may have been a harpsichord-like instrument date from the 14th century, when sources in England, France, Spain, and Burgundy mention an \*echiquier that was described in 1387 as "an instrument like an organ which sounds by means of strings." A drawing of the harpsichord in plan view and several suggested mechanisms for jacks with a discussion of their operation is contained in the mid-15th-century manuscript of Henri Arnaut de Zwolle, a member of the retinue of the Duke of Burgundy. Other early representations are French, German, and English in origin [see *SaHMI*, pp. 334–43, for a discussion of the early history of the harpsichord]. One of the earliest of all detailed treatments of the harpsichord is preserved in S. Virdung's *Musica getutscht* of 1511. Virdung provides extremely crude illustrations of what he calls a virginal, clavicimbalum, and claviciterium. The distinction between the first two is not clear since both appear to have been small rectangular instruments. The claviciterium was a small upright harpsichord looking very much like the small portable organs of the period.

Although nearly all of the early written descriptions of the harpsichord were made north of the Alps, the oldest extant instruments are Italian. Boalch has provided the names of several 15th-century Italian makers who were active as early as 1419, but the oldest harpsichord to have

survived was made in Rome in 1521. Italian harpsichords from this date until late in the 18th century generally resembled this instrument very closely. Their construction was very light, of unfinished cypress ornamented by elegant moldings. The elongated and deeply incurved harpsichords were enclosed in outer boxes ornamented according to the prevailing fashion. Usually there were two 8' stops and a single manual of four octaves, range C–c''', with a \*short octave in the bass. The lack of development of the Italian type of harpsichord can perhaps be explained by the Italian emphasis on its role as a continuo instrument in the baroque. The transparent but rhythmically emphatic tone of the Italian instrument could hardly be improved upon for that purpose.

The demands of the solo keyboard literature developing north of the Alps produced a much more elaborate instrument. The earliest extant northern instruments were made in Antwerp toward the end of the 16th century, especially by the Ruckers family. Much heavier in construction than the Italian instruments, with painted exteriors and interiors covered with block-printed paper, this Flemish type influenced all subsequent schools of harpsichord-making north of the Alps. At first single manual instruments C–c''' (short octave) with two stops, 1 × 8', 1 × 4', the Flemish harpsichords later are found with 2 × 8' and occasionally 2 × 8', 1 × 4'. About the middle of the 17th century a second manual was first fitted for expressive purposes (originally it was used merely as a transposing device), probably developed by French makers. Flemish harpsichords were imitated and rebuilt throughout the 18th century in Germany, England, and especially France. During the 18th century each of these countries developed a characteristic national style that nevertheless owed a great deal to the Antwerp makers of the previous centuries.

Between 1500 and 1800 there were a variety of shapes and constructions under names that cannot always be identified with a given type. There were instruments in the shape of a long wing called harpsichord, clavicembalo, clavecin, Flügel, virginal, épinette; a rectangular box—virginal, Instrument, spinetta; an upright wing—clavicytherium; and a short wing extending diagonally—spinet, épinette à l'Italienne [ill. in *GD* i, opp. 664; ii, opp. 546; v, opp. 552; *GBD* iv, opp. 96, 102]. See Arcicembalo; Arpicordo; Clavicytherium; Spinet; Virginal; also under Pedal piano.

In the late 18th century the harpsichord was gradually displaced by the piano. It is interesting to note that the original editions of almost all the Beethoven sonatas up to op. 27 bear the inscription: "Pour le Clavecin ou Pianoforte." This does not mean that such essentially pianistic works were composed for the harpsichord, but it does show that harpsichords were still widely in use about 1800 and that the publishers (who in all probability were chiefly responsible for such inscriptions) were anxious to accommodate the players and owners of the old instrument as well as those of the newer one.

Boalch, *Makers of the Harpsichord and Clavichord, 1440 to 1840* (1956); E. Harich-Schneider, *The Harpsichord: An Introduction to Technique, Style and the Historical Sources* [1954]; H. Neupert, *Harpsichord Manual* (1960). See also under Keyboard Instruments.

F.H.

**Harpsichord music.** Throughout the 16th and 17th centuries it is difficult to draw clear lines of demarcation among compositions for the organ, harpsichord, and clavichord. See the explanations under Keyboard music.

I. *Renaissance* (to 1600). Practically all keyboard music written prior to 1500 is organ music. Clearly secular compositions, such as the numerous intabulations of Italian, French, or German songs in the Codex Faenza and the Buxheim Organ Book, could *a priori* be claimed for the harpsichord, but it is more than doubtful whether this instrument was generally known in Italy about 1400 (Codex Faenza) or in Germany about 1470 (Buxheim Organ Book). In the 16th century we find a large repertory of keyboard dances, and these may well be considered the beginning of the literature for the stringed instruments, primarily the harpsichord. The earliest examples are in the MS book of Hans Kotter (c. 1515), in P. Attaignant's *Quatorze Gaillards* (1529), and in an English MS of c. 1525 [see Dump; Hornpipe]. Some of them also show traces of an idiomatic harpsichord style, such as quick tone repetition and "percussive" chords [see Ex., from Hans Weck's *Spanyöler Tancz*; HAM, no. 102]. Similar elements occur in the dances found in the *Intabolutura nova di varie sorte di balli* of 1551 and in the late 16th-century books of the German \*colorists. Dances and variations figure prominently in the repertory of the English virginalists, who were the first to develop an idiomatic harpsichord style based on

quick "pianistic" figurations (broken-chord passages, parallel thirds, quick scales, etc.). See also *Basse danse*; *Passamezzo*; *Pavane*; *Variations IV* (1).

II. *Baroque* (1600–1750). As in the preceding period, the harpsichord literature consists mainly of dances, now arranged in suites, and of variations. Gradually certain types of organ music, such as the toccata and the fugal forms (*ricercar*, *canzona*, *capriccio*, *fugue*), took on stylistic features that made them suitable for stringed keyboard instruments as well. In Italy we find, about 1600, a school of composers working in Naples [see Neapolitan school II] who were the first to prefer the harpsichord to the organ. A. Valente published, in 1576, an *Intavolatura de cimbalo*, and G. M. Trabaci said, in his publication of 1615, that "the harpsichord is the sovereign of all the instruments in the world, and upon it all music can be played easily" [see W. Apel, in *MQ* xxiv, 425]. These Neapolitan masters represent the transition to Frescobaldi (1583–1643), whose numerous *partitas* (variations) could well be claimed for the harpsichord although, like Sweelinck's variations, they also belong to the literature for the organ. Frescobaldi abandoned the strictly contrapuntal texture of the earlier period for a freer and more idiomatic keyboard style in which the voices are allowed to come and go freely [see *Freistimmigkeit*]. His pupil Froberger (1616–67) went even further in this direction, being influenced by the free style of French lute music (Denis Gaultier). Johann Caspar Kerll (1627–93), Alessandro Poglietti (d. 1683), and Johann Kuhnau (1660–1722) contributed some amusing program pieces, the last-named particularly known for his *Musikalische Vorstellung einiger Biblischen Historien* (1700) and his attempts to transfer the trio sonata to the harpsichord (*Clavier-Übung* ii, 1692). A large repertory of preludes, fugues, suites, toccatas, etc., was created by numerous 17th-century German composers mentioned under Organ music II. Bach's compositions for the harpsichord include such immortal works as the *Inventions*, *Well-Tempered Clavier*, *English and French Suites*, *Partitas*, *Chromatic Fantasy and Fugue*, *Ital-*

ian Concerto, French Overture, and Goldberg Variations.

An important school of harpsichord composers (clavecinists) existed in France, from Chambonnières (c. 1602–72) to Rameau (1683–1764) [see France III]. François Couperin (1668–1733) created the \*character piece, a genre that Rameau endowed with traits of ingenious characterization. In England Henry Purcell (c. 1659–95) and Handel (1685–1759) made important contributions, mainly to the suite. In Italy the toccata took on features of a somewhat superficial virtuosity with Bernardo Pasquini (1637–1710) and Alessandro Scarlatti (1660–1725), while Domenico Zipoli (1688–1726) pursued a more serious line in his toccatas, fugues, and suites. The greatest Italian keyboard composer of this period was Domenico Scarlatti (1685–1757), who wrote more than 400 pieces, called sonatas, in which he exhibited a highly remarkable display of ingenuity, introducing such special devices as the crossing of the hands and extended rapid scales. His style was imitated by the Spanish padre Antonio Soler (1729–83). A contemporary of Scarlatti's, Francesco Durante (1684–1755), represents the transition to the rococo style of the 18th century.

III. *Rococo* (1730–80). While Bach was writing his masterpieces, the apex of a glorious tradition, other composers eagerly adopted the facile methods of the \*gallant style and produced quantities of mediocre works that even today fill volumes euphemistically entitled "The Early Masters of the Piano." Italian composers such as Durante, Porpora, Antonio Rossi (frequently confused with Frescobaldi's pupil Michelangelo Rossi), Paradisi, Galuppi, Grazioli, Sacchini, and Rutini wrote numerous harpsichord sonatas that, however slight in quality, are historically important as the precursors of the classical sonata [see Sonata B, III; also Haffner collection]. Padre Martini's (1706–84) sonatas are of a more serious nature but tend to be academic.

The end of the harpsichord literature can be seen in the works of Bach's sons. Karl Philipp Emanuel published in 1742 and 1744 two collections entitled *Sei Sonate per Cembalo* (the Prussian and Württemberg Sonatas), but his later keyboard compositions are for the clavi-chord (*Sechs Sonaten für Clavier*, 1760) and his latest for the piano (*Clavier-Sonaten . . . fürs Fortepiano*, 1780, '81). Wilhelm Friedemann also published *Sei Sonate per il Cembalo* in 1745, while his *12 Polonaises* (1765?) are written in a

highly expressive style that calls for the clavi-chord or piano. Johann Christian Bach's compositions nearly always are marked "pour le clavecin ou le piano forte" (sonatas, 1770; concertos, 1777), as is an early publication of Haydn's Variations in F minor (1799), obviously as a publisher's advertisement. None of Mozart's compositions was written for the harpsichord. Not until the 20th century did composers again write for the harpsichord, mostly concertos with a small orchestra. The first work of this kind was by De Falla (1923), followed by others by Poulenc, Martinu, Orff, and Hugo Hermann.

Steinberg, "Some Observations on the Harpsichord in Twentieth Century Music" (*Perspectives of New Music* i). See also Keyboard music; Piano music.

**Harp-way tuning.** See under Viol IV, 3 (lyra viol).

**Hasosra.** A Biblical trumpet. See Jewish music I; Brass instruments V (a).

**Hastig** [G.]. With haste, hurrying.

**Haupt-** [G.]. Chief, principal. *Hauptstimme*, principal part (usually soprano); *Haupttonart*, principal key, i.e., the original key returned to after a modulation; *Hauptwerk*, great organ;

**Hauptsatz**, first theme (or section) in the sonata form [see under *Satz*].

**Hausmusik** [G.]. Music for home use, as opposed to music for public performance. See *Gebrauchsmusik*.

**Haut, haute** [F.]. High. *Haute-contre*, high tenor, male \*alto, usually replaced by a female contralto. *Haut-dessus*, high treble, soprano.

**Hautbois, hautboy** [F.]. \*Oboe.

**Haydn Quartets**. Familiar name of six string quartets by Mozart (K. 387, 421, 428, 458, 464, 465), composed 1782–85 and all dedicated to Haydn. They are listed as nos. 14 to 19 in the complete series of Mozart's string quartets.

**Haye, hay, heye**. A dance figure or dance of the late 16th century. Arbeau, in his *Orchésographie* (1589), speaks of the "passage de la haye" in the dances of the *bouffons* (*matasins*). It was well known in England during the Elizabethan period. In the 17th century it was identified with the \*canarie (John Playford's *Musick's Handmaid* of 1678 includes an air entitled "The Canaries or the Hay"). The name may be derived from F. *haie*, hedge, because the dancers are aligned in two hedgelike rows, probably in imitation of a battle.

**Hb.** Abbr. for F. *hautbois* (oboe).

**Headvoice**. Higher register of a voice; cf. \*chest voice. See *Register* (2).

**Hebrew music**. See *Jewish music*.

**Hebriden, Die, or Fingals Höhle** [G., The Hebrides, or Fingal's Cave]. Concert overture by Mendelssohn (B minor, op. 26, 1830). The composition was inspired by a visit to the famous cave in Scotland during his first tour through the British Isles.

**Hebung** [G.]. See under *Arsis* and *thesis*.

**Heckel-clarina, Heckelphonklarinette** [sometimes misspelled *heckel-clarind*]. See *Clarinet* family II.

**Heckelphone**. See under *Oboe* family II, E.

**Heftig** [G.]. Violent.

**Heirmos**. See *Hirmos*.

**Heiter** [G.]. Cheerful.

**Heldenleben, Ein** [G., A Hero's Life]. Symphonic poem by R. Strauss, op. 40, completed 1898. The work describes the composer's own strug-

gles to achieve recognition, depicting the jibes of the critics (by a dissonant "adversaries' section" and a noisy "battle scene") and the unceasing devotion of his wife (by an extended violin cadenza).

**Heldtenor** [G.]. A tenor voice of great brilliancy and volume, well suited for operatic parts of the "hero," e.g., Siegfried.

**Helicon**. See under *Brass instruments* III (e).

**Hemidemisemiquaver**. See under *Notes*.

**Hemiola, hemiola** [Gr.]. In early theory the term had two meanings, both implying the ratio 3 : 2. (1) If applied to pitches, *hemiola* meant the fifth, since the lengths of two strings sounding this interval are in the ratio 3 : 2 [see *Acoustics* III]. (2) In treatises on mensural notation (15th, 16th centuries) the term is applied to time values that are in the relationship 3 : 2, particularly to the use of blackened notes in *tempus perfectum* [see *Mensural notation* V], or, in modern terms, of three half notes instead of two dotted half notes:  $\frac{6}{4}$  | d . d . d d d | or  $\frac{3}{4}$  | d . d . d d |. This change from 6/4 to 3/2 or vice versa is found very frequently in the works of Dunstable, Dufay, and other 15th-century composers, as well as in music of the baroque period [see H. H. Wintersgill, "Handel's Two-length Bar," in *ML* xvii, no. 1]. It is a typical trait of the \*courante. In the 19th century it was rediscovered by Schumann (*Spanische Liebeslieder*, op. 138, no. 6) and used frequently by Brahms [see Ex., from *Symphony* no. 2]. See

*Polo*. See M. B. Collins, "The Performance of Sesquialtera and Hemiola in the 16th Century" (*JAMS* xvii); K. P. Bernet-Kempers, "Hemiolenrhythmik bei Mozart" (*CP Osthoff*).

**Hemitonium** [Gr.-L.]. Semitone.

**Heptachord**. A term occasionally used to distinguish the concept of the modern octave, which consists of seven different tones, from the earlier \*hexachord, which includes only six. Ramos de Pareja (*Musica practica*, 1482) used *heptachordum* to mean the interval of the seventh [see ed. by J. Wolf, p. 49].

**Hermannus letters.** A system of letters used by Hermannus Contractus (d. 1054) in order to clarify the intervals in nondiastematic MSS (*e* = *equalis*, i.e., unison, *s* = semitone, *t* = tone, etc.). See A. Mocquereau, in *CP Riemann*.

**Hermeneutics.** The term, which properly means interpretation of the Scriptures, was introduced into musical aesthetics by H. Kretzschmar (c. 1900) for his method of "interpreting" musical motifs as the expression of human emotions, etc. This method, which was also adopted by R. Lach and A. Schering, is similar in principle to the *Affektenlehre* of the 18th century but places more emphasis on scientific method and systematic investigation based on the study of intervals, motion, rhythm, rests, etc. See Aesthetics of music III (a). See H. Kretzschmar, in *JMP* ix, xii; A. Schering, in *Bericht: Kongress für Aesthetik und allgemeine Kunstwissenschaft* (1914); *id.*, in *KJ* xxi; *id.*, in *Zeitschrift für Ästhetik und allgemeine Kunstwissenschaft* ix (1914); R. Lach, in *CP Kretzschmar*.

**Hero's Life, A.** See *Heldenleben, Ein*.

**Hervorgehoben** [G.]. Emphasized.

**Hesitation waltz.** See Boston.

**Heterophony.** A term used by Plato (*Laws* vii, 812 D) and adopted by modern musicologists (first by C. Stumpf) to describe an improvisational type of polyphony, namely, the simultaneous use of slightly or elaborately modified versions of the same melody by two (or more) performers, e.g., a singer and an instrumentalist adding a few extra tones or ornaments to the singer's melody. In addition to other polyphonic forms, heterophonic treatment plays an important role in many genres of primitive, folk, and non-Western art music (Chinese, Japanese, Javanese, etc.). Javanese and Balinese orchestral (gamelan) music in particular is largely based on a complex and highly sophisticated form of this technique. See Java III and the illustration, p. 438f. See also *HAM*, nos. 2 (Japan) and 3 (Siam).

Adopting the term as a convenient designation for a rather well-defined type of non-harmonic polyphony in which the intent is mono-melodic and horizontal is not tantamount to answering the question of what Plato meant in the passage indicated above. The basic meaning of Plato's text is that "the heterophony and diversity of the lyre, with the tune of the chords being different from the poet's melody, the use of tightness and looseness [small and wide inter-

vals?], of speed and slowness, of height and depth [itches?—all these in 'symphony' or 'antiphony' [agreement or contrast?], also the diversity of rhythm in the sounds of the lyre: are not suitable for the education of young people." From this description it is clear that ancient Greek heterophony involved a difference between the melody of the lyre and that of the singer. Whether the subsequent references to different intervals, speeds, pitches, and rhythms are details of heterophony or elements of "Greek polyphony" is not clear.

Handschin, *Musikgeschichte*, p. 61; P. Barry, in *MQ* v; G. Adler, in *JMP* xv; A. Dechévrens, "Étude sur le système musical chinois" (*SIM* ii).

**Heure espagnole, L'** [F., The Spanish Hour]. Opera in one act by Ravel (libretto by Franc-Nohain, based on his own comedy), produced in Paris, 1911. Setting: Toledo, Spain, 18th century. The music is in a delicate impressionist style.

**Hexachord.** I. In medieval theory, a group of six tones following each other in the intervallic sequence of *ttstt*, (*t* = *tonus*, whole tone; *s* = *semitonus*, half tone), e.g., *cdefga*. In the diatonic (C major) scale there are two—and only two—hexachords, one beginning with *c*, the other with *g*. If, however, the *b*-flat is added, there is a third hexachord, starting on *f*. The hexachord on *c* was called *hexachordum naturale*; that on *g* *hexachordum durum*, because it included the *b durum*, i.e., *b* natural [see Letter notation]; that on *f* *hexachordum molle*, because it included the *b molle*, i.e., *b*-flat. Since medieval theory did not consider tones of higher or lower octaves "identical," there were seven hexachords in the scale from *G* to *e''*:

In medieval theory the compass of tones was obtained not by joined octaves but by overlapping hexachords. This method, although generally considered inferior to the modern practice, is actually superior in that it produces the scale without at the same time establishing a preference regarding tonality. Indeed, in the modern

system the initial tone *c* automatically becomes a tonal center (in other words, our diatonic scale is necessarily a "C-major scale"), whereas in the system of the hexachord such a fixation is avoided.

II. As an aid for memorizing, Guido d'Arezzo (c. 990–1050) designated the six tones of the hexachord by the vocables [L. *voces*, *voces musicales*] *ut*, *re*, *mi*, *fa*, *sol*, *la*. These are the initial syllables of the first six lines of a hymn to St. John [see *LU*, p. 1504], whose melody (probably invented by Guido himself) has the peculiarity of beginning one tone higher in each successive line:

<i>c</i> <i>d</i> <i>f</i> <i>de</i> <i>d</i>	<i>d</i> <i>d</i> <i>cd</i> <i>e</i> <i>e</i>
<i>Ut</i> <i>quant</i> <i>la-</i> <i>xis</i>	<i>Re</i> - <i>sonare</i> <i>fibris</i>
<i>efg</i> <i>e</i> <i>d</i> <i>c</i> <i>d</i>	<i>f</i> <i>g</i> <i>a</i> <i>gf</i> <i>d</i> <i>d</i>
<i>Mi-</i> <i>ra</i> <i>ges</i> . <i>orum</i>	<i>Fa</i> - <i>muli</i> <i>tu</i> - <i>orum</i>
<i>gag</i> <i>e</i> <i>f</i> <i>g</i> <i>d</i>	<i>a</i> <i>g</i> <i>a</i> <i>f</i> <i>ga</i> <i>a</i>
<i>Sol-</i> <i>ve</i> <i>polluti</i>	<i>La</i> - <i>bi-i</i> <i>re</i> - <i>a</i> <i>tum</i> , <i>Sancte</i> <i>Johannes</i> .

(That with relaxed voices thy servants may be able to sing the wonders of thy deeds, remove the sin from their polluted lips, O holy John.) These syllables were used as a "movable solmization," being applied to each of the seven hexachords. Thus, the tone *d* was *sol* (fifth) in the hexachord on *G*, and *re* (second) in that on *c*.

III. To indicate the various "functions" of a given tone, compound names were devised so as to include the tone's pitch letter as well as all its syllables, e.g., *D sol re* (*Desolre*), thus indicating that the tone *d* may appear either as a *sol* or a *re*. Following is a chart of the complete nomenclature (*D.* = *durum*; *N.* = *naturale*; *M.* = *molle*):

<i>e''</i>	<i>la</i>	<i>la</i>	<i>E la</i> ( <i>Ela</i> )
<i>d''</i>	<i>sol</i>	<i>sol</i>	<i>D la sol</i> ( <i>Delasol</i> )
<i>c''</i>	<i>fa</i>	<i>fa</i>	<i>C sol fa</i> ( <i>Cesolfa</i> )
<i>b'</i>	<i>mi</i>	<i>mi</i>	<i>B mi</i> ( <i>Bemi</i> )
<i>bb'</i>	<i>re</i>	<i>re</i>	<i>B fa</i> ( <i>Befa</i> )
<i>a'</i>	<i>ut</i>	<i>ut</i>	<i>A la mi re</i> ( <i>Alamire</i> )
<i>g'</i>	<i>fa</i>	<i>fa</i>	<i>G sol re ut</i> ( <i>Gesolreut</i> )
<i>f'</i>	<i>mi</i>	<i>mi</i>	<i>F fa ut</i> ( <i>Fefaut</i> )
<i>e'</i>	<i>re</i>	<i>re</i>	<i>E la mi</i> ( <i>Elami</i> )
<i>d'</i>	<i>sol</i>	<i>sol</i>	<i>D la sol re</i> ( <i>Delasolre</i> )
<i>c'</i>	<i>fa</i>	<i>fa</i>	<i>C sol fa ut</i> ( <i>Cesolfaut</i> )
<i>b</i>	<i>mi</i>	<i>mi</i>	<i>B mi</i> ( <i>Bemi</i> )
<i>bb</i>	<i>re</i>	<i>re</i>	<i>B fa</i> ( <i>Befa</i> )
<i>a</i>	<i>ut</i>	<i>ut</i>	<i>A la mi re</i> ( <i>Alamire</i> )
<i>g</i>	<i>fa</i>	<i>fa</i>	<i>G sol re ut</i> ( <i>Gesolreut</i> )
<i>f</i>	<i>mi</i>	<i>mi</i>	<i>F fa ut</i> ( <i>Fefaut</i> )
<i>e</i>	<i>re</i>	<i>re</i>	<i>E la mi</i> ( <i>Elami</i> )
<i>d</i>	<i>sol</i>	<i>sol</i>	<i>D sol re</i> ( <i>Desolre</i> )
<i>c</i>	<i>fa</i>	<i>fa</i>	<i>C fa ut</i> ( <i>Cefaut</i> )
<i>B</i>	<i>mi</i>	<i>mi</i>	<i>B mi</i> ( <i>Bemi</i> )
<i>A</i>	<i>re</i>	<i>re</i>	<i>A re</i> ( <i>Are</i> )
<i>G</i>	<i>ut</i>	<i>ut</i>	<i>G ut</i> ( <i>Gamma ut</i> )
<i>D.</i>			

To a certain extent the compound names served to differentiate octaves, e.g., *C fa ut* (*c*), *C sol fa* (*c'*), and *C sol fa* (*c''*).

IV. In order to accommodate melodic progressions exceeding the compass of one hexachord, two (or more) hexachords were inter-

locked by a process of transition, called *mutation*. For example, in order to interpret the melody *c e d g a b a*, the tone *g* was considered a pivot tone, being *sol* in the lower hexachord *c-a* and *ut* in the higher hexachord *g-e'*. Hence, the solmization of this melody would be: *ut mi re sol* (= *ut*) *re mi re*. If, however, the melody were *c e d g a b<sup>b</sup> a*, the mutation would have to be made into the hexachord *f-d'*: *ut mi re sol* (= *re*) *mi fa mi*. According to Engelbert (c. 1250–1331) the mutation was made preferably on *e*, *a*, *e'* or *a'* (*GS* ii, 324), while Johannes de Garlandia and Marchetto da Padua said that it could be made "in any tone having two or three *voces*" (*CS* i, 160; *GS* iii, 90). The accompanying figure shows a mutation passage from an instructive two-part composition found in the Codex Huelgas of c. 1300 (ed. Anglès, iii, 405).

V. The hexachord system superseded the Greek (and early medieval) system of the \*tetra-chord, in which a group of four tones served as the generating segment for the construction of the entire scale. The development of the hexachord system began with Guido (c. 990–1050), who in his "Epistola ad Michaellem Monachum: de ignoto cantu" introduced the syllables *ut*, *re*, *mi*, etc.) for the tones *c* to *a* (*GS* ii, 45). He also called attention to the identity of intervallic construction between *G-e* and *c-a* but did not apply the syllables to the former (*GS* ii, 47a). Nor did he mention the segment *f-d'* (*hexachordum molle*), probably because of the "irregular" nature (*minus regulare*) of the *b*-flat. No details concerning the post-Guidonian development seem to be known. The system appeared in its full form (three hexachords, compound pitch names, mutation, \*Guidonian hand, etc.) about 1300 in the writings of Hieronymus de Moravia (*CS* i, 21ff, 83ff). The term "hexachord" seems to be of a rather late date (16th century?). Tinctoris does not include it in his *Diffinitorium*. Medieval writers used designations such as *sex voces* (Tunstede, d. 1369; see *CS* iv, 220).

VI. The six tones of the hexachord have repeatedly been used as a *cantus firmus* or thematic subject for compositions, both vocal and instrumental. There are hexachord Masses

(*Missa Ut re mi fa sol la*) by A. Brumel (?), Morales, and Palestrina, the last-named being particularly noteworthy for an ingenious presentation of the basic material. Byrd, Bull, Sweelinck, and Frescobaldi used it as a subject for organ fantasias. Bull's composition (Fitzwilliam Virginal Book, i, 183ff) is especially interesting on account of its modulatory scheme, the hexachord (ascending and descending) being successively used in the keys of G, A, B, D<sup>b</sup>, E<sup>b</sup>, F and A<sup>b</sup>, B<sup>b</sup>, C, D, E, F<sup>♯</sup> [see Arcicembalo]. See also Solmization; Mi-fa; *Soggetto cavato*; *voces musicales* under Vox.

Lit.: H. Riemann, *Geschichte der Musiktheorie*, rev. ed. [1920]; *id.*, *History of Music Theory*, trans. R. H. Haggh (1962); *RiHM* 1.2, 173ff.

**Hexameter.** See under Poetic meter II.

**Hey.** See Haye.

**Hichiriki.** A Japanese oboe. See *Gagaku*; Oboe family III.

**Hidden fifths, octaves.** See under Parallel fifths, octaves.

**High fidelity**, abbr. *hi-fi*. The term refers to a standard of excellence in the reproduction of sound on discs, tape, and film. Recording companies and manufacturers of recording equipment have made great progress in this respect since 1945. See under Phonograph and recorded music.

**Hilfslinie** [G.]. Ledger line.

**Hinaufstrich** [G.]. See Bowing (a).

**Hindu music.** See India.

**Hinsterbend** [G.]. Fading away.

**Hintersatz** [G.]. Old term for organ mixture stop, so called because of the arrangement of the pipes one behind (*hinter*) the other.

**Hirmos (Heirmos).** In early \*Byzantine music (9th–12th centuries), a melody composed for the first stanza of a hymn and repeated with subsequent stanzas, in a strophic song. Naturally, the procedure was more flexible than with a modern strophic chant, admitting adjustments to the varying number of syllables in the different stanzas, like the method used with the psalm tones. Most of the *hirmoi* (which were collected in books called *hirmologion*) were composed in the 7th and 8th centuries, and were later used for other hymns modeled on the earlier music.

Lit.: H. Gaïsser, *Les "Heirmoi" de Pâques dans l'Office grec* (1905; also in *RMC* ii); A. Gastoué, *Les Origines du chant romain* (1907), pp. 60ff. See also general bibl. under Byzantine chant.

**Hirtenflöte** [G.]. Shepherd's flute. *Hirtenlied*, shepherd's song.

**His** [G.]. See under Pitch names.

**Hispaniae schola musica sacra.** See Editions XX.

**Histoire du soldat, L'** [F., The Soldier's Tale]. A play with music and dance by Stravinsky (libretto by C. F. Ramuz), produced in Lausanne, 1918. Setting: fairy tale. It is somewhat like a *ballet d'action*, combining ballet performance with a story told in dialogue by the characters and a narrator. The music, in acrid dissonances and pungent rhythms, consists of a number of \*character pieces such as Marche, Tango, Valse, Ragtime, and Choral, composed for a chamber orchestra of six instruments and percussion.

**History of music.** This article is devoted to a survey of epochs, schools, and musical forms, with cross-references to relevant articles elsewhere in this dictionary.

Nothing certain is known about the music of earliest man, but there is no reason to doubt that some kind of music was practiced even by Stone Age peoples. Some ancient peoples, especially those of \*Egypt, \*China, and \*Mesopotamia, have a musical tradition that can be traced back about three thousand years before the birth of Jesus. No music from these remote times has been preserved, but numerous archaeological findings and pictorial representations of instruments from different periods give evidence of musical activity and development long before the beginning of Western music. Somewhat later, other civilizations, e.g., those of \*Japan and \*India, developed.

Western music, on the other hand, began at a much later time, and, aside from scattered archaeological data [see, e.g., Lur], its history is recorded essentially in musical documents supplemented by theoretical writings. Moreover, it is a history that can be continuously traced from c. A.D. 800 to the present.

I. *The main periods.* Three times during its development, at intervals of 300 years, the evolution of Western music produced changes so strikingly novel that contemporary writers used the term "new" to describe them: the \**ars nova* of 1300, the \**nuove musiche* of 1600, and the

\*new music of 1900. To these "landmarks of innovation" we might add the year 1000, which marks one of the most important inventions in music, the musical \*staff (Guido and his predecessors). Other landmarks of equal importance occur almost exactly at the midpoint of each of the 300-year periods. The year 1750 marked the death of J. S. Bach. About 1450 came the rise of the \*Flemish school, marking the end of medieval music and the beginning of the Renaissance; and about 1150 arose the first important school of polyphonic music, the school of St. Martial. Finally, the middle of the 9th century can be regarded as the "beginning of polyphony," judging from the earliest preserved records. The 150-year periods so derived can be conveniently described by terms long used in the visual arts:

850: Beginning of polyphony  
 1000: Invention of the staff  
 1150: School of St. Martial  
 1300: \**Ars nova*  
 1450: Rise of \*Flemish school  
 1600: \**Nuove musiche*  
 1750: Death of Bach  
 1900: \*New music

but remarkable changes of style. About 1150 the school of \*St. Martial stands out as an important landmark in this evolution, being followed, about 1175, by the even more important school of \*Notre Dame, which, with its two masters, Leoninus and Perotinus, is usually considered the beginning of the \**ars antiqua* (13th century). Secondary forms developed by this school were the nonliturgical \*conductus and the \*clausulae—fragments, as it were, of organa that acquired particular importance as the starting point of the \*motet, the most characteristic form of the *ars antiqua* proper (Franco of Cologne, Petrus de Cruce). The early Gothic period also saw the rise of secular music under the Provençal \*troubadours (c. 1100–1300), who were followed, half a century later, by the northern French \*trouvères (c. 1150–1300) and the

\*Rococo, \*classicism, \*romanticism

\*Twentieth-century music

It goes without saying that in reality these periods are not as neatly marked off as the table above suggests. However, it does serve as a useful outline.

II. To 1300. For want of information, the history of pre-Christian music in Europe is practically limited to that of Greek music [see also under Rome]. The early Christian era saw the rise of Christian chant (plainsong), which appears to be rooted chiefly in the tradition of the \*Jewish synagogue. The most important branch of Christian chant [see Chant], that of the Roman Catholic Church, probably developed into its final form relatively late, approximately between 750 and 850 [see Gregorian chant]. Parallel developments led to the formation of \*Old Roman, \*Ambrosian, \*Gallican, \*Mozarabic, and \*Byzantine chant. About 850 (Romanesque period) began a period of amplification of the traditional repertory, leading to the \*tropes, \*sequences, and finally \*liturgical drama. More important than this "horizontal" broadening is the simultaneous rise of polyphonic music, which, in its early period, might be described as "vertical" broadening of the chant, i.e., as polyphonic settings of plainsong \**cantus firmi*. In the ensuing three centuries these settings, known as organa, underwent slow

German \*minnesingers (c. 1150–1350). The latter tradition continued to live in the \*Meistersinger (c. 1400–1600), the last representatives of monophonic music, aside from folksong, which, of course, was not restricted to any single period. Monophonic music also had a relatively short period of flowering, chiefly during the 13th century, in Spain (\**cantigas*) and in Italy (\**laude*).

III. 1300–1450. With the advent of the late Gothic period or, in musical terms, of the \**ars nova*, the emphasis in music underwent a striking change from the sacred to the secular, a change that engendered the appearance of an entirely new repertory, the polyphonic \**ballades*, \**rondeaux*, and \**virelais* in France (Machaut), and the \**madrigals*, \**caccie*, and \**ballate* in Italy (Jacopo da Bologna, Francesco Landini). The motet continued to be cultivated in France, growing in dimensions and acquiring peculiar structural features [see Isorhythmic]. Toward the end of the 14th century the development led to a highly mannered style of great rhythmic complexity and intricate dissonance treatment (Matteo da Perugia, Solage, and others). Gothic music was brought to a glorious climax by England's Dunstable, whose great genius left scant traces in his own country [see England III]

but became all the more important as the inspiring force of the renovation of French music, culminating in the \*Burgundian school of Dufay and Binchois.

IV. 1450–1600. The middle of the 15th century (\*Renaissance) saw a renewed emphasis on sacred music under the first masters of the \*Flemish school (or schools), Ockeghem and Obrecht. Although their Masses and motets, particularly those of the former, are far removed from what the term “Renaissance” suggests, Renaissance-like features—the “sun of Italy,” as it were—appeared in the secular compositions of Obrecht and still more so in those of his great successor, Josquin. In the early 16th century as in the early 14th century, numerous secular forms arose: the Italian \*frottola, the German polyphonic \*lied, the Spanish \*villancico, the Italian \*madrigal. The tradition of sacred music, however, continued in the numerous Masses and motets, reaching a peak under Palestrina, Lasso, Byrd, and Victoria. The beginning of the Renaissance also marks the starting point of a continuous development of \*instrumental music, for \*ensemble as well as for the organ and, somewhat later, the lute [see Prelude; Intabulation; Ricercar; Canzona (5); Fantasia; Toccata; Variations; Dance music; the last-mentioned with interesting forerunners in the 13th and 14th centuries (\*estampie)]. The Renaissance came to an impressive close with the pompous splendor of the Venetian \*polychoral style of G. Gabrieli [see Venetian school].

V. 1600–1750. In spite of attempts by various scholars to show that “nothing new happened” about 1600 (baroque), this year remains one of the most important landmarks in music history [see *Nuove musiche*; Baroque music], witnessing the rise of the \*recitative, the \*monodic style, and the \*thoroughbass, together with such novel forms as the \*opera, \*oratorio, \*cantata, and *basso ostinato* forms (\*chaconne and passacaglia), and leading quickly to a development of instrumental music equal in importance to that of contemporary vocal music. The fact that most of these styles and forms can be traced back to earlier roots again warns us that not all of the lines demarcating periods are hard and fast. Witness the continued influence of the Venetian as well as the \*Roman schools of the 16th century, or the fact that the two chief forms of baroque instrumental music, the \*suite and \*sonata, both are rooted in 16th-century developments [see Canzona (5)], while the contrast style of the \*concerto is more exclusively a fea-

ture of the baroque. In a way, the baroque period is the most “international” period in music history, with Italy, Germany, and France competing on almost equal terms and England not far behind. No other period can boast of such a variety of forms, so many great composers, or a summit such as that represented by Bach.

VI. 1750–1900. Although the changes following Bach’s death (1750) are well known, there actually is more (at least, just as much) “transition” here than elsewhere, namely in the \*rococo movement that began in France (Couperin) about 1700 and continued, under the name \*galant style, chiefly in Italy and Germany. In the latter country it took on, in the hands of W. F. and K. P. E. Bach, a greater expressiveness [see *Empfindsamer Stil*; also Berlin school] that heralds the achievements of the classical and even the romantic period. At the same time the members of the \*Mannheim school (and other composers also) laid the foundations for the formal development of the \*sonata, the dominant form of the 19th century, with its orchestral and chamber varieties, the \*symphony and \*quartet. Vienna became the musical center of the world under the masters Haydn, Mozart, Beethoven, and Schubert [see Classicism]. The last-named, the great master of the \*lied, also represents the transition to the \*romanticism of the 19th century. The early romanticists (Schumann, Mendelssohn, Chopin) cultivated particularly the \*character piece for piano, in which they achieved better results than in the large forms of the classical period. The symphonic tradition was revived, however (c. 1870–90), in the symphonies of Bruckner, Brahms, Tchaikovsky, and C. Franck, coming to a close with those of Mahler (c. 1890–1910). About 1850 the \*symphonic poem developed as a novel type of symphonic music, and the opera took a new direction under Wagner. Against the dominant position of German music there arose, about 1860, the national schools [see Nationalism] of the “peripheral” nations (Bohemia, Norway, Russia, Spain, England), and, about 1900, the \*impressionism that brought France back into the spotlight.

VII. After 1900. Impressionism was the first manifestation of a quickly growing reaction against romanticism and the musical tradition of the 19th century in general. The ensuing revolutionary tendencies, summed up under the term \*twentieth-century music, embrace a variety of attempts, experiments, and tendencies for which there is no parallel in the entire history of music.

General Periods	Musical Periods	Monophonic Music	Part Music, Vocal
600	Early Middle Ages	Gregorian chant

**Hoboe.** Old spelling for oboe.

**Hoch Kammerton** [G.]. See under Pitch.

**Hocket** [L. *hoketus*, *oketus*, *ochetus*; F. *hocquet*, *hoquet*; It. *ochetto*]. In medieval polyphony (13th and 14th centuries), a peculiar device consisting of the rapid alternation of two (rarely three) voices with single notes or short groups of notes, one part having a rest while the other sounds. See the accompanying examples: (1) motet *In Bethlehem*, c. 1280; (2) French \**chace*, c. 1320. Numerous motets of the period (Petrus de Cruce, De Vitry, Machaut) include passages in hocket style [see *HAM*, nos. 32e, 35]. Theorists of the 13th century mention *hoketus* not only as a technique to be used within a composition but also as an independent musical form. They probably mean pieces in which hocket technique is used consistently between the two upper parts. Six compositions of this type are in the Codex Bamberg [see P. Aubry, *Cent motets*, nos. 102, 103, 104, 106, 107, 108] and one among the works of Machaut (*Hoquetus David*, so called because the tenor employs the melisma DAVID from the *Alleluia Nativitas* (today *Alleluia Solemnitas*, *LU*, p. 1676a). All these are "motets" for instrumental performance, probably on wind instruments, which are more appropriate for playing single notes or short fragments than strings. Such hockets are the earliest type of \*instrumental music known to us.

Some of the 17th-century \*catches show a fragmentary alternation of voices similar to the

1

houp! Hu - o, Hu - o.

hocket technique. See M. Schneider, in *ZMW* xi; H. Husmann, in *AMW* xi, 296.

**Hoflied** [G.]. See under *Gesellschaftslied*.

**Hoftanz** [G.]. A 16th-century German dance, possibly a German variety of the French *basse danse*. About 50 examples are found in lute and keyboard tablatures of the 16th century, the earliest in the lute books of Judenkünig of 1515 and 1523 [*DTO* 37]. A "Hoftanz mit durchstraichen" (strumming all the strings of the lute, resulting in full chords) by Hans Newsidler is reproduced in *HAM*, no. 105a. Like other dances of the 16th century [see Spagna; *Passamezzo*], the majority of *Hoftänze* are based on traditional melodies ("Der schwarze Knab," "Bentzenauer"). See O. Gombosi, in *AM* vii; D. Heartz, "Hoftanz and Basse dance" (*JAMS* xix).

**Ho-hoane**. Corruption of Irish "ochone," i.e., \*lament. The Fitzwilliam Virginal Book contains a piece labeled "The Irish Hohoane" [ed. Barclay-Squire, i, 87].

**Hold**. Same as \*pause.

**Holz-** [G.]. Wood. *Holzblasinstrumente*, woodwinds. *Holzblaser*, player of woodwinds. *Holzharmonika*, *Holzstabspiel*, xylophone. *Holzschlegel*, wooden drumstick. *Holztrumpete*, see Clarinet family II; also *SaRM*, p. 181.

**Homme armé, L'**. See *L'Homme armé*.

**Homo-, iso-**. Prefixes that both mean "same" or "equal to." In musical terminology, particularly concerning rhythm, they are useful in distinguishing two different kinds of "identity" or "similarity," one vertical and the other horizontal. Thus, \*homorhythmic means the simultaneous use of the same rhythm in different parts of a contrapuntal texture, while \*isorhythmic means the successive use of the same rhythm in one part. A similar distinction can be made between homoperiodic and isoperiodic. Homoperiodicity is found in many clausulae and 13th-century motets [see, e.g., Aubry, *Cent motets*, no. 60] and isoperiodicity in those of the 14th century. See Poly-, multi-.

**Homophony**. Music in which one voice leads melodically, being supported by an accompaniment in chordal or a slightly more elaborate style. Practically all music of the 19th century is homophonic. Homophony is the opposite of polyphony, music in which all parts contribute more or less equally to the musical fabric.

However, the term is also applied to a kind of polyphonic (or part) music in which all the voices move in the same rhythm, thus producing a succession of intervals (in two-part writing) or chords (in three- or four-part writing). Hence, homophonic is synonymous with "strict chordal style" or familiar style. A more suitable term for this style is \*homorhythmic.

In French usage *homophonie* means (1) monophonic music; (2) enharmonic equivalence.

**Homorhythmic**. Designation for a type of polyphonic (or part) music in which all the voices move in the same rhythm, thus producing a succession of intervals (in two-part writing) or of chords (in three- or four-part writing; see under Homo-, iso-). The best-known examples are the four-part harmonizations of hymn or chorale melodies. Such music is commonly described as being in \*chordal style, \*familiar style, \*homophonic, \*isometric, note-against-note, or even harmonic. Since, however, homorhythmic texture has been used since the beginning of polyphony, terms implying the presence of chords or harmony are misleading.

The early organum, from its beginnings about 850 to c. 1100, is strictly homorhythmic. So are most of the conductus of the 13th century, written in two to four parts; hence the term "conductus style" as yet another synonym for homorhythmic, used preferably with reference to 13th- and 14th-century music. In the 15th-century \*fauxbourdon and the 16th-century \*falsobordone, homorhythmic writing takes on the function of harmonization. In the Masses and motets of Obrecht, Josquin, and later 16th-century composers the prevailing polyphonic (more properly, \*polyrhythmic) texture is often balanced by sections in homorhythmic style. This style was also used for the more popular types of 16th-century music, such as the *frottola*, *musique mesurée*, villanella, etc. After 1600 it persisted chiefly in harmonized hymns and chorales. As a rule, homorhythmic treatment goes hand in hand with a strictly syllabic setting of the text.

**Honduras**. Despite various efforts made at different times, musical life in Honduras has remained relatively undeveloped. Since the establishment of the first military band in 1876,

musical activity has been confined to a fairly small number of native conductors and composers. These include Ignacio Villanueva Galeano (b. 1885), composer of several military marches, Camilo Rivera (b. 1878), Ramón Ruiz (b. 1894), and Francisco R. Díaz Zelaya (b. 1898), as well as Manuel de Adalid y Gamero (b. 1872), the most prominent member of the group, composer of numerous orchestral, chamber, and solo instrumental works. Younger Honduran composers are Roberto Domínguez, Modesto Martínez, and Rafael Coello Ramos.

In the mid-1930's Leonidas Rodríguez founded an academy of music in Tegucigalpa, and in 1951 the *Escuela Nacional de Música* was established by government decree.

Leading in ethnomusicologic research has been Rafael Manzanares, director of the *Officina del Folklore Nacional*. According to him, folk music in Honduras reflects three main traditions: the indigenous, especially in the northwest areas of the country; the Creole or mestizo in the urban centers; and the Afro-Honduran. Typical of the indigenous tradition is music played on the native instrument known as *zambumbia* or *\*caramba*. *La correa* is a popular dance of Spanish origin, and the *iancunú* or *baile de máscaras* reflects African influences.

**Horn** [F. *cor*; G. *Horn*; It. *corno*; Sp. *trompa*]. I. The modern orchestral instrument, called French horn (in order to distinguish it from the English horn, a member of the \*oboe family), is a \*brass instrument with a funnel-shaped mouthpiece and a narrow conical bore wound into a spiral and ending in a large flaring bell. It has three valves (usually rotary, though in England piston valves are used) and is therefore also called valve horn [F. *cor-à-pistons*, *cor chromatique*; G. *Ventilhorn*; It. *corno ventile*, *corno a macchina*; Sp. *trompa de pistón*] to distinguish it from the early valveless instruments [see II]. See ill. under Brass instruments.

For the basic principles of tone production on the horn, see Wind instruments.

Normally the horn is pitched in F, and the series of its natural tones is F<sub>1</sub> F c f a c' f' g' a', etc. Owing to the narrow bore, however, the lowest tone of this series (pedal tone) is practically unobtainable, so that the series starts with F. By operating the valves a complete chromatic scale from B<sub>1</sub> to f'', etc., becomes available (the highest tones, however, being of little use). The horn is notated as a transposing instrument, written a fifth higher than it sounds. For the lowest notes the bass clef is used, usually (in older scores always) with the notes written a fourth lower—instead of a fifth higher—than their actual sound [see Ex.]. In older scores key signatures are avoided for the horn parts, the chromatic alterations being given with each single note; but today horn parts are commonly written with a key signature, which, owing to the transposed notation, has one flat less or one sharp more than that of nontransposing instruments, e.g., the violins (E-flat for a composition in A-flat, etc.).

The horn has the reputation of being the most difficult of all the orchestral instruments. Horn playing requires several special methods of tone production. The most important of these is stopping [F. *bouché*; G. *gestopft*; It. *chiuso*; Sp. *tapada*], achieved by inserting the hand into the bell. Formerly, on the natural (valveless) horn the missing tones of the natural series were produced by inserting the hand flat into the bell and closing it  $\frac{1}{4}$ ,  $\frac{1}{2}$ , or  $\frac{3}{4}$ . This gave a continuous scale mostly of diatonic tones, which, however, was not very satisfactory since the stopping changed the timbre. Nowadays stopping is used only to obtain a special effect. Blocking the bell with the hand and sharply increasing the wind pressure cause the tone to rise approximately a semitone. Stopped tones are indicated thus: +. To a limited extent (mainly in the lower two octaves) stopping can also be used to lower the pitch by as much as a semitone. The different methods of stopping depend largely on the individual player.

The mute [F. *sourdine*; G. *Dämpfer*; It., Sp. *sordina*] is a pear-shaped piece of metal, wood,

or cardboard that is inserted into the bell in order to obtain yet another timbre (muted horns). Modern mutes are nontransposing, while the older ones, smaller and shaped slightly differently, raised the pitch. Muting may also be done with the player's hand.

"Brassy" tones [F. *cuivré*; G. *schmetternd*] are obtained by increased wind pressure and can be produced either open, stopped, or muted.

Horns are also built and occasionally demanded in other sizes, e.g., E, E<sup>b</sup>, D, low C, low B<sup>b</sup>, and also in high B<sup>b</sup>, an octave above the largest size. More recently a "double horn" has come into use, a combination of the horns in F and B<sup>b</sup> alto [see Duplex instruments].

The solo and chamber music literature for the horn includes: Haydn, two concertos for one horn (maybe a third); Mozart, four concertos, and a quintet for horn, violin, two violas, and cello; Beethoven, Sonata for piano and French horn, op. 17, Sextet for two horns and strings, op. 81b; Schumann, Adagio und Allegro for horn and piano, op. 70, *Concertstück* for four horns and orchestra, op. 86; Brahms, Horn Trio, op. 40; R. Strauss, Concerto for horn, op. 11; Hindemith, Sonata (1939) and Concerto (1949); Britten, Serenade for tenor, horn, and strings.

II. *History.* The discussion here deals only with the modern horn's most immediate predecessors, the other members of the horn family being treated under Brass instruments. The earliest type was the hunting horn, a plain pipe that was coiled in a circle large enough to permit carrying over the shoulder. It had a shallow mouthpiece like that of a trumpet and therefore a loud and brilliant tone. Toward the end of the 17th century the instrument, having undergone various changes (smaller size, wider bell, etc.), began to be used in the orchestra. It was similar in most respects to the modern horn, except that it had no valves or crooks [see below], so that only the tones of a single harmonic series could be obtained. The details of the development leading from the hunting horn to the natural horn [F. *cor. d'harmonie*; G. *Naturhorn*, *Waldhorn*; It. *corno naturale*] are difficult to trace. Throughout the first half of the 18th century the orchestral horns had a trumpetlike sound and were frequently criticized as coarse and vulgar. Not until 1750 did the instrument take on proportions that gave it its typical "mellow" timbre.

About 1760 the Bohemian Kölbl constructed an instrument called *Amorschall*, a horn with a modified bell and with lateral holes covered by

keys, the first instance of a keyed brass instrument. Also c. 1760 the horn player Hampel of Dresden found that the natural tones of the horn could be lowered a semitone or whole tone by placing the open hand with closed fingers into the bell. This technique made it possible for the first time to produce "artificial" horn tones, thus bridging to some extent the gaps between the natural tones. The natural horns thus played were called *hand horn* [It. *corno a mano*].

In the 18th century horns were provided with \*crooks, additional lengths of tubing whereby the instrument's pitch could be changed. Thus, a horn in F could be made into a horn in E or E<sup>b</sup>, etc. At first the crooks were inserted immediately under the mouthpiece. This method, however, made the instrument inconveniently long, especially for hand-stopping. The above-mentioned Hampel is credited with the invention of curved sliding crooks, called "inventions," and hence the name *Inventionshorn* for instruments using them. The use of crooks together with stopped notes made the horn an almost completely chromatic instrument. However, the stopped notes differed in timbre from the natural notes and changing crooks was a time-consuming process. The invention, c. 1815, of \*valves by F. Blümel (or H. Stölzel?) did away with these inconveniences and revolutionized horn playing. The first part for the valve horn is in Halévy's *La Juive* (1835). The hand horn, however, continued to be used along with the modern type, owing to its more brilliant tone. See ill. under Brass instruments.

Lit.: R. Morley-Pegge, *The French Horn* [1960]; R. Gregory, *The Horn* [1961]; K. Taut, *Beiträge zur Geschichte der Jagdmusik* (1927); F. Piersig, *Die Einführung des Hornes in die Kunstmusik . . . bis zum Tode Joh. Seb. Bachs* (1927); H. Fitzpatrick, "Some Historical Notes on the Horn in Germany and Austria" (*GSJ* xvi); *id.*, "An Eighteenth-Century School of Horn-Makers in Bohemia" (*GSJ* xvii).

**Horn fifths** [G. *Hornquinten*]. See under Parallel fifths.

**Hornpipe.** (1) An obsolete wind instrument, probably identical with the pibgorn [see Clarinet family IV; Reed II]. (2) A dance popular in England from the 16th through 19th centuries [see Dance music III], which, at least in its later development, was performed as a solo dance by sailors, with folded arms and many characteristic steps and gestures. The earliest preserved hornpipe ("hornepype") is a composition by

Hugh Aston, dating from c. 1525 [repr. in J. Stafford Smith, *Musica Antiqua* (1812), in J. Wolf, *Sing- und Spielmusik*, rev. ed. (1931), and (slightly abridged) in *ApMZ* ii]. It is one of the most remarkable early keyboard compositions, noteworthy for its sheer flow of melodic inspiration above an extremely simple harmonic scheme, i.e., alternation of tonic and dominant [see *Ostinato*]. The numerous hornpipes of the 17th and 18th centuries are usually in moderate 3/2 time, later in 4/4 time, with a characteristic "Scotch snap" rhythm [see *Ex.*]. Examples are found in the theatrical works of Purcell, Handel's Concerto Grosso no. 7, Gottlieb Muffat's *Componimenti Musicali* (1739), *A Col-*

lection of *Original Lancashire Hornpipes* (1705), and the various books of \*country dances.

**Hornquinten, Hornsatz** [G.]. Horn fifths.

**Horn Trio.** A celebrated trio by Brahms, op. 40 (1865), for horn, violin, and piano.

**Hornwerk.** In Austria in the Gothic period and Renaissance, a set of organ pipes set on their own chest in a tower. The pipes, which all sounded together continuously so long as the mechanically operated bellows supplied wind, announced the hours of the day, the beginning of Mass and Vespers, etc. Later the Hornwerk was connected to a pinned barrel whereby tunes were inserted. The only intact surviving example is the *Stierorgel* (bull organ) at Hohe Feste, Salzburg, built in 1502. Others (only partly preserved) are at Rein (near Graz) and Heiligenkreuz (near Vienna). See R. Quoika, *Altösterreichische Hornwerke* [1959].

**Hosanna, Osanna.** A Hebrew word expressing triumph and glorification. In the phrase "Hosanna in excelsis" it occurs in the Sanctus of the Ordinary of the Mass [see *Mass C*, III]. In polyphonic Masses the phrase is always treated as a brilliant coda.

**Hptw.** [G.]. Abbr. for *Hauptwerk* (in organ music).

**Hr.** Abbr. for Horn.

**Huaiño** [Sp.]. Lively dance of Bolivia, Ecuador, and Peru. Also written *wainyio* and *guaiño*, it is usually in 2/4 meter and moderate tempo and

consists of two four-measure phrases that are constantly repeated. Originally, at the time of the Spanish conquest, the name *huaiño* was used by the Quechuan Indians for funeral dances.

J.O-S.

**Huapango** [Sp.]. Generic name for tunes played and danced at the *Bailes de Huapango*, a kind of popular festivity common mainly along the shores of the Gulf of Mexico. Fast and complicated steps danced to intricate cross-rhythms are characteristic of these dances, as well as the juxtaposition of 2/4, 3/4, and 6/8 meter. It is performed by instrumental ensembles that range from duos of harp and guitar to a full \**mariachi* band.

J.O-S.

**Huehuetl** [Sp.]. Generic name for a series of ancient Mexican upright drums made from hollowed logs. A jaguar skin that can be tightened or loosened to raise or lower the pitch covers the single drumhead. The player uses his fingers rather than mallets. Also see *MaMI*.

J.O-S.

**Hufnagelschrift** [G.]. See *Nagelschrift*.

**Huguenots, Les** [F., The Huguenots]. Opera in five acts by Meyerbeer (libretto by E. Scribe), produced in Paris, 1836. Setting: Paris and Touraine, 1572.

**Humanism, humanist music.** Music of the 16th century that was influenced by humanism in literature, especially the revival of interest in the Greek and Roman classics. Its clearest musical expressions are in the composition of Horatian \*odes, in \**vers mesuré*, in the revival of Greek theory, and in the resulting experiments with chromaticism and \**enharmonic* tones. The term is also used more broadly to describe the entire school of early 16th-century composers (chiefly German and French) who had close contact with the leading humanist writers and thinkers (Erasmus, Ulrich von Hutten, Johann Reuchlin, Ronsard, Baïf) and who adopted the humanist emphasis on refinement, balance, and restraint (Hofhaimer, Senfl, Janequin, Claudin). A popular practice of this period was the use of scholarly names, such as *prooemium* [L.] or *anabole* [Gr.] for prelude [see W. Merian, *Der Tanz in den deutschen Tabulaturbüchern* (1927), pp. 60, 62, 63]. See *Renaissance*.

Lit.: D. P. Walker, *Der musikalische Humanismus* (1949; also in *MR* ii, iii); H. J. Moser, *Geschichte der deutschen Musik*, rev. ed. (1930), i, 379; *LavE* i.3, 1298.

**Hummel** [G.]. (1) A Swedish zither with frets, widely used during the 18th century. See S. Walin, *Die schwedische Hummel* (1952). (2) In German, older designation for the drone of bagpipes and perhaps also for a primitive bagpipe itself.

**Humoreske** [G.], **humoresque** [F.]. A 19th-century name for instrumental compositions of a humorous, fanciful, or simply good-humored nature. R. Schumann (op. 20) used it for a long composition in which the expression frequently changes from one extreme to another.

**Hungarian Dances** [G. Ungarische Tänze]. A collection of twenty-one dances by Brahms, for piano, four hands, published in four volumes (1852–69). Some of them employ genuine Hungarian melodies, while others are freely invented in the Hungarian Gypsy style.

**Hungarian Rhapsodies.** See *Rhapsodies hongroises*.

**Hungary.** I. The oldest stratum of Hungarian music is represented by folk music discovered after 1905 by Bartók and Kodály, which, according to recent findings, extends eastward to the Cheremis tribe around the Volga, to the Bashkirs, and to the Mongols as far as the Yellow Sea. This music is pentatonic, with characteristic rhythms and melodies. Gregorian chant was introduced during the Middle Ages. The earliest recorded sources (Codex Hahót, Codex Albensis, Codex Pray), dating from the 11th century, show by their notation that they are related to the Frankish, North Italian, and St. Gall repertoires. Soon afterward Hungarianized “popular” versions of Gregorian melodies with Hungarian texts appeared. During the late Middle Ages (c. 1200–1480) the courtly and popular music of the minstrels flourished. Literary sources indicate that this tradition was closely connected with specific instruments—the *kobuz* (a short lute), viol, horn, bagpipe. Toward the end of the Middle Ages, e.g., at the court of Matthias Corvinus (1443?–90), this indigenous tradition gave way to more international influences, in part mingled with the practices of wandering players.

The 16th century brought the flowering of epic song, developed by traveling singers, among them some schoolmasters trained in the humanist tradition. Their long historical or Biblical epics were usually sung with some instrumental accompaniment. The most important of them is Sebastian Tinódi (1505?–56), whose *Cronica* of

1554 includes rhymed verses as well as some melodies. Particularly remarkable is the song commemorating the siege of Eger (1389) because of its unmistakably “national” traits [see *LavE* 1.5, 2615]. At the same time there developed, under the influence of the Reformation, an indigenous repertory of religious choral music. Beginning in 1607, the melodies of the French Huguenot Psalter were underlaid with Hungarian texts and partly displaced the earlier Hungarian hymns.

Traces of instrumental dance music are found in German and Italian collections of keyboard or lute music, which contain pieces such as “Ungaresca,” “Ungarischer Tanz,” “Ballo ongaro,” etc. The most important representative of Hungarian lute music is Bálint (Valentin) Bakfark (1507–76), who worked mostly at the French and Polish courts and won international recognition. Between 1552 and 1565 he published four books of lute music, containing *ricercars*, fantasias, and intabulations of motets and chansons [see Editions XV, 37].

An interesting repertory of 17th-century harpsichord music is preserved in four manuscripts (Codex Kájoni, Codex Vietórisz, Sopron MS by J. J. Stark, Löese MS), which contain arrangements of songs, dances, suites, etc., originally scored for instrumental ensembles. In Transylvania the Franciscan monk János Kájoni (1629/30–87) collected Hungarian, Rumanian, and Gypsy dances, together with Italian monodic pieces, German choral compositions, and French suites. In 1711 Prince Pál (Paul) Esterházy (1635–1713) had published, under the title *Harmonia Caelestis*, a collection of 55 sacred compositions (“Concertos”) for voices and instruments. Traces of the 17th-century repertory also are present in popular melodies known as *kuruc* songs, which appeared about 1800, at the time of the anti-Hapsburg uprisings, and represent an effort to restore the old national tradition.

II. In the middle of the 18th century student choirs were established, especially encouraged by Professor Georg Maróthi of Debreczin, who published (1743) Goudimel’s Psalter with Hungarian texts by Albert Szenczi Molnér. This tradition of religious choral polyphony was carried over to secular songs, and between 1780 and 1820 the repertory of numerous provincial schools was included in several “Melodaria” (MS *Liederbücher*). In these the influence of rococo dance forms played an important role. The 18th century also saw the development of

a new Hungarian folksong, which links the old Oriental tradition with new forms, melodies, and tonalities. Simultaneously there appeared a new style of dance music, the so-called *\*verbunkos* [from G. *Werbung*, draft], which were used to recruit soldiers. This dance type became so popular that in 19th-century western Europe it was regarded as the national music of Hungary, and the type was imitated by Haydn, Mozart, Schubert, Weber, and Brahms. The *verbunkos* and its offspring, the *\*csárdás*, are the most important achievements of Hungarian romanticism, an inspiration for all 19th-century Hungarian composers.

In opera, cultivated since the beginning of the 19th century, Franz (Ferenc) Erkel (1810–93) became the leading composer. His nationalist operas (*Hunyadi László*, 1844; *Bánk Bán*, 1861; *Brankovics György*, 1874; etc.) represent the new romantic style, as do the Hungarian Rhapsodies of Franz Liszt (1811–86) and the symphonic works of Mihály Mosonyi (1814–70). Liszt's importance, however, transcends nationalist romanticism. His innovations in style, form [see Symphonic poem], and harmony mark a new direction for the entire development of late romantic music, as well as the beginnings of 20th-century Hungarian music.

III. About 1900, some of the late romantic composers such as Jenő Hubay (1858–1937), Ernst von Dohnányi (1877–1960) and Leo Weiner (1885–1960) attempted to combine the native tradition with contemporary European trends. These efforts produced wholly new results after 1905, in the works of Béla Bartók (1881–1945) and Zoltán Kodály (1882–1967). Setting themselves apart from the romantic conventions and striving for international contacts, they created a new Hungarian idiom based on the old folk material they had discovered. Bartók's research extended far beyond the borders of Hungary, into the folk music of Rumania, Slovakia, the Ukraine, Bulgaria, Turkey, etc. He is generally regarded as one of the outstanding composers of the 20th century. Kodály achieved a fusion of Hungarian folk tradition and European art music. Among the followers of Bartók and Kodály are László Lajtha (1891–1963) and numerous younger composers who, like them, strive for a synthesis of the Hungarian tradition with the most recent trends (Ferenc Szabó, Endre Szervánszky, Pál Kadosa, Pál Járdányi, György Ranki, Ferenc Farkas, Emil Petrovics, György Kurtág, András Mihály, Rezső Sugár, and others).

B.S. trans. W.A.

**Hunnenschlacht, Die** [G., The Battle (Slaughter) of the Huns]. Symphonic poem by Liszt (1857), inspired by a painting by Kaulbach.

**Hunting horn.** See under Horn II.

**Hunt music** [G. *Jagdmusik*]. See K. Taut, "Beiträge zur Geschichte der Jagdmusik" (diss. Leipzig, 1927). See Fanfare.

**Hunt Quartet.** (1) Popular name for Mozart's String Quartet in B-flat, K. 458 (no. 3 of the *\*Haydn Quartets*), also called *La Chasse*, with reference to the hunting-horn motif in the opening theme. (2) Popular name for Haydn's String Quartet in B-flat, generally considered his first quartet, first published in 1762.

**Hunt Symphony.** Haydn's Symphony in D major, no. 73 (1781), also called *La Chasse*, with reference to the last movement, which was originally composed to depict a hunting scene in his opera *La Fedeltà premiata* (1780).

**Hupfau** [G.]. See under *Nachtanz*.

**Hurdy-gurdy** [F. *vielle (à roue)*; G. *Drehleier*; It. *ghironda*; Sp. *zanfoña*]. A medieval stringed instrument, shaped somewhat like a lute or viol, whose strings are put in vibration not by a bow but by a rotating rosined wheel operated by a handle at the lower end of the body. The instrument usually had two to four unfingered bass-

strings that were allowed to sound continuously, producing a drone harmony (c-g-c'), and two melody strings (tuned in unison) running over the fingerboard, which were stopped by tangents connected with a keyboard. The instrument was very popular from the 10th to 14th centuries; later it was disdained as a street musician's instrument. Praetorius, in *Syntagma Musicum* (1615), expressly declines to speak of the "Bauern- und umblaufenden Weiber-Leyer" (the lyre of peasants and itinerant wenches). However, in the 17th century it, together with the musette, became fashionable in French society [see Musette]. Haydn wrote five concertos and seven \*nottornos for two hurdy-gurdies. He called the instrument *lyra* or *lira organizzata*, a name that has been erroneously interpreted as *lira da braccio*. Some 18th-century specimens of hurdy-gurdy have a small number of organ pipes attached in the body, and it is probably to these that the term "organizzata" refers. The name "lyra" as well as the use of a crank has also led to confusion with the street-organ [G. \**Leierkasten*]. Schubert's well-known song "Der Leiermann" portrays the player of a hurdy-gurdy, not a street-organ. See ill. under Violin.

The hurdy-gurdy is described in a 10th-century treatise entitled *Quomodo organistrum construatur* (GS i, 303, where it is attributed to Oddo of Cluny). Pictures from the 12th and 13th centuries show a much larger instrument (held and played by two men) than the later type. The original name *organistrum* was replaced about 1300 by the names *armonia* and *symphonia*, the latter of which was corrupted into *chifonie*, *cinfonia*, *zanfonia*, *zampugna*, \**sambuca*, etc. In the 15th century the instrument was given the name *vielle*, after the old \*vielle (a fiddle) had become obsolete. See *SaHMI*, pp. 271f; E. de Bricqueville, in *BSIM* 1909, p. 735.

**Hurtig** [G.]. Quick, nimble.

**Hydraulos** [F. *orgue hydraulique*; G. *Wasserorgel*]. The organ of ancient Greece, invented by Ktesibios of Alexandria (c. 300-250 B.C.). It differed from the pneumatic organ mainly in the wind supply, which was provided by water instead of bellows. The water did not, as older writers fancifully said, run through the pipes, but was enclosed in a separate container and served to conduct hydraulic pressure provided by hand pumps. The instrument was very accurately described by Hero of Alexandria (c. 120 B.C.) and Vitruvius Pollio (c. 14 B.C.). A clay model found in the ruins of Carthage and

portions of an actual instrument discovered in 1931 at Aquincum, near Budapest, have shown additional details of its construction. The hydraulos was not, as is frequently stated, a "loud and noisy" instrument. Cicero, who describes its use at banquets, calls its sound a sensation "as delectable to the ears as is the most delicious fish to the palate" (*Tusculan Disputations*, iii, 43). It was originally and predominantly for home use but later was also used to accompany gladiator contests in Rome. The most remarkable feature of the hydraulos was its playing mechanism, which consisted of small hinged keys that could easily be depressed with one finger and that automatically returned to their normal position

*Hydraulos (reconstruction)*

by means of springs. It was not until the 10th century that this keyboard mechanism was rediscovered and used in organs. See Organ XII; Magrepha.

Schneider, in *MF* vii; P. Tannery and C. de Vaux, in *Revue des études grecques* xxi.

**Hymn.** A song of praise or adoration of God (originally, in honor of Apollo; two hymns to Apollo of c. 150 B.C. are among the most complete remnants of Greek music; see *HAM*, no. 7a, b). In the early Christian era, the term "hymn" was applied to all songs in praise of the Lord; later it was restricted to newly written poems, as distinguished from the scriptural Psalms and canticles [see Gregorian chant II].

I. *Hymns of the Eastern churches.* Antioch (Syria) and Constantinople (Byzantine Empire) were the earliest centers of hymn writing (hymnody). The movement apparently started among the Gnostics, a sect that flourished in the 2nd century. Bardesanes (154–c. 222) and his son (or disciple?) Harmonius wrote a complete Gnostic Psalter, a collection of poetic paraphrases of the Psalms. Its great popular success (cf. the \*Psalms of the 16th century) led to imitations among the Christians. Saint Ephraem (d. 378?) of Syria is usually considered the father of Christian hymnody. The Eastern churches (Syrian, Byzantine, Armenian) gave hymns a much more prominent part in the service than they ever attained in the Western church [see Byzantine chant; Armenia; Syrian chant]. The earliest preserved hymn melody is the \*Oxyrhynchos Hymn of c. A.D. 300. See H. J. W. Tillyard, *Byzantine Music and Hymnography* (1923); Editions XXIX.

II. *Latin hymns.* St. Hilary, Bishop of Poitiers (d. c. 367), is credited with having written the first Latin hymns, in imitation of the Syrian and Greek hymns of the early Eastern churches. Their style (three survive) is rather involved and obscure. It was left to St. Ambrose (c. 340–397) to introduce a type of hymn that, because of its

clarity and regularity, became immensely popular and gained a firm foothold in the Milanese as well as the Roman rites [see Ambrosian hymns]. Among his successors were Aurelius Prudentius (348–after 405), Caelius Sedulius (mid-5th century), Venantius Fortunatus (530–609), Paulus Diaconus (d. 799), Theodulphus (d. 821), Hrabanus (Rhabanus) Maurus (d. 856), and many poets of succeeding centuries. The 55 volumes of the *Analecta hymnica* (ed. by G. M. Dreves and C. Blume) contain a very large though not complete collection of medieval hymn texts; a useful index for quick reference is U. Chevalier's *Repertorium hymnologicum*. Of the innumerable hymns written between A.D. 400 and 1400 (if not later), about 120 are still in use.

The earliest sources of hymn melodies (hymnaries) date from the 11th or 12th century. To assume (as is frequently done) that any of these melodies dates from the time of St. Ambrose is entirely gratuitous. Equally unwarranted are reconstructions purporting to show the "original" form of such melodies, i.e., strictly syllabic and in triple meter. The great majority of the preserved melodies employ groups of two to four notes that fall just as frequently on the strong as on the weak syllable. Obviously they do not admit a strictly metrical rendering [see P. Wagner, *Einführung in die Gregorianischen Melodien*, iii, 462, and *ApGC*, p. 428f].

III. *Polyphonic hymns.* From before 1400 there exist only a few scattered examples of polyphonic hymns, among them the famous 13th-century Hymn to St. Magnus, written in parallel thirds (*HAM*, no. 25c). The earliest source containing a number of polyphonic hymns is the Codex Apt [see Sources, no. 19]. They are in a simple homorhythmic style, usually with the plainsong melody in the highest part. Dunstable wrote one hymn ("Ave maris stella"), Dufay a cycle of 21 hymns in a similar though slightly more ornate style [ed. by R. Gerber, *Das Chorwerk*, no. 49]. In the 15th-century MSS most of the hymn settings follow the alternation principle whereby the odd-numbered strophes are sung to the chant melody and a single polyphonic setting is provided for the even-numbered stanzas. The cycle of hymns in the Codex Capella Sixtina 15 (c. 1500), however, provides a new polyphonic setting based on the same *cantus firmus* for each of the alternate strophes, thus setting a pattern that was to become more or less standard for a long series of hymn collections by individual com-

posers through the next two centuries. The four complete sets of Vespers hymns by Carpentras, C. Festa, A. Willaert, and F. B. Corteccia, written before the middle of the 16th century, were followed by similar cycles by such composers as J. de Kerle, D. Ortiz, G. M. Asola, T. M. de Victoria, G. P. Palestrina, C. Porta, and O. Lassus—to mention only a few. Organ hymns were written by H. Buchner, G. Cavazzoni (1543), T. Tallis, A. de Cabezón, J. Titelouze, and others; see Organ chorale I.

IV. *German hymns.* Long before any other nation, the Germans began to sing hymns in their native language. As early as c. 1300 some Latin sequences had German versions, e.g., “Christ ist erstanden” (after Wipo’s Easter sequence, *Victimae paschali laudes*) or “Komm, heiliger Geist” (Whitsun sequence, *Veni sancte spiritus*). The Münch (Monk) of Salzburg (fl. c. 1400) and Heinrich Laufenberg (c. 1390–1460) translated a large number of hymns into German. Along with these original compositions of great beauty were written, e.g., the Crusader’s song “In Gottes Namen fahren wir” and cradle-songs for the Nativity, remarkable for their C-major melodies and lulling rhythm in triple meter (“Joseph, lieber Joseph mein” and “In dulci jubilo”). A Marian hymn, “Maria zart,” has survived in a Mass by Obrecht and in two settings by Arnolt Schlick, one for organ [*HAM*, no. 101] and the other for lute. These are only a few examples from a large repertory that became the point of departure for the ensuing development of the German Protestant hymn [see Chorale].

V. *English hymns.* See next entry.

Lit.: *For I:* See under Byzantine chant, etc. *For II:* G. M. Dreves and C. Blume, *Analecta hymnica*, 55 vols. (1886–1922); U. Chevalier, *Repertorium hymnologicum*, 6 vols. (1892–1921); †*Monumenta monodica medii aevi* (vol. i, *Hymnen*), ed. B. Stäblein (1956); A. S. Walpole, *Early Latin Hymns* (1922); M. Britt, *The Hymns of the Breviary and Missal* (1922, ’24); G. Jahrhunderts” (diss. Berlin, 1937); M. John Bosco Connor, *Gregorian Chant and Medieval Hymn Tunes in the Works of J. S. Bach* (1957).

**Hymn, English.** I. From evidence in literary works, it appears that sacred ballads and carols were sung outside the church in the late 15th and 16th centuries. Some of the ballads circulated in broadsides; the *Song made by F.B.P.*, “Jerusalem my happy home,” dates from 1571. By 1540 echoes of Continental hymn singing had reached the British Isles. Sometime in the 1540’s John Wedderburn, a Scottish priest, published *Gude and Godlie Ballates*, which contained a translation of Luther’s hymn, “Vom Himmel hoch.” About 1543, Miles Coverdale’s *Goostly Psalmes and Spirituall Songes* was published, containing words and music of 40 hymns, many of them English translations from the German, including the tunes used in Germany, as, e.g., “Ein’ feste Burg.” The collection was proscribed and burned in 1546.

Music editions of the Sternhold and Hopkins metrical psalms date from 1560, although an English collection was published four years earlier in Geneva. All of these collections, apart from containing the 150 psalms set in meter, also had a few hymns or metrical prayers appended.

The English Psalters suffered musically by comparison with the French or Genevan Psalter and the German \*chorale melodies because of the limited number of regular meters to which the texts were set. This continued well into the 18th century, even after the New Version of the metrical psalms by Tate and Brady had appeared (1696). Another inhibiting factor was the illiteracy of most congregations; this required each hymn to be \*lined-out; a precentor, clerk, or deacon, as he was variously called, sang one line of the hymn at a time and then waited while the congregation sang it after him before singing the second line, etc. The result was that by 1725 many congregations knew fewer than ten tunes and sang most of the hymns to those tunes.

After the Psalters published by John Day (1522–84), significant collections with new tunes were published by Thomas East (1591, ’92), Thomas Ravenscroft (1621), and John Playford (1671, ’77). The new style of hymn texts by Isaac Watts (1674–1748) and Charles Wesley (1707–

1788) inspired many newer tunes with more rhythmic freedom and wider use of intervals than in the older psalm tunes. Because of their association with singing at Wesleyan services, they have been referred to as "Methodist tunes."

Significant English \*tune books of the 18th century were *Lyra Davidica* (1708); John Arnold's *The Compleat Psalmist* (1741); John Wesley's *A Collection of Tunes . . . sung at the Foundery* (1742); *Psalms, Hymns and Anthems of the Foundling Hospital* (1774); and Martin Madan's *A Collection of Psalm and Hymn Tunes* (1769). There was some provision for three or four parts in these books, but basically they were intended for unison singing by the congregation. It should be noted that from the earliest printing until the mid-19th century, tune books contained either no text at all or merely the first stanza; singers had to use a separate hymnal for the words.

Composers such as J. B. Dykes in the mid-19th century wrote tunes with four-part harmony that were miniature part songs. These, introduced in successive editions of *Hymns Ancient and Modern* (1861–1950), completely changed the character of hymn singing. Other significant musical editions of the period were Arthur Sullivan's *Church Hymns with Tunes* (1874) and Joseph Barnby's *The Hymnary* (1872). Important collections of the 20th century are *The English Hymnal* (1906) and *Songs of Praise* (1925), both of which have come out in recent editions.

II. In America, apart from a few tunes bound in the back of successive editions of *The Bay Psalm Book*, the first tune book to be published was James Lyon's *Urania* (1761), followed shortly by Francis Hopkinson's *A Collection of Psalm Tunes* (1763) and Josiah Flagg's *A Collection of the best Psalm Tunes . . . to which are added some Hymns and Anthems; the greater part of them never before printed in America* (1764; on plates engraved by Paul Revere). By 1800, more than 130 such collections had been published along the Atlantic coast. In the 19th century, collections such as Lowell Mason's *Carmina Sacra* went through thirteen editions between 1841 and 1860, selling more than 500,000 copies. During the same years, Joseph Funk, a Mennonite, brought out about twenty editions of his *Genuine Church Music* (later called *Harmonia Sacra*) in the Shenandoah Valley of Virginia.

Today, each major denomination has its own hymnal, sharing nearly half its hymns and tunes

with other denominations and adapting the remainder to its own traditions. Musically, the Episcopal *Hymnal 1940* perhaps has the broadest interest; its 600 tunes include plainsong melodies, German chorale melodies, tunes from the Genevan Psalter and the early English Psalters, part-song tunes of the Victorian era, folksongs (apart from the Christmas carols), broad modern unison melodies, and 44 newly composed tunes.

One phenomenon connected with American congregational song of the latter part of the 19th century was the gospel song. Many of its texts were closely connected with the doctrine of salvation by grace, and their content sometimes seems to be an irritatingly priggish assumption of Christian superiority. Both as literature and as music they plumbed the depths of commonness, but nevertheless their influence extended beyond the confines of the revival meeting into the regular services of the church. The tunes were pallid imitations of popular songs, always using a refrain that in practice was frequently sung several times between stanzas.

A.T.D.; rev. L.E.

**Hypate** [Gr.]. See under Greece II.

**Hyper-, hypo-** [Gr.]. Prefixes denoting higher and lower pitches respectively. *Hyper-* (*hypo-*) *diatessaron* is the upper (lower) fourth; *hyper-* (*hypo-*) *diapente*, the higher (lower) fifth. In Greek theory, terms such as Hyperdorian and Hypodorian signify modes (more properly, octave species) that start a fifth above and below the initial tone of the original octave, e.g., Dorian on e, Hyperdorian on b, Hypodorian on A [see Greece II]. In the medieval system of church modes the prefix *hypo-* denotes modes

whose range (*ambitus*) is a fourth below that of the corresponding primary (authentic) mode [see Church modes I].

**Hyporchema** [Gr.]. An ancient Greek dancing song from Crete.

**I.** This letter was introduced by Kirnberger to denote the natural seventh, i.e., the seventh harmonic, such as that produced on the natural horn. Its pitch ( $7/4 = 969$  cents) is noticeably lower than that of the well-tempered seventh (1000 cents) and that of the seventh in \*just intonation (996 cents).

**Iamb, iambic.** See under Poetic meter; also Modes, rhythmic.

**Iastian.** See under Greece II.

**Iberia** [L.]. Twelve piano pieces, in four sets of three each, by Albéniz, published 1906–08. Each is based on a Spanish theme or locale. For Debussy's *Ibéria*, see under *Images*.

**Iceland.** The Icelanders possess a remarkable tradition of folk music that probably antedates all the other European folk traditions [see Folk music III]. A comparison of medieval manuscripts (Arnarnagna collection, University Library of Copenhagen; see *WoHN* i, 119) with recent collections shows that types of folk music have not changed much during the last 600 years. A characteristic feature of the *rímur* (dancing songs, ballads) is frequent change of meter accompanied by a change of tune (*Kvædalög*). Particularly interesting is the *tvísöngur* (twin song), i.e., two-part singing in parallel fifths, which is evidently a remnant of the parallel organum of the 9th century and was still practiced until comparatively recent times [see *ReMMA*, p. 270f]. Modern composers include Jon Leifs (b. 1899), who incorporates both *rímur* and *tvísöngur* in his work, and Páll Isólfsson (b. 1893), an organist-composer whose work reflects the Lutheran background of Icelandic music.

**Iconography of music.** The representation of musical instruments, musicians, and the like in painting, sculpture, mosaics, coins, and other media is a very important repository, particularly for music of ancient times, for which it is practically the only source of information. Knowledge of Babylonian, Assyrian, and Egyptian music is based almost entirely on iconographic material. Medieval representations such as the illuminations for the \**cantiga* MS of the 13th century are the main source of information about the early development of European instruments. Even where other information is available, pictorial representations often provide additional evidence, showing, e.g., how the organ was played in the 15th century or how the violin and bow were held in the 18th century. In a broader sense, iconography includes also the portraits of composers, conductors, and performers, reproductions of concert halls, operatic stagings, music titles, etc.

The most important collections of pictorial material are: G. Kinsky, *A History of Music in Pictures* (1930); M. Pincherle, *An Illustrated History of Music* [1959]; A. Buchner, *Musical Instruments through the Ages* [1956?]; A. G. Hess, *Italian Renaissance Paintings with Musical Subjects* (1955); H. Bessler and M. Schneider, ed., *Musikgeschichte in Bildern* (1961—); M. Sauerlandt, *Die Musik in fünf Jahrhunderten der europäischen Malerei* [1922]; C. Moreck, *Die Musik in der Malerei* (1924); G. Kanth, *Bilder-Atlas zur Musikgeschichte von Bach bis Strauss* [1912]; G. F. Schorer, *Bildnis der Musik* (1955); K. Andorfer and R. Epstein, *Musica in nummis* (1907; on coins); E. Buhle, *Die musi-*

kalischen Instrumente in den Miniaturen des frühen Mittelalters (1903); L. Parigi, *La Musica nelle Gallerie di Milano* (1935); id., *I disegni musicali del gabinetto degli "Uffizi" . . . a Firenze* (1951); H. Lavoix fils, *La Musique dans l'ymagerie du moyen âge* (1875); P. Collaer and A. Vander Linden, *Atlas historique de la musique* [1960]; E. Lit.: F. Auerbach, *Tonkunst und bildende Kunst* (1924); E. Hohne, *Music in Art* (1965); H. Leichtentritt, in *CP* 1906; id., in *SIM* vii (14th-17th cent.); M. Seiffert, in *AMW* i (16th cent.); H. Bessler, in *AMW* xvi (16th cent.); C. Sachs, in *AMW* i; E. Winternitz, in *CP* 1961; P. Egan, in *JAMS* xiv (Ital. Renais.).

**Ictus.** In prosody, a stress or accent. The term was introduced in music by the monks of \*Solesmes as an integral part of their rhythmic interpretation and performance of Gregorian chant [see Gregorian chant VI]. The ictus serves primarily to mark off those groups of two and three notes that form the basis of their rendition of the chant. The ictus has nothing to do with the speech accent (tonic accent); it often falls on the weak syllable [see Ex.]. The monks of Solesmes make it a point that, in actual performance, the

ictus should not be rendered as an increase in intensity ("ictus nullam cum intensitate connectionem habet"), nor by sustaining the tone (in the Solesmes rhythm all notes have the same duration unless dotted or marked with horizontal episema). Thus, its actual meaning remains rather obscure. Probably the perception of alternating high and low points (aided by chironomic representations and analogies such as the

waves of the sea) helped the singer produce the effect. See the authoritative explanation in *LU*, pp. xxviff. Also all the Solesmes books [Dom Mocquereau, *Le Nombre musical grégorien*, etc.; particularly, Dom Gajard, *Notions sur le rythme grégorien* (1935)].

**Idée fixe.** Berlioz' name for the principal subject of his *Symphonie fantastique*. It occurs in all the movements [see Cyclic], representing the artist at various stages of his life. It is considered an important forerunner of Wagner's \*leitmotiv.

**Idiomatic style.** A style appropriate for the instrument for which particular music is written. To write idiomatically is a matter of prime concern for modern composers, particularly in orchestral scoring, since the quality of the score is judged largely by the degree to which the various parts exploit the technical and sonorous resources of the instruments without exceeding them. In early music, however, including that of Bach, the question of "idiomatic style" is often controversial, since examples abound in which the style does not conform to the technical properties of the instrument or voice. For example, a piece such as the E-major Fugue from *The Well-Tempered Clavier*, vol. ii, is neither in harpsichord style nor in clavichord style, but in organ style or even instrumental ensemble style (string quartet). Examples like this show that idiomatic writing cannot always be considered a valid criterion for evaluating a composition or composer.

**Idiomelon** [Gr.]. In Byzantine chant, a hymn (*kontakion*, *kanon*, *sticheron*, etc.) having its own melody, as opposed to *prosomoion*, a hymn text sung to a borrowed melody [see *Contrafactum*]. A select group of *idiomela* whose melodies were used for *prosomoia* are known as *automela* (sing. *automelon*).

**Idiophone.** See under Instruments I.

**Idomeneo.** Opera in three acts by Mozart (libretto by G. B. Varesco), produced in Munich, 1781. Setting: Crete in legendary times.

**Images** [F.]. Title used by Debussy for two cycles of compositions. (1) Six piano pieces in two sets of three each: I (1905), *Reflets dans l'eau*, *Homage à Rameau*, and *Mouvement*; II (1907), *Cloches à travers les feuilles*, *Et la Lune descend sur le temple qui fut*, *Poissons d'or*. (2) Three symphonic poems (*Images pour orchestre*, 1906-11): *Rondes de printemps*, *Ibéria*, *Gigues*. The second, *Ibéria*, consists of three movements:

*Par les rues et par les chemins, Les Parfums de la nuit, and Le Matin d'un jour de fête.*

**Imbroglia** [It.]. An operatic scene in which the idea of utter confusion is artfully carried out by giving the singers and players parts that, although properly coordinated harmonically, are deliberately incongruous and contrasting in rhythm and meter. The three orchestras in the ballroom scene of Mozart's *Don Giovanni* [end of Act I] and the street scene of Wagner's *Die Meistersinger* [end of Act II] are famous examples.

**Imitation.** The restatement in close succession of a melody (theme, motif) in different parts of a contrapuntal texture. This device is most consistently employed in the \*canon, in which a whole voice-part is imitated in another (canonic imitation). Imitation of themes (subjects) is an essential feature of the \*fugue (fugal imitation) as well as the 16th-century motet and the various prefugal forms, the \*ricercar, \*canzona, \*fantasia, and \*capriccio. While in a fugue the imitation is normally restricted to one theme, the earlier forms usually have a number of themes.

Imitation is predicated on the presence of two (or more) equivalent voice-parts, and it is interesting to note that its history begins with the earliest type of composition meeting this requirement, the *organa tripla* and *quadrupla* of the school of Notre Dame, c. 1200 [Ex. 1]. Imitation, sometimes quite extensive, occurs also in a few three-voice motets of the 13th century, always in connection with an identical text (i.e., an identical phrase occurring within the essentially different texts of the two upper parts; see Y. Rokseth, *Polyphonies du XIIIe siècle*, nos. 104, 105, 325). A thorough study of the numerous conductus is likely to yield many additional examples of imitation in their \**caudae*. In the 14th century, imitation found its first systematic realization in the Italian \**caccia* and French \**chace*, which are extended two- and three-part canons. Of greater importance to the development of imitation (which is essentially the development of fugal, not canonic imitation) are imitative passages found in a number of Italian madrigals and *ballate* of the 14th century, particularly in the works of Lorenzo Masini and Paolo Tenorista. In some of the motets by Jean Ciconia (c. 1335–1411) imitation takes on a structural significance. In the 15th century Hugo de Lan-tins made frequent use of imitation, much more so than his contemporary, Dufay, or than Ocke-

ghem, who has quite wrongly been called the "father of imitation." The works of Obrecht, Isaac, and Josquin show more and more deliberate use of imitation, which c. 1500 became an essential element of musical style. The development reached its climax with Nicolas Gombert (c. 1490–1556), who established the \*through-imitative style commonly associated with the 16th-century motet. Throughout the 16th century and the baroque period imitation remained a basic element of contrapuntal writing (\*imitative counterpoint). The various learned devices of imitation—augmentation, diminution, inversion, double counterpoint, combination of two and three themes—were developed in the \*ricercar, particularly by Andrea Gabrieli. Prior to 1700, fugal imitation at the interval of a fourth (lower fifth) was much more common than that of a fifth. Bach was one of the first to establish imitation at the interval of a fifth as a characteristic feature of fugal writing [cf. Ex. 2 and 3].

In the rococo period (c. 1725–75) came a sharp reaction against the fugal style of the baroque era [see Gallant style]. However, free use of imitation made a comeback in Haydn's and Mozart's later symphonies and quartets, and has

The image contains three musical staves, each with a treble and bass clef and a key signature of one flat.   
 Example 1: Labeled '1' in the top left. It shows a three-part setting (triplum, duplum, and tenor) with descending melodic lines. The notation includes various note values and rests.   
 Example 2: Labeled '2' in the top left. It shows a three-part setting with more complex imitative entries and rhythmic patterns.   
 Example 3: Labeled '3' in the top left. It shows a two-part setting with imitative passages between the two voices.

1. *Organum triplum, Descendit*, c. 1200. 2. Josquin, *Cœurs desolez*, c. 1500.

3. Bach, *Well-Tempered Clavier*, vol. II, 1744.

since remained an important technique of composition, particularly in the development section of symphonies, quartets, sonatas, etc.

Lit.: G. Adler, "Die Wiederholung und Nachahmung in der Mehrstimmigkeit" (*VMW* II); M. Schneider, "Zur Satztechnik der Notre-Dame Schule" (*ZMW* XIV); W. Apel, "Imitation in the Thirteenth and Fourteenth Centuries" (*CP Davison*); C. van den Borren, "Quelques Reflexions à propos du style imitatif syntaxique" (*RBM* I); J. Kerman, "Byrd, Tallis, and the Art of Imitation" (*CP Reese*). See also literature under Fugue; Canon.

**Imitative counterpoint.** Contrapuntal music based on \*imitation, i.e., the use of the same thematic material in all the parts. There are three chief types: \*canon (imitation of an entire voice-part); \*fugue (imitation throughout the piece of an initial subject); and \*motet (imitation of several subjects, each one being used for one point of imitation; see Through-imitation). The preludes in Bach's *Well-Tempered Clavier* offer many interesting examples of "free imitative counterpoint" (e.g., vol. II, no. 19).

**Imperfect.** See Perfect, imperfect.

**Impressionism.** An artistic movement of the late 19th and early 20th centuries, represented in music chiefly by Debussy (1862–1918). The term

is borrowed from painting, indicating the close relationship of contemporary trends in the various arts. The paintings of the French impressionists (Monet, Manet, Renoir) and the refined poetry of Verlaine, Baudelaire, and Mallarmé suggested to Debussy a new type of music, eminently French in character: a music that hints rather than states; in which successions of colors take the place of dynamic development, and "atmospheric" sensations supersede heroic pathos; a music that is vague and intangible as the changing light of day. The implementation of these ideas led to the partial abandonment of such "German" achievements as sonata, symphony, thematic material, and development technique, and led to the introduction of various novel devices that represent the antithesis of the principal features of classical and romantic harmony. Prominent in the impressionist vocabulary are unresolved dissonances, mostly triads with added seconds, fourths, sixths, sevenths; the use of chords, consonant as well as dissonant, in parallel motion (\*parallel or gliding chords); the \*whole-tone scale in melodic as well as chordal combinations; frequent use of the tritone; modality, particularly avoidance of the leading tone; avoidance of "direction" in the melodic contour (preference of vague "zigzag" design); and irregular and fragmentary construction of phrases.

Foreshadowed in the works of Edouard Lalo and Emmanuel Chabrier [see France IV], impressionism found its first full realization in Debussy's *Prélude à l'après-midi d'un faune* (1892–94) and still more so in his ensuing works, such as the three *Nocturnes* for orchestra (1893–99), the orchestral suite *La Mer* (1903–05), the opera *Pelléas et Mélisande* (1902), or the collections for piano *Images* (1905, '07) and *Préludes* (1910–13). After Debussy, Ravel became the main exponent of impressionism, although his classical inclinations, general feeling for form, dancelike rhythms and elegance are traits hardly compatible with impressionism in the purest sense. In fact, except for its founder, impressionism has not found any full-fledged representative, but it has left its imprint upon the works of many composers, e.g., the Frenchmen Dukas, Roussel, De Séverac; the Englishmen Delius, Bax, Cyril Scott; the Germans Gräner, Schreker, Niemann; the Americans Loeffler, Carpenter, Griffes; the Spaniard De Falla; the Italian Respighi; and the Czech Novak.

After a relatively short time impressionism began to lose much of its original fascination. Its

overrefinement and fin-de-siècle character were not conducive to active development. In his latest works (*Études, En blanc et noir*, 3 Sonatas), written 1915–17, Debussy himself—who, incidentally, objected to being called an impressionist—developed a more impersonal style indicative of neoclassical trends. His friend Erik Satie did much to discredit the rich impressionist palette with his whimsical and barren sketches, which seem like a cynical caricature of impressionist technique (e.g., his *Embryons desséchés*). It was the French writer Cocteau who pronounced the death sentence on impressionism: “After the music with the silk brush, the music with the axe.” Ironically, Debussy’s work today appears to some not as he intended—the negation of romanticism—but as part of it, indeed its acme and conclusion. On the other hand, some impressionist devices have been adopted, with characteristic modifications, in twentieth-century music, particularly the parallel chords, modified from a coloristic into a rhythmic effect [see Parallel chords].

Lit.: E. B. Hill, *Modern French Music* (1924); R. Lyr, *Les Musiciens impressionistes* (1938); H. G. Schulz, “Zur Phänomenologie des musikalischen Impressionismus” (diss. Würzburg, 1938); H. F. Kölsch, *Der Impressionismus bei Debussy* (1937); O. Wartisch, *Studien zur Harmonik des musikalischen Impressionismus* (1930); E. Evans, “French Music of Today” (*PMA* xxxvi); P. Capri, “Le Origini dell’impressionismo musicale” (*LRM* xi).

**Impromptu** [F.]. Fanciful name for 19th-century \*character pieces of the romantic period. The best-known examples are Schubert’s Impromptus op. 90 and op. 142 (probably their title is not Schubert’s but that of his publisher, Haslinger) and Chopin’s Impromptus op. 29, 36, 51, 66. The title does not refer to elements of improvisation in these pieces (they all are in straightforward style and form) but is meant to describe their somewhat casual origin in the composer’s mind. Several years before Schubert wrote his Impromptus a collection of *Impromptus* (1820) by H. Wozzischek was published.

**Improperia** [L.]. In the Roman Catholic liturgy, chants for Good Friday Mass. They consist of three passages from the Prophets (“Popule meus quid feci tibi”; “Quia eduxi te per desertum”; “Quid ultra debui facere tibi”), each of which is

followed by the \*Trisagion and a number of other short texts, sung in alternation with “Popule meus” [see *LU*, pp. 737ff]. A vestige of the long suppressed \*Gallican rites, the *improperia* were adopted in Roman liturgy c. 1200. Palestrina set them in \**falsobordone* style for double chorus. His settings, whose artistic quality has been much overrated, have been regularly performed since 1560 in the Sistine Chapel on Good Friday. Victoria, Anerio, and Ingegneri composed the text in the same style as Palestrina.

**Improvisation, extemporization.** I. The art of performing music spontaneously, without the aid of manuscript, sketches, or memory. Also, in a more restricted sense, the art of introducing improvised details into written compositions. The former is a phenomenon so evanescent that it defies documentation and detailed description. This is true, at least, of the great days of improvisation, when masters such as Bach, Handel, Mozart, and Beethoven were as famous for their improvising as for their written compositions. Today, the tape recorder could readily make a permanent record of such performances. However, the great art of improvisation has been lost, since it is no longer practiced by composers and survives chiefly among organ virtuosos.

II. Early musicians famous for their improvisation were Francesco Landini and Paulus Hofhaimer. In the 16th century the ability to improvise in fugal style was a common requirement for an appointment as organist [see *Fantasia* (5)]. Important information about this practice is given in the *Arte de tañer fantasia* of the Spanish theorist Tomás de Santa María [see O. Kinkeldey, *Orgel und Klavier* (1910)]. In the 17th century the organ improvisations of Sweelinck, Frescobaldi, and Buxtehude attracted people from far-distant places. Bach is known to have improvised a prelude and a fugue, an organ trio (i.e., a piece in three obbligato parts), a chorale prelude, and a final fugue, all on a single hymn tune. In 1747, on visiting Frederick the Great in Potsdam, he extemporized a fugue on the “royal theme” that he subsequently worked out in his \**Musikalisches Opfer*. John Hawkins is one of several writers who have vividly described the effect of Handel’s extemporization. Mozart frequently extemporized fugues or variations on a given theme. There are a number of enthusiastic accounts of Beethoven’s fascinating improvisation [see *Thayer’s Life of Beethoven* ed. E. Forbes (1964), i, 367f]. In the romantic

period, Moscheles, Liszt, Franck, and Bruckner were famous for their improvisations, which frequently were included in their concert programs.

III. The introduction of improvised details in a written composition is a more tangible phenomenon. It probably played an important role in the emergence of the more ornate (melismatic) types of Gregorian chant [see Ornamentation I]. It is more clearly discernible in the 14th- and 15th-century practice of improvised harmonization [see *Discantus supra librum*]. Tinctoris, in his *Liber de arte contrapuncti* (1477), distinguished between improvisation (*supra librum cantare*) and composition (*res facta*). In the 16th century *contrapunctus* often meant improvised counterpoint (also called \**sortisatio*) in contrast to written out counterpoint, which was called *compositio*. In the second half of the 16th century interest turned from contrapuntal (vertical) to melodic (horizontal) improvisation, i.e., the improvised rendition of ornaments and coloraturas (\**diminution*; \**glosa*), which played an important part in musical instruction and practice [see Diego Ortiz, *Trattado de glosas* (1553); Agostino Agazzari, *Del sonare sopra il basso* (1607); see Ornamentation II; also under Ensemble (3)]. "Melodic" improvisation continued particularly in the English \*divisions of the 17th century, while a new, very important practice arose in the "harmonic" improvisation of the \*thoroughbass [see also *Partimento*]. In the 18th century the improvised coloraturas of vocal virtuosos led to the \*cadenzas of the classical concerto. An interesting revival of improvisation is the jam session of contemporary \*jazz. See also Pennillion.

roque" (*AnnM* iv); *id.*, "Embellished 'Parody Cantatas' in the Early 18th Century" (*MQ* xlv). See also under *Sortisatio*, Ornamentation.

**Im Takt.** See *Takt*.

**Incalzando** [It.]. Pressing, hurrying.

**In campo aperto** [L.]. See under Neumes II.

**Incantation.** A spell that is sung in a magic ritual. In opera, a scene in which spirits are conjured. Famous examples are the song of Medea in Cavalli's *Il Giasone* of 1649 [see *SchGMB*, no. 201] and a scene in Massenet's *Roy de Lahore* of 1877.

**Incatenura** [It.]. Italian term for \**quodlibet*.

**Incidental music.** Music to be used in connection with a play. It may consist of occasional songs, marches, dances, and background music for monologues and dialogues, as well as instrumental music before and after each act. The Greek theater and the \*liturgical dramas of the Middle Ages made ample use of incidental music [for the latter, see E. Coussemaker, *Drames liturgiques du moyen âge* (1860)]. Shakespeare frequently prescribed incidental music, e.g., at the beginning of *Twelfth Night*. Nearly all of Purcell's dramatic music is incidental music for plays. Later examples are Beethoven's music to Goethe's *Egmont* and to Kotzebue's *Die Ruinen von Athen*, Mendelssohn's music to *A Midsummer Night's Dream*, Bizet's music to Daudet's *L'Arlésienne* (1872), and Grieg's music to Ibsen's *Peer Gynt* (1875).

Manifold, "Theatre Music in the Sixteenth and Seventeenth Centuries" (*ML* xxix, 366); A. Salazar, "Music in the Primitive Spanish Theatre before Lope de Vega" (*PAMS* 1938, p. 94). See also Dramatic music.

**Incipit** [L.]. (1) In Gregorian chant, the first words of a liturgical text (also called "intonation") sung by the cantor before the chorus enters at the place indicated by an asterisk; e.g., "Ad te levavi \*animam meam" [*GR*, p. 1]. (2) In psalm tones, etc., same as \**initium* (*inceptio*). (3) In the *cantus firmus* motets of the 13th and 14th centuries, a word or two given at the beginning of the tenor and serving as a reference to the chant from which the tenor is taken, e.g., *Manere*, referring to the melisma on the word "manere," which occurs in the Gradual "Exiit

sermo" (inter fratres . . . moritur. V. Sed: sic eum volo manere . . .) [GR, p. 39]; see Motet I. Long lists of incipits are found in P. Aubry and A. Gastoué, *Recherches sur les "Tenors" latins* (1907); P. Aubry, *Recherches sur les "Tenors" français* (1907); Y. Rokseth, *Polyphonies du XIIIe siècle* (1936-39), iv, 152; F. Ludwig, ed., *Guillaume de Machaut, Musikalische Werke*, ii, 58ff (\*Editions XLVI 3.i; see also Editions XLVI 1.i, 4.ii, 12); A. Rosenthal, in *AnnM* i, 129f, supp. by M. Bukofzer in *AnnM* iv, 255-58.

**Incoronazione di Poppea, L'** [It., The Coronation of Poppea]. Opera in three acts by Monteverdi (libretto by G. F. Busenello), produced in Venice, 1642. Setting: Rome during Nero's reign, A.D. 62. It is Monteverdi's last opera, and the first to deal with a historical (rather than Biblical or mythological) subject.

**India.** The music of India can be divided into four periods: the Vedic period, beginning in the 2nd (or even 4th) millennium B.C.; the classical period, beginning with the 2nd century A.D., a time of the evolution of elaborate theoretical systems and the creation of the *rāga* concept; the medieval period, beginning with the Islamic invasions in the 11th and 12th centuries, the time of division between northern and southern music; and the modern period, beginning with the 18th century, when the northern and southern systems were crystallized.

I. *Vedic chant.* The Vedic sacrificial ceremonies are remarkable for their strict and correctly performed textual and musical formulas. Any mistake in the enunciation and intonation of the sacred formulas was believed to upset the balance of the universe. Of the four Vedas only three are chanted; the Yajur Veda was recited on one note only. The Rīgvedic hymns were chanted according to the textual accents, on a middle note (*udātta*), a low note (*anudātta*), and a high note (*svarita*), usually at the distance of a whole tone. The Sāmaveda, chanted comparatively rarely and only at large offerings and sacrifices, shows a wider range of notes, in some schools extending to one octave. The scales of Sāmavedic chant were considered in descending order. The Sāmavedic text, derived mainly from the Rīgveda, was embellished with additional syllables and extended vowels and required comparatively florid melodies. Sāmavedic chants were and still are performed by three Brahmins.

Research in Vedic chant has been greatly hampered by Brahmin secrecy, as well as by the complex traditions, different schools and inter-

pretations, and present "anti-Brahmin" trend among the people, offering little hope that this great art will be preserved.

II. *The classical system.* The oldest source of Indian music theory is the *Bharatanāṭyaśāstra* (ch. xxviii-xxxiii), a work probably written c. 200 B.C. (though some authorities say A.D. 200 and others even A.D. 500). The chapters on music state that there are seven degrees in the scale, named *SA*, *RI*, *GA*, *MA*, *PA*, *DHA*, *NI* (abbr. of *Ṣaḍja*, *Rṣabha*, *Gāndhāra*, *Madhyama*, *Pañcama*, *Dhaivata*, *Nisāda*). The distances between these degrees are measured by means of twenty-two *śrutis* (Sanskrit *śru*, to hear), theoretically slightly unequal but for all practical purposes equal microtonal intervals, each roughly equal to a quarter tone. There are two basic scales (*grāmas*): the *SA-grāma*, defined in its rising form by a sequence of 4 3 2 4 4 3 2 *śrutis*, and the *MA-grāma*, by 4 3 4 2 4 3 2 *śrutis* (if the latter scale begins with *MA*). If the *MA-grāma* is transposed to *SA* (by maintaining the original scale degrees), the two *grāmas* differ in their third scale degrees: the *SA-grāma* shows a minor third and the *MA-grāma* a major third. Later authors (Nārada, Śārṅgadeva) mention a third basic scale, the *GA-grāma*, with the *śrutis* 4 3 3 3 4 3 2, which was never used "on earth."

Numerous Sanskrit accounts are vague in describing scales, failing to state whether the *śrutis* are placed below or above the seven notes. Generally it is assumed (or known, e.g., Śārṅgadeva) that there are four *śrutis* below *SA*, three *śrutis* below *RI*, and so on. This method is contradicted in later centuries when *SA* is represented by the first rather than the fourth *śruti*, a procedure that alters the form of the scale. There are seven *murchanās* (scales) from the *SA-grāma* and another seven from the *MA-grāma*. The first notes of each *murchanā* group are listed in a descending order, e.g., the first three *murchanās* derived from the *SA-grāma* are: *Uttaramandrā* beginning with *SA*, *Rajani* beginning with *NI*, *Uttarāyatā* beginning with *DHA*, etc. This practice seems to be the only link with the much older Sāmavedic scale types. Of the fourteen *murchanās*, seven are called *jātis*. They are distinguished from the *murchanās* by having "strong" and "weak" notes, referring to initial, central, and final notes. The use of these notes and several other features shows that *jātis* are indeed the forerunners of the *rāgas*.

The word *rāga* appears for the first time as a musical term in the *Brhaddeśi*, a Sanskrit work by Mātāṅga (c. A.D. 5th century). Mātāṅga

groups his *gītis* (melodies) into several types, among which the *rāga-gītis* are listed together with subordinate forms (*bhāṣā-gītis*). Mātāṅga is fully aware of the distinct moods (*rasas*) created by the performance of his *rāga-gītis*. He discusses their functions and use in Sanskrit drama, stating that certain *gītis* have to be used at the beginning, others in the middle and for the climax, and still others during the intermissions.

Another author, Nārada (7th century), groups the *rāgas* into male and subordinate female types (*rāginīs*) and assigns fixed performance times to them.

III. *The medieval period. A. North.* With the Mohammedan invasions there began a new phase of Indian music, characterized by further elaboration of the *rāgas*, the fusion of Mohammedan and Hindu elements in the music of the North, and, particularly, a division between northern and southern musical styles. Among the important musician-theorists of the North was Locanakavi or Lochana-Kavi (*Rāga-Tarangini*, 12th century), who wrote of 12 *melas* (a southern term referring to basic scales and *rāgas*) and 77 *janya* (subordinate) *rāgas*. One of the most famous musicians and theorists was Śārṅgadeva (a northerner), author of the oft-quoted *Saṅgīta-Ratnākara* (13th century). He is vague in describing scales, and later authors who quoted him contributed much to the confusion in theory. Śārṅgadeva links some of the *rāgas* of which he lists five groups, with gods and patron saints, and seasons. Pārśvadeva (*Saṅgīta-Samayasāra*, c. 13th–14th centuries), groups the *rāgas* into head- and “imitation” (*āṅga*) types. In another list he classifies the *rāgas* musically as seven-, six-, and five-tone types. Amir Khosru (1254–1325), a Mohammedan poet, was one of the important experimenters who fused \*Persian *maqamat* and Hindu *rāgas* [see Persia]. Khosru Indianized Persian melodies and supposedly is the creator of several famous Indian *rāgas*, such as *Yaman-kalyan*, *Kafi*, *Sazgiri*, *Bahar*, etc. Puṇḍarika Viṭṭhala (17th century) wrote three books, in which he groups the *rāgas* into male (*purusa*), female (*bhāryā*) and offspring (*putra*) types. He calls the head scales *thāta-melas* (*thāta* being a northern and *mela* a southern term). Another Nārada (16th century) groups the *rāgas* into *janakas* (parent) and *janyas* (derivative). Both terms are southern. He also offers brief pictorial descriptions of the *rāgas*. Dāmodara Miśra (17th century) groups his *rāgas* into head and subordinate forms and states their perform-

ance times in detail (morning, afternoon, etc.). Somanātha (17th century) determines the *srutis* by referring to divisions of strings of the *vina*. His *rāgas* are grouped into *melas* and *janyas*.

B. *South.* Up to the time of Śārṅgadeva there were few differences between the systems of the north and south. Numerous Sanskrit works appear to deal with both styles, and opinion about which they refer to is divided. The term “Carnatic music,” meaning the music of the south, appears for the first time in the *Mānosālāsa*, a dictionary of the 12th century. Rāmāmatya (16th century) groups the *rāgas* into *melas* and *janyas*. His basic scale, the ancient *Mukhari*, corresponding to the modern *Kanakangi*, is C D<sup>b</sup> E<sup>bb</sup> F G A<sup>b</sup> B<sup>bb</sup> c. These notes are the *shuddha svaras*, the “naturals” of the southern system, and all other scales are derived from them. Rāmāmatya indicates performance times of his *rāgas*. Govinda Dīkṣit (17th century) and especially Venkatamakhin (17th century) laid the foundation of the modern system of the south.

IV. *Modern period. A. North.* In the north, Muhammed Reza Khan of Patna (*Naqmat-e-Asaphi*, 1813) declared the grouping of *rāgas* into male and female types utterly absurd and presented for the first time a new classification based on the tonal material of the various scales. He adopted as the basic scale (*shuddha* scale) that of *rāga Bilaval* (approximately C D E F G A B c) and thus paved the way for the eminent Pandit V. N. Bhatkhande, author of several works, most notably the *Hindusthani Saṅgīta Paddhati* (1934–41). Bhatkhande grouped all northern *rāgas*, entirely on a musical basis, under the headings of ten fundamental scales (*thātas*) and created the modern system of North Indian music.

B. *South.* In the south another Govinda, author of the *Samgraha-Cūḍa-Mani* (late 18th century) elaborated the Carnatic system of 72 *melas* and numerous subordinate *janyas*. Two systems evolved: the so-called *Kanakambari-Phenadyuti* and the *Kanakangi-Ratnangi*. The latter became the modern system of the south. The 72 *melas* are grouped into twelve *chakras* (“wheels”), each containing six *melas*. The scales of the *melas* are arranged in an orderly manner whereby the same or similar sequences of notes appear and show rotating modifications. The names of the *melas* are related to their numbers (1–72) by their first two consonants. These consonants are numbered according to their appearance in the Sanskrit (and related) alpha-

bet and its four letter groups. For example, in the *mela* name *Kiravani* the letters K and R are the first two consonants; K is the first letter of the *ka* group, R the second letter of the *ya* group. The resulting numbers are 1 and 2. If reversed to 2 1 the correct number of *mela Kiravani* in the system of the 72 *melas* is obtained. This rule of deriving the *mela* number from the two consonant numbers of the alphabet (in reverse order) applies to the majority of the 72 *mela* names. There are, however, a few exceptions.

V. *Rāga and performance practice.* Bharata established ten characteristics of the *jātis*: initial note; central note; final note; secondary final note; height and depth (ambitus); "muchness" and "fewness" of notes (five, six, or seven); six-tone form; and five-tone form (the seven-tone form is not specifically mentioned). Today North Indian music recognizes only the *vādi* and *samvādi*, the central and secondary central notes and, occasionally, a *vishrantisthan* that has a function similar to the *vādi*. The scales may consist of five, six, or seven tones. The tone material of the majority of *rāgas* can be demonstrated by scales. Some *rāgas*, however, have *vakra* (zigzag) features in their scales.

Each *rāga* must be accompanied by a drone that consists of the constant sounding of the basic note of the scale (*SA*) together with its fifth (*PA*). If the scale of the *rāga* does not contain a fifth, the fourth (*MA*) is used. If the scale possesses neither fourth nor fifth, the major seventh (*NI*) is employed. If, e.g., the basic note is C, the following drone types, usually performed on a \*tambura, are possible:

Each *rāga* has its own, fixed, unalterable tone material, which must be used throughout its performance. Modulations are strictly forbidden. In contrast to a plain scale, a *rāga* has "strong" and "weak" notes, which together with special intonations, typical phrases, etc., form the physiognomy of the *rāga*. After the basic note (*SA*), the *vādi* (the "speaker"), or *amśa*, is the predominant note. Most melodies and phrases end either with *SA* or the *vādi*, or, at times, with the secondary central note, the *samvādi*, generally a fourth or fifth distant from the *vādi*. The importance of these "strong" notes is further shown by the fact that they have to

coincide with a similarly "strong" beat (*sam*) on the drums.

Below are the formulas of two different *rāgas* that use the anhemitonic pentatonic tone material *c' d' e' g' a' c''*. The use of half, quarter, eighth, etc., notes in the examples indicates not rhythmic values but the relative melodic importance of the notes in the design of the *rāga*:

#### Rāga Bhupali

#### Rāga Deshkar

There is little doubt that the constant use of certain notes in one *rāga* creates a certain mood or atmosphere (*rasa*). The step from the recognition of a specific mood to the deification and personification of a *rāga* is small, and so it is no wonder that numerous *rāgas* are represented pictorially (*rāga-māla*). In the 16th century a considerable iconography of *rāga-mālas* evolved. Further, *rāgas* were believed to possess magic powers, such as creating rain (*Mallar rāgas*), fire (*Dipak*), healing of diseases and melting stones (*Kedar*), etc.

The compositions are not rigidly fixed. The performer is aware of all essential features of the *rāga* he is presenting and will improvise within the often very tightly knit framework of the given rules: scale, strong and weak notes, characteristic phrases, special intonations, plus the careful observation of rhythm and formal structure. Today melodies can be found in notated form, but they usually constitute only the skeleton for an elaborate performance that generally varies from one occasion to the next.

Southern *rāgas* have the same or similar features as the *rāgas* of the North. Musicians of the South prefer the term *amśa*, which does not necessarily represent one but may represent several notes.

VI. *Tāla (rhythm).* The term *mārga tāla*, derived from Sanskrit prose, refers to the free recitation of the Vedic texts, while *deśī tāla* refers to secular music. Northern as well as Carnatic music inclines toward the additive formation of *tālas* in which a fixed group of bars

(*āvarta*) is repeated over and over. For instance, *Dhamār-tāla* consists of the repetition of the following four bars, which constitute an *āvarta*:

This *āvarta*, containing four *vibhāgas* (bars) of five, two, three, and four metrical units respectively, occurs throughout the performance. The first beat (*sam*) is notated with an X, the sixth beat (the first of the second bar) with 2, the eighth (the first of the third bar) with 0 (the *khālī*, the "open" beat), and the eleventh beat (the first of the fourth bar) with 3. Particularly *sam* and *khālī* require special drumbeats and thus provide the soloist with acoustical signposts through his often complex performance. Some of the most commonly used northern *tālas* are:

<i>Chautāl</i>	1 2   3 4   5 6   7 8   9 10   11 12   X   0   2   0   3   4
<i>Dādā</i>	1 2 3   4 5 6   X   0
<i>Dhamār</i>	(see above)
<i>Ektāl</i>	the same number of beats as <i>Chautāl</i> but with different types of drumbeat
<i>Rūpak</i>	1 2 3   4 5   6 7   X   2   3
<i>Tintāl</i> ( <i>Tritāl</i> )	1 2 3 4   5 6 7 8   9 10 11 12   13 14 15 16   X   2   0   3

The southern *tālas* are similar to those of the north but are organized into groups. Southern musicians speak of seven basic *tālas*, each of which can be performed in five forms (*jātis*). The following table shows the seven basic *tālas* in two *jātis*: *Trisra* (based on three rhythmic units) and *Chatusra* (based on four). The other three *jātis* (*Khanda*, *Misra*, *Sankirna*) have the same basic organization but are based on, respectively, five, seven, and nine rhythmic units.

Basic <i>tālas</i> :	<i>Trisra</i>	<i>Jātis</i> <i>Chatusra</i>
<i>Eka</i>		3 4
<i>Rūpaka</i>	2 + 3	2 + 4
<i>Jhampa</i>	3 + 1 + 2	4 + 1 + 2
<i>Tripūṭa</i>	3 + 2 + 2	4 + 2 + 2
<i>Mātya</i>	3 + 2 + 3	4 + 2 + 4
<i>Dhruva</i>	3 + 2 + 3 + 3	4 + 2 + 4 + 4
<i>Āṭa</i>	3 + 3 + 2 + 2	4 + 4 + 2 + 2

Another frequently used *tāla* is *Āḍi-tāla* (4 + 2 + 2), which is simply *Tripūṭa tāla* in its *chatusra jāti* form.

VII. *Musical forms*. A. *North*. The ancient Hindu form, not influenced by Mohammedan types, is the *Dhrūpad*. The name is derived from *dhrūva*, "firm," and *pāda*, "quarter-verse," the latter referring to a recurring verse somewhat similar to the Western rondo. *Dhrūpad* performances today are extremely rare and it is said that a singer must have the strength of five buffalos in order to accomplish this musical *tour de force*. A *dhrūpad* performance is free from all ornaments and is believed to show the *rāga* in its purest form. It may last for several hours. *Dhrūpads* are always sung in a slow and dignified tempo and only a few *tālas* can be employed: *Chautāl*, *Dhamār*, *Surphakta* (2 + 2 + 2 + 2 + 2), and *Tevra* (3 + 2 + 3). The drum used in *dhrūpad* performances is the ancient *mridanga*. The structure of the *dhrūpad* is: (a) *Ālāp*, a rhythmically free prelude in which the singer presents the essential features of the *rāga*. This is performed to the drone of the tambura but without drumming; (b) *Asthayi* (*Sthāyī*), the first part of the song, usually emphasizes the notes of the lower tetrachord. It is accompanied by the drummer (and, of course, by the tambura); (c) *Antara*, the second part of the song, emphasizes the notes of the upper tetrachord; (d) *Sanchāri*, the third part, deals with the notes of the entire range; (e) *Ābhog*, the fourth part, is usually a return to the *Asthayi*; occasionally it introduces a new, fast melody. The recurring melody (of the *Asthayi*) appears not only in the *Ābhog* but is interpolated between the other parts of the song. Occasionally the end of the *dhrūpad* appears in the form of a fast "stretto" that may be subdivided into several, rhythmically differing sections (*Āḍi*, *Chaugan*, *Kuar*).

The *Khyāl*, created by both Hindu and Mohammedan musicians, is the comparatively modern and very frequently used form of northern art music. The name is derived from *khyāl karo*, "Do imagine!" or "Fancy this!" which musicians would say to each other when performing something newly created. The *khyāl* consists of: (a) *Ālāp*; (b) *Asthayi*; (c) *Antara* plus a repetition of a part (usually the first line) of the *Asthayi*; (d) *Ālāp* proper, an elaborate *ālāp* performed with the drummer; (e) repetition of *Asthayi* and *Antara*; (f) *Bol-tāns*, fast passages, florituras, and variations, sung to textual syllables (the term is derived from *bolna*, "to speak"); (g) repetition of the *Asthayi* and *Antara*;

(h) *Tāns* proper, *tāns* without text, sung on "ah" or "na"—this is the virtuoso part of the song;  
 (i) conclusion, either a repetition of the *Asthayi* or a new, fast melody.

Other northern forms are *Thumri*, a Hindu love song; *Ghazal*, a Mohammedan love song with Urdu or Persian text; *Sargam*, a song that uses the tone syllables *SA, RI, GA*, etc., as text; *Tarana*, a song that uses drum words as text; *Tappa*, a Mohammedan love song, usually with Hindi text. All these and numerous other forms follow the *Asthayi-Antara* sequence but avoid the complicated *tāns*.

**B. South.** The musical forms of the south are similar to those of the north. The *Kīrtana* consists of four parts: *Pallavi*, *Anupallavi*, *Charana*, and a return to the *Pallavi*. The four parts have the same significances as the four parts of the *dhrūpad* and the basic sections of the *khyāl*. The *kīrtanas*, however, are more flexible than the *khyāls*; textually and musically they are simple and can be sung by persons who do not have a thorough musical education. The *Kṛti*, however, having more or less the structure of the *kīrtana*, shows elegant virtuoso features and can be performed only by trained singers. In addition, Carnatic music uses a large number of smaller forms such as the *Namavali*, *Mangalam*, *Nirupanam*, etc.

**VIII. Instruments.** The ancient *vīṇa*, a stick zither, often fretted, has two resonance gourds in the north and usually one in the south, although there are several exceptions. There are various forms of the *vīṇa* with different names. The instrument has four strings strung across the frets and generally three open bourdon strings. The tuning is in fourths and/or fifths. The sitar (*setar*) is a long-necked lute with movable frets. Sitar have three to seven strings. Below the strings are a dozen (or thirteen) thin, sympathetic wire strings. The tuning is similar to that of the *vīṇa*. The sarod, either plucked or bowed, has a pear-shaped body and one resonance gourd below the peg-box. It has six gut strings and about twelve thin sympathetic wire strings below the main strings. The tambura (*tanbura*, *tanpura*) is a long-necked lute with four wire strings. The instrument is not fretted and is used only for producing the drone sounds in *dhrūpad* and *khyāl* performances. The sarangi, a popular fiddle with three thick gut strings, has numerous sympathetic wire strings below the main strings. The instrument is played with a short bow. The dilruba (and *esraj*) is a fretted long-necked fiddle with three or four main

strings and numerous sympathetic wire strings strung below the main strings.

India possesses a large number of flutes, mostly made of bamboo with a varying number of holes. A popular double reed instrument is the *shannai* (*sāṇāyī*). A horn (conical bore) in the shape of the letter S appears often in folk music.

The mridanga, the ancient barrel drum of India, has two heads and is used in *dhrūpad* performances in the north and is still favored in certain districts of the south. Extremely popular are the *tablas*, a pair of small kettledrums (actually one is a kettle, the other a barrel), both with single heads. The *tablas* are used in art and popular music, and occasionally also in folk music. In addition, numerous other drums (*khol*, *dholaka*, etc.) are used, chiefly in folk music.

India possesses a large number of bells, cymbals, gongs, clappers, rattles, etc., in a great variety of shapes and sizes. Of interest is the *jaltarang*, a set of china cups filled with water and tuned to the scale of the *rāga* to be performed. The cups are beaten with small sticks.

**Lit. Works in Sanskrit:** Bharata, *Nāṭyaśāstra* (Benares, 1926; Kashi Sanskrit Series, no. 60); V. N. Bhatkhande, *Hindusthani Sangit Paddhati*, 6 vols. **Inégales** [F.; abbr. for *notes inégales*]. The practice of performing certain evenly written notes “unequally,” with alternation of longer and shorter values. This manner crystallized in France during Lully’s age into a distinct convention that, elaborately codified, lasted with little apparent change to the eve of the French Revolution (1789). The earliest mention of this practice is in Loys Bourgeois’ *Le droict chemin de Musique* (1550), which was followed by a few scattered references in other Latin countries (Tomás de Santa Maria, Pedro or Pietro Cerone, Frescobaldi). After 1615 foreign sources grew silent, while in 17th-century France the sources lagged behind the practice. Though clearly documented as part of the Lully style by its German chronicler, Georg Muffat (*Flori-legium Primum, Secundum*, 1695, ’98; particularly the latter), references in Lully’s lifetime are sporadic and not too specific. The first detailed account is presented by E. Loulié in his *Eléments ou principes de musique* (1696). After Loulié the sources rapidly multiply, and during the 18th century at least 40 French writers recorded the convention with remarkable unanimity.

Inequality was definitely long-short only and applied generally speaking to the fastest prevailing notes: in duple meter to the fourfold subdivision of the metrical unit such as ♪ in 4/4,

♪ in 2/4; in triple meters to twofold subdivisions: ♪ in 3/4, ♪ in 3/8; to shorter notes, if they occurred, but never to longer ones. It applied to melodies that moved by and large in stepwise progression; it was limited to French music written in the French style, hence excluding works patterned after foreign models such as Italianate sonatas or concertos. The composer could cancel inequality by such words as *détaché* or *marqué*, or by dots or dashes above the notes. The degree of unevenness was left up to the performer, varying from a slight lilt (*louré*) to a more pronounced inequality (*pointé* or *piqué*) that could approach, but only rarely reached, the full meaning of a dot.

A dotted note in a setting of inégales. The dot here takes the place of the long note of a long-short pair. This practice is probably the source of the mistaken theory of a “French style” of overdotting.

The only known non-French reference in the 18th century is a passage in Quantz’ treatise of 1752, where this advocate of a “mixed style” endorses the *inégales* convention. The passage has become the mainstay of a widely accepted theory that the *inégales* were a universal “baroque practice” that applied to German masters, including Bach, as well as to the French. Based on a misinterpretation, this mistaken theory was compounded by the frequent confusion of the *inégales* with other types of unevenness of genuinely international currency, such as agogic accents, the accentual pattern of the so-called “good” and “bad” notes, and the occasional assimilation of duple to triple meter:

which "Instrument" obviously stands in opposition to spinet and clavicymbel (both harpsichords). In the preface to his *Musicalisches Blumen-Büschlein* (1698), Johann Caspar Fischer says that the pieces are "stillere Music, . . . allein auf das Clavicordium, oder Instrument einge-richte" (more quiet music proper only for the clavichord or Instrument), a remark in which "Instrument" is clearly a synonym for "Clavicordium." In the early 19th century the name was often used for the piano.

**Instrumental music.** Music performed on instruments, as opposed to music performed by voices (\*vocal or \*choral music). Since in mixed participation the voices are usually treated as the more important body, compositions for voices and instruments (cantatas, operas, etc.) are usually classified as vocal music. There are two main types of instrumental music: ensemble (chamber and orchestral music) and solo (piano, organ, lute, etc.). Often the term "instrumental music" is used for the former only. Below is a brief summary of the development of instrumental music (both ensemble and soloist), divided into three periods in which instrumental music was (A) of lesser, (B) of equal, (C) of greater importance than vocal music.

**A. Period of lesser importance (1250–1600).** 13th century: French \**estampies*; instrumental motets \*"In seculum"; \*hockets. 14th century: Italian *estampies*; arrangements [see Intabulation]; liturgical organ pieces [see Organ music I]. 15th century: German instrumental pieces and dances [Glogauer \**Liederbuch*]; \*preludes; liturgical organ music; \*intabulations for keyboard [Ileborgh, Paumann, \**Buxheim Organ Book*]; *carmina* and other instrumental pieces by Isaac [DFO 28]. 16th century: numerous dances for keyboard [see Dance music III], lute [see Lute music], and ensemble; \**ricercar*; \**fantasia*; \**canzona*; \**toccata*; \**variations*; a large repertory of liturgical organ music including organ Masses, organ hymns, verses for the Psalms and the \**Magnificat*, etc.

**B. Period of equal importance (1600–1750).** Chamber music: instrumental \**canzona*; \**fancy*; \**sonata da camera*; *sonata da chiesa*; \**trio sonata*; \**ground*. Orchestral music: operatic \**overture* and \**sinfonia*; orchestral \**suite*; \**concerto grosso*. Keyboard music: \**suite*, \**toccata*; \**fugue*; \**chaconne* and *passacaglia*; \**variations*; \**organ chorale*.

**C. Period of greater importance (1750—).** Chamber music: \**string quartet* and other types

of modern chamber music; violin sonata. Orchestral music: \**cassation*; \**divertimento*; \**symphony*; \**concerto*; \**symphonic poem*. Piano music: \**sonata*; \**variations*; \**character pieces*.

Wolf, "Die Tänze des Mittelalters" (*AMW* i); W. J. von Wasielewski, *Geschichte der Instrumentalmusik in XVI. Jahrhundert* (1878); J. Jacquot, ed., *La Musique instrumentale de la Renaissance* (1955). For B: C. Sartori, *Bibliografia della musica strumentale italiana stampata in Italia fino al 1700* (1952); L. Torchi, *La Musica istrumentale in Italia nei secoli XVI, XVII e XVIII* (RMI, 1897–1901; pub. separately in 1901); K. Nef, *Zur Geschichte der deutschen Instrumentalmusik . . . des 17. Jahrhunderts* (1902); E. H. Meyer, *Die mehrstimmige Spielmusik des 17. Jahrhunderts* (1934). For C: W. Altmann, *Orchester-Literatur-Katalog: Verzeichnis von seit 1850 erschienenen Orchester-Werken*, 2 vols. (1924, '36). See the literature under the various forms; also under Organ music; Piano music; Violin music; Lute music; Dance music.

**Instrumentation.** The art of using instruments in a composition. Instrumentation is essentially the same as orchestration, since it is particularly in writing for the orchestra that the composer must select and combine various instruments. See Orchestra; Orchestration.

**Instruments.** Generic name for all mechanisms producing musical sounds and hence for all musical media with the exception of the human voice.

**Classification.** Studies of musical instruments used to be restricted to those of European art music, but the scope of investigation was widened considerably in the 1920's by the inclusion of non-Western (Oriental, African, etc.) instruments, which far outnumber the others. The Western instruments were (and usually still are) grouped in three categories: *stringed instruments*, *wind instruments*, and *percussion instruments*. The members of the first group are called *chordophones* [Gr. *chordos*, string; *phonos*, sound]; the second, *aerophones* [Gr. *aeros*, air, wind]; the third, which are extremely numerous in non-Western music, are divided into two classes, *idiophones* [Gr. *idios*, self], instruments that consist simply of elastic material (metal, wood) capable of producing sound, and *membrano-*

*phones* [L. *membrum*, skin], instruments in which a stretched skin is the sound-producing agent. To these four classes a fifth has recently been added, the *electrophones*, in which the acoustical vibrations are produced by electric contrivances. Each of these categories is further subdivided. The following survey is based on the classification established by C. Sachs and E. M. von Hornbostel [see *SaHMI*, pp. 455ff].

#### I. Idiophones.

A. Struck: triangle; gong; \*bell; \*chimes; \*glockenspiel; \*cymbals; \*xylophone; celesta; \*castanets [see Percussion instruments]. Also numerous non-Western instruments, e.g., the Javanese \*gambang (xylophone) and the Chinese ching (stone chimes).

B. Shaken: \*rattle; \*sistrum; crescent.

C. Plucked: \*Jew's-harp; also the music box.

D. Rubbed: \*glass harmonica; \*nail violin.

II. *Membranophones*. Chiefly \*drums. Classifications can be made according to shape (tubular drums, kettledrums, frame drums) or material (wood, metal, coconut, gourd, etc.), fastening of the skin, etc. The \*mirliton is a membranophone that is not a drum.

#### III. Aerophones.

A. Free aerophones. Instruments that act on the principle of the free (more properly, idiophonus) \*reed: \*harmonium; \*accordion; \*regal; \*sheng; the reed section of the organ [see Organ X].

B. \*Wind instruments. Instruments in which the sound-generating medium is an enclosed column of air. According to the device that sets the air into vibration, the following classes are distinguished:

1. Trumpets and horns. The device is the compressed lips of the player: lip-vibrated aerophones, commonly called \*brass instruments.
2. Flutes. The device is the sharp edge of a mouth-hole.
  - a. Vertical flutes. The mouth-hole is formed by the upper aperture of the pipe. Found occasionally in Egypt and Arabia; \*panpipes.
  - b. Transverse flute. The mouth-hole is cut in the side of the pipe. Flute proper; see Flute.
  - c. Whistle flutes. The player blows from the upper end through a flue against the sharp edge cut in the side; \*recorder; flageolet; the flue section of the organ [see Organ IX].

3. Reed pipes. The device is a (heterophonus) reed.

a. A single reed: clarinets. See Clarinet family.

b. A double reed: oboes. See Oboe family.

#### IV. Chordophones.

A. Zithers. The strings are stretched between the two ends of a flat body, such as a board or a stick.

1. Board zithers. The body has the shape of a flat board.

a. Psalteries. The strings are plucked: \*psaltery; \*zither; kantele; \*kanum. Keyboard psalteries: \*harpsichord; \*virginal; \*spinet.

b. Dulcimers. The strings are struck with a hammer: \*dulcimer; \*cimbalom; \*pantaleon. Keyboard dulcimer: \*piano.

c. The strings are touched by tangents: \*clavichord.

2. Stick zithers. The body has the shape of a stick: several non-Western instruments, notably the Hindu \*vīṇa.

3. Long zithers. The body has the shape of a long board with a slightly curved surface (originally made from the longitudinal segment of a bamboo pipe): the Chinese \*chyn (Japanese koto).

B. Lutes. Instruments having a body with a neck. The following families can be roughly distinguished:

1. Plucked: \*lute family (round back); \*guitar family (flat back).

2. Bowed: fiddles; \*violin family; \*viols; \*vielle; \*hurdy-gurdy; \*tromba marina.

C. Lyres. Instruments having a yoke, i.e., two projecting arms connected at their upper end by a crossbar: \*kithara, \*lyra, \*crwth, kinnor.

D. Harps. Instruments in which the plane of the strings is perpendicular rather than parallel to the soundboard. See Harp.

#### V. Electrophones. See Electronic instruments.

Another classification of instruments, considerably wider in scope and taking into account various other aspects (e.g., the relationship between instrument and player) is given in H. H. Dräger, *Prinzip einer Systematik der Musikinstrumente* (1948).

*History.* Restricting ourselves to Western culture, the most important pre-Christian instru-

ments were the various instruments of the Bible [see Jewish music], the \*kithara, \*lyra, \*hydraullos, and \*aulos of the Greeks, and the \*tuba (salpinx) and \*lituus in Rome (used chiefly for military purposes). The fact that, in the late Roman Empire, instruments were mainly in the hands of the *mimus* (actors), *joculares* (jongleurs), dancers, and other entertainers provoked a general prejudice against the actual use of instruments in the medieval Christian Church, although they are frequently mentioned in the writings of the church fathers as religious symbols. Nonetheless, there existed—outside the Church—a variety of instruments, as shown in numerous pictorial representations ranging from the 6th to the 13th centuries. Of these, the organ is the most important as well as the best documented. Particularly informative are the famous miniatures of the 13th-century Spanish Codex of \*cantigas (numerous reproductions in *GD*). The medieval instruments included plucked instruments such as the \*harp, \*lyra, \*psaltery, \*lute, and chrotta [see *Crwth*]; bowed instruments such as the rebec, rubeba [see *Rabab*], \*hurdy-gurdy, and \*tromba marina; various wind instruments (trumpets, horns, flutes, shawms, bagpipes); the \*portative (organ) and the \*echiquier (clavichord or harpsichord); bells and bell chimes, drums (nacaire), and castanets. Most of these instruments came from the Orient, probably through the Arabs via Spain. Except for the organ and vielle, they were used chiefly for the improvised (or, at least, unrecorded) accompaniment of singers and dancers.

During the 15th and 16th centuries most of the types above continued to be used, developing into more elegant forms. For the 15th century, our knowledge is in the main restricted to what has been recorded in paintings and drawings, particularly in numerous representations of "celestial harmony" showing beautifully shaped and decorated instruments in the hands of angels (Van Eyck, Memling; see, e.g., *SaHMI*, p. 304). In the 16th century there developed an independent repertory of music for the organ, harpsichord, and lute [see *Instrumental music*]. Many other instruments, however, were built and used, as shown in the writings of Sebastian Virdung (*Musica getutscht*, i.e., "Music Germanicized," 1511); Martin Agricola (*Musica instrumentalis deudsch*, 1528); and Michael Praetorius (*Syntagma musicum*, vol. ii, 1618). These books, together with evidence such as, e.g., surviving lists of instrument collections, show

that the 16th century placed a marked emphasis on wind instruments. The collection of 381 instruments left by King Henry VIII of England comprised 272 wind instruments (cross flutes, recorders, shawms, cromornes, horns, cornets, organs, bagpipes) and 109 stringed instruments (virginals, lutes, viols, guitars, clavichords). An important feature of this period was the building of instruments in families; in fact, the playing of music in homogeneous groups, e.g., on four recorders, four viols, four trombones, replaced to a large extent the mixed ensembles of the 15th century, which had preferred the simultaneous sound of contrasting timbres [see *Sound ideal*].

The 17th century (baroque) brought a marked trend toward the stringed instruments: the soft viol, the delicate lute, the "singing" violin. The lute, especially, existed in a great variety of sizes and types, such as the chitarrone, theorbo, cittern, mandola, etc. [see *Lute*; *Guitar family*]. Special types of viol were the \*viola d'amore, baryton, and \*viola pomposa. Among the wind instruments of the baroque, the recorder and oboe were prominent, with the trumpet and horn coming into use after 1700. For the ensuing history and current classification of the modern orchestral instruments, see *Orchestra and Orchestration*.

**Inszenierung** [G.]. Staging [F. *mis en scène*] of an opera or play.

**Intabulation** [G. *Intabulierung*; It. *intavolatura*]. Designation for a keyboard or lute \*arrangement of vocal music from the 14th to the 16th centuries. The term, derived from L. *tabula* (table), refers to the change from the original notation in single parts (\*mensural notation) to the scorelike (tabular, vertical) notation used for the \*tablatures of the solo instruments, the organ and lute. The intabulation of a motet or chanson by Josquin is the 16th-century counterpart of the piano arrangement of a modern symphony or quartet. The chief difference between the early and modern procedures is the

greater freedom of the former. Not only were original parts omitted or differently distributed wherever their range was inconvenient for the reach of the hand, but the texture was enriched by the addition of coloraturas, passing notes, etc. [see Ex.].

The documented history of intabulation begins with the earliest extant source of keyboard music, the so-called Robertsbridge Fragment of c. 1320, which includes three intabulations of contemporary motets, two of them preserved in the *Roman de Fauvel*. The next source, the Codex Faenza (c. 1400), consists largely of arrangements of 14th-century *ballades*, madrigals, etc., by Machaut, Landini, and others, while the \*Buxheim Organ Book of c. 1460 contains nearly 200 arrangements of French chansons (by Dunstable, Dufay, Binchois) and German lieder. All these pieces show the characteristic trait of the intabulation, the liberal addition of ornamental figurations. In the 16th century intabulations of motets, Mass compositions, chansons, and madrigals appeared in ever-increasing quantity in the numerous publications of keyboard and lute music. The artistic importance of this sometimes overwhelmingly large repertory is very slight. It is interesting, however, from the sociologic viewpoint, since it indicates an ever-growing desire on the part of music lovers to have favorite pieces of their time available for domestic use. In the late 16th and early 17th centuries some composers of intabulations replaced the routine ornaments of the earlier specimens with freely invented and often very ingenious figurations. One of the earliest examples of this type is Hernando de Cabezón's "Suzanne un jour," which he included in his edition of the works of his father (*Obras de música*, 1578; \*Editions XX). Equally interesting are intabulations by Peter Phillips (in the Fitzwilliam Virginal Book), Coelho (*Flores de música*, 1620) and Frescobaldi (Arcadelt's "Ancidemi pur," in *Toccate* ii, 1627). These are among the latest that were written.

Musicologists have drawn on the intabulations chiefly for the study of \**musica ficta* [E. Frerichs, in *ZMW* vii; W. Apel, *Accidentien und Tonalität in den Musikdenkmälern des 15. und 16. Jahrhunderts* (1936)], and ornamentation [A. Schering, *Studien zur Musikgeschichte der Frührenaissance* (1914); O. Kinkeldey, *Orgel und Klavier in... 16. Jahrhunderts* (1910)]. See Arrangement. Examples in *HAM*, nos. 145, 160; *SchGMB*, nos. 35/36 and 62b/63a. For additional examples (original plus intabulation), see

Original version

Intabulation

*WoGM* iii, 191 (Robertsbridge Fragment; D. Plamenac, in *JAMS* iv, 190 (Codex Faenza); A. Schering, *Studien zur Musikgeschichte der Frührenaissance* [1914; Buxheim Organ Book]; Y. Rokseth, *Treize Motets . . . parus chez Pierre Attaignant* (1930; motets and Mass compositions by Obrecht, Compère, Févin, *et al.*; also \*Editions XLIX, 5); O. Kinkeldey, *Orgel und Klavier* (1910), pp. 245 (ensemble *ricercar* by Buus), 260, 264 (French chansons).

**Intavolatura** [It.]. See Intabulation. In titles of Italian publications of keyboard music (16th–17th centuries) the designation “Toccate (Canzone, Capricci, etc.) d’intavolatura” indicates that the music is notated on two staves (piano score), as distinguished from “di partitura” (or “spartiti”), i.e., with a separate staff for each part, as in the open score.

**Integer valor** [L.]. In mensural notation of the 15th and 16th centuries, the normal value of a note (*brevis*, *semibrevis*), as distinguished from the reduced or enlarged values caused by the proportions. See Proportions.

**Interchange of voices.** See Voice exchange.

**Interference.** See under Acoustics VI.

**Interlude.** Any kind of inserted music [see *Entr’acte*; *Intermezzo*]. Specifically, name for short organ pieces played between the various verses of a hymn or a psalm. These were usually improvised and hence are rarely found in printed books except in those of the early 19th century, when the art of improvisation had begun to decline. One of the few early books containing interludes is Daniel Purcell’s *The Psalms Set Full for the Organ or Harpsichord . . . as also with their Interludes of Great Variety* (pub. 1718; see Nagel, in *MfM* xxx, 47). The low standard of the later interludes is illustrated by an example from Gresham, *Psalmody Improved* (c. 1780), which is reproduced in P. A. Scholes, *The Oxford Companion to Music* (1955), pl. 86 (opp. p. 503). In the German Protestant service short interlude-like passages were inserted between the various lines of the chorale rather than after a complete stanza. Certain organ chorales by Bach illustrate this procedure, e.g., his *In dulci jubilo* (BG xl, 74).

**Intermedium** [L.], **intermède** [F.], **intermedio** [It., Sp.]. See *Intermezzo* (1).

**Intermezzo.** (1) A light theatrical entertainment introduced between the acts of a serious play or

opera (interpolations consisting only of instrumental music are more properly termed \**entr’actes*). Twice in music history *intermezzi* have led to new forms: the 16th-century *intermedi* of stage plays are among the forerunners of the opera [see *Opera* II], and the 18th-century *intermezzi* of operas were the predecessors of the *opera buffa* [see *Comic opera* II B]. A similar process took place in the 13th century when certain \**tropes* (in a sense, *intermezzi* of Gregorian chant) developed into the medieval \**liturgical drama*.

As early as the last quarter of the 15th century, musical interludes were used with presentations of plays based on ancient Greek and Latin themes. In 1471 an *Orfeo* was performed at Mantua with music consisting of a *canzone*, choruses of dryads and bacchantes, and a prayer of Orfeo’s [see *ReMR*, p. 173]. In 1502, at the wedding of Lucrezia Borgia and Alfonso d’Este, Plautus’ *Asinaria* was presented with *intermedi* by Tromboncini and others. At the marriage of Cosimo de’ Medici and Eleonora of Toledo in 1539, a play by Antonio Landi, *Il Commodo*, was performed, with *intermedi* for which Corteccia composed the music, which has been preserved [see F. Ghisi, *Feste musicali*]. In 1565, Corteccia and Striggio provided music for *intermedi* representing the story of Cupid and Psyche, which were played between the acts of a comedy, *La Cofanaria*. The music is lost, but an account that survives includes a detailed description of the instruments employed [see *Orchestra* II]. A particularly sumptuous entertainment took place at Florence in 1589, at the wedding of Ferdinand de’ Medici and Christine of Lorraine. On this occasion *intermedi* composed by Cavalieri, Malvezzi, Marenzio, and Caccini were performed with a comedy, *La Pellegrina*. The pieces—a *Sinfonia* by Marenzio, madrigals, solo songs, and ballets, with considerable instrumental accompaniment—had no connection with the main play nor among themselves, but represented individual scenes such as “The Harmony of Spheres,” “The Strife between the Pierides and the Muses,” and “The Combat between Apollo and the Dragon” [see A. Della Corte and G. Pannain, *Storia della musica* i, 339ff]. Similar presentations also took place in France, culminating in the *Balet comique de la royne* of 1581 [see *Ballet* I].

In the latter part of the 17th century most of the Italian operas performed at Paris were furnished with *intermèdes* (ballets and vocal music) by French composers, especially Lully

[see H. Prunières, *L'Opéra italien en France avant Lulli* (1913)]. In Italy itself the intermezzi developed along a particularly important line that can be traced back to 1623, when an opera, *L'Amorosa innocenza*, was performed in Bologna with intermezzi that, although inserted between different acts, formed a little continuous opera of their own called *Coronazione di Apollo*. This was the beginning of a practice of "interwoven twin operas" that continued throughout the 17th century, uniting a serious plot and a lighter one into a unique kind of entertainment. In the Neapolitan opera of the early 18th century the comic intermezzi so appealed to the public that they became a dangerous rival of the main operas, with their somewhat stereotyped plots. The final stage of this development is represented by Pergolesi's *La Serva padrona*, which, originally performed as an intermezzo to the composer's serious opera *Il Prigionero superbo* (1733), was so successful that it continued to exist independently as an *opera buffa* [see Comic opera II, B]. See also Masque.

(2) One of the numerous titles of 19th-century \*character pieces, suggestive of the somewhat casual origin of a piece, as if it were composed between works of greater importance (Schumann, Brahms).

Lit. for (1): D. P. Walker, ed., *Les Fêtes du mariage de Ferdinand de Médicis et de Christine de Lorraine, Florence 1589*, 2 vols. (1963—); *id.*, *Musique des Intermèdes de "La Pellegrina"* (1963); L. Schrade, *La Représentation d'Edipo tiranno au teatro olimpico (Vicence 1585)* (1960); A. Della Corte and G. Pannain, *Storia della musica* (1944), i, 332ff; O. Kinkeldey, *Orgel und Klavier in der Musik des 16. Jahrhunderts* (1910), pp. 163ff; F. Ghisi, *Feste musicali della Firenze*

O. Sonneck, in *MA* iii (*Cofanaria*); H. Engel, "Nochmals die Intermedien von Florenz 1589" (*CP Schneider*); W. F. Weichlein, in *JAMS* xi, 85. For the intermezzi of the 17th and 18th centuries, see Comic opera.

**International Musical Society.** For this organization, Internationale Musikgesellschaft, and others, see under Societies III.

**Interpretation.** The personal and creative element in the performance of music, which, as in drama, depends on a middleman between the composer and the audience (except in \*electronic music). The player or conductor, while studying a composition, absorbs it and, consciously or unconsciously, models it according to his own general ideas and taste [see also Expression]. A personal interpretation is the performer's great privilege, granted him by the composer. A really fine performer is always aware of the responsibility toward the work that this privilege imposes.

In early music, interpretation is primarily a matter of study of standards and styles entirely different from those of the current repertory. Even Bach presents many problems of interpretation that are not in the main questions of personal taste but of historical fact. See Performance practice. See G. Brelet, *L'Interprétation créatrice*, 2 vols. (1951).

**Interrupted cadence.** See under Cadence I.

**Interval.** The distance in pitch between two tones. The name of each interval indicates the number of tones of the diatonic scale it includes. Following are these names in English, German, French, Italian, Spanish, and Latin (medieval):

	c-c	c-d	c-e	c-f	c-g	c-a	c-b	c-c'
E.	unison (prime)	second	third	fourth	fifth	sixth	seventh	octave
G.	Prime	Sekunde	Terz	Quarte	Quinte	Sexte	Septime	Oktave
F.	unisson	seconde	tierce	quarte	quinte	sixte	septième	octave
It.	prima	seconda	terza	quarta	quinta	sesta	settima	ottava
Sp.	unísono	segunda	tercera	cuarta	quinta	sexta	séptima	octava
L.	unisonus	tonus	ditonus	diates- saron	diapente	tonus cum diapente	ditonus cum diapente	diapason

*medicea (1480–1589)* (1939); R. G. Kiesewetter, *Schicksale und Beschaffenheit des weltlichen Gesanges* (1841), pp. 65ff (examples from the *intermedi* of 1539 and 1589); articles by L. Schrade, D. P. Walker, and F. Ghisi in *Les Fêtes de la Renaissance*, J. Jacquot, ed., i (1956);

The intervals larger than an octave are called *compound intervals*. The first four of these also have special names: c-d', ninth or compound second [F. *neuvième*; G. *None*; It. *nona*; Sp. *novena*]; c-e', tenth or compound third [F. *dixième*; G. *Dezime*; It. *decima*; Sp. *décima*];

c-f', eleventh or compound fourth [F. *onzième*; G. *Undezime*; It. *undicesima*; Sp. *undécima*]; c-g', twelfth or compound fifth [F. *douzième*; G. *Duodezime*; It. *duodecima*; Sp. *duodécima*]. The same intervals occur between any two notes, e.g., f-a is a third, g-d' is a fifth, b-c' is a second. Intervals leading down from a note are described as "lower"; e.g., the lower fifth of c is F, etc. See also Complement; Inversion (1).

Although, e.g., a third always includes three tones, there are various kinds of third, according to whether the tones are whole tones or semitones, i.e., according to the number of chromatic steps contained in the interval. The following table shows the classification and terminology (the numbers in parentheses indicate the number of semitones in each interval):

	Diminished	Minor	Major	Augmented
Second	c#-d <sup>b</sup> (0)	c-d <sup>b</sup> (1)	c-d (2)	c-d# (3)
Third	c#-e <sup>b</sup> (2)	c-e <sup>b</sup> (3)	c-e (4)	c-e# (5)
Sixth	c#-a <sup>b</sup> (7)	c-a <sup>b</sup> (8)	c-a (9)	c-a# (10)
Seventh	c#-b <sup>b</sup> (9)	c-b <sup>b</sup> (10)	c-b (11)	c-b# (12)
			Perfect	
Fourth	c#-f (4)	c-f (5)		c-f# (6)
Fifth	c#-g (6)	c-g (7)		c-g# (8)
Octave	c#-c' (11)	c-c' (12)		c-c# (13)

**Intervals, calculation of.** The following explanation presupposes some knowledge of algebra, including powers, roots, and (optionally) logarithms.

I. The pitch of a tone is determined by its frequency, i.e., the number of vibrations per second produced by the tone [see Acoustics I]. The interval between two tones is determined by the quotient or ratio (not the difference; see under IV) of the two frequencies. For instance, the interval between the tones 500 and 800 is  $800:500 = 1.6$ ; that between the tones 512 and 1024 is  $1024:512 = 2$  (the octave); the interval between 512 and 728 is the same as that between 384 and 546, i.e., 1.42. In the calculations of intervals the actual pitches are, of course, immaterial. An arbitrary tone, usually c, is chosen as the point of departure and is designated by the frequency 1.

II. Practically all calculations of intervals are based on three elementary intervals, the octave (O), the fifth (F), and the major third (T). Experiments already begun by Pythagoras (6th century B.C.) produced the following laws: (1) If the frequency of a tone is  $n$ , those of the octave, fifth, and (major) third are  $2n$ ,  $\frac{3}{2}n$ , and

$\frac{4}{3}n$  respectively. In terms of intervals (initial tone = 1) this means that the octave (O) is 2, the fifth (F)  $\frac{3}{2}$ , the third (T)  $\frac{4}{3}$  i.e.,  $O = 2$ ;  $F = \frac{3}{2}$ ;  $T = \frac{4}{3}$ . (2) Intervals are added by multiplying their respective fractions. Thus, the interval of the twelfth (upper fifth) is  $F + O = \frac{3}{2} \times 2 = 3$ ; that of the major seventh is  $F + T = \frac{3}{2} \times \frac{4}{3} = 2$ ; that of the third octave is  $O + O + O = 2 \times 2 \times 2 = 8$ ; etc. (3) An interval is subtracted by multiplying with its inverted fractions:  $-O = \frac{1}{2}$ ;  $-F = \frac{2}{3}$ ;  $-T = \frac{3}{4}$ . Thus, the fourth is  $O - F = 2 \times \frac{2}{3} = \frac{4}{3}$ ; the minor third is  $F - T = \frac{3}{2} \times \frac{3}{4} = \frac{9}{8}$ ; the major sixth is  $2 \times \frac{3}{4} = \frac{3}{2}$  (octave minus minor third); etc.

III. The calculation of intervals, particularly of the more complicated ones, can be considerably simplified by disregarding the octave, i.e.,

the factor 2. In doing so, the fifth becomes 3 (actually the twelfth), the third becomes 5 (actually the second higher third):  $F = 3$ ;  $T = 5$ . Naturally, when using these figures the results are not correct in terms of their octave position; however, they can easily be corrected by multiplying them by such a power of 2 (2, 4, 8,  $\frac{1}{2}$ ,  $\frac{1}{4}$ ,  $\frac{1}{8}$ ) as will cause the product to lie between 1 and 2. Examples: (1) Calculation of the major seventh, i.e., fifth plus third:  $F + T = 5 \times 3 = 15$ ; multiplied by  $\frac{1}{8}$ , hence  $\frac{15}{8}$ . (2) Calculation of the fourth, i.e., lower fifth:  $-F = \frac{1}{3}$ ; to be multiplied by 4, hence  $\frac{4}{3}$ . (3) Find the syntonic comma, i.e., the difference between the tone e of the \*Pythagorean system (fourth consecutive fifth) and the natural third:  $4F - T = 3^4:5 = \frac{81}{5}$ , to be multiplied by  $\frac{1}{16}$ , hence  $\frac{81}{80}$ . This method is especially convenient for the reverse calculations, i.e., determining the interval if the ratio is given. Examples: (4) Which interval is represented by  $\frac{9}{8}$ ? Disregarding all powers of two ( $8 = 2 \times 2 \times 2$ ) we find that the interval is  $3 \times 3$ , i.e.,  $F + F = 2F$ , hence the second consecutive fifth, d. (The fact that the original figure lies between 1 and 2 is enough to show that this is the d within the normal octave, hence, the

second.) (5) Determine the interval  $2\frac{3}{8}$ . Solution:  $\frac{5 \times 5}{3 \times 3 \times 2} = 2T - 2F$ , hence two consecutive thirds minus two consecutive fifths, that is, f-sharp. (6) Determine the interval  $4\frac{5}{32}$ . Solution (the denominator contains only powers of 2,  $2^5 = 32$ ):  $3 \times 3 \times 5 = 2F + T$ , that is, f-sharp. Naturally, this f-sharp is not exactly the same as the one before; the difference between them is again the syntonic comma, as can easily be found by dividing the two figures (a quicker method is to subtract the two "symbols":  $(2F + T) - (2T - 2F) = 2F + T - 2T + 2F = 4F - T$ , a quantity that always indicates the syntonic comma).

IV. *Logarithmic intervals.* Several drawbacks of the method above are avoided if logarithms are used. According to the fundamental equation of logarithms,  $\log a \times b = \log a + \log b$ , the logarithm of a product is equal to the sum of the logarithms of the factors (e.g.,  $\log 15 = \log 3 + \log 5$ ). If, therefore, two intervals  $i_1$  and  $i_2$  are represented, not by their frequency ratios  $f_1$  and  $f_2$  but by the logarithms of these figures,  $\log f_1$  and  $\log f_2$ , the compound interval  $i_1 + i_2$  is represented, not as before by  $f_1 \times f_2$  but by  $\log (f_1 \times f_2) = \log f_1 + \log f_2$ . It follows that, if logarithmic intervals are used, "addition" or "subtraction" of intervals is done by actually adding and subtracting figures instead of multiplying or dividing them. The chief advantage of logarithmic frequencies is that equal musical intervals are represented by equal distances on a geometric scale. For instance, in the usual logarithmic scale of \*cents, the various octaves are indicated by the equidistant figures 0, 1200, 2400, 3600 [Ex. b], while in ordinary frequencies they are indicated by the figures 1, 2, 4, 8, etc. [Ex. a]:

Note that in the ordinary measurement the fifth g ( $1\frac{1}{2}$ , 3, 6) lies exactly in the middle of the octave, although this place should actually be occupied by the well-tempered f-sharp, as it is in the logarithmic scale.

V. Logarithmic frequencies are particularly important—in fact, indispensable—in all calculations concerning tempered intervals or microtonic intervals (non-Western scales). The well-tempered scale consists of twelve equal intervals (semitones) within one octave. If the interval of the semitone were  $i$ , the successive tones of the chromatic scale would have the frequencies: 1 (c),  $i$  (c $\sharp$ ),  $i^2$  (d),  $i^3$  (d $\sharp$ ), etc., until  $i^{12}$  (c'). Since, on the other hand, the octave has the frequency 2, we have the equation  $i^{12} = 2$ ; hence  $i = \sqrt[12]{2} = 1.05946$ . The successive powers of this figure give the relative frequencies of the successive tones of the well-tempered scale (e.g., d would be  $1.05946 \times 1.05946 = 1.12246$ , etc.). In using logarithms, the intervals of the well-tempered scale are found much more easily as the multiples of  $\log i = 0.0251$ : c = 0; c $\sharp$  = 0.0251; d = 0.0502; d $\sharp$  = 0.0753; . . . c' =  $12 \times 0.0251 = 0.3010$  (=  $\log 2$ ). The only flaw in this scale is that the important interval of the octave is represented by the rather cumbersome figure 0.3010. This defect, however, can easily be corrected by multiplying the scale by a convenient factor. Various such "enlarged logarithmic scales" are in use; the most widely adopted one is that suggested by Ellis, in which the enlarging factor is  $\frac{1200}{\log 2}$ , so that the octave becomes exactly 1200.

The unit of this measurement is called *cent*; each chromatic semitone equals 100 cents [see Cents]. The formula for the conversion of interval ratios ( $i$ ) into cents ( $c$ ) is:  $c = \frac{1200}{\log 2} \times \log i = 3986 \times \log i$ . For nearly all purposes the factor 3986 can be replaced by 4000. Thus, the calculation of the fifth is as follows:  $F = 4000 \times \log \frac{3}{2} = 0.1761 \times 4000 = 704.4 \approx 704$  cents. If very accurate results are desired, the following correction should be made: Subtract from the result 0, 1, 2, 3, or 4, according to whether the interval lies next to c, e $\flat$ , f $\sharp$ , a, or c'. Therefore, the accurate figure for  $F$  is 702 cents. A similar calculation for  $T$  is  $T = \log \frac{4}{3} \times 4000 = 0.0969 \times 4000 = 387$  cents, corrected to 386. With these figures for  $F$  and  $T$ , all the other intervals of \*just intonation and of the \*Pythagorean system can easily be calculated. For instance, the major seventh  $T + F$  is  $702 + 386 = 1088$ . This result shows that the major seventh of just intonation is 12 cents lower than that of equal temperament, 1100.

VI. The accompanying table gives the most important intervals in relative frequencies and in cents. The letters P, E, and J indicate the tones

	P	E	J
Semitone	$2^{56}_{243} = 90$	$i = 100$	$1^{6}_{15} = 112$ (C-D <sup>b</sup> ); $1^{35}_{128} = 92$ (C-C#)
Whole tone	$\frac{9}{8} = 204$	$i^2 = 200$	$\frac{9}{8} = 204$ (C-D); $1^9 = 182$ (D-E)
Minor third	$3^{22}_{27} = 294$	$i^3 = 300$	$\frac{6}{5} = 316$
Major third	$8^{11}_{64} = 408$	$i^4 = 400$	$\frac{5}{4} = 386$
Fourth	$\frac{4}{3} = 498$	$i^5 = 500$	$\frac{4}{3} = 498$
Aug. fourth	$7^{29}_{512} = 612$	$i^6 = 600$	$4^{5}_{32} = 590$
Dim. fifth	$10^{24}_{729} = 588$	$i^6 = 600$	$6^{4}_{45} = 610$
Fifth	$\frac{3}{2} = 702$	$i^7 = 700$	$\frac{3}{2} = 702$
Minor sixth	$12^{8}_{81} = 792$	$i^8 = 800$	$\frac{8}{5} = 814$
Major sixth	$2^{7}_{16} = 906$	$i^9 = 900$	$\frac{5}{3} = 884$
Minor seventh	$1^6 = 996$	$i^{10} = 1000$	$1^6 = 996$ (D-C); $\frac{9}{8} = 1018$ (E-D)
Major seventh	$2^{43}_{128} = 1110$	$i^{11} = 1100$	$1^5 = 1088$ (C-B); $2^{56}_{135} = 1108$ (C-C <sup>b</sup> )
Octave	$2 = 1200$	$i^{12} = 1200$	$2 = 1200$

of the systems of Pythagoras (factors 3 and 2), equal temperament (powers of  $i$ ), and just intonation (factors 3, 5, and 2). For a graphic table, see Temperament III.

It must be understood that the systems P and J actually consist of an infinite number of tones within one octave (P one-dimensional, J two-dimensional); only the simplest of these are given in the table.

Unfortunately, the measurement based on cents is not the only one in use; various others are employed, all of them logarithmic but differing in the enlarging factor and, therefore, in the number of units contained in the octave. Some of these other systems are:

\**Savart* (301 to the octave) =  $1000 \times \log i \approx \frac{1}{4}$  cent (1 savart = approximately 4 cents).

*Millioctave* (1000 to the octave) =  $\frac{1000}{\log 2} \times \log i = \frac{5}{8}$  cent (1 millioctave =  $\frac{5}{8}$  cents).

*Centitone* (600 to the octave) =  $\frac{600}{\log 2} \times \log i = \frac{1}{2}$  cent (1 centitone = 2 cents).

For example, the well-tempered fifth is 700 cents = 175.6 savarts = 583.3 millioctaves = 350 centitones.

See Pythagorean scale; Just intonation; Microtone; Temperament; Comma; Cents.

Lit.: R. W. Young, *A Table Relating Frequency to Cents* (1939); H. Husmann, *Fünf- und siebenstellige Centstafeln zur Berechnung musikalischer Intervalle* (1951); A. Daniélou, *Tableau comparatif des intervalles musicaux* (Publications de L'Institut français d'Indologie viii [1958]).

**Intolleranza 1960.** Opera-oratorio by L. Nono (libretto by the composer after A. M. Ripellino), produced in Venice, 1961. Setting: the present.

**Intonation.** (1) In ensemble performance, intonation means singing or playing in tune. Correct intonation in violin (and all string) playing results from a combination of exact listening, technical facility, and a good instrument. The violinist generally uses the well-tempered scale when accompanied by the piano but has greater freedom to modify leading tones, raise thirds, etc., with a string group. See C. Heman, *Intonation auf Streichinstrumenten* (1964); K. G. Mostrass, *Die Intonation auf der Violine* (1961). (2) In Gregorian chant, the opening notes of a \*psalm tone or other recitation tones. (3) See Just intonation.

**Intonatione.** A 16th-century Italian name for a prelude, designed chiefly for liturgical use. The best-known examples are those in *Intonationi d'organo di Andrea Gabrieli, et di Gio. suo nepote* of 1593. This publication contains eight *intonationi* by A. Gabrieli, one for each of the eight church modes (*del primo, secondo, . . . tono*), and eleven by G. Gabrieli, one for each of Glareanus' enlarged system of twelve modes, except for modes 3 and 4, which are represented by a single *Intonatio del terzo et quarto tono* (the actual number of pieces is twenty-two, since each is also given in transposition to the fourth or fifth). B. Schmid's *Tabulatur Buch* of 1607 ascribes eight *intonationi* to G. Gabrieli and the group of twenty-two to A. Gabrieli. The term was occasionally used by later composers, e.g., F. X. Murschhauser and S. A. Scherer.

**Intrada, entrada** [It.]. A 16th- and 17th-century name for an opening piece of a festive or march-like character, written in full homophonic style. A number of intradas for five to six instruments (the earliest in existence?) are in a publication of 1597 by Alessandro Orologio. Intradas in duple

or triple meter figure prominently among the dance types of the German orchestral suites of the early 17th century, in which they usually (but not always) appear at the beginning [see the suites of M. Franck and V. Haussmann, in *DdT* 16; J. H. Schein, *Banchetto musicale* (1617), new ed. by A. Prüfer, vol. i; *SchGMB*, nos. 153, 154, 157; *RiHM* ii.2, 173]. Mozart (*Bastien und Bastienne*) and Beethoven (*Wellingtons Sieg*) used the name for short overtures. See M. Reimann, in *MF* x.

**Introduction.** A slow section frequently found at the beginning of symphonies, quartets, sonatas, etc. An unusually long and elaborate introduction is that of Beethoven's Seventh Symphony.

**Introit** [*L. introitus*]. (1) The initial chant of the (Proper of the) \*Mass. It is an antiphonal chant [see under Antiphon (3)] and is usually in a moderately ornate style. For the form of the Introit, see Psalmody III. The Introit was introduced by Pope Celestine I (reigned 422–32) as a chant accompanying the entrance of the priest to the altar [cf. the Ambrosian analogue \**ingressa*] and consisted originally of an entire psalm sung antiphonally. The text, particularly its first section (antiphon), frequently refers to the occasion, e.g., the Christmas Introit "Puer natus est nobis" [see *GR*, p. 33]. Several Sundays are named for the initial word of their Introit, e.g., Laetare Sunday (fourth Sunday in Lent) from the text: "Laetare Jerusalem" [*GR*, p. 138]; see also Requiem Mass. (2) In isorhythmic motets of the 14th and 15th centuries, an *introitus* is an introductory section that stands outside the isorhythmic structure. Usually the tenor is silent during this section. Two motets by P. de Vitry, "In arboris" and "Virtutibus laudabilis" (ed. L. Schrade, in *Polyphonic Music of the Fourteenth Century* [1956], i), five by G. de Machaut (ed. F. Ludwig, \**Editions XLVI*, 4.ii, nos. 9, 19, 21, 22, 23), seven by G. Dufay (ed. G. de Van, nos. 1, 3, 4, 5, 7, 12, 13), and many others (J. Ciconia, N. Grenon, J. Dunstable) begin with an *introitus*. Sometimes it is composed as a canon (e.g., Dufay, nos. 4, 7, 13). Occasionally the *introitus* has no text, becoming an instrumental introduction (Dufay, no. 3).

**Invention.** A rarely used term but familiar to every musician through Bach's collection (1723) of 15 keyboard pieces in two parts, called "Inventiones," and 15 pieces in three parts, called "Sinfoniae." (In the *Klavierbüchlein für Wilhelm Friedemann Bach* they are called "Praeambulum" and "Fantasia" respectively.) The usual

names, "two-part invention" and "three-part invention," are not authentic but seem justifiable on account of the similarity of style in both groups. Bach's reason for choosing these terms is entirely obscure. The word "sinfonia" was widely used in his day, but for an entirely different type of music [see Sinfonia]. The designation "invention" was used by G.-B. Vitali for pieces involving special tricks ("inventioni curiose," 1689; see Editions III, 7) and by F. A. Bonporti as a synonym for suites (*partitas*) in a work (op. 10) published under different titles at various times (1712, '25). Four of Bonporti's "inventions" have been reprinted as works of Bach in *BG* [vol. xlv, pp. 172–89; see W. Wolffheim, in *BJ*, 1911; C. Bouvet, in *RdM* 1918]. No less obscure than the origin of the name is the development leading to the type represented by Bach's inventions and sinfonias, which might best be described as "studies in double or triple counterpoint." Possibly an investigation of the numerous 17th-century Italian publications of two-part "ricercars" [see Ricercar II (d); *inventio* = translation of *ricercar*?] would throw light on whether or not Bach "invented the inventions." It may be noted that the invention style is very common in the preludes of Bach's *Well-Tempered Clavier* (e.g., vol. i, nos. 3, 9, 11, 13, 15, 18, 19, 20), and is used also in the preludes of the first three *partitas* [see Suite I].

**Inventions-horn.** See under Horn II.

**Inversion.** Substitution of higher for lower tones and vice versa. There are two main types of inversion, harmonic inversion and melodic inversion. In harmonic inversion, the lower note (of an interval) or the root (of a chord) is in an upper part instead of in the bass. In melodic inversion, the successive intervals of the melody are inverted.

(1) *Harmonic inversion.* An interval is inverted by transferring its lower note into the higher octave, or its higher note into the lower octave, e.g., the inversion of d–a is a–d' or A–d. By inversion, a fifth changes into a fourth, a third into a sixth, etc. (the sum of the numbers indicated in the names of the two intervals is always nine, e.g., 5 + 4 = 9; 3 + 6 = 9). Both intervals together form an octave [see Complement]. Major intervals become minor, augmented intervals become diminished, while a perfect interval produces another perfect interval. See the table shown on p. 419, in which inverted intervals can easily be found by looking for two figures whose sum is twelve, the number of semitones in the

octave, e.g., major third and minor sixth ( $4 + 8 = 12$ ) or augmented second and diminished seventh ( $3 + 9 = 12$ ) [Ex. 1a]. A chord (triad, etc.) is inverted by applying the principle just explained to the lowest tone, e.g., changing  $g-b-d'$  into  $b-d'-g'$ . For more details, see Harmonic analysis IV.

a. Inverted intervals. b. Inverted chords. c. Inverted counterpoint.

In counterpoint, the principle of harmonic inversion leads to an exchange of higher and lower parts by means of octave transposition. For more details see Invertible counterpoint. The term "inverted pedal (point)" means a sustained note (pedal) in a higher part rather than in the bass [see Pedal point].

(2) *Melodic inversion.* A melody (subject) is inverted by changing each ascending interval into the corresponding descending interval, and vice versa. By this process, an ascending fifth  $c-g$  changes into a descending fifth  $c-F$ , the ascending progression  $c-d'-e'$  into the descending progressions  $c-b-a$ . The result is a mirrorlike exchange of upward and downward movements [Ex. 2, from Bach's *\*Well-Tempered Clavier*, vol. I; in the illustration here the second line of music has been transposed a fourth higher than the original (from meas. 20ff) for purposes of comparison]. Inversion is said to be strict (or real) if the original and inverted intervals agree

exactly with regard to semitonal distance. Thus the strict inversion of  $c-d'-e'$  is  $c-b^b-a^b$ . However, since this procedure destroys the tonality, it is practically never used except in the twelve-tone system, in which tonality has no place [see

Serial music]. Normally, inversion is "tonal," i.e., it utilizes the degrees of the scale of the key. Thus  $c-d'-e'$  would become  $c-b-a$ , preserving the tonality. Inversion plays an important part in fugues [see Counterfugue], in *\*gigues*, and in the development sections of sonatas and symphonies [Ex. 3, Bruckner, Symphony no. 7].

Melodic inversion appears in the works of Ciconia [see under Isomelic] and in the tenors of 15th-century Masses and motets, where it is indicated by canons such as "Subverte lineam" (Dunstable; see *ApNPM*, p. 187), "Per antifrasm canta" (Obrecht, *Missa L'Homme armé*), or "Qui se exaltat humiliabitur, et qui se humiliat exaltabitur" (Obrecht, *Missa Graecorum*). As a device of fugal composition, it was first exploited by Andrea Gabrieli [see W. Apel, in *MD*, iii].

**Inverted canon.** Canon either by (melodic) inversion or by retrograde motion; see Canon I (d), (e).

**Inverted fugue.** *\*Counterfugue.*

**Inverted mordent** [G. Schneller]. An 18th-century ornament involving alternation of the written note with the note immediately above it, to be performed as a short, rapid trill beginning on the beat. The inverted mordent was not one of the French *agréments*, having been introduced after 1750 by K. P. E. Bach, who always indicated it by two small grace notes [Ex. a]. Later composers often designated the inverted mordent with a short wavy line [Ex. b], which originally indicated a somewhat different ornament called *Pralltriller*. This is a rapid trill of four notes, beginning with the upper auxiliary, as was customary with trills in that period. This trill was used only on the lower note of a descending second and tied to the preceding note, sometimes giving the erroneous impression that the *Pralltriller* begins with the main note. The *Schneller*, on the other hand, can occur only on a detached note, that is, the upper note of a descending second, so that the position of the sign (b) usually indicates whether a *Schneller* [Ex. c] or a *Pralltriller* [Ex. d] is meant.

After 1800 the *Pralltriller* dropped out of use so that the sign (b) always indicates the *Schneller*. Simultaneously, however, the name *Schneller* dropped out of use and the ornament illustrated under (c) became known as *Pralltriller*, the current German term for the inverted mordent.

The former restriction regarding its position on the first note of a descending second has, of course, been long abandoned, and the inverted mordent is frequently found in connection with skips to which it adds crispness and a determined attack [last movement of Beethoven's "Hammerklavier" Sonata op. 106]. About 1830 (Hummel, Moscheles) the inverted mordent began to be performed before the main note, and today this is generally considered the proper manner of execution. As late as in Chopin, however, examples abound in which the old method appears to be preferable, owing to its greater expressiveness [Ex. e, Valse in A-flat]. For some questionable cases, see P. Aldrich, in *MQ* xlix.

P.A.

**Invertible counterpoint.** A passage in contrapuntal texture so designed that, by means of transposition (usually of an octave) the lower part may become the higher part, or the higher the lower [Ex. 1]. This is an application of the principle of harmonic inversion [see Inversion (1)]. If applied to two parts, the method is called

double counterpoint, if to three (four) parts, triple (quadruple) counterpoint [Ex. 2; Beethoven, op. 10, no. 3].

Occasionally double counterpoint is treated in a more elaborate manner, involving transposition at intervals other than the octave. For instance, in double counterpoint at the fifth (tenth, twelfth) one part is transposed to the

upper fifth (tenth, twelfth) while the other remains at the same pitch or is merely transposed an octave. Several examples of this technique occur in S. Scheidt's *Tabulatura nova* of 1624 [Ex. 3, "Bicinium duplici contrapuncto"; see *DdT* 1, 130]. Particularly remarkable is its application in J. S. Bach's *Einige kanonische Veränderungen über . . . "Vom Himmel hoch, da komm ich her"* [Ex. 4; here transposed up one octave for clarification]. Other examples are found in the canons of Bach's *\*Art of Fugue*. This technique is in general somewhat less "labored" than it is frequently thought to be. A comparison of the various intervals (unison, second, third, etc.) with their equivalents in, e.g., double counterpoint at the fifth (fifth, sixth, seventh, etc.) readily reveals which intervals will make good consonances in the original as well as in the inverted position. Extensive studies of these and other, more complicated devices (usually combinations of the double counterpoint with canonic treatment) are found in most books on counterpoint. See S. I. Taneiev, *Convertible Counterpoint in the Strict Style* [1962].

Exceptionally early examples of double counterpoint occur in the *caudae* of some 13th-century conductus. They are all the more remarkable because they involve transposition at the fourth and fifth [see Y. Rokseth, "Le Contrepoint double vers 1248," in *CP Laurencie*]. In the 16th century double counterpoint became established as a standard technique of contrapuntal style. It is treated by Vicentino (1555), and with special attention by Zarlino in his *Le institutioni harmoniche*, vol. iii (1558).

The term "invertible counterpoint" is occasionally used to mean melodic inversion [see Inversion (2)]. This usage is unfortunate, particularly because melodic inversion, although frequently found in contrapuntal writing, does not in any way involve counterpoint but applies essentially to a single melody. See Mirror composition. For the exchange of parts without transposition, see Voice exchange. Also see Y. Rokseth, "Le Contrepoint double vers 1248" (\*Editions XLIX, ser. ii, 3–4).

**Invitation to the Dance.** See *Aufforderung zum Tanz*.

**Invitatory** [L. *invitatorium*]. In the Roman Catholic rites, the opening chant of Matins [see Office], consisting of Psalm 94 (*psalmus invitatorius*) "Venite, exsultemus Domino" (Psalm 95 of the King James Version: "O come let us sing unto the Lord"), sung with varying antiphons (invitatory antiphons). The invitatory is one of the few remaining examples of the original structure of antiphonal psalmody [see Psalmody III], the antiphon being sung not only at its beginning and end but also between each pair of verses. The psalm is sung to a number of tones considerably more elaborate than the ordinary psalm tones [see *Liber responsorialis*, pp. 6ff; for more details, see *ApGC*, pp. 241ff], and the antiphons are equally elaborate. Being a chant of Matins, the *invitatorium* is given in the *Liber usualis* only for Christmas, Whitsuntide, Corpus Christi, and the Office for the Dead [LU, pp. 368, 863, 918, 1779]. It is more fully represented in the *Liber responsorialis*.

In the Anglican rites the "Venite" with proper antiphons forms a part of every Morning Prayer, being sung either in plainsong or in Anglican chant [see Service]. The antiphon is sung only at the beginning and end. The Lutheran and Methodist churches also include the "Venite" set to Anglican chant in their morning services, the former with antiphons and the latter without.

**Ionian.** See under Church modes; Greece II.

**Iphigénie.** Two operas by Gluck, *Iphigénie en Aulide* (F. *Iphigenia in Aulis*; libretto by F. L. G. Lebland du Roullet, based on Racine's tragedy), produced in Paris, 1774, and *Iphigénie en Tauride* (F. *Iphigenia in Tauris*; libretto by N. F. Guillard), produced in Paris, 1779. Both are based on dramas by Euripides. Setting: ancient Greece.

**Ireland.** Historically, Ireland's most important musical achievements were in folksong and early medieval music. In the early Middle Ages, Irish monks were among the first to foster Gregorian chant, both at home and abroad. For example, in 614 St. Gall, an Irish hermit, built a cell near the site of the town in Switzerland named after him (Sankt-Gallen). After his death in 640, a monastic community developed there, and in the year 719 the Abbot Othmar founded a Benedictine cloister at St. Gall. By the mid-8th century this foundation had become a regular establishment and a leading center for plainsong.

In the 9th century, Joannes Scotus (called Erigena; c. 815–c. 877) wrote his "De Divisione Naturae," which contains interesting remarks about music [see J. Handschin, in *ZMW* ix]. The oldest representations of Irish instruments (lyres? harps?; see Harp III) are reliefs on stone crosses of the 8th and 9th centuries, whose presence perhaps explains why the harp became Ireland's national instrument and heraldic symbol. In the 12th century Giraldus Cambrensis frequently referred to the achievements of Irish instrumentalists and their influence on Scottish and Welsh music [see *ReMMA*, p. 392]. Various claims for the precedence and eminence of early Irish music, advanced by G. Flood and others, have not been substantiated. Apart from J. de Garlandia, Dowland, and Purcell, all three alleged by Flood to be of Irish descent, prominent composers from Ireland include Thomas Roseingrave (1690–1766), John Field (1782–1837), Michael W. Balfe (1808–70, composer of the opera *The Bohemian Girl*), William V. Wallace (1812–65), Charles V. Stanford (1852–1924), Hamilton Harty (1879–1914), and Arnold E. T. Bax (1883–1953; of Irish descent, born in England). Also see England.

**Irish harp.** See under Harp.

**Isomelic.** Term for a device found in isorhythmic motets of the time of Ciconia to Dufay (c. 1400–50), i.e., the use of the same or similar melodic material in the upper parts at corresponding places (measures) of their isorhythmic structure. A clear distinction must be made according to whether the "corresponding places" occur from *talea* to *talea* (of the same *color*) or from *color* to *color*. The former type seems to be the older, since it is used in several motets by Ciconia. Because corresponding measures of different *taleae* usually have different pitches in the tenor, isomelic recurrence normally involves transposition or some other modification (e.g., inversion). Ex. 1 shows two isomelic passages from Ciconia's panisorhythmic motet, "Ut per te omnes" [see Van den Borren, *Polyphonia sacra*,

p. 180]. Similar examples occur in some motets by Dunstable (e.g., "Veni sancte spiritus," meas. 22–24 = 67–69) and Dufay (e.g., "Fulgens iubar," motetus meas. 4–10 = 52–58, 97–98 = 113–114; in *Opera Omnia*, I<sup>2</sup>, 52). The other type of isomelic correspondence, relating to the *colores* of a motet, means that hand in hand with the restatement of the tenor melody (*cantus firmus*) the upper parts also make use of the same melodic material. This recurrence is usually on a broader scale than the *talea* recurrence but also much less exact, involving considerable variation [see Ex. 2, from Dufay's "Fulgens iubar"; for another example, from "Nuper rosarum flores," see *ReMR*, p. 80]. It is usually in this sense that the term isomelic is employed by musicologists. Less commendable is the use of the term isomelic for certain Masses

that employ the same *cantus firmus* in their various movements but in rhythmic variants [see E. Reeser, "Een 'isomelische mis' uit den tijd van Dufay" (*TV* xvi, 151); see, e.g., the *Missa O rosa bella* in *DTO* 22, p. 28]. In this meaning, the term is practically synonymous with cyclic [Mass cycle; see Mass C II] and, moreover, fails to indicate, as it should, different rhythm rather than unchanged melody. See *BeMMR*, p. 206; *ReMR*, pp. 80, 92; W. Stephan, *Die burgundisch-niederländische Motette zur Zeit Ockegheims* (1937), p. 12; M. F. Bukofzer, *Studies in Medieval and Renaissance Music* [1950], pp. 65ff; S. E. Brown, "New Evidence of Isomelic Design in Dufay's Isorhythmic Motets" (*JAMS* x).

**Isometric.** Term used for polyphonic compositions in which all the voice-parts move simultaneously in the same rhythmic values, thus forming a succession of chords. See \*Homo-, iso-, where it is advocated that a better name for this style would be "homometric" or, preferably, \*homorhythmic. The term "isometric" might then be used to describe horizontal identity of meter, i.e., continued presence of the same meter, as opposed to \*polymetric, i.e., varying meter. See K. Jeppesen, "Das isometrische Moment in der Vokalpolyphonie" (*CP Wagner*); K. P. Bernet Kempers, "Isometrische Begriffe und die Musik des 19. Jahrhunderts" (*CP Blume*).

**Isoperiodic.** See under Isorhythmic.

**Isorhythmic.** A term introduced by F. Ludwig [*SIM* iv, 16–69] to denote a structural principle frequently used in 14th-century motets, particularly in the tenors. Its main feature is the use of a reiterated scheme of time values for the presentation of a liturgical *cantus firmus*. The tenor of

G. de Machaut's motet "Hé Mors—Fine Amour—Quare non sum mortuus" [see *Guillaume de Machaut, Musikalische Werke*, ed. F. Ludwig, iii, 9] serves as an example [Ex. I].

The repeated scheme of time values used in sections A, B, C, and (half of it) D is called *talea* in 14th-century treatises. Beginning with (a), the entire liturgical melody, the so-called *color*, is repeated in halved values (diminution), a procedure normally employed in isorhythmic motets. Two typical schemes of 14th-century tenor structure are:  $[c/3t] \times 2$  (2:1) and  $[c/2t] \times 3$  (3:2:1). In the first, the *color* (c) is divided into three *taleae* (t), this being restated in halved values. Similarly, in the second formula there are three statements of the *color* in progressive diminutions, each divided into two *taleae*.

The isorhythmic principle, although usually thought of as a characteristic feature of the *ars nova*, is the logical development of the modal rhythm of the 13th century. Modal patterns such as:

3  
4

[see *SchGMB*, no. 12] differ from the 14th-century *taleae* only in length. Particularly interesting are examples in which the number of notes in *color* and *talea* (i.e., in the melodic and in the rhythmic pattern) are not in proportion, thus leading to the repetition of the melody in different rhythmic patterns. The tenor of an Alleluia which was written about 1200 serves as an illustration [Ex. 2]. Since here the *color* ( $\alpha$ ,  $\beta$ ,  $\gamma$ , etc.) includes nine notes and the *talea* (A, B, C, etc.) five, the *color* would have to be repeated five times until both schemes would come to a simultaneous close. Actually, the piece stops after the fourth *color*, leaving the last *talea* incomplete. Such configurations, involving overlapping of *taleae* and *colores* ([2c/3t],

[illegible]

[3c/5t], etc.), also are found in some 14th-century motets.

In the 14th century the isorhythmic principle was not only the chief method for the rhythmic organization of the tenors but was also applied—more freely—to the upper parts [for an example by P. de Vitry, see *ReMMA*, p. 338]. In most of Machaut's motets the upper parts have identical rests at corresponding places of the *talea*, so that the periods within one *talea* are of the same length as those within the others (isoperiodicity). Moreover, they usually are partly isorhythmic, i.e., a passage of three or four measures recurs isorhythmically in some or all of the subsequent *taleae*. The culmination of this development is the panisorhythmic motet, in which every voice-part is strictly isorhythmic. (It may be noted that often the term "isorhythmic" is employed in the specific meaning more clearly indicated by "panisorhythmic".) A panisorhythmic motet may be said to consist of a number of "melody-variations" of a fixed rhythmic theme. This type, represented in Machaut by only two motets, is the one normally used by the latest composers of isorhythmic motets, Ciconia, Dunstable, and Dufay. In the late 14th century isorhythm was occasionally applied to the two sections of the rondeau [see W. Apel, *French Secular Music of the Late 14th Century*, p. 7a]. In some motets of about 1400 the upper parts only are isorhythmic, the tenor being free [see C. van den Borren, *Polyphonia sacra*, no. 25]. After 1450 the isorhythmic principle survived in various attenuated modifications [see R. Dammann, "Spätformen der isorhythmischen Motette im 16. Jahrhundert" (*AMW* x)]. See Isomelic.

**Isosyllabic.** Term for a principle of versification based solely on the number of syllables, without regard for either quantity or quality [see Poetic meter]. It was discovered by F. J. Mone (*Lateinische Hymnen des Mittelalters* ii, 1854) and independently by Cardinal J. B. Pitra (*Hymno-*

*graphie de l'Église grecque*, 1867) in connection with the Byzantine *kontakia* and *kanons*, which until then had been regarded as prose. This principle was already used in ancient Syrian poetry (St. Ephraem, St. Romanus) and may even be of pre-Christian origin. St. Romanus' "Hymn on the Nativity", for example, has the structure 7 8 7 8/8 5 8 5 8 5/7 [see E. Wellesz, *A History of Byzantine Music and Hymnography*, rev. ed. (1961), p. 188].

**Israel in Egypt.** Oratorio by Handel (to a scriptural text), composed in 1738.

**Istampita, istanpitta.** See *Estampie*.

**Istar Variations.** Seven orchestral variations by V. d'Indy, op. 42 (1896), which are a unique example of "variation in the reverse," starting with the most complex variation and ending with the theme in octaves. This process of "disrobing" is implied in the title, Istar being the Babylonian goddess of passion.

**Istesso tempo** [It.]. Indication that, even though the meter changes, the duration of the beat remains unaltered. For example, it means ♩ = ♩ if there is a change from 2/4 to 6/8; ♩ = ♩ if the time changes from 2/4 to 3/4. The situation is different, of course, if the tempo is so fast that the half note becomes the beat. In this case, a change from 2/4 to 3/4 would have to be interpreted ♩ = ♩; in any case, exact indications of equivalent note values are a much more definite indication than the somewhat vague term *istesso tempo*.

**Istituto italiano per la storia della musica.** See Editions XXII.

**Istituzioni e monumenti dell' arte musicale italiana.** See Editions XXIII.

**Italiana in Algeri, L'** [It., The Italian Woman in Algiers]. Opera in two acts by Rossini (libretto by A. Anelli), produced in Venice, 1813.

**Italian Concerto.** A composition for harpsichord by Bach, so called because it is in the form and style of the instrumental concertos of the early 18th-century Italian school (Vivaldi); see Concerto III (b).

**Italian overture.** See under Overture I.

**Italian sixth.** See Sixth chord.

**Italian Symphony.** Mendelssohn's Symphony no. 4 in A major, op. 90 (1831–33), begun in Italy and containing allusions to Italian folk music,

particularly in the last movement, entitled "Saltarello."

**Italy.** I. Among the leading musical nations, Italy has the distinction of having the longest recorded music history and, after France, the most influential position. Perhaps its most important contribution is the development of Christian chant, which took place in Rome (*cantus romanus*, Roman chant) and is usually referred to as \*Gregorian chant in recognition of the role Pope Gregory I (reigned 590–604) played in its evolution. While the final development of this chant probably took place outside Italy, there has recently come to light another chant repertory known as \*Old Roman chant, which undoubtedly developed in Italy and was used in Rome. Even 200 years before Gregory, St. Ambrose (333–97) had established a rite that today is used only in Milan (\*Ambrosian chant, Milanese chant), though his hymns [see Ambrosian hymns] were incorporated into the Roman repertory. The contributions of Italy to the development of the \*sequences and \*tropes seem to have been restricted to their latest period, the 13th century, when Thomas of Celano wrote the "Dies irae," Thomas Aquinas the "Lauda Sion," and Jacopone the "Stabat mater" [see Sequence II D]. Guido d'Arezzo (c. 990–1050) not only made (or established) the epochal invention of the \*staff but also discussed, in his "Micrologus," the primitive polyphony of his day [see Organum I]. Nonetheless, until the end of the 13th century the development of polyphonic music remained in the hands of France [see France II], and Italy's contribution to the music of the *ars antiqua* was restricted to monophonic religious songs, the \*laude. The 14th century saw the first flowering of Italian polyphony in the \*caccie and \*madrigals of Giovanni da Cascia (or de Florentia) and Jacopo da Bologna (fl. c. 1350), culminating in the work of the blind Francesco Landini (1325–97), whose \*ballate represent an amalgamation of French polyphony with Italian melody [see *Ars nova* III]. Other composers of Landini's time are Laurentius de Florentia and Paolo tenorista, whose works are noteworthy for the frequent use of \*imitation. The development of Italian music about and after 1400 is not wholly clear. Composers such as Matheus de Perusio, Antonellus and Filipoctus de Caserta, Bartolomeo de Bononia, and Nicolaus Zacharias wrote mainly secular pieces of French derivation (*ballades*, *virelais*, *rondeaux*, frequently with French texts) in a highly complex and even mannered style.

The central figure of this period was Johannes Ciconia (c. 1340–1411), a Walloon who worked in Padua. He wrote sacred music (motets, Mass items) in a dignified and “festive” style, similar to that of Dunstable, as did his younger contemporary, Antonius Romanus [see *SchGMB*, nos. 29, 30; for additional examples, see *WoGM* ii, iii, nos. 30ff]. Important theorists were Marchettus de Padua (“Pomerium,” c. 1325), Theodoricus de Campo (c. 1350), and Prosdocimus de Beldemandis (c. 1400).

II. *Renaissance*. During the 15th century Italian musical development declined, at least so far as we know. Only recently have some traces of musical activity come to light. Of particular interest is the discovery of a number of choirbooks from Modena containing simple homorhythmic settings of psalms and hymns for two alternating choruses, the earliest known examples of this kind [see Bukofzer, *Studies in Medieval and Renaissance Music*, pp. 181ff]. Northern composers such as Dufay, Obrecht, Isaac, and Josquin traveled to the south, and features of harmony and balance found in their works have frequently, though with doubtful authenticity, been ascribed to “sunny Italy.” While art music declined, popular music seems to have flourished [see *Villota*], and it is this field that, toward the end of the 15th century, gave Italian music new life, in the *\*frottola* (Marco Cara, Tromboncino) and the *\*canti carnascialeschi*. Once more, Flemish masters took the lead in raising these unpretentious songs to the high standard of the *\*madrigal*, but after 1550 we find Italian composers such as Costanzo Festa, Andrea Gabrieli, Luca Marenzio, and Gesualdo in successful competition with the *oltramontani*. Rome became the center of sacred music (*\*motet*, *\*Mass*) through Palestrina (c. 1525–94) and his numerous successors [see Roman school], while in Venice Giovanni Gabrieli (c. 1555–1612), uniting large choral and instrumental sonorities, attained unparalleled pomp and splendor [see Venetian school]. Hardly less important were the contributions of 16th-century Italian organ composers (Cavazzoni, Andrea Gabrieli, Claudio Merulo), who created the *\*ricercar*, *\*canzona*, and *\*toccata*.

III. *Baroque*. From about 1600, during the early baroque era, we meet with terms such as *\*Camerata*, *\*nuove musiche*, *\*monody*, *\*thoroughbass* (*basso continuo*), *\*opera*, *\*oratorio*, *\*cantata*—all exclusively Italian—and names such as Caccini, Peri, E. del Cavalieri and, above all, Monteverdi, whose *I & II Pratica* of the

8 Books of Madrigals epitomizes the evolution from Renaissance polyphony to *\*stile recitativo e rappresentativo*. To the numerous masters of vocal forms (Caccini, Peri, Banchieri, Monteverdi, Carissimi, Cavalli, Grandi, Cesti, Legrenzi, Stradella, G. B. Bassani, A. Scarlatti, Caldara, B. Marcello, Leo, Pergolesi, Piccinni, Sacchini) must be added composers of instrumental music (*\*sonata*, *\*concerto*, *\*concerto grosso*, *\*sinfonia*: L. Viadana, M. A. Rossi, B. Marini, Legrenzi, Torelli, G. B. Vitali, Vivaldi, Corelli, Bonporti, Durante, Veracini, Geminiani, Porpora; see Bologna school) and keyboard music (Trabaci, A. Mayone [see Neapolitan school], Frescobaldi, M. A. Rossi, B. Pasquini, Zipoli, D. Scarlatti). About 1750, when Italian vocal music declined into empty virtuosity, composers such as Sammartini, Locatelli, and Piatti worked to develop a new style in instrumental music, simultaneously with the *\*Mannheim* school of Germany. The leadership, however, soon fell to Germany, and Italian music remained in the hands of academics such as Padre Martini (who taught the young Mozart) or cheap entertainers such as Paradisi, Rutini, and Paganelli [see Rococo; Gallant style]. Muzio Clementi (1752–1832), one of the founders of modern piano technique (*\*Gradus ad Parnassum*) lived and worked abroad. A survey of Italian baroque music would be incomplete without mentioning such outstanding achievements in musical reproduction as *\*bel canto* [see also *Castrato*] and the building of violins [see Violin].

IV. *Opera, 1760–present*. About 1760 the leadership in instrumental music passed from Italy to Germany and for about 100 years Italian composers devoted themselves almost exclusively to opera (Jommelli, Galuppi, Cimarosa, Paisiello). Instead of building up a national opera, however, most of them were attracted by the operatic centers outside Italy, especially Paris. It was in Paris that Niccolò Piccinni (1728–1800) became a dangerous rival of Gluck and that Antonio Sacchini (1730–86) competed with Piccinni. Antonio Salieri, the teacher of Beethoven and Schubert, worked in Vienna and Paris, and Maria Luigi Cherubini (1760–1842) became the central figure in French music during the Napoleonic era, while Gasparo Spontini (1774–1851) played a similar role at the court of Berlin. Gioacchino Rossini (1792–1868) was the first to write another great Italian opera, his *Il Barbiere di Siviglia* (1816). His *Guillaume Tell* (1829), written for Paris, marks the beginning of the *grand opéra*, which was continued by Gae-

tano Donizetti (1797–1848) and Vincenzo Bellini (1801–35), and can be considered the first to show signs of \*romanticism.

In marked contrast to the above-mentioned stands Giuseppe Verdi (1813–1901), who devoted his long life to the establishment of a national opera. From his early *Nabucodonosor* (1842) to the mature masterpieces (*Rigoletto*, *Il Trovatore*, *La Traviata*) and his late *Otello* (1887) and *Falstaff* (1893), his style shows a steady progress to great artistic heights, a progress all the more remarkable in that he managed to escape the all-pervading influence of Wagner. He was followed by three composers who each wrote only one successful opera: Arrigo Boito (1842–1918; *Mefistofele*, 1868), Pietro Mascagni (1863–1945; *Cavalleria rusticana*, 1890), and Ruggiero Leoncavallo (1858–1919; *Pagliacci*, 1892), the last two being known as the founders of \*verismo. Italian opera took on a more lyrical and slightly sentimental tinge with Giacomo Puccini's (1858–1924) world successes, *La Bohème* (1896) and *Madama Butterfly* (1904). Among more recent operatic composers, Italo Montemezzi (1875–1952; *L'Amore dei tre re*, 1913) and Ildebrando Pizzetti (b. 1880; *Debora e Jaele*, 1922) are outstanding.

V. 20th century. Not until the late 19th century was activity in instrumental music renewed in Italy. Giovanni Sgambati (1841–1914) wrote symphonies and chamber music in the style of Brahms, as did Giuseppe Martucci (1856–1909). Neither they, however, nor their successors, such as Enrico Bossi (1861–1925) or Leone Sinigaglia (1868–1944), succeeded in breaking the all-powerful position of opera, and not until 1910 did tendencies toward a more universal and cosmopolitan attitude emerge. This reorientation of Italian music was first promoted by F. Busoni (1866–1924) and then continued by O. Respighi (1879–1936), I. Pizzetti (b. 1880), G. F. Malipiero (b. 1882), A. Casella (1883–1947), and G. F. Ghedini (b. 1892). The first two cultivated an eclectic, neoromantic style, variously influenced by Rimsky-Korsakov, R. Strauss, and Ravel, while the last three often drew inspiration from the works of early Italian masters (chiefly Monteverdi, Scarlatti, Frescobaldi). The main representatives of the next generation are Luigi Dallapiccola (b. 1904), who introduced the twelve-tone technique into Italy and, like Busoni, was oriented toward the German tradition, and Goffredo Petrassi (b. 1904), who was strongly influenced by Stravinsky in his early works and combines neoclassical with baroque

influences. Both helped give Italian music an important place on the European scene, preparing the way for further developments, which, through the works of Bruno Maderna (b. 1920), Luigi Nono (b. 1924), Luciano Berio (b. 1925), F. Donatoni (b. 1927), and others suggests that Italian instrumental music has definitely regained a prominent place in contemporary music.

Desderi, "Le Tendenze attuali della musica" (*RMI* xxxv–xxxviii).

**Ite missa est.** The concluding salutation of the \*Mass: "Ite, missa est, Deo gratias" (Go, [the congregation] is dismissed; thanks to the Lord). It is from this salutation that the word "Mass" [*L. missa*] is probably derived. In Masses lacking the Gloria it is replaced by the \*"Benedicamus Domino." See W. Fischer, "Die Herkunft des 'Ite, Missa est' V. toni" (*CP Orel*).

**Jácara** [Sp., Port.]. A popular ballad or dance tune. Originally (17th century) *jácara* (or *xácara*) was a picaresque comic interlude inserted into stage plays and describing the antics of some objectionable person. In time it developed into the \**tonadilla*. The term also has been used for a dance, for the popular songs of coachmen and cart drivers, etc. A *jácara* for three sopranos and chorus is published in F. Pedrell's *Cancionero musical popular español*, 4 vols. (1918–22), iv, no. 101. There are some *jácaras* for keyboard, written as a continuous variation of a short ostinato theme, similar to the chaconne; see H. Anglés, ed., *Johannis Cabanilles opera omnia*, 3 vols. (1927–36), ii, 146; M. S. Kastner, ed., *Silva ibérica* [n. d.], nos. 8, 9 (anonymous, Bertolomieu de Olagué). For a description of the dance, see *AnM* v, 194.

**Jack.** See under *Harpsichord* I.

**Jagd-** [G.]. Hunt. *Jagdhorn*, hunting horn; *Jagdmusik*, hunting music. Also see under *Hunt music*.

**Jahreszeiten, Die.** See *Seasons, The*.

**Jale.** See under *Solmization* III.

**Jaleo** [Sp.]. An Andalusian solo dance in moderate 3/8 time, accompanied by rhythmic hand-clapping of the spectators.

**Jam.** Jazz musicians' term for improvisation, used until c. 1945. At a jam session, a group of musicians choose a familiar tune and improvise, both together and as soloists. Jamming is thus distinguished from the "hot chorus" or "takeoff," in which an improvised solo is played against a written or memorized accompaniment performed by the whole group.

**Janizary music** [G. *Janitscharenmusik*]. Music of the Janizary, the military bodyguard of the Turkish sovereigns (c. 1400–1826), or pieces written in imitation thereof. The characteristic instruments of the Janizary were big drums, cymbals, triangles, and the \*Turkish crescent. About 1800, this type of music was extremely popular in Europe [see *Military music*]. Haydn imitated it in his "Military" Symphony (no. 100); Mozart in his *Entführung aus dem Serail* and the Rondo "alla Turca" of his Piano Sonata in A (K. 331); Beethoven in *Die Ruinen von Athen*

(also his *Variations* op. 76) and, most effectively, in the finale of his Ninth Symphony (tenor solo: "Froh wie Deine Sonnen fliegen"). The harpsichords and pianos of the late 18th century were frequently provided with a *Janitscharenzug* (Janizary stop), which produced a rattling noise. See N. Bessaraboff, *Ancient European Musical Instruments* (1941), pp. 20ff; P. Panoff, "Das musikalische Erbe der Janitscharen" (*Atlantis* x); W. Lichtenwanger, "The Military Music of the Ottoman Turks" (*BAMS*, nos. 1–13, pp. 55ff).

**Japan.** There are two distinct traditions in Japanese music, folk music and art music. The latter can further be divided according to the historic periods [see I–VII below].

I. *Before A.D. 612.* Concerning Japanese music prior to the introduction of Continental Asian culture, early historic documents, both Japanese and Chinese, as well as archaeological findings confirm the use of the five-stringed *wagon* (of the \**koto* family), the *yamato-bue* (a flute), drums, etc. Music was frequently associated with dances or with ceremony; one type of music, for example, performed at a Shinto ritual, is known by the generic term *kagura*, but surviving examples of *kagura* are of later date.

II. *612 to the end of Nara period (794).* Although the earliest known record of the introduction of Continental Asian music dates from A.D. 453, when eighty musicians were sent to Japan by the ruler of Silla (a small Korean kingdom), it was only after a Korean scholar, Mimashi, imported the *gigaku* (Chinese dance and music) in 612 that the Japanese really began to learn the foreign music. During the succeeding years, music from Korea, India (via the Chinese), etc., was frequently introduced to Japan, and this active exchange finally culminated in the establishment in 701 of *Gagaku-ryō*, or the Imperial Music Bureau, which at its inception included 250 Japanese musicians and dancers, 72 Chinese, 72 Koreans, and a few others. A collection of instruments, used at the celebration for the completion of the Great Buddha of Tōdaiji Temple (752), is still preserved in the Imperial Treasury of Shōsōin in Nara.

III. *Heian period (794–1192).* The repertoires of these court musicians of different origin were

soon modified into a Japanese-style instrumental ensemble, with or without dances, known as *\*gagaku*, which flourished during the Heian period and still exists today in only slightly changed form. Among vocal types belonging to *gagaku*, there were *saibara* (art song based on popular song) and *rōei* (singing of a Chinese-style poem). Besides *gagaku*, there were also *gigaku* and *sangaku* (the latter an acrobatic entertainment). Also imported from China during this period were theories of music, which included the invention of a twelve-tone system by a Pythagorean-like method. Toward the end of the Heian period, the recitation of Buddhist *sutras* (scriptural narratives), imported earlier from China, became popular, establishing a vocal style called *shōmyō*. Two Buddhist sects, Shingon and Tendai, became famous for this genre.

IV. *Kamakura period (1192–1333)*. The *shōmyō* continued its popularity during the Kamakura period, thanks to two important masters, Kanchō (936–98) of the Shingon sect and Ryōnin (1073–1132) of the Tendai sect. Buddhist priests also performed the *ennen* (primarily dances), while secular music included the *dengaku* (evolved from a ceremony in the rice fields) and *sarugaku* (derived from the *sangaku*). However, the most characteristic product of this period was *heikyoku*, sung by a blind storyteller with a *biwa* (a four-stringed lute derived from the Chinese *\*pyiba*, or *p'i-p'a*), played with a large plectrum. In a *heikyoku* piece, the oldest example of narrative (*katarimono*) style [see VI below], the instrument is not used to accompany the voice but to insert instrumental interludes between the vocal parts.

V. *Muromachi and Azuchi-Momoyama periods (1333–1600)*. The major entertainment of this period is the *\*noh* drama, derived from *sarugaku*. *Kyōgen*, a comic play either inserted between the acts of a *noh* or performed independently, often included popular tunes of the time. A treatise by Zeami (*Kadensho*, 1402) represents a significant essay on aesthetics. During the late 15th and 16th centuries, beggar priests, who played a short, vertical bamboo flute called *hitoyogiri* (the later *shakuhachi*), frequently performed in the streets.

VI. *Edo period (1600–1868)*. The *zokusō*, *shakuhachi*, and *shamisen* (*samisen*) were the three representative instruments of this period. The *zokusō* (or simply *\*koto*) is a rectangular instrument made of paulownia wood with thirteen silk strings set on movable bridges and

played with ivory picks. It became popular after Yatsushashi-Kengyō (1614–85) composed the earliest *kumiuta*, a vocal piece composed of several short poetic texts. The instrument can be tuned in various ways [see Ex. 1], *hira-jōshi* [1a], *kumoi-jōshi* [1b], and *kokin-jōshi* [1c] being the

most common tunings. *Sōkyoku*, or music for *zokusō*, may be either purely instrumental or, far more often, have a vocal part. In the latter category, the most important is *jiuta*, and the most important music form *tegatomono*, both derived from early *shamisen* music. *Tegatomono* normally consists of three parts: *maeuta*, or fore-song (S); *tegoto*, an instrumental interlude (I); and *atouta*, an after-song (S); sometimes this form is extended to S I S I S, or even to S I S I S I S. The purely instrumental *sōkoyu* is represented by *danmono* (free-style variations, e.g., the famous six-part "Rokudan"). Later, the tradition of the instrument was carried on by two major schools: the Ikuta school of Kyoto, founded by Ikuta-Kengyō c. 1700, and the Yamada school of Edo (i.e. Tokyo), founded by Yamada-Kengyō c. 1800.

The *shakuhachi* is a vertical bamboo flute with five finger holes, four in front and one in back. [For ill. see under Flute.] It was played solo by *komusō* (mendicant Buddhist priests), and its tradition was carried on by the Kinko school, founded by Kurosawa Kinko (1710–71).

The *shamisen* (*samisen* or *sangen*) is a long-necked three-stringed instrument with a square wooden sound box, covered on the top and bottom with catskin. It is played with a large ivory plectrum. The three principal tunings are 1–4–8, 1–5–8 and 1–4–7 (minor). The *shamisen* normally accompanies a vocal part, either solo or in ensemble. There are numerous schools of *shamisen* music, which differ both in the nature of the text and music they play and in the size and shape of the instruments they use; a major distinction is between narrative (*katarimono*) and lyric (*utaimono*) types. The former is represented by a

style called *jōruri*, which includes *gidayū*, founded by Takemoto Gidayū (1651–1714) and used in a puppet play called *bunraku*; the other principal existing *jōruri* are *kiyomoto*, *shinnai*, and *tokiwazu*, played for the *kabuki* theater. Early examples of the lyric type include *kumiuta* and *jiuta* (just like *sōkyoku* above), while *nagauta* became indispensable to the *kabuki* dance, often with *hayashi* ensemble (a flute and drums).

*Sankyoku*, an ensemble for *koto*, *shamisen*, and *kokyū* (a rarely played, bowed stringed instrument) that became popular during the 19th century, represents a rare instance of Japanese instrumental ensemble; sometimes *kokyū* was replaced by *shakuhachi*. The *tegatomono* form, as used in *sōkyoku* or in *shamisen* pieces, is also popular among the *sankyoku* repertory.

VII. *Modern*. The drastic reforms of Emperor Meiji (reigned 1868–1912) included the adoption of European music in the Japanese educational system, with the result that European music soon became a part of Japanese life. The first among modern composers is Kōsaku Yamada (1886–1966), who produced symphonic works, operas, songs, etc. The generation between world wars includes Kiyoshi Nobutoki (b. 1887), Syūichi Mitsukuri (b. 1895), Akira Ifukube (b. 1914), and Yorinori Matsudaira (b. 1907). Michio Miyagi (1894–1957) is known for his adaptation of European styles in his compositions for *zokusō*. The post-war generation is represented by Ikuma Dan (b. 1924), Yasushi Akutagawa (b. 1925), Toshirō Mayuzumi (b. 1929), Kan Ishii (b. 1921), Makoto Moroi (b. 1930), Hikaru Hayashi (b. 1931), and Akira Miyoshi (b. 1933).

VIII. *Folk music*. Japanese folksongs are normally associated with work (e.g., rice planting, fishing), dance, ceremony, feasts, etc. They were sung with or without the accompaniment of hand-clapping or instruments (flute, *shamisen*, *shakuhachi*, drums, etc.). The form used is frequently strophic. The instrumental pieces are usually for dances or for local ceremonies; the instruments often include the *fue* (a flute), *taiko* (a drum), *dōbyōshi* (small cymbal), *bin-zasara* (bamboo clappers), *suri-zasara* (bamboo scraper), *suzu* (bell), etc. The Ainu in Hokkaidō and the Okinawans in the Ryūkyū Islands have their own folk tradition, some of which is related to Japanese music.

IX. *Scales*. A twelve-tone system introduced from China has been known since the Heian period. In actual performance, the scales mostly consist of five or seven notes; the more impor-

tant are the *ryō-sen* and *ritsu-sen* system, used in *gagaku*, and the *yō-sen* and *in-sen* system, found in the music of the Edo period. The former consists of two scales, each with five basic notes and two auxiliary notes [Ex. 2, a and b]. The latter includes two pentatonic scales, *yō* and *in*, of which the second makes a characteristic use of semitones [Ex. 2, c and d].

2  
a *Ryō scale*

Kyū Shō Kaku Hen - chi chi U Hen - kyū (Kyū)

b *Ritsu scale*

Kyū Shō Ei - shō Kaku Chi U Ei - u (Kyū)

c *Yō scale*

d *In scale*

X. *Examples*. It is impossible to summarize the styles of Japanese music in a few words, but the examples chosen below may give the readers some idea of some of the more representative styles. Ex. 3 is a *gagaku* passage (*Sekai Ongaku Zenshū*, xviii, 10), illustrating the heterophonic treatment of the principal melody by two wind instruments, the “harmony” by *shō*, the accelerating beats of *kakko*, and typical patterns of the string accompaniment. Ex. 4, a recitative in *noh* (*ibid.*, xxv, 3), has a melody confined to few notes, is rhythmically rather free, and has a few ornaments; also characteristic is the sparse use of drums. Ex. 5, from the *sōkyoku*, “Rokudan” (*ibid.*, xxv, 199), has a typical melodic line with big skips and intervals of a fourth and a second. Ex. 6 shows a typical treatment of voice and *shamisen*, in which the melodic lines, basically heterophonic, are rhythmically shifted by a half beat to one another, creating occasional intervals of seconds, thirds, fourths, etc. Ex. 7, taken from a folksong of a northern district, illustrates an elaborate melodic line on an *in* scale, with a declamatory quality and with many ornaments.

M.K.

**Jarabe** [Sp.]. Traditional Mexican dance, binary in form and moderate in tempo, derived from the Spanish \*zapateado and musically similar to the \*mazurka. Within its basic 3/4 meter the *jarabe* shifts occasionally to 6/8 meter. As in the Chilean \*cueca, the dancing is based on the idea of a man pursuing a girl who gracefully eludes him.

J.O-S.

**Jarana** [Sp.]. A hybrid dance type from the state of Yucatan, involving Mexican and West Indian rhythms. Examples using 3/4 or 6/8 meter have been traced, as well as others using both alternately. The *jarana* requires very agile movements. The dancers scrape the floor with their shoes, continuing the rhythm during the sudden stops in the music. Improvised short poems,

recited either in Spanish or in the Mayan language, are often inserted.

J.O-S.

**Java.** I. *History.* Of all the highly diversified societies that inhabit more than 3,000 islands in the Republic of Indonesia, the peoples of Java and \*Bali have attained the richest cultural development. For more than 2,000 years, compatible influences from the mainland of Southeast Asia, China, India, and the Middle East have affected religion, social institutions, government, literature, language, architecture, and other modes of cultural expression. These were rapidly assimilated and became distinctly Indonesian in character. The mainstream of musical evolution, on the other hand, appears to be an autochthonous development that responded to and became integrated with the development of other cultural institutions. The relatively incompatible pressures of various Western countries during the past three centuries have had little or no effect on the principal musical traditions of Java and Bali. Although on both of these islands there persists a great variety of musical genres, it is the music of numerous types of gamelan orchestra that remains the overwhelmingly dominant tradition. The singular importance of music in relationship to religion, functions of state, literature, and various forms of puppetry and dance drama has been fostered by the royal courts and emulated by cities, towns, and even the remotest villages since at least the 8th century and has continued to the present day— notwithstanding the fact that in Java the adoption of a mystical form of Islam has been nearly universal since the 16th century.

The most ancient form of gamelan, known as *gamelan Munggang*, has only three tones, and extant ensembles more than 1,000 years old are still in use on special state occasions. It appears likely that from an original three-tone gamelan of this type there were two lines of development, one that led to the five-tone sléndro system, established by the 8th century or earlier, and another that became successively a four-tone system, a six-tone system, and finally, by the 16th century or earlier, the seven-tone pélog system. Archaic ensembles representing all these stages of development still survive and are in use [see Lit., M. Hood, "The Effects of Medieval Technology"]. In the course of the past four or five centuries three distinct musical traditions and types of ensemble have been developed from this common origin: one by the Javanese in Central and East Java, one by the Sundanese in West Java, and one by the Balinese in Bali [see Bali].

II. *Tuning systems and mode.* The Javanese recognize eighteen species or basic types of tuning, nine in sléndro and nine in pélog. Beyond this general classification of tuning system and species, no two gamelan have precisely the same intervallic structure. It appears that the individuality of each gamelan tuning derives in part from the practice of stretching or compressing octaves throughout the six-octave compass of the orchestra, so that a unique "tuning pattern" is responsible for the particular character of each ensemble [see Lit., M. Hood, "Sléndro and Pélog Redefined"]. Both sléndro and pélog are composed of nonequidistant intervals, those of the former ranging from slightly less than 200 cents to slightly less than 300 cents, those of the latter ranging from less than 100 cents to more than 300 cents [see Cents]. The tuning pattern of a gamelan produces a different intervallic structure for each octave. The examples given below represent the intervallic structure of octaves iii, iv, v, and vi taken from the sléndro and pélog halves of the *gamelan Kjai Mendung* ("Venerable Dark Cloud"). The five pitches of sléndro are numbered according to the Javanese cipher notation, 1, 2, 3, 5, 6 and those of pélog 1, 2, 3, 4, 5, 6, 7. The size of the intervals between pitches is given in cents.

#### Sléndro

Octave	1	2	3	5	6	1
vi	246	241	219	254	246	
v	245	237	234	245	267	
iv	218	255	248	233	259	
iii	220	280	236	242	248	

#### Pélog

Octave	1	2	3	4	5	6	7	1
vi	131	163	252	126	131	173	—	
v	140	143	275	127	116	204	222	
iv	125	141	297	113	124	165	255	
iii	120	144	297	117	126	155	246	

There are three modes or *patet* in sléndro (*patet nem*, *patet sanga*, *patet manjura*) and four modes in pélog (*patet lima*, *patet nem*, *patet barang*, [*pélog*] *patet manjura*). Each mode is governed by a hierarchy of five pitches; melodic movement is guided by a primary and a secondary interval of the sléndro or pélog fifth, and melodic resolution is achieved through the use of typical cadential formulas outlining the primary interval of the fifth. The modes are also associated with certain times of the day or night and specific time periods in the presentation of puppet plays and dance dramas based on the

literature of the Mahabharata, Ramayana, Pandji cycle, and historical subjects. The pélog system has more flexibility than the sléndro system because each five-tone mode, representing a particular selection from the available seven pitches, may employ either of the two omitted tones as *sorogan* or exchange tones to effect modulation to auxiliary scales lying a pélog fifth higher or lower than the principal scale [see Lit., M. Hood, *The Nuclear Theme as a Determinant*]. In both tuning systems "vocal tones" are added to the basic supply of pitches by a bowed lute, flute, and voices; in Central Java five additional vocal tones are recognized in sléndro and two vocal tones in pélog. Occasionally, these "vocal" parts in sléndro may borrow a pitch from pélog, or vice versa. In West Java the Sundanese have carried the development of vocal tones to a more complex and formal system of submodes known as *surupan* [see Lit., J. Kunst, *Music in Java*].

III. *Orchestras and musical practice.* The generic term *gamelan* includes a great variety of ensembles in Java, differing in size, function, and musical style. A gamelan is a particular set of instruments that is valued with increasing age as its individual characteristic beauty of sound develops, i.e., as the crystalline structure of the bronze instruments stabilizes through being played. Frequently a gamelan has its own proper name. During the past few decades in West Java the Sundanese have begun to favor smaller ensembles. The largest gamelan are found among the royal courts and princely residences of Central and East Java. A complete gamelan, *sapangkon*, is a double set of instruments, one tuned to sléndro, the other to pélog, and may consist of as many as seventy-five to eighty instruments. There are two styles of playing: (1) the soft style, a subtle, mystical, and seemingly timeless flow of sound, associated with singing and the *alus* or refined style of dance (or puppet) characterization; (2) the strong style, a virile and powerfully resonant battery of sound associated with the *gagah* or strong, "heroic" dance characterization. [See Lit., M. Hood, "The Enduring Tradition"]. The players are seated cross-legged on mats with the sléndro instruments in front of them and the corresponding pélog instruments arranged on one side or the other. A principle of orchestration that may be termed "polyphonic stratification" supports the group improvisation of about thirty instrumentalists, a male chorus of approximately fifteen, and three female soloists in realizing a complex

musical fabric of as many as twenty-five distinct strata of sound. Each orchestral composition or *gending* consists of a fixed and unique melody that serves as the foundation for all strata of improvisation. This melody is more than a *cantus firmus* in the Western sense; it is the *gending* itself and bears an individual name, e.g., "Udan Mas" ("Golden Rain"), "Pangkur," etc. The melody may be in long regular note values, or it may consist of relatively short note values with frequent rhythmic irregularities. *Gending* are known in a great variety of traditional musical forms determined by the particular periodicity of various members of the gong family and basic drumming patterns [see J. Kunst, *Music in Java*]. Principal instruments of this family are the large hanging gongs, *gong ageng*; the *kenong*, a number of large bronze inverted kettles suspended on crossed cords; the *kempul*, a series of smaller hanging gongs; the *ketuk*, a small inverted kettle; and a pair of small kettles known in *sléndro* as *engkok* and *kemong* and in *pélog* as *kempyang*. The drums come in four sizes: the large *kendang gending*, the small *ketipung*, the *batangan* or *tjiblon*—the dance drum, and, finally, a very large double-ended barrel-shaped drum known as the *bedug*. The fixed melody of the piece is carried by a family of instruments found in three sizes, each consisting of six or seven bronze slabs over a trough-resonator: the *saron demung*, the *saron barung*, the *saron panerus* or *peking*. Simultaneous variations of the fixed melody are executed by a family of instruments occurring in three sizes known as the *bonang*, each consisting of a double row of kettles suspended on crossed cords: the *bonang panembung*, the *bonang barung*, the *bonang panerus*. These instruments, together with the *gendèr panembung*, described below, form the strong-playing ensemble. In soft playing, highly complex simultaneous variations are added: by a family of *gendèr*, found in three sizes and consisting of thin bronze slabs suspended over bamboo or metal resonators, the single-octave *gendèr panembung* or *slentem*, the multioctave *gendèr barung* and *gendèr panerus*; by the *gambang*, a xylophone; by the *tjelempung*, a thirteen-double-course zither plucked with the thumbnails; by the *suling*, an end-blown flute; and by the *rebab*, a two-stringed, bowed lute played by the leader of the gamelan. In strong playing he delegates his responsibility to the drummer.

Several forms of basic notation have developed during the past two centuries, usually providing only the colotomic structure (played

by the gong family), the basic drumming patterns, indications of tempo and tempo change, the fixed melody, and sometimes additional indications as a guide to register for the bonang family. Collections of such notation are maintained at the principal courts as a means of preserving individual pieces that might otherwise fade from the musician's memory. In recent times a cipher notation has been used for instruction in three different conservatories of gamelan study in an attempt to replace the traditional method of instruction by imitation and rote learning. Neither students nor professional gamelan players, however, perform from written music but entirely from memory and improvisation. The accompanying transcription by Hardja Susilo is a fragment of the *gending* in *ladrang* form called "Sriredjeki" as played in *pélog patet nem*.

In this fragment the fixed melody is being played by Saron I-II, Demung I-II. Saron III-IV are playing one style of imbal; other styles include the alternation of the tone of the fixed melody with either upper or lower neighbor tones. Western pitches indicated are only an approximation of the pélog tones.

(*Djawa* iii); J. S. Brandts Buys, in *Djawa* i, ii, iv, xx; A. Brandts Buys-van Zijp, in *Djawa* viii, xiv, xv, xvi. M.H.

**Jazz.** A kind of indigenous American music of the 20th century, originally identified with social dancing, featuring rhythmic patterns peculiar to the "jazz beat." The origin of the word "jazz," which first appeared in print in 1917, is obscure. [See, e.g., R. Blesh, *Shining Trumpets* (rev. ed. 1958), p. 328; M. Stearns, *The Story of Jazz* (1956; corr. pr. 1962), p. 154.]

I. Jazz grew out of several kinds of earlier American music: minstrel-show music, early brass bands, early string bands (fiddle, guitar, banjo or mandolin, double bass or "lard stand"), \*ragtime (c. 1890–c. 1915), and \*blues (c. 1910–). In the 1910's and 1920's jazz was loosely connected with the popular songs of Tin Pan Alley. However, jazz titles indicate closer ties with ragtime and minstrel music.

Jazz music is closely allied with ragtime (the names are sometimes used interchangeably) and blues. Although ragtime was easily notated, early jazz was rarely written, the instrumental parts being composed spontaneously by performers who often could not read notes. Ragtime was an outgrowth of the minstrel-show bands and music for dancing at "pleasure houses" (bordellos). The ragtime pianist was in great demand around the turn of the century. For many years he performed in the music departments of the larger ten-cent stores. Important figures who appeared in various sections of the country were Buddy Bolden (c. 1878–1931) and his band in New Orleans, pianists Louis Chauvin and Tom Turpin in St. Louis, and Scott Joplin (1868–1917) in Sedalia, Missouri. Joplin organized the Queen City Negro Band in Sedalia in 1896. From this band he took six instruments (clarinet, E-flat tuba, cornet, baritone, drums, and piano) to form a hot dance band.

Publication of ragtime piano music began about 1900. Sedalia especially encouraged ragtime players and their publications, and Joplin, before he moved to New York, had published there his most famous composition, "Maple Leaf Rag," in 1899. The first rag, "Harlem Rag," by Tom Turpin, may have been published in 1895. H. A. French, of Nashville, Tennessee, published several ragtime pieces, among them Thomas Broady's "Mandy's Broadway Stroll" (1898), "A Tennessee Jubilee" (1899), and "Whitling Remus" (1900). Throughout the period Zes Confrey published ragtime instruction books as well as "Kitten on the Keys" (1921).

The distinguishing characteristic of ragtime is its persistent syncopation, as opposed to the incidental syncopation found in classical music. In the piano versions ragtime figures are usually played by the right hand accompanied by a harmonic figure in duple meter in the left. For two decades ragtime was the principal music of Broadway musicals and vaudeville. Joplin, who was the most prominent pioneer composer of the period, wrote two operas using the ragtime idiom, *A Guest of Honor* (1903) and *Treemonisha* (1907); neither of them enjoyed much popularity. [See also Ragtime.]

The unwritten folk \*blues, a precursor and a rich ingredient of jazz, emerged in the 20th century, although many have placed the origin earlier. W. C. Handy, an unusually sensitive band man who traveled widely, first heard the blues in the early 1900's [see Niles, *Blues*, p. 20]. Gertrude "Ma" Rainey, Bessie Smith, and Ethel Waters were also associated with the early blues. The first published blues were Jelly Roll Morton's "Jelly Roll Blues" (1905; © 1915), Handy's "Memphis Blues" (1912), and "St. Louis Blues" (1919; first pub. 1913 as "Jogo Blues").

Unlike ragtime, which had a standard form of 8, 16, or 32 measures, the folk blues had a 12-measure mold divided into three 4-measure phrases. The first phrase was usually a melody over a tonic chord. The second, using the same text, was accompanied by a subdominant chord cadencing on the tonic, while the third was accompanied by the dominant chord closing on the tonic. In the rural South, where blues originated, the principal accompaniment is the guitar. The text often does not last the full 4-measure phrase, but the dance-rhythm must be continued by the guitar on each beat. Filling in a measure following an incomplete text is an important function of the accompaniment. These "fill-ins" (similar to "episodes" in fugal music) were called "riffs" and were an essential part of the music.

The derivation of jazz from blues is obvious, but in jazz the band replaces the single instrument accompanying the singer, and each instrument improvises free rhythms and idiomatic counterpoint at each performance. A striking example of a piano, cornet, and trombone accompaniment is heard in the Bessie Smith recording of "Standin' in the Rain Blues" (14338–D Columbia). Subsequent verses have variants—not repetitions—of the accompaniment. The true blues singer likewise sings a variant for each new verse. Blues, usually sung in slow tempo, are in 4/4 meter although the

accompaniment often plays in 12/8. The rhythm of the words avoids a straight marchlike meter and replaces it with the "jazz beat," where the emphasis is shifted from the strong beat and frequently falls on fragments of the beat. It is characterized by anticipations of the beat and of the afterbeat. This style, which makes accurate notation difficult, depends on the experience, tradition, and sensitivity of the performer. The authentic melodic style of the blues singer involves the use of "blue notes" (the flatted third and seventh in the major keys), slurs, and portamentos. The instrumental accompanists also added sevenths to the chords and enriched the harmony considerably. When the ragtime bands began to use the style they had learned from playing blues, jazz was born. [See also Blues.]

II. Just when jazz emerged as an identifiable entity has not been determined. Marshall Stearns suggests 1900, while earlier historians placed the point of origin in New Orleans, stressing the importance of Joe "King" Oliver (1885-1938) and Ferdinand "Jelly Roll" Morton (1885-1941) and their bands, as well as local pleasure houses such as Storyville, which provided employment for jazz musicians. The success of the Original Dixieland Jazz Band (1912-) and the fame of such jazz musicians as Sidney Bechet, Edward Ory, Robert ("Baby") Dodds, Bunk Johnson, Alphonse Picou and, especially, Louis Armstrong, strengthened this claim. Later studies, however, have shown that the development taking place in New Orleans occurred simultaneously elsewhere, in Kansas City, Chicago, Memphis, and New York City.

One reliable chronicler of the growth of dance-band music and of the music heard in the early 1900's was W. C. Handy. Another report on early jazz comes from Robert Goffin, who describes the impact of Louis Mitchell's loud Southern Symphony Quintet on New York in 1912 and on Europe in 1914 [see Lit.]. Dance music in Baltimore is described by Leonard Feather, who quotes Eubie Blake, composer and ragtime player of an earlier era. In New York about 1912, Will Marion Cook and James Reese Europe at the Clef Club were playing exciting music.

In the early stages, jazz was highly improvisory, depending for its appeal more on the skill, intuition, and experience of the individual performers than on the written note. Most of the early jazz performers were not formally trained but were apprenticed musicians who relied on the traditional idioms of the style or

created new ones.

III. After World War I, the growing popularity of recorded jazz music, the development of commercial radio, and the enthusiasm of the American people for public dancing ushered in the "Jazz Age" of the 1920's. Jazz now became big business. Important hotels replaced salon orchestras with jazz bands. Conservatory-trained musicians, who were already skilled in instrumental techniques, invaded the field. Their jazz was learned from jazz-band recordings, performances, and rehearsals. Jam sessions, occasions when jazz musicians gathered informally to play for themselves and to experiment [R. Blesh, *Shining Trumpets*, p. 237], were eagerly sought out.

In 1918, when Joe "King" Oliver began his reign in Chicago, his famous Creole Jazz Band consisted of a cornet, trombone, drums, clarinet, bass, and piano. Other jazz bands used the same instruments, sometimes adding a banjo. Gradually the band began to expand; a tuba was added, a second cornet, then a tenor saxophone. Later a first and second alto saxophone became essential for the "big" jazz band [L. Feather, *The Book of Jazz*, p. 94]. In the 1930's the addition of another cornet (or trumpet) and trombone resulted in the "five brass" idea. A fourth saxophone, the replacement of the banjo by the guitar, and the replacement of the tuba by the string bass gave the big band its characteristic sound.

In the earliest forms of jazz the leader "stomped off" the tempo (gave it by tapping his foot), and the ensemble played a refrain maintaining some faithfulness to the melody. Then each soloist was given a refrain for his individual expression. The background for these solos was generally provided by the piano player, sometimes a spur-of-the-moment idea of an idle side man. The "solo" continued as long as the leader wished to let the people dance. In conclusion came the "out" chorus, in which the entire band played ecstatic excursions of music within the harmonic framework of the composition.

Whereas the jazz band had presented a musical product that was more or less spontaneous and therefore quite flexible, the big dance band presented a contrived, rigid composition. A solo passage was presented within a written framework that was the same at every playing, thus diminishing spontaneity of expression. The era of the "arranger" and "arrangement" had been launched, and the real jazz band was temporarily relegated to the background.

1

This musical score is for the original version of 'Royal Garden Blues'. It consists of three systems of piano accompaniment. Each system has a treble and bass staff. The music is in B-flat major (two flats) and 4/4 time. The first system shows a steady eighth-note bass line and chords in the treble. The second system continues this pattern. The third system ends with the word 'etc.' written in the treble staff.

2

Trombone

Piano  
Guitar

Drums  
Bass

This musical score is for the improvisation version of 'Royal Garden Blues'. It is arranged for four parts: Trombone, Piano/Guitar, and Drums/Bass. The score is divided into three systems. The first system shows the Trombone part with a melodic line, while the Piano/Guitar and Drums/Bass provide harmonic support. The second and third systems continue the improvisation, with the Trombone part becoming more complex and the piano accompaniment providing a steady foundation.

This musical score is for the improvisation version of 'Royal Garden Blues'. It consists of two systems of piano accompaniment. Each system has a treble and bass staff. The music is in B-flat major (two flats) and 4/4 time. The first system shows a steady eighth-note bass line and chords in the treble. The second system continues this pattern.

An example of improvisation, transcribed by John W. Work from "Royal Garden Blues" by Clarence Williams. 1. Original version. 2. Improvisation.

Perhaps the greatest musician during the transition from the jazz band to the big band was Fletcher Henderson (1898–1952). He gave impetus to the contrived music but at the same time played individual, exciting, organized jazz. His arrangement and recording of "Sugar Foot Stomp" (including the then sensational new trumpeter, Louis Armstrong) became, with a few changes, a hit for Benny Goodman some fifteen years later. Paul Whiteman (1890–1967) "king of jazz," who assembled a large orchestra of expert performers and supplied them with attractive arrangements of jazz pieces, called his music "symphonic jazz." Until then, jazz had been music to which people danced. Whiteman taught his audiences to listen to it. Whether he applied jazz rhythms to classical melodies (Rimsky-Korsakov's "Song of India") or to Tin Pan Alley tunes, he emphasized the idea that jazz was not a kind of music but a way of performing it. The culminating event in Whiteman's career was a concert at Aeolian Hall in 1924, which attracted a highly intellectual audience. The highlight of the concert was the now famous *Rhapsody in Blue* by George Gershwin.

Concurrent with the big-band style, the Chicago style (small groups of four to seven men) was continued by Eddie Condon, Bud Freeman, and Dave Tough. Among this group was Louis Armstrong, a trumpet virtuoso and scat singer from New Orleans. Largely under his influence there arose (c. 1925) the style known as "hot" jazz. Bix Beiderbecke, among others, was strongly influenced by him. Armstrong's vibrato and short expressive phrases were imitated on the clarinet, saxophone, trombone, and piano. The harmonies remained simpler than the big-band chords, rhythms were more pronounced, easily singable melodies were abandoned, and, above all, advance preparation and arrangements were taboo.

In the late 1920's and early 1930's the Duke Ellington band created a new style of jazz music,

neither true jazz nor totally contrived. It was a band of individualists, ingeniously welded together, who created the well-known Ellington sound. Ellington's greatest talent was his ability to blend different instruments into a beautiful or unusual sound. A great stylist, he was probably the first leader to have special rehearsals for his rhythm section. As a result, his music was eminently danceable, unlike the music of some later bands.

In the big band the arranger was the most important individual at the leader's command. For the sparkling spontaneity and unlimited individual expression found in early jazz, the arranger substituted a technical brilliance and fine concerted playing that were unheard of before. True jazz was now in the background and a new dance music, "swing," had come to the fore. The great names in swing were Benny Goodman, Artie Shaw, the Dorsey Bands, Harry James, and others. In the midst of this big-band era Benny Goodman introduced a swing combo: Teddy Wilson, piano; Gene Krupa, drums; Lionel Hampton, Vibraharp; and Benny Goodman, clarinet. Dancers welcomed swing with a frenzy. In 1938 at the Randall's Island concert in New York, called "A Carnival of Swing," a crowd estimated at more than 20,000 listened for five and a half hours with unrestrained glee.

In the 1920's and 1930's jazz assumed the function of entertainment as well as furnishing dance music. Many instrumentalists provided antics to entertain listeners, while others performed skits (e.g., Fred Waring's Pennsylvanians). Vocalists who sang in a style called "crooning," such as Bing Crosby, Rudy Vallee, and Frank Sinatra, began their singing careers with these jazz bands. At the same time, many band leaders contributed significantly to jazz music: Louis Armstrong, Count Basie, Bix Beiderbecke, Cab Calloway, Bob Crosby, Jimmy Dorsey, Tommy Dorsey, Duke Ellington, Benny Goodman, Lionel Hampton, Fletcher Henderson, Woody Herman, Earl "Father" Hines, Gene Krupa, Guy Lombardo, Vincent Lopez, Glenn Miller, Red Nichols, Ben Pollack, William McKinney, Don Redman, Thomas "Fats" Waller, Fred Waring, Chick Webb, and Paul Whiteman.

While some people regard only the music of Joe "King" Oliver's band and the Original Dixieland Band as pure jazz, others call all music performed by a jazz band "jazz": accompaniments to popular songs, boogie woogie, rock and roll, rhythm and blues, Afro-Cuban music, and bop as well as "progressive jazz." Both these interpretations represent extreme points of view.

IV. As the bands grew smaller and their personnel and locale changed, changes in jazz music were inevitable. In 1938 there was a revival of New Orleans (Dixieland) jazz (Mezz Mezzrow, Bunk Johnson). However, in the 1940's four great jazz musicians appeared on the scene and brought still another revolution. They were Charlie "Bird" Parker, tenor saxophonist; Dizzy Gillespie, trumpeter; Miles Davis, trumpeter; and Art Tatum, pianist. The loudness of the old jazz band was reduced, small combos began to displace the big bands, new rhythms replaced the four- or eight-beat pattern, and melodies became more florid and complex. Dissonant, strange harmonies bewildered audiences, who were more listening- than dance-oriented. This was the era of \*bop [M. Stearns, *The Story of Jazz*, p. 227; also see Historical Masterpieces, album of three records of Charlie Parker's bop, issued by the Charles Parker Corporation].

Bop developed into "progressive jazz," whose principal exponents are Thelonious Monk, Stan Kenton, Dave Brubeck, Jerry Mulligan, John Lewis, and Gil Evans. The performance demands of "progressive jazz" and its harmonic and contrapuntal concepts are so severe that they have made membership in any of the progressive groups, such as the Modern Jazz Quartet, very exclusive. The success of the Modern Jazz Quartet and of Thelonious Monk indicate that the big band is unwieldy and therefore incapable of the subtleties required for "progressive jazz." Progressive jazz men have turned completely away from dancing, which to their music is nearly impossible.

A blending of the new music with classical forms is found in the music of the John Lewis Piano Combo. Instead of the older minstrel-music titles and the "stomps," their titles seem to be derived from European impressionism, e.g., "Harlequin," "The Bad and the Beautiful," "Warmeland," "Pierrot," and "Colombine." Some composers have combined jazz with the European art music tradition. In this area only George Gershwin has produced a number of successful serious compositions. A new movement called "third stream," led by Gunther Schuller in the 1960's, combines "progressive jazz" with the classical tradition. John Coltrane (b. 1926, tenor saxophonist) is the leader of the newest movement in jazz.

Jazz has also occasionally been used in Protestant churches. On Dec. 27, 1965, Duke Ellington and his jazz band played at the Fifth Avenue Presbyterian Church, New York City. Others have followed his example. On April 24, 1966,

the Emmanuel Church of Boston offered a Service in Jazz based on the themes from the ancient Apostolic Tradition of Hippolytus (A.D. 217). A jazz suite on texts of the English Mass has been composed by Lalo Schiffrin, while Vince Guaraldi has set the Eucharist for organ, choir, and his own jazz trio.

Various composers have incorporated jazz forms or styles into their works, through either direct imitation or subtle allusions. A few such works are: 1908, Claude Debussy, "Golliwog's Cake Walk" (From *Children's Corner*); 1918, Igor Stravinsky, *Ragtime* for eleven instruments; 1922, Paul Hindemith, *1922 Suite für Klavier* (movements "Shimmy" and "Ragtime"); 1923, Milhaud's *La Création du Monde* (blues intonations); 1925–26, E. Krenek's opera, *Jonny spielt auf* ("Shimmy," "Blues," "Spiritual"); 1928, Kurt Weill, *Die Dreigroschenoper*; 1935, G. Gershwin, *Porgy and Bess*; 1954, R. Liebermann, *Concerto for Jazz Band and Symphony Orchestra*.

J.W.W.

**Jeanne d'Arc au Bûcher** [F., Joan of Arc at the Stake]. Dramatic oratorio by A. Honegger with a prelude and ten scenes (libretto by P. Claudel), produced in Basel, 1938. Setting: Rouen, 15th century.

**Jena Symphony.** A symphony discovered at Jena, Germany, in 1909. Once acclaimed as an early work of Beethoven, it was not generally accepted as such. H. C. Robbins Landon (in *MR* xviii, pp. 109ff) has fairly convincingly estab-

lished that it was composed by Friederich Witt (1770–1837).

**Jeng** (also spelled cheng, tseng). (1) A Chinese stringed instrument similar to the \*chyn but without frets. See W. D. Sheepers, in *Folklorist* vi, 396. (2) A shallow, basin-shaped Chinese gong corresponding to the Korean \*ching.

R.C.P.

**Jenufa** [Cz.; orig. title *Jerí Pastorkyna*, Her Foster-daughter]. Opera in three acts by L. Janáček (libretto by the composer after G. Preissová), produced in Brno, 1904. Setting: village in Moravia.

**Jephtha.** (1) Handel's last oratorio (English text by Thomas Morell), produced in London, 1752. (2) Oratorio by Carissimi (Latin text from the Scriptures), composed about 1650.

**Jeté** [F.]. See under Bowing (e).

**Jeu** [F.]. In organ music, stop; *jeu de fonds*, foundation stop; *jeu de mutation*, mutation stop; *jeu à bouche*, flue stop; *jeu d'anche*, reed stop. *Jeu de timbres*, \*glockenspiel. *Jeu-parti*, see Tenso.

**Jeu de cartes, Le** [F., The Card Game]. Ballet "in Three Deals" by Stravinsky, produced in New York, 1937. The dancers represent the chief cards in a poker game that proceeds through three deals, each successively more complex.

**Jeune France, La.** A group of French composers, formed in 1936, consisting of Yves Baudrier (b. 1906), André Jolivet (b. 1905), Daniel Lesur (b. 1908), and Olivier Messiaen (b. 1908). They were united in their common objective of "sincerity, generosity, and artistic good faith."

**Jewish music.** I. *The original tradition.* The frequent references in the Bible to musical instruments have been reconstructed by modern scholars (Idelsohn) into a lively, interesting picture. The music of the Temple (the center of the Jewish religion in Jerusalem, comparable to St. Peter's in Rome) was in the hands of professional musicians, the Levites. Instruments such as the hasosra (chatzotzra, a silver trumpet, used in numbers up to 120 in Solomon's time), \*magrepha (organ), tzilzal (cymbals), and others apparently served chiefly for signaling, i.e., to announce the entrance of the priests, give the sign for the congregation to prostrate themselves, etc. Many instruments mentioned in the Scriptures have an Egyptian ancestry, e.g., the nevel (nebel, probably a large harp, played with the fingers), the kinnor (a lyre, played with a

plectrum, similar to the Greek kithara; see Harp III), the halil (probably a double-oboe and, like the Greek aulos, used for highly exciting and virtuoso-like music; it had to be banned from ritual use), etc. The only instrument to survive up to the present is the \*shofar, a ram's horn that also was (and still is) used as a signaling instrument [see ill. under Brass instruments; see also the detailed study of the Biblical instruments in *SaHMI*, pp. 106–27].

The instrumental music of the Temple fell into oblivion after its destruction in A.D. 70. However, the chanting of the Bible (believed to have been established in the 5th century B.C.) has survived in the various synagogues to the present day, representing the oldest extant type of Jewish music [see under II below]. Particular interest attaches to the singing of the psalms, which is expressly indicated in inscriptions such as “To the chief Musician on Neginoth” [for a correct interpretation of these inscriptions, see Psalm]. The singing was entrusted to professional musicians. A number of psalms, however, show that the congregation occasionally participated in their performance by responding “Hallelujah” or “Amen” after each verse. Some early sources also refer to choral singing in two answering groups, i.e., \*antiphonal singing.

Although no manuscripts of early Jewish music exist, the state of music in the late pre-Christian era has been clarified considerably by Idelsohn, who examined the musical tradition of Jewish tribes in Yemen, Babylonia, Persia, Syria, etc. A startling similarity was found among the chants sung by these tribes, who, living in strict isolation, had no contact with one another after leaving Palestine. Therefore these melodies probably antedate the destruction of the Temple and have been preserved for 2,000 years with only slight alterations. They thus are thought to approximate very closely the Jewish chant of the pre-Christian era. No less interesting is the close resemblance between some of these melodies and certain melodies of Gregorian chant. For instance, a chant used by the Jews of Yemen for the recitation of the Pentateuch (as well as of certain psalms) shows a striking similarity to the Gregorian psalm tones [Ex. 1].

II. *The main types of Jewish chant.* The oldest type of Jewish ritual music is the chant used for

reading the prose books of the Bible, such as the Pentateuch, Prophets, Ruth, etc. This chant, usually called “cantillation,” consists of a succession of stereotyped melodic formulas, each of which is represented by a sign written above or below the scriptural text. These signs, called *ta’amim* (accents), no doubt developed from an earlier system of accents designed to assist the reader in the proper emphasis and rendition of the important words of the text [see Ecphonic notation]. The oldest extant sources for the *ta’amim* date from the 9th century (for 11th- and 12th-century MSS, see A. Gastoué, in *TG* xxii). For almost 1,000 years the meaning of these signs was handed down orally by the Jewish singers and, therefore, was exposed to considerable variation in different periods and localities. Fortunately their late medieval status was recorded by Johannes Reuchlin (*De accentibus et orthographia linguae hebraicae* [1518]) and S. Münster (*Institutiones grammaticae in Hebraeam linguam* [1524]). Ex. 2 shows one of these

signs, the *t’lishá* (*talsá*) *gadólá* (“major drawing out”) in four variants: (a) as recorded by Münster; (b) as sung today in northern Europe; (c) from Morocco; (d) from Egypt and Syria.

Even within a single rite, e.g., that of the North European (Ashkenasic) Jews, a given sign indicates different melodic formulas depending on which book of the Bible is chanted. Each book has its own mode, usually based on a tetrachordal scale (e.g., d–g, g–c’), so that the rendition of the *ta’amim* varies in pitch and other details from one book to another. Ex. 3 shows

the same text sung (a) in the ordinary Pentateuchal mode, (b) in the penitential Pentateuchal mode, and (c) in the Prophetal mode. Long tables of the *ta'amim* are given in *The Jewish Encyclopedia* under "Cantillation" and in Idelsohn's *Jewish Music*, p. 44; see also F. L. Cohen, in *PMA* xix; S. Rosowsky, in *PMA* lx. Ex. in *HAM*, no. 6.

Second oldest after the cantillation of the Bible is that of the prayers, which is not based on a set of stereotyped melodic formulas indicated by signs but belongs to the general category of \*melody types. For each service there are certain traditional themes or motifs, but the actual singing is a free vocal fantasia, frequently of a highly virtuoso character, which retains only the barest outline of the prayer motif (mainly in the closing formula). These more or less freely created melodies are known as *hazzanut*, a word derived from *chazzan*, the name for the professional cantor to whom the singing of the prayers is entrusted. From the Middle Ages through the end of the 19th century the *chazzanim* were the main carriers of Jewish ritual music. They were chosen mainly for their beautiful voices and their ability to improvise on the prayer motifs. Until the middle of the 19th century, even the most famous among them had no formal education in music and were unable to read notes.

Finally, there are a number of melodically fixed chants. These represent the most recent development of ritual music, starting after the 9th century. Most of the melodies show evidence of contact with various kinds of non-Jewish music, e.g., the famous Kol Nidre, partly borrowed from Gregorian chant; the beginning of Maoz Zur, taken from the Protestant chorale "Nun freut Euch Ihr frommen Christen"; and one of the melodies for Adonai Melek, borrowed from Verdi's *La Traviata*.

III. *Semireligious music and folksong*. To the former category belong the *zmioroth*, the chants used at home for singing grace at meals or, e.g., for reciting the Haggadah, the account of the Hebrews' captivity in and deliverance from Egypt. An important repertory of semireligious songs are the Hasidic melodies, created by the Hasidim, a pietist sect that originated in the early 18th century in Poland and Russia. Music played an important part in their creed as a means of ecstatic communication with God.

The Jews of eastern Europe possess a large repertory of domestic songs, including love songs, work songs, lullabies, wedding tunes, dance melodies, etc. Some 3,000 such songs have been gathered under the auspices of the

Petrograd Jewish Folk-Song Society, founded by pupils of Rimsky-Korsakov's. Outstanding among the collectors of Jewish folksong was A. Z. Idelsohn, whose *Hebräisch-orientalischer Melodienschatz* (10 vols., 1914ff) includes the results of his studies in Morocco, Yemen, Persia, Palestine, Poland, etc.

IV. *The European development*. Shortly after 1500, Jews for the first time participated in musical life outside the ghetto. Abramo dall'Arpa Ebreo was a famous singer at the court of Mantua from 1542 to 1566. Allegro Porto published his *Nuove musiche* in 1619 and two collections of madrigals, one (without title page) probably in 1622, the other in 1625. The most important of these Jewish composers was Salomone Rossi (c. 1587–1630), who was one of the pioneers of violin music [see Sonata B, I; *Romanesca*; *Ruggiero*] and the first to compose polyphonic music for the Jewish service, in his *Hashirim Asher Li'Shlomo* (The Songs of Solomon; 1622). Needless to say, these compositions, written for chorus and soloists, completely break away from the Jewish tradition.
