About 1700 some of the wealthier German synagogues employed instrumental music for the Friday-evening service and installed organs, and choirs were fairly generally employed. Since there was no traditional music for such performances, the contemporary repertory of non-Jewish music was used, including secular and even operatic elements, dance tunes, and rococo arias. Ahron Beer (1738–1821), one of the first *chazzans* to possess some musical knowledge, made an extensive collection of compositions for the service and of traditional Jewish songs, including two versions of the Kol Nidre, marked 1720 and 1783. A different line was followed by Israel Jacobson (1768–1828), who was an exponent of the Reform movement and who, in the first Reform temple (Seesen, Westphalia, 1810), not only used organ and bells but also German chorales provided with Hebrew texts [see Idelsohn, p. 237]. The consequent reaction against this Christianization of the Jewish service led to the moderate reform of Salomon Sulzer (1804–90), who declared that the "restoration should remain on historical grounds" and that "the old tunes should be improved, selected and adjusted to the rules of art" (*Denkschrift*, 1876). Although Sulzer succeeded in bestowing on the musical service a fundamental dignity and appropriateness, his compositions and versions of songs tend to represent current European idioms rather than Jewish tradition. The same was true of Louis Lewandowski (1821–

1904), whose thorough training in musical theory, harmony, etc., enabled him to write choruses in Mendelssohn's oratorio style. His complete service, *Kol Rinnah* (1871), with its facile and pleasing tunes, has been widely adopted. In America, synagogue music started by imitating the current European models (Alois Kaiser of Baltimore; Max Spicker and William Sparger of New York; Edward Starck of San Francisco). Recently, however, there has been a remarkable movement toward independent development, represented by a number of choral compositions of a distinctly Hebraic character, mostly for the Sabbath service. Among the contributors have been Ernest Bloch, Frederick Jacobi, Lazare Saminsky, and Isadore Freed.

Throughout the 19th and 20th centuries, Jews played an active part in the development of European music, as composers (Giacomo Meyerbeer, 1791–1864; Jacques Halévy, 1799–1862; Felix Mendelssohn, 1809–47; Jacques Offenbach, 1819–80; Karl Goldmark, 1830–1915; Gustav Mahler, 1860–1911; Arnold Schoenberg, 1874–1951; Ernest Bloch, 1880–1959; Darius Milhaud, b. 1892; George Gershwin, 1898–1937; Aaron Copland, b. 1900; and many others), and even more prominently as performers and conductors (Joachim, Kreisler, Heifetz, Menuhin, Godowsky, Schnabel, Serkin, Myra Hess, Damrosch, Bruno Walter, Klemperer, to name only the most outstanding).

Since about 1915 there has been a movement to create a "Jewish national music," comparable to the national music of other countries. The leader of this movement was Ernest Bloch who, in his symphony *Israel* (1912–16), *Schelomo* (1915–16), *Sacred Service* (1930–33), and other works, used distinctly Hebraic idioms. The establishment, after World War II, of the national state of Israel has given further impetus to this trend. In 1936 Bronislaw Huberman founded the Palestine Orchestra, which gave its first performance under Toscanini. A considerable number of operas have been performed in Hebrew. Musical education has reached high standards under the guidance of L. Kestenbergh. Composers working in Israel include Paul Ben-Haim (b. 1897), Joseph Tal (b. 1910), Ödön Partos (b. 1907), Herbert Brün (b. 1918), and others.

**Jew's-harp or trump** [F. *guimbarde*; G. *Maultrommel*]. A primitive instrument consisting of an elastic strip of metal, one end of which is attached to a small horseshoe-shaped frame of metal or wood. The frame is held between the teeth (the name Jew's-harp may be a corruption of jaw's-harp), and the elastic strip is plucked with the fingers, causing it to vibrate in the player's mouth. Although the instrument as such produces only one sound, different harmonics can be obtained by changing the position of lips, cheeks, and tongue. The instrument is very ancient and widespread. It is mentioned and depicted in a Chinese book of the 12th century, and specimens have been found in Japan, Borneo, Siberia, North Germany (14th century), Norway, etc. In the early 19th century it was temporarily revived by virtuosos who used larger instruments with several vibrating reeds. [For ill. see under Percussion instruments.] See *MaMI*; *SaHMI*, bibl., p. 471; M. Heymann, "La Guimbarde" (*RM* 1923, no. 6).

**Jig.** (1) An English popular dance of the 16th century, which is especially important as the forerunner of the \*gigue. Names such as "Kemp's Jig" and "Slaggin's Jig" refer to famous comedians of the English stage. The "Nobody's Jigg" that appears in various sources is the jig of the comedian R. Reynolds, who played "Nobody" in the popular comedy *Somebody and Nobody*. The English comedians who, in the early 17th century, invaded the Netherlands, Scandinavia, and Germany, introduced the jig there. According to a recent theory, jigs were also introduced in America, where they were imitated by Negroes and gradually transformed into the grotesque dances of the minstrel shows; in this respect, note the jazzlike rhythm [see Dotted notes III] in the Ex. ["Mr. Slaggin's Jigg," from *The Dancing Master* (1686); see W. Danckert, *Geschichte der Gigue* (1924), p. 17].

(2) A type of English stage entertainment (also spelled "jigg"), a kind of low comedy nearly always dealing with indecent subjects, that was popular in England from the late 16th to the early 18th centuries. A forerunner of the \*ballad opera, it consisted of verses sung to well-known tunes, interspersed with lively dances. The Elizabethan comedian Nicholas Tarleton played an important role in the early development of this entertainment. His pupils (William Kemp, Robert Reynolds, Thomas Sackville) popularized it not only in England but also on the Continent (Holland, Germany). See C. R. Baskerville, *The Elizabethan Jig* (1929); P. E. Mueller, "The Influence and Activities of English Musicians on the Continent" (diss. Indiana Univ., 1954).

**Jingling John(ny).** See Turkish crescent.

**Jodel.** See Yodel.

**Jongleur.** See Minstrel; Troubadour; also reference under *Estampie*.

**Jonny spielt auf.** Opera in two parts by E. Krenek (to his own libretto), produced in Leipzig, 1927. Setting: the present.

**Joropo** [Sp.]. The most typical of all Venezuelan folk dance-songs. It is always performed by a couple using steps and figures quite similar to those employed in the Colombian \**pasillo* and \**bambuco*. The *joropo*, in fast 3/4 meter, employs

short melodic phrases in rhythmic patterns such as:

The accompaniment supports the melody with strongly accentuated quarter notes, resulting in a rhythmic conflict. As a rule the texts consist of quatrains in eight-syllable lines. J.O.-S.

**Jota** [Sp.]. A dance of Aragon (northeast Spain) in rapid triple time, performed by one or more couples and accompanied by castanets. One of the most popular melodies has been used by Liszt in his *Rhapsodie espagnole* no. 16 (*Folies d'Espagne et jota aragonese*) and by Glinka in his orchestral overture *Jota aragonese*. Other examples occur in De Falla's *El Sombrero de tres picos* and in compositions by Saint-Saëns, Albéniz, et al. Statements regarding the medieval or Arab origin of the *jota* [see J. Ribera y Tarragó, *La Música de la jota aragonese*, 1928] are entirely unfounded. See G. B. Brown, in *BAMS* ii; M. Arnaudas Larrodé, *La Jota aragonese* (1933); A. de Larrea, in *AnM* ii; Ex. in *LavE* i.4, 2373ff.

**Jubilus.** In the Gregorian Alleluias, the melisma sung to the final vowel of the first word "Alleluia," which invariably stands at the beginning of this chant. The melisma of the jubilus often recurs at the end of the verse. It often shows repeat forms such as a a b, a a b b c, etc. After the verse, the word Alleluia with its jubilus is repeated. See *ApGC*, p. 386. Also see Alleluia.

**Judas Maccabaeus.** Oratorio by Handel (libretto by T. Morell), produced in London, 1747.

**Jupiter Symphony.** Nickname of Mozart's last symphony, in C major, no. 41 (K. 551), composed in 1788. The name appears to refer to the "majestic" opening of the first movement.

**Justiniana.** Same as *giustiniana*; see under Villanella.

**Just intonation** [G. *Reine* or *natürliche Stimmung*]. A system of intonation and tuning in which all the intervals are derived from the natural (pure) fifth and the natural (pure) third [see Acoustics III]. Therefore, all the intervals of just intonation are contained in the formula  $m \times F + n \times T$  ( $F$  = fifth,  $T$  = third). The formula for the relative frequencies is therefore  $(\frac{3}{2})^m \times (\frac{5}{4})^n$ . They are easy to calculate if [as explained under Intervals, calculation of III] the octaves, i.e., all the factors 2, are disregarded at first, so that the formula for the relative frequen-

cies becomes  $3^m \times 5^n$ , in which  $m$  and  $n$  designate the number of fifths and thirds contained in the interval in question. There result the following values for the C-major scale:

$$\begin{array}{cccccc} c & d(=2F) & e(=T) & f(=-F) & g(=F) & \\ 1 & 9 & 5 & \frac{1}{3} & 3 & \\ a=(T-F) & b=(T+F) & & & & \\ \frac{2}{3} & 15 & & & & \end{array}$$

Reduced into the normal octave, they become:

	c	d	e	f	g	a	b	c'
c = 1:	1	$\frac{9}{8}$	$\frac{5}{4}$	$\frac{4}{3}$	$\frac{3}{2}$	$\frac{5}{3}$	$\frac{15}{8}$	2
c = 24:	24	27	30	32	36	40	45	48
Intervals:		$\frac{9}{8}$	$\frac{10}{9}$	$\frac{16}{15}$	$\frac{9}{8}$	$\frac{10}{9}$	$\frac{9}{8}$	$\frac{16}{15}$

Owing to the presence of two constituents ( $F$  and  $T$ ) the complete system of just intonation forms a two-dimensional infinite set of tones [G. *Tongewebe*; see C. Eitz, *Das mathematisch-reine Tonsystem*, 1891]. A selection of these tones is given under Intervals, calculation of, VI.

Just intonation has the advantage of giving the three fundamental triads, c-e-g, f-a-c', and g-b-d', as "natural triads" (characterized by the ratio 4:5:6; e.g., 24:30:36 = 4:5:6), which are more "euphonious" than those in \*Pythagorean or well-tempered tuning [see Temperament III]. However, its disadvantages are much more numerous and, in fact, so serious as to make it practically useless. The chief ones are: (a) The tones of the C-major scale include one "dissonant" fifth, namely d-a, which is  $\frac{40}{27}$  ( $\frac{80}{54}$ ) instead of  $\frac{3}{2}$  ( $\frac{8}{4}$ ). (b) The C-major scale has two different whole tones,  $\frac{9}{8}$  (major tone) and  $\frac{10}{9}$  (minor tone); their difference is the syntonic \*comma  $\frac{81}{80}$ . (c) Modulation is impossible; the first three tones of the G-major scale, g-a-b, already have different intervals from those of the C-major scale, c-d-e. Hence, two different tones a would be necessary, one for the sixth of c, the other for the second of g. The difficulties would rapidly increase with the introduction of chromatic tones. (d) In chordal music, just

intonation produces pure triads and has, therefore, been considered ideal for a *cappella* music in the style of Palestrina, etc. However, the principle of pure triads can be maintained only at the expense of a constant lowering in pitch. For instance, if the succession of chords indicated in our example were sung in pure triads, the notes indicated in black would have the following frequencies: c' = 1; a' =  $\frac{9}{8}$ ; d' =  $\frac{9}{8} \times \frac{4}{3} = \frac{20}{9}$ ; g' =  $\frac{20}{9} \times \frac{3}{2} = \frac{40}{9}$ ; c' =  $\frac{40}{9} \times \frac{3}{2} = \frac{80}{9}$ , i.e., the syntonic comma ( $\frac{81}{80}$ ) lower than the initial c. Since harmonies including the supertonic (this chord is responsible for the lowering of pitch) are particularly common in the Palestrina style, just intonation proves unsatisfactory for exactly the type of music for which it has frequently been recommended. Thus, just intonation is primarily of theoretical importance. Its practical application is probably limited to violin music, for which it was recommended as early as the 18th century by P. Prelleur (*The Modern Musick-Master*, 1731), Geminiani, Tosi, and Tartini. It may be noted, however, that the tendency of modern violinists to play sharps higher than their equivalent flats (e.g., C-sharp and D-flat) cannot be justified by invoking the authority of just intonation, as is usually done. In just intonation the sharps are actually lower than the flats [see the table under Intervals, calculation of, first line under J].

Kuttner, *The Theory and Practice of Just Intonation* (record and booklet, 1958); *id.*, "Just Intonation Confuted" (*ML* xix, 48); *id.*, in *BAMS* ii; L. S. Lloyd, "Just Temperament" (*ML* xx, 365ff); D. D. Boyden, "Prelleur, Geminiani, and Just Intonation" (*JAMS* iv). See also under Acoustics; Intervals, calculation of; Temperament.

## K

**K.**, **K.V.** Abbr. for *Köchel-Verzeichnis*, i.e., the chronological list of all the works of Mozart made by L. von Köchel (publ. 1862, rev. by Einstein, 1937, '47; by Giegling, Weinmann, and Sievers, 1964). Mozart's compositions are usually referred to by the numbers of this list, e.g.,

K. 357 or K.V. 357. See A. Hyatt King, "Das neue Köchel-Verzeichnis" (*MF* xviii).

**Kadenz** [G.]. (1) \*Cadence; (2) \*cadenza.

**Kaffeekantate** [G.]. See Coffee Cantata.

**Kaiserquartett** [G.]. See Emperor Quartet.

**Kalevala.** The Finnish national epic [see Finland], dating from the 13th and 14th centuries. Several symphonic poems by Sibelius (and other Finnish composers) are based on legends from this epic, e.g., *\*Lemminkäinen's Homecoming*, *\*Pohjola's Daughter*, *\*Swan of Tuonela*, *\*Tapiola*.

**Kamānja, kemāņģe.** See Arab music. For ill. see under Violin.

**Kammer-** [G.]. Chamber. *Kammerton*, chamber pitch [see Pitch (2)]; *Kammermusik*, chamber music; *Kammerkantate*, chamber cantata; etc.

**Kanon.** (1) German for *\*canon*. (2) A type of medieval Byzantine poetry [see Byzantine chant II]. (3) In ancient Greek music, name for the *\*monochord* [see Canon (2); Kanun].

**Kantate** [G.]. *\*Cantata*.

**Kantele.** See under Finland. For ill. see under Zither.

**Kantional** [G.]. See Cationale.

**Kantorei** [G.]. In the 15th and 16th centuries, a group of professional singers employed by a church or at a prince's court; later also groups of amateurs who provided music for their communities.

**Kanun** (*qānūn*). Arab name for a psaltery shaped like a trapezoid and mounted with numerous strings (as many as 64 in the 14th century). [For ill. see under Zither.] The name, derived from the Greek *kanón* [monochord; see Canon (2)], occurs as early as the 10th century in a story of the *Arabian Nights*. Later (11th century?) the instrument was imported into Europe. See Psaltery.

**Kanzone** [G.]. (1) *\*Canzona*. (2) *\*Canzo*.

**Kapelle** [G.]. *\*Chapel*, usually with the connotation of "private or small orchestra," e.g., *Hofkapelle* (court orchestra), *Militärkapelle* (military band). *Kapellmeister*, originally an honorable title (Bach served as *Kapellmeister* to Prince Ernst of Cöthen from 1717 to 1723), is now an old-fashioned provincialism for *Dirigent* (conductor). *Kapellmeistermusik* is a pejorative designation for compositions of formally correct design but lacking in imagination and originality—as the pieces of the *Kapellmeister* often were.

**Kapodaster** [G.]. *\*Capotasto*.

**Karelia.** Orchestral overture (op. 10) and Suite (op. 11) by Sibelius, composed in 1893. Karelia

is the southern province of Finland, where the composer lived at the time.

**Káta Kabanová.** Opera in three acts by L. Janáček (libretto by V. Červinka, after a story by A. N. Ostrovsky), produced in Brno, 1921. Setting: Kalinow, a small town on the Volga, about 1860.

**Katerina Ismailova.** See *Lady Macbeth of Mtsensk*.

**Katzenmusik** [G.]. *\*Charivari*.

**Kazoo.** See Mirliton.

**Kehraus** [G.]. The last dance at a ball.

**Kemāņģe.** *\*Kamānja*.

**Kent bugle, Kent horn.** Key bugle; see under Brass instruments V (c).

**Kerabe** [G.]. Old term for *\*Kehraus*, used to denote a 16th-century *\*Nachtanz*.

**Kesselpauke, Kesseltrommel** [G.]. Kettledrum.

**Kettenform** [G.]. See under Forms (after I, A).

**Kettledrum.** See under Percussion instruments A, I; also Drum II.

**Key.** (1) On keyboard instruments, the visible parts of the action [F. *touche*; G. *Taste*; It. *tasto*; Sp. *tecla*], which are depressed by the player's fingers [see Keyboard]. In woodwinds the term applies to comparable devices, i.e., the levers covering the side holes [F. *clef*; G. *Klappe*; It. *chiave*; Sp. *llave*].

(2) By specialization, the term came to mean the "main" key of a composition, i.e., the main note or "tonal center" to which all its notes are related and finally, by extension, the meaning of the entire tonal material itself in relation to its center. Thus, "key" is practically synonymous with *\*tonality*. There is, however, a distinct difference between key and scale, since numerous notes extraneous to the scale can be used in the key, e.g., as chromatic variants or in connection with modulations.

Corresponding to the 12 tones of the chromatic scale, there are 12 keys, one on C, one on C-sharp, etc. (this number is increased to 14 or 15 by the notational distinction between *\*enharmonic* keys, such as C-sharp and D-flat, or G-sharp and A-flat). With any given key there is a choice of *\*modality*, i.e., of certain alterations of the tones that form the scale. Thus, in C there is the choice between major (mode): c d e f g a b c'; minor (mode): c d e<sup>b</sup> f g a<sup>b</sup> b c';

Lydian mode: c d e f# g a b c'; and others derived from the \*church modes. Of these, only the first two are usually considered and are actually (though not quite logically) distinguished as different keys, thus leading to a total number of 24 keys, one major and one minor on each tone of the chromatic scale. See Key signature; Key relationship. See W. W. Roberts, "Key Quality" (ML xi, 58).

**Keyboard.** I. The whole set of keys in pianos, organs, harpsichords, etc. (\*keyboard instruments). The modern piano keyboard usually includes 88 keys for seven full octaves, from C<sub>1</sub> to c''''', and a quarter octave added at the lower end of the compass. (The organ has 61; the harpsichord varies.) In each octave there are seven white and five black keys, arranged as illustrated in Ex. 1. This arrangement is the natural result of the fact that the fundamental

scale of Western music consists of seven tones, which are given to the white keys. Except for the steps e-f and b-c' the intervals between these tones are whole tones, each of which admits the introduction of a semitone in between, represented by a black key. Although the introduction of equal temperament, which permits unlimited transposition, seriously weakened the dominating position of the white keys, the old "C-major keyboard" has proved fully capable of adapting itself to the new system and has to the present day successfully withstood all attempts at reform, e.g., the adoption of the truly "chromatic keyboard" [Ex. 2], in which all scales beginning on a white key would have the same arrangement and consequently the same fingering (as would all those beginning on a black key).

II. *History.* The earliest keyed instrument was the organ. According to Galpin's reconstruction of the Greek \*hydraulos, this instrument had 19 keys about 8 inches long and 2 inches wide. Organs of the 9th and 10th centuries had a number (8 to 10) of large keys called *linguae* (tongues), which were pulled out and pushed in.

Reports that keys of organs were so large and heavy that they were played with the fist seem of rather dubious authenticity. About 1200, the keyboard covered nearly three octaves (from G to e''; see Hexachord). From then on, its compass as well as the number of chromatic keys steadily increased. The early 14th-century organ pieces from the Robertsbridge Codex (Brit. Mus. Add. 28550) make use of all the chromatic tones in at least one octave. A normal device of all the old keyboards was the \*short octave. The 16th-century experiments with enharmonic music (Vicentino) led to the construction of keyboards with separate keys for C# and D<sup>b</sup>, etc. [see Arcicembalo]. In the 17th century, keyboards had an average compass of four octaves, with all the chromatic notes except for the lowest range. Bach's harpsichord had more than five octaves. Broadwood, in 1794, made the first piano keyboard with six octaves, from C<sub>1</sub> to c'''''; this was the compass of the Broadwood instrument used by Beethoven from 1817 on.

III. *Modern reforms.* Since about 1875 various unsuccessful attempts have been made to improve the keyboard. The *Janko keyboard* (patented 1882) had six rows of short keys arranged somewhat like a typewriter keyboard. Each row included the keys for a whole-tone scale, that beginning with C in rows 1, 3, 5, and that beginning with C# in rows 2, 4, 6. Thus, each octave had 36 keys, three for each tone of the chromatic scale. In spite of certain advantages and its initial success (Liszt and Rubinstein recommended it), the Janko keyboard failed to supersede the traditional one. Later modifications and simplifications (*Adam keyboard*, *Durand keyboard*, *Clavier Hans*) met with the same fate. *Mangeot's keyboard*, called "piano à doubles claviers renversés" (1878), had two keyboards, the lower of which, intended for the right hand, had the usual arrangement, while the higher, for the left hand, had the reverse arrangement, i.e., with the keys for high notes on the left side. The advantage claimed for this innovation was identical fingering of, e.g., the ascending scale, for both hands. In the *Clutsam keyboard* (1907) the keys were arranged in a slightly curved instead of a straight line, taking into account the fact that the player's arms move in arcs. This arrangement has been widely adopted for organ pedals. Moor's *Duplex Coupler Grand Piano* imitates the two manuals of the harpsichord. The upper of the two keyboards, otherwise normal, gives the tones of the higher octave and can be coupled with the lower. This keyboard greatly

facilitates the execution of the usual virtuoso effects and permits the execution of many others not possible on the usual keyboard. Its failure to win acceptance might be ascribed to decreasing interest in purely virtuoso playing. If invented 50 years earlier it would probably have been a great success. Another use of two keyboards is made in the *quarter-tone keyboards* (Haba, 1923; Stoehr, 1924), in which the upper keyboard is a quarter tone higher than the lower. At present, it would seem that attempts to enlarge the traditional keyboard are less likely to succeed than those leading in the opposite direction, i.e., eliminating the highest and lowest tones, which, being seldom used in music played at home, unnecessarily increase the size and price of the instrument.

**Keyboard instruments.** Instruments having a keyboard, i.e., the piano, organ, harpsichord, and clavichord. The term is used particularly for instruments used before c. 1750, when there was often no clear distinction among works written for the three last-named instruments [see Keyboard music]. The piano, harpsichord, and clavichord have an important technical feature in common, i.e., the use of strings, and therefore they are often grouped together in studies dealing with their history and their music.

Lit.: A. J. Hipkins, *A Description and History of the Pianoforte and of the Older Keyboard Stringed Instruments* (1896); P. James, *Early Keyboard Instruments from Their Beginnings to the Year 1820* (1930); F. J. Hirt, *Meisterwerke des Klavierbaus: Geschichte der Saitenklaviere von 1440 bis 1800* (1955); J. Wörsching, *Die historischen Saitenklaviere und der moderne Klavichord- und Cembalobau* (1946); H. Brunner, *Das Klavierklangideal Mozarts und die Klaviere seiner Zeit* (1933); P. James, "Early Keyboard Instruments" (*PMA* Ivii); V. G. Woodhouse, "Old Keyed Instruments and Their Music" (*ML* i, 45ff); C. Krebs, "Die besaiteten Klavierinstrumente bis zum Anfang des 17. Jahrhunderts" (*VMW* viii). See also under Instruments; Clavichord; Harpsichord; Organ; Piano.

**Keyboard music.** Music for \*keyboard instruments, particularly prior to 1750, when there was often no clear distinction among works for the organ, harpsichord, or clavichord. The 16th-century (and modern) Spanish term is *tecla* [see A. de Cabezón's *Obras de música para tecla arpa y vihuela* (1578; Musical works for keyboard, harp, and vihuela)]. Italians occasionally used the term *istrumenti perfetti* or *istrumenti da*

*tasti*. The lack of distinction among keyboard instruments is most clearly indicated in titles such as "du jeu orgues, espinettes, manicordions" (P. Attaignant, ed., *Quatorze gaillardes*, 1531), or "... per ogni sorte di stromenti da tasti" (A. Gabrieli, 1595), "... auff Orgeln und Instrumenten zugebrauchen" (B. Schmid, 1607), or "di cimbalo et organo" (Frescobaldi, *Il primo libro d'intavolatura*, 1628), Storace (*Selva di varie compositioni d'intavolatura per cimbalo ed organo*, 1664), G. Strozzi, *Capricci da sonare cembali et organi*, 1687). Modern demarcations are usually based on the various types of music. Liturgical compositions, such as Masses, hymns, and versets for psalms or the Magnificat, are obviously organ music, while dances clearly belong to the domain of the harpsichord or clavichord. Variations on secular tunes are primarily harpsichord music, although they may also have been played (and often sound best) on the organ (e.g., Sweelinck's variations on "Mein junges Leben hat ein End"). Occasionally, considerations of style are helpful or decisive, e.g., in some ricercars that employ the theme in quadruple augmentation, involving long notes that can be sustained only on the organ (A. Gabrieli). Canzonas are usually designated "Canzona d'organo" and must be considered primarily organ music, despite their "secular" background and character.

Such problems are not confined to the keyboard music of the 16th and 17th centuries. Indeed, they exist in connection with the keyboard music of Bach. To the present day it is not known whether his *\*Well-Tempered Clavier* was written for harpsichord, clavichord, or both instruments, or even some pieces for the one instrument and some for the other. See E. Bodky, *Der Vortrag alter Klaviermusik* [1932]; *id.*, in *DM* xxiv, no. 2; L. A. Coon, in *PAMS* 1936; N. Wilkinson, in *ML* iv, 162ff; R. Buchmayr, in *BJ* 1908; various authors in *BJ* 1910.

Gillespie, *Five Centuries of Keyboard Music* (1965); M. Seiffert, *Geschichte der Klaviermusik* (1899); W. Apel, *Geschichte der Orgel- und Klaviermusik bis 1700* (1967); F. W. Riedel, *Quellenkundliche Beiträge zur Geschichte der Musik für Tasteninstrumente in der zweiten Hälfte des 17. Jahrhunderts* (1960).

**Key bugle.** See under Brass instruments V (c).

**Key characteristics.** A branch of musical aesthet-

ics concerned with what might be called the "psychological properties" of a given key (usually, a given scale). In ancient Greek music each *harmonia* had a specific ethical connotation [see *Ethos*]. Guido was probably familiar with this doctrine when he said, "The diversity of the tropes [i.e., church modes] corresponds to the diversity of feelings so much that one man may delight in the broken jumps (*fractis saltibus*) of mode 2, another prefer the voluptuousness of mode 5, another approve of the suavity of mode 8" (*Micrologus*; ed. Smits van Waesberghe, p. 159). Johannes Cotto (*Afflighemensis*) also assigns specific characterizations to each mode, some of which are obscure (*De Musica*, cap. 16; ed. Smits van Waesberghe, pp. 109ff). How different his concept is from the present-day correlation of major = joyful, minor = sad, is seen in his designation of mode 4 as *adulatorius* (flattering), mode 6 as *lacrimosus* (tearful). Almost 400 years later, Ramos de Pareia correlated the four *\*maneriae* to four kinds of temperament and their "colors" (*Musica practica*; ed. J. Wolf, p. 56):

*protus*: *phlegmaticus*; *color cristalinus* (crystal)  
*deuterus*: *colericus*; *color igneus* (fire)  
*tritus*: *sanguineus*; *color sanguineus* (blood)  
*tetrardus*: *melancholicus*; *color luteus* (yellow, orange-red)

In addition, he ascribed to each mode characteristics similar to Cotto's. In the 16th century these concepts underwent significant changes, as appears from a comparison of Ramos with Diruta (*Il Transilvano*, pt. II, book 4), who probably copied Zacconi. Particularly interesting are the Phrygian and Hypophrygian modes:

Ramos	Diruta
mode 3: <i>severus, incitatus</i>	<i>commovere al pianto</i>
mode 4: <i>blandus, adulatorius</i>	<i>lamentavole, mesta</i>

For Ramos mode 3 is exciting, mode 4 bland and ingratifying; for Diruta, both are plaintive and sad.

Today, one point on which there is general agreement is the difference in feeling between major and minor. It is interesting, however, that Mattheson did not accept what in his day had already become a trivial convention. In *Das Neu-Eröffnete Orchestre* (1713) he rejects the view that minor is sad and major gay, or that flat keys are "soft" and sharp keys "hard." Among his interesting characterizations the following are particularly noteworthy: "E major expresses a desperate and deadly sadness"; "B

major (*H dur*) . . . seems to have a disgusting, harsh and unpleasant, also somewhat desperate quality."

In the 19th century the "feeling" of the keys was usually expressed by correlation with colors; see Color and music. Cf. also the *rāgas* of \*Indian music and, at the other end of the scale, the preface to Hindemith's *Marienleben*.

Wustmann, "Tonartensymbolik zu Bachs Zeit" (*BJ* 1911); A. Montani, "Psicologia dei moderni modi musicali" (*RMI* xlv); F. Monfort, Jr.; "L'Éthos des tonalités" (*CP Borren*).

**Keynote.** Same as \*tonic.

**Key relationship.** The degree of relationship between two keys. All keys are related, but in different degrees. The order of relationship generally follows that of the tones in the series from consonant to dissonant: fifth (dominant), fourth (subdominant), third (mediant), etc. The most important such relationships are as follows: (a) *parallel keys*—major and minor key with the same tonic (C major and C minor); (b) *relative keys*—major and minor key with the same signature (C major and A minor; C minor and E-flat major); (c) *related keys*—keys whose signature differs by not more than one sharp or flat from that of the main key (in C major: A minor, G major, E minor, F major, D minor; in A minor: C major, E minor, G major, D minor, F major). See W. H. Frere, "Key-relationship in Early Medieval Music" (*PMA* xxxvii; also in *CP* 1911, p. 114).

**Key signature.** The sharps or flats appearing at the beginning of each staff to indicate the \*key of a composition. A given signature indicates one of two keys, a major key or its relative minor key; these are shown in the accompanying illus-

tration by a white and a black note respectively. Normally there are 12 key signatures, corresponding to the 12 chromatic tones of the octave.

There may, however, be 13, 14, or even 15 if a notational distinction is made between \*enharmonic keys, e.g., C-sharp and D-flat. See also Circle of fifths.

In early music the use of key signatures is very limited. Until the late 15th century the only signature occurring frequently is one flat, and this is used mostly in the lower voices only [see Partial signature]. In the 16th century the increased use of transposed modes produced signatures (usually partial) with two flats. Not until the middle of the 17th century were sharps generally adopted as signatures. Actually, the scope of keys in use was somewhat wider than the variety of signatures, since the keys were usually written with fewer signs in the signature than they are today, and with more accidentals during the course of the composition. Thus, the minor keys with flats (D minor, G minor, C minor) were usually notated with one flat less than in modern practice, the flat for the sixth being omitted. One of the numerous examples of this practice is an organ toccata and fugue by Bach, actually in D minor throughout but written without a B-flat in the signature and therefore (quite wrongly) nicknamed "Dorian Toccata." Likewise, the major keys (G major, D major, A major) are sometimes notated without a sharp for the leading tone in the signature. A well-known example is Handel's Harpsichord Suite in E (containing the so-called "Harmonious Blacksmith"), which in the original has only three sharps.

**Key trumpet.** See under Trumpet II.

**Khovanshchina.** Opera in five acts by M. Musorgsky (to his own libretto), produced in St. Petersburg, 1886. Setting: Moscow and environs, 1682–89.

**Kielflügel** [G.]. Old name for harpsichord.

**Kin.** Japanese name for a smaller \**koto*. *K'in* is used in German for the Chinese \**chyn* (ch'in).

**Kinderscenen** [G., Scenes from Childhood]. A composition by Schumann, op. 15 (1838), consisting of 13 short and simple \*character pieces for piano. The familiar "Träumerei" (Dreams) is no. 7 in the group.

**Kindertotenlieder** [G., Children's Death Songs]. A cycle of five songs with orchestra or piano by Mahler (poems by Rückert), composed 1901–04. The poems are an elegy on the death of Rückert's child. The songs are masterpieces of melodic invention and artistic simplicity. The orchestra is

treated throughout as a large chamber ensemble rather than as a mass of sound.

**King David.** See *Roi David*, *Le*.

**Kinnor.** See under Harp III; Jewish music I.

**Kirchen-** [G.]. Church. *Kirchenjahr*, church year; *Kirchenkantate*, church cantata; *Kirchenmusik*, church music; *Kirchenschluss*, plagal cadence; *Kirchensonate*, church sonata (*sonata da chiesa*); *Kirchenton*, church mode; *Kirchenlied*, church song, either a Protestant \*chorale or a Roman Catholic hymn written in German (in contradistinction to the older Latin hymn; see Hymn IV).

**Kit** [F. *pochette*; G. *Taschengeige*; It. *sordino*]. A tiny fiddle to be carried in the pocket, used by the dancing masters of the 17th and 18th centuries. There were two different types, one a diminutive violin, the other a descendant of the medieval \*rebec. See ill. under Violin.

**Kithara.** The foremost instrument of ancient Greece, consisting of a square wooden soundbox and two curved arms connected by a crossbar. A number of strings, varying from five (8th century B.C.) to seven (7th century B.C.) and finally eleven or more (5th century B.C.), were stretched between the soundbox and the crossbar. They were plucked with a plectrum. The tuning of the traditional type with six strings was anhemitonic: e g a b d' e'. The tuning of the outer strings could be changed to f and f' [see Greece II]; the additional strings of the later periods seem to have been mainly octave-duplications of the original ones. The additional tones required for the various tetrachords—diatonic as well as chromatic and enharmonic—were obtained by pressing a piece of hardwood shaped like a finger against a string at a place near its lower end, thereby increasing its tension. Thus, the pitch of a string could be raised a quarter tone, a semitone, or a whole tone [see O. Gombosi, in *CP* 1939]. It was this practice that led to the curious system of Greek instrumental notation, as has been convincingly shown by C. Sachs [see *Musik des Altertums* (1924); also *AdHM* i, 45].

Instruments closely resembling the kithara existed in Mesopotamia and about 1500 B.C. in Egypt. In Greece the kithara became the symbol of Apollo, in whose hands it represented the Greek ideal of *kalokagathia* (harmonious moderation), as contrasted with the "emotional" \*aulos, associated with Dionysus. See ill. under Lyra.

**Kl.** [G.]. In orchestral scores, abbr. for Klarinette.

**Klagend** [G.]. Lamenting.

**Klang** [G.]. Sound, sonority. *Klangboden*, sounding board; *Klangfarbe*, tone color, timbre; *Klangfolge*, chord progression; *Klanggeschlecht*, mode (major or minor); *Klangideal*, see Sound ideal.

**Klangfarbenmelodie** [G.]. A term suggested by Schoenberg in his *Harmonielehre* (1911, p. 470f) in a discussion of the possibility of composing "melodically" with varying tone colors, on a single pitch level as well as with varying pitch, duration, and intensity. The term attempts to establish timbre as a structural element comparable in importance to pitch, duration, etc. If Schoenberg did not apply this theory to one sustained note, nevertheless his concern with timbre as a structural element became evident in the *Five Orchestral Pieces* op. 16 (1909, rev. 1949), especially the third of these. The concept of melodic writing with successive points of tone color was explored almost obsessively by Schoenberg's pupil Anton Webern, beginning with his first chamber and orchestral works. A striking example of Webern's concept of *Klangfarbenmelodie* is found in the first of his *Five Pieces for Orchestra* op. 10 (1913). Webern also

applied this pointillistic procedure, characteristic of his mature style, to a remarkable orchestral transcription of the six-voice ricercar from Bach's *Musikalisches Opfer*. The technique has been much exploited by his followers in \*serial composition and by \*electronic composers. For interesting examples of *Klangfarbenmelodie* applied to a single pitch, see Alban Berg's Theme and Variations, Act III, *Wozzeck* (op. 7), and Elliott Carter's *Eight Etudes and a Fantasy for Woodwind Quintet* (1950). J.R.W.

**Klappe** [G.]. Key of wind instruments. *Klappenhorn*, -trompete, key bugle, key trumpet.

**Klar** [G.]. Clear, distinct.

**Klarinette** [G.]. \*Clarinet.

**Klausel** [G.]. (1) Cadence, particularly those in 16th-century polyphonic music. (2) \*Clausula (2).

**Klaviatur** [G.]. Keyboard.

**Klavier** [G.]. Piano. *Klavierauszug*, piano arrangement; *Klavierstück*, piano piece; *Klavierspiel*, piano playing. In historical studies *Klavier* is the generic designation for stringed keyboard instruments, as distinct from the organ. Sometimes the term means manual (*Orgel mit 2, 3, Klavieren*). Prior to the introduction of the piano, i.e., until about 1775, *Klavier* (then usually spelled *Clavier*) meant the harpsichord and/or clavichord. Hence, titles such as *Clavier-Übung* or *Wohltemperiertes Clavier* do not reveal which instrument was intended. To K. P. E. Bach and his contemporaries *Clavier* usually meant the clavichord. See also Clavier.

**Kleine Nachtmusik, Eine** [G., A Little Night Music, or Serenade]. A celebrated composition for string orchestra by Mozart (K. 525), composed in 1787. It is in four movements, similar to those of a symphony.

**Kleine Oktave** [G.]. The "small octave," from c to b. See Pitch names.

**Kl. Fl.** [G.]. Abbr. for *kleine Flöte*, piccolo.

**Kl. Tr.** [G.]. Abbr. for *kleine Trommel*, side drum. See Percussion inst. B, I.

**Kluge, Die** [G., The Clever Girl]. Opera in one act by C. Orff (to his own libretto, after a Grimm fairy tale), produced in Frankfurt, 1943. Setting: fairy tale.

**Knaben Wunderhorn, Des** [G., The Youth's Magic Horn]. A group of songs by Mahler, based on texts of German folksongs collected and published under the title *Des Knaben Wunderhorn* by Achim von Arnim and Clemens Brentano (c. 1820). The group includes nine songs with piano, ten songs with orchestra, and three songs as parts of symphonies. One of them, "Urlicht," was incorporated into the \*Resurrection Symphony.

**Knarre** [G.]. \*Rattle.

**Knieseige** [G.]. Viola da gamba.

**Knyaz Igor**. See *Prince Igor*.

**Koboz**. Old Hungarian name (mentioned first in 1326) for the short-necked lute.

**Köchel-Verzeichnis**. See under K.

**Koleda, kolenda**. A Bohemian, Rumanian, or Polish song for Christmas and other feasts, comparable to the English \*carol. The earliest examples (without music) date from the 12th

century. Large collections of the 16th, 17th, and 18th centuries indicate the great popularity of the custom of singing *koledy*. See J. Kuckertz, *Gestaltvariation in den von Bartók gesammelten rumänischen Colinden*, 2 vols. (1963).

**Kollektivzug** [G.]. Composition stop or combination stop of the organ. See Organ IV.

**Kolorieren** [G.]. To introduce coloraturas, i.e., ornaments into a composition, as was done in the \*intabulations of the 16th century. For *Koloristen*, see Colorists.

**Komplementärfigur** [G.]. An important device of early keyboard music, consisting of a figure that alternates among the various voice-parts. The technique was used by Cabezón [see Ex.,

"Obras diferencias de Vacas," from *Obras de música*, 1578], Sweelinck, and particularly by Sweelinck's German pupils (Scheidt, Scheide-mann, etc.). See *Spilfigur*.

**Kondakarion**. In Russian church music, manuscripts of the 12th and 13th centuries containing collections of short hymns of praise (*kondak*, from *kontakion*?). They contain melodies written in an early type of notation, the so-called *kondakarny* notation, which has not yet been deciphered. See Russia I. See also *ReMMA*, p. 96; *WoHN* i, 90.

**König Hirsch, Der** [G., The Stag King]. Opera in three acts by H. W. Henze (libretto by H. von Cramer, after C. Gozzi), produced in Berlin, 1956. Setting: in the South, any time.

**Königskinder, Die** [G., The King's Children]. Opera in three acts by E. Humperdinck (libretto by E. Rosmer), produced in New York, 1910. Setting: Germany, Middle Ages.

**Kontakion**. See under Byzantine chant II.

**Kontra-** [G.] *Kontrabass*, double bass; *-factur*, \**contrafactum*; *-fagott*, contrabassoon; *-bass-klarinet*, double-bass clarinet; *-oktave*, contra octave [see Pitch names]; *-punkt*, counterpoint; *-subjekt*, countersubject.

**Kontretanz** [G.]. \**Contredanse*.

**Konzert** [G.]. Concert or concerto. *Konzertmeister*, concertmaster.

**Konzertstück** [G.]. See under Concertino (2).

**Kopfstimme** [G.]. Head voice.

**Koppel** [G.]. Coupler.

**Korea**. I. *History*. Probably the earliest historical reference to Korean music is found in the *Annals of the Three Kingdoms*, a Chinese history of the 3rd century: "The Mahan [a Korean tribe] always end the planting in the 5th month by acknowledging the spirits. They gather together, sing, dance, carouse not stopping for day or night...." The music for these festivities undoubtedly had North Asian roots and is ancestor to present-day Korean folk music. In early times (to the end of Silla) a steady stream of musical instruments and music came in from China, and the dichotomy between *tarangak* (*tangak*)—music from Tarng (T'ang) China—and *hyangak*—Korean music—was established at this time. That the flow of ideas was not entirely one-sided is shown by the presence of a Korean orchestra at the Tarng court. Korean music in turn exerted a direct influence on \*Japanese music, presumably still seen in the present-day *komagaku*. The large number of *tsyr* (*ch'ü*) melodies of Sonq (Sung) times mentioned in the *Koryo-sa* (history of the Koryo dynasty) suggest their popularity during this period, when they apparently superseded the earlier Tarng music. Of these melodies, *Bohoja* (*Po-hü-cha*) and *Nakyangch'un* (*Nak-yan-chun*) are still performed by the orchestra of the National Traditional Music Institute. Some of the *hyangak* melodies mentioned in the *Koryo-sa* have been preserved in the later Yi dynasty notation, and others were reworked and given new titles, particularly at the beginning of the Yi dynasty.

With the resurgence of Confucianism during the later Tarng and Sonq periods, interest was revived in Confucian music, which appeared in Korea during the reign of Yejong (12th century). Musical contact between China and Korea was reduced to a minimum from the time of the Yuan dynasty (considered a barbarian dynasty by the Koreans as well as the Chinese), although a noteworthy exception was the introduction of the *yanggum* or *yang-küm* (dulcimer) to Korea during the coeval Ching (China) and Yi (Korea) periods. At this time Korean court music became decidedly nationalist. Under Sejong, the most enlightened of the Yi monarchs, imperial shrine

music commemorating the founding of the dynasty was newly created, as was music for the court epic *Yong-bi-o-ch'on ga*, the first literary work to employ the Korean alphabet. In general the dichotomy between *tarngak* and *hyangak* broke down, and the repertory became largely Koreanized. This process was abetted by the introduction of aristocratic music into the court in the latter half of the dynasty. During this period Pak Yon helped restore Confucian music to something of its original purity (an example of musical humanism antedating the Florentine Camerata by more than a century) and Song Hyon published the musical treatise *Akhak kwebom* (*Ak-hak-koe-pum*). Equally important were the developments in music not sponsored by the court, particularly vocal music associated with the major literary forms and, in the 19th century, the solo instrumental repertory known as *sanjo*, but documentation for these categories is sparse.

II. *Kinds of music.* The main kinds of traditional music that have survived are:

I. Court music. A. Ritual music: 1. Confucian music; 2. Imperial shrine music. B. Banquet music: 1. *Tarngak*; 2. *Hyangak*. C. Military music.

II. Non-court music. A. Instrumental music: 1. Aristocratic chamber music; 2. Virtuoso solo music with drum accompaniment; 3. Agricultural music; 4. Shamanist music. B. Vocal music: 1. *Kagok*; 2. *Kasa*; 3. *Sijo*; 4. *P'ansori*; 5. *Japka*; 6. *Sonsori*; 7. Folksong; 8. Buddhist chant.

In Confucian music two orchestras are used, and the instruments and style are unique to the category. Two orchestras also are used in the imperial shrine music. The ritual associated with this music is divided into the following sections: ushering in of the spirit; offering of tribute; offering of food; offering of the first cup of wine; the second cup; the third cup; withdrawal of tribute; ushering out of the spirit. The majority of pieces of the court repertory belong to the category of banquet music. Mention should be made of *Sujech'on*, probably the most highly regarded piece in the repertory, and *Yomillak* (*Yu-min-ak*), the instrumental version of the previously mentioned court epic. *Sijo*, the most important Korean poetic form (all Korean poetic forms, it should be noted, are associated with music), is a three-line verse with a secondary pause within each line. In a musical performance the singer is accompanied by a *janggo*, and the three lines have the following metrical subdivision: 5 8 8 5 8, 5 8 8 5 8, 5 8 5 8. *Sijo*

texts also are employed in *kagok*, where they are divided into five sections with an instrumental interlude and postlude. (The secondary pause in the first *sijo* line marks the division between the first and second *kagok* lines, and the secondary pause in the third line marks the division between the fourth and fifth lines.) *Sijo* are sung mainly by amateurs, whereas *kagok*, with richer scales and instrumental accompaniment, are sung only by professional musicians. *P'ansori* is sung drama; originally all the parts were sung by a single performer accompanied only by a *puk*, a barrel-shaped drum. The vocal techniques and pyrotechnics employed are astonishing, ranging from patter and various types of onomatopoeia to something that is a good approximation of white noise. All these techniques serve for dramatic expression, and the over-all effect of a *p'ansori* such as *Sim Ch'ong ga* is of surpassing tragic grandeur.

III. *Notation.* The twelve-tone Chinese character notation known as the *yulja* (*yul-cha-po*) notation is the most widely used. The following are the Korean readings of the characters with Western equivalents arbitrarily chosen to indicate the relative values: *hwang* (F), *tae* (F#), *t'ae* (G), *hyop* or *hyup* (A<sup>b</sup>), *ko* (A), *jung* or *chung* (B<sup>b</sup>), *yu* (B), *yim* or *im* (C), *yi* (C#), *nam* (D), *mu* (E<sup>b</sup>), *ung* (E). The *kong-ch'ak* (*kong-chuk-po*) notation, which is in part an absolute pitch and in part a scale-degree notation without cognizance of octave equivalence, and the simple five-tone notation, which is a kind of number notation, are both found in the historical notation books. Mnemonic notations for the various instruments, a tablature notation for the *komungo* (*komunko*), and a kind of neumatic notation for *kagok* also exist. Rhythm is indicated by columns of squares, with each square representing a beat and each column a measure. Subdivisions of the measure are indicated by heavy lines, and subdivisions of the beat are indicated by appropriate placement of the characters within the squares.

IV. *Theory.* The majority of pieces in the court repertory employ a five-tone scale, *jung*, *yim*, *nam*, *hwang*, *t'ae* (B<sup>b</sup>, c, d, f, g), which can be generated only by a fourth (or fifth) and takes the following form in terms of fourths: *jung*, *hwang*, *yim*, *t'ae*, *nam*. This is also a rough indication of the pitch hierarchy, although some writers consider *hwang* the most important note. The scale yields the following intervals: 4 perfect fourths, 3 major seconds, 2 minor thirds, and 1 major third. This also represents a fair approximation of the frequency with which the intervals

occur, at least for some of the pieces. The Korean fourth tends to be flat, and there is perhaps some indication of a gravitation toward equidistance. In addition to the above, the following transpositions occur: *mu, jung, hwang, yim, t'ae, hwang, yim, t'ae, nam, ko; hyop, mu, jung, hwang, yim*. The *yanggum* [see under V below], which contains eight pitches disregarding octaves, seems to set the limit for the number of transpositions, at least in the *hyangak* category. In earlier periods, six-tone and seven-tone scales were widely used. The *Akhak-kwebom* describes a system of sixty seven-tone modes. Pieces employing seven-tone melodies are also notated in the same work. At present a seven-tone scale is employed in the Confucian music. With the virtual obliteration of the *tarngak* portion of the repertory, however, the seven-tone scale has otherwise fallen almost into complete disuse. The situation of the *hyangak* modes is complicated and seems to vary according to period. In general, four modes are recognized, and they apparently hold a relationship with the transpositions mentioned above. Fortunately the *Yang gum shin bo* (*Yang-kum-shin-po*), a *komungo* tablature of 1610, contains the piece *Jung-dae-yop* (*Chung-tae-yŏp*) in the four modes, throwing light at least on the modal practice of its period. Ex. 1 gives the first two lines of each modal version in He-gu Yi's (Hie-ku Lee) transcription. Ex. 2 indicates the structure of the modes as derived by Yi (Lee) from a comparison of the four versions.

The ornamentation of Korean music is very rich, including a characteristic slow vibrato as well as many kinds of figuration. The rate of dynamic change also tends to be very high. Korean music, both court and non-court, is notable for its large, compound, symmetrical metric structures. The vast majority of pieces in

1

d Ujo-kyemyonjo

hwang hyop jung yim mu hwang

the historical notations have the metrical structure 3 + 2 + 3 [see Ex. 1]. This was apparently associated with extremely slow tempos. The present court repertory, however, displays considerably more metrical variety. Non-court music is remarkable for the large number of compound triple meters. (Triple meter is apparently quite rare in both China and Japan.) Ex. 3 gives some of these meters with their names, transcribed by Sa-hoon Chang.

V. *Instruments*. Two classification systems have been employed for instruments. One is according to the material of manufacture, as in China, and the other according to function in the repertory (*a-ak* [ah-ak] or ritual music, *tarngak*, and *hyangak*). The main instruments in

use today are the *kayagum* (*kaya-kūm*), a plucked zither with 12 strings related to the Japanese *\*koto* and Chinese *\*cheng*; *komungo*, a fretted 6-stringed zither played with a stick plectrum; *a-jaeng*, a bowed 7-stringed zither, the bow consisting of a bare stick that is resined; *haegum* (*hae-kūm*), a two-stringed fiddle with horsehair bow; *yanggum* (*yang-kūm*), a zither with 14 quadruple strings, played with only one hammer; *piri*, a double reed with 8 finger holes, which comes in several different types; *t'aep'-yong-so*, a conical double reed with brass funnel; *taegum*, a horizontal flute with one of the holes covered with a membrane, producing a buzz when actuated (this flute comes in three sizes); *tanso*, a vertical notched flute; *janggo* (*chang-ko*), an hourglass-shaped drum, one head of which is played with a bamboo stick and the other with the bare hand; *p'yon-kyong*, a set of tuned stones; *p'yon-jong*, a set of tuned bronze bells; and *pak*, clappers in the shape of a fan.

Lit.: He-gu Yi (Hie-ku Lee), *Studies in Korean Music* (*Hanguk Ŭmak Yōngu*) (1957); *id.*, *Yang gum shin bo* (1959; fac. ed. of the 1610 *komungo* tablature); Sa-hoon Chang, *Kukak Kaeyo* (1961; Eng. trans., mimeographed ed., *A Glossary of Korean Music*); *id.*, *Kukak-kye ui Jo-sul mit Nonmun* (1963; extensive bibl. of writings since World War II; Kyōng-nin Sōng, *Hanguk Akbo Haeje* (1965; inventory of all extant historical notation books). D.S.

**Kornett** [G.]. See under Cornet.

**Kortholt** [Low G.]. According to Praetorius (*Syntagma musicum* ii, 1619), a short double-reed instrument with a reed cap. Later the term seems to have been applied to double-reed instruments that, like the bassoon, have a tube doubled back on itself, thus being shortened. For this instrument the English name is *curtal* [see Oboe family III].

**Koto** [Jap.]. A Japanese stringed instrument, usually classified as a zither. It has a rectangular wooden body and 7 to 13 silk strings. It is placed horizontally on the floor and is plucked with the fingers, sometimes assisted by artificial nails. [See ill. under Zither.] Sometimes the name *koto* is specifically used for the *zokusō*, an instrument popular during the Edo period (see Japan VI). There are two types of *koto*: *sō* (or Chinese *\*jeng*), with movable bridges; and *kin* (or Chinese *\*chyn*) without such bridges and usually with seven strings. The representative types of *sō* are the *gakusō*, used in *\*gagaku*; the *tsukushi-goto*, which was popular in the late 16th

century in the Kyūshū district; and the *zokusō*. All of these have 13 strings, while the *wagon*, an ancient Japanese instrument, today has six strings. The modern addition to the *sō* family is the *shinsō*, or new *sō*; which has 17 strings. See S. Isawa, ed., ‡*Collection of Koto Music* (Tokyo, 1888). M.K.

**Kräftig** [G.]. Strong, vigorous.

**Krakowiak** [F. *Cracovienne*]. A Polish dance named after the city of Cracow (Krakow). The music is in 2/4 time and employs simple syncopated patterns. The *krakowiak* was danced by large groups, with shouting, improvised singing, and striking of the heels together. It was in vogue in the early part of the 19th century and became known all over the world through the stage performances of Fanny Elssler. Chopin wrote a "Krakowiak" for piano and orchestra (op. 14).

**Krebskanon** [G.]. Crab canon; *krebsgängig*, in retrograde motion.

**Kreisleriana**. Schumann's cycle of eight piano pieces (op. 16, 1838), which are in strongly contrasting moods [see under Character piece]. The title refers to the whimsical and fantastic figure of the "Kapellmeister Kreisler," invented by the German novelist E. T. A. Hoffmann.

**Kreutzer Sonata**. Popular name for Beethoven's Violin Sonata op. 47 (1803), dedicated to the French composer and violin virtuoso Rodolphe Kreutzer (1766–1831) but originally composed for the English violinist George Bridgetower (c. 1780–1860), whom Beethoven accompanied at the first performance in 1803. The first movement is notable for its forceful expression of intense emotion. In Tolstoy's story "The Kreutzer Sonata," the composition symbolizes the destruction of morals caused by violently emotional music.

**Kreuz** [G.]. Sharp.

**Kreuzflöte** [G.]. \*Transverse flute.

**Kriuki, krjuki**. See under Russia I; Znamenny chant.

**Krummhorn** [G.]. Cromorne; see under Oboe family III. Also, an organ stop; see Organ XI.

**Kuhreigen** [G.]. \**Ranz des vaches*.

**Kujawiak**. A Polish dance from the province of Kujawy. It is a rapid variety of the *\*mazurka*. Chopin's mazurkas op. 33, no. 3, and op. 41, no. 2, are *kujawiaks*.

**Kunst der Fuge, Die.** See *Art of Fugue, The*.

**Kunstlied** [G.]. Term used in American (rather than German) literature for art song, especially those of German composers such as Schubert, Schumann, and Brahms, in contrast to German folksongs. It is also applied to 16th-century polyphonic songs with a German text (Hofhaimer, Senfl).

**Kurz** [G.]. Short. *Kurz Oktave*, \*short octave. *Kurzer Vorschlag*, short appoggiatura.

**K.V.** See **K**.

**Kyrial** [L. *kyriale*]. See under Liturgical books I (6).

**Kyrie** [Gr.]. The first item of the Ordinary of the \*Mass. Its full text is: *Kyrie eleison; Christe eleison; Kyrie eleison* (Lord, have mercy, etc.). Each of these three invocations is sung three times, usually with the melodies repeated according to the scheme: aaa bbb ccc' (c' indicates an extension or variant of c), or aaa bbb

aaa'. Other schemes are aba cdc efe and aaa aaa', the former probably of a later date, the latter an earlier type represented in the present-day collection only by the Kyrie of the Mass for the Dead [LU, p. 1807]. Originally (4th century) the Kyrie was employed in connection with litanies, a usage that survives in the archaic Mass of Holy Saturday [LU, p. 756] and in the procession of Rogation Days [LU, p. 835]. Not until about 800 is it described as consisting of "three times three" acclamations. In the 10th and 11th centuries the Kyries were frequently troped (farced Kyrie) by the interspersing of attributes, e.g., *Kyrie lux et origo eleison* [see Trope (3)]. Although these tropes have disappeared, the Kyries are still named after them, e.g., *Kyrie lux et origo* (Mass I, LU, p. 16). See *ApGC*, p. 405; M. Melnicki, *Das einstimmige Kyrie des lateinischen Mittelalters* (1954).

The Church of England adopted the Kyrie in the response "Lord, have mercy upon us, and incline our hearts to keep this Law" after the recitation of the Ten Commandments.

**Kyrieleis** [G.]. See *Leise*.

## L

**L**. Abbr. for left or [G.] *links*; L. H., left hand, [G.] *linke Hand*.

**La**. See under Solmization; Pitch names; Hexachord II.

**Labial pipes** [G. *Labialpfeifen*]. Same as flue stops. See Organ VIII, IX.

**Lacrimoso** [It.]. Mournful.

**Lady Macbeth of Mtsensk** [Rus. *Lady Macbeth Mtsenskogo Uyezda*]. Opera in four acts by Shostakovich (libretto by A. Preis and the composer, based on a novel by N. S. Lyeskov), produced in Moscow, 1934. Setting: a village in Russia, 1840. The opera became notorious because of some unpleasant scenes that represent the \*verismo technique at its most degenerate. Although these scenes were omitted from later performances, the opera was officially condemned by the Soviet government in 1936 as "bourgeois and formalistic." It was revised after the official decree was rescinded (1958) and was produced under the title *Katerina Ismailova* (1962).

**Lage** [G.]. Position with reference to (1) violin playing (*erste, zweite, . . . Lage*, i.e., first, second, . . . position); (2) chords (*enge* or *weite Lage*, i.e., close or open position); (3) ranges of voices and instruments (*hohe* or *tiefe Lage*, i.e., high or low range).

**Lagnoso** [It.]. Lamenting.

**Lai, lay** [G. *Leich*; not to be confused with \**leis(e)* or *laisse*]. A form of medieval French poetry and music developed mainly in northern France during the 13th century by the *trouvères*. The lai was also cultivated in southern France, but only two or three troubadour (Provençal) lais are preserved with music. The development ended with Machaut, who wrote 18 lais. The texts of the lais are poems (usually addressed to the Virgin or to a lady) consisting of 60, 100, or more lines of 4 to 8 syllables each, divided into irregular stanzas of 6 to 16 or more lines. Each stanza is based on one or two rhyme-syllables, and there is a great variety in the schemes of meter and rhyme to be found in the various

stanzas, e.g.,  $a^4 a^4 b^7 a^4 a^4 b^7 a^4 a^4 b^7 b^7 b^7 b^7 b^7$  (the letters indicate lines with the same rhyme; the figures give the number of syllables in the line).

The musical structure of the lai is essentially that of the sequence [see Sequence II], from which it evidently stems, but it has certain traits of elaboration or modification. Instead of the double versicles of the sequence, there are triple versicles and quadruple versicles (a melody repeated three or four times), as well as single versicles involving no repetition. Following is the scheme of one of the shortest lais, Guillaume le Vinier's "Espris d'ire et d'amour" [A. Jeanroy, *Lais et descorts français du XIIIe siècle* (1901), p. 87; cf. *HAM*, no. 191]:

I				II	III				
A	B			C	D	E			
a a	b <sub>1</sub> b <sub>2</sub> b <sub>1</sub> b <sub>2</sub>			c c	d d d	e <sub>1</sub> e <sub>2</sub> e <sub>1</sub> e <sub>2</sub>			
		IV		V					
		F	G	H	I				
		f f	g	h h h	i				

(a, b, etc., are the versicle melodies; A, B, etc., the musical sections; I, II, etc., the poetic stanzas, according to Jeanroy; b<sub>1</sub>, b<sub>2</sub>, different endings for the same melody.) Another name for the lai is *descort* ("disorder"), a term thought to refer to its highly variable structure in contrast to the \**formes fixes*, such as the *ballade*, *rondeau*, etc.; or to a discord between the lover and his lady; or to some other irregularity [see *ReMMA*, p. 225]. In Machaut's lais the musical scheme is somewhat less irregular because all the versicles are either double or quadruple. Of particular interest are his "Lay de la fonteinne," in which all the even-numbered sections are three-part \**chaces*, and the "Lay de confort," which is composed entirely in three-part polyphony, every section being a *chace*.

The German counterpart of the lai is the 14th-century *Leich*. Here the double-versicle structure of the sequence is, as a rule, rigidly observed. For example, Heinrich Frauenlob's "Unser Frauen Leich" [see Runge, p. 1] consists of 44 stanzas (*Lieder*) sung to 22 melodies (*Töne*).

Handschin, in *ZMW* xii, xiii; H. Spanke, in *ZMW* xiv; G. Reaney, in *ML* xxxix (origins of lai); *id.*, in *PMA* lxxxii (Machaut); J. Maillard, in *MD* xvii (Ernoul). See also general bibl. under Trouvère; Minnesinger.

**Laisse.** See under *Chanson de geste*.

**Lakmé.** Opera in three acts by Delibes (libretto by E. Gondinet and P. Gille), produced in Paris, 1883. Setting: India, 19th century.

**Lament.** (1) In Scottish and Irish music, a piece for bagpipes or a song used at clan funerals or other mournful occasions. Each clan has its traditional tune, which is often performed with a number of more or less irregular variations. See also Ho-hoane.

(2) General designation for compositions commemorating the death of a famous person. The earliest examples are a "Planctus Karoli" lamenting the death of Charlemagne (814) and another *planctus* for his son Hugo (844), both preserved with melodies in an early neumatic script that has not been deciphered. A late 12th-century troubadour *planç* (*planh*) by Gaucelm Faudit deplores the death of Richard the Lion-Hearted (1199). From the 14th to 17th centuries laments, called *déplorations*, *tombeaux*, *plaintes*, or *apothéoses*, were often written for great composers by their pupils. The oldest known example is a *ballade*, "Armes, amours," written by Deschamps and composed by F. Andrieu on the death of Machaut in 1377 [see F. Ludwig's edition of Machaut, i, 49ff]. From the 15th or 16th century comes a lament by Ockeghem for Binchois ("Mort tu as navré"; see J. Marix, *Les Musiciens de la cour de Bourgogne* [1937], pp. 83ff), by Josquin for Ockeghem ("Nymphes des bois," with the Introit "Requiem aeternam" as a *cantus firmus*, the entire composition being written in black notes; see Eye music), by Gombert for Josquin ("Musae Jovis"), and others [see *ReMR*, index, s.v. Lament]. A great number of laments, often very moving expressions of grief, exist in the French literature of the 17th century, e.g., *tombeaux* by Denis Gaultier for the Seigneur de Lenclos, by Raquette for Gaultier, and by L. Couperin and D'Anglebert for their teacher Chambonnières. F. Couperin

wrote two *apothéoses* in the form of sonatas, one for Lully and one for Corelli. Froberger's *lamentation* for Ferdinand IV [see *DTO* 13, p. 32], *tombeau* for Monsieur Blancheroche [*DTO* 21, p. 14], and *lamentation* for Ferdinand III [*DTO* 21, p. 116] should be added to a repertory in which the romanticism of the 17th century is most beautifully expressed. Many of these compositions are written in the form and style of a *\*pavane*. Comparable pieces are Blow's setting of Dryden's ode on the death of Purcell, "Mark how the Lark and Linnet sing," Purcell's elegy for Locke, "What hope for us Remains now he is gone," and similar works of late 17th-century England. A well-known modern example is Ravel's *Le Tombeau de Couperin*. See M. Brenet, in *RMC* iii.

**Lamentations.** Music set to the Lamentations of Jeremiah. In the Roman Catholic service the Lamentations are sung, in place of the three lessons, during the first Nocturn of Matins on Thursday, Friday, and Saturday of Holy Week (*\*Tenebrae*), in a simple recitation tone [*LU*, pp. 631, 692, 754]. A characteristic feature of the text, taken over from the Bible, is the enumeration of the verses by Hebrew letters: "ALEPH. Quo modo sedit . . . BETH. Plorans ploravit," etc.

From the late 15th through the 17th centuries the famous text was often composed polyphonically, usually in a simple homorhythmic style, except for the Hebrew letters, which often received a more elaborate treatment. Probably the earliest extant example is a four-part composition of a portion of the text, "Patres nostri peccaverunt" (Lesson III from Holy Saturday; see *LU*, p. 759) by the Spaniard (Italian?) Johannes Cornago (fl. c. 1450-70; see *ReMR*, p. 576). In 1506 Petrucci published two volumes, *Lamentationum Jeremiae prophetae liber primus*; . . . *liber secundus*, that include settings by Johannes Tinctoris, de Orto, Tromboncino, and others. In 1532 a setting by Carpentras (pseud. of Elzéar Genet, c. 1475-1548) was published that was used until 1587 by the Papal Chapel in place of the ancient plainsong. In 1557, LeRoy and Ballard published a collection of settings (*Piissimae ac sacratissimae lamentationes Jeremiae Prophetae*) that, in addition to Carpentras' composition, included others by Pierre de La Rue, Févin, Arcadelt, Festa, and Claude Le Jeune. In 1588, Palestrina published his *Lamentationum Hieremiae Prophetae, liber primus* [comp. ed., vol. xxv], which supplanted Carpentras' composition in the service of the

Papal Chapel [for more details, see *GD* iii, 80; *GDB* v, 34f.]. Other settings are by Stephan Mahu, Gaspar van Werbecke [*SchGMB*, no. 58], Cristobal Morales (1564), Tallis, Byrd, Händl [*DTO* 30], Giovanni Maria Nanini, and Gregorio Allegri. In 1640, Allegri's composition was added to the setting of Palestrina, which did not include the complete text. The Sistine Choir still uses the settings of these two composers. For Palestrina's complete and original composition, see R. Casimiri, *Il "Codice 59" dell'Archivio musicale lateranense* (1919). In the 17th century the text was composed in a highly expressive aria style, e.g., by J. Rosenmüller [see *HAM*, no. 218] and F. Couperin. A recent setting is Stravinsky's *Threni* (1958).

Lit.: G. Massenkeil, *Mehrstimmige Lamentationen aus der ersten Hälfte des 16. Jahrhunderts* [1965]; A. E. Schröder, "Les Origines des lamentations" (*CP* 1952); G. Watkins, "Three Books of Polyphonic Lamentations of Jeremiah" (diss. Univ. of Rochester, 1953); R. P. Rojo, "The Gregorian Antiphony of Silos and the Spanish Melody of the Lamentations" (*Speculum* v); G. Massenkeil, "Eine spanische Choralmelodie in mehrstimmigen Lamentationskompositionen des 16. Jahrhunderts" (*AMW* xix/xx); *id.*, in *AMW* xvii.

**Lamento.** Music of an elegiac, mournful character. For unknown reasons a dance of the 14th century bears the title *Lamento di Tristano* [*SchGMB*, no. 28]. In 17th-century opera the *lamento* is a scene expressing utter despair, usually placed shortly before the unexpected "turn to the happy end." This type was inaugurated by Monteverdi's famous "Lamento d'Arianna" of 1608 [*SchGMB*, no. 177]. See A. Westrup, in *MR* i. See also Lament.

**Lancio, con** [It.]. With vigor.

**Landini cadence.** A cadence, named after Francesco Landini (1325-97), in which the sixth

degree (a, "Landini sixth") is inserted between the leading tone (b) and the octave (c'). Frequently the altered fourth (f#) appears in the middle part, as a leading tone to the dominant (g) [see Ex. a], a formation that properly belongs to the Lydian mode [Ex. b]. The use of this cadence is much wider than is suggested by the

name. It occurs in the works of Machaut (c. 1300–77; see, e.g., *SchGMB*, no. 26, “loyau-ment”), was used frequently by Landini, and is a characteristic feature of the music of the \*Burgundian school, usually in the ornamented form shown in Ex. c. There are cases, however, in which the “flatted” formula [Ex. d] would seem to be required [see *ApNPM*, p. 106]. The 7–6–8 progression, which is the characteristic trait of the Landini cadence, was used sporadically throughout the 16th century, e.g., by Josquin (*Missa de Beata Virgine*, close of Kyrie I), Schlick (*Salve regina*), Palestrina (only in the middle parts; see K. Jeppesen, *The Style of Palestrina and the Dissonance*, rev. ed., [1946], p. 194), and Victoria [see *HAM*, no. 149]. It was still employed in the recitative of the early 17th century, e.g., in Monteverdi’s *Orfeo*, where the words “De la bell’Euri-dice” (in “In questo lieto e fortunato giorno”) are sung to f♯ . . . f♯ e–g g. See Cadence II.

**Ländler.** An Austrian dance much like a slow waltz. It was very popular in the early 19th century, before the \*waltz came into vogue. Mozart (K. 606), Beethoven (11 *Mödlinger Tänze*, 1819), and Schubert (op. 171) wrote collections of *Ländler*. See Dance music IV.

**Languis** [G.]. An Austrian dance of the late 18th century, danced in such a wild manner that it was prohibited by the police. The music was similar to that of the waltz or *Ländler*. See P. Nettl, *The Story of Dance Music* [1947], p. 242; E. Schenk, in *Studia musicologica* iii, 301ff.

**Langsam** [G.]. Slow.

**Laos.** See under Thailand.

**Larga** [L.]. In mensural notation, rare name for the *maxima* (Verulus de Anagnia; see *CS* iii, 135f).

**Largamente** [It.]. Broadly.

**Largando.** Same as \*allargando.

**Larghetto** [It.]. The diminutive of \*largo, therefore somewhat faster than this tempo. Also, title for pieces in such a tempo.

**Largo** [It.]. (1) Very slow in tempo, usually combined with great expressiveness. See Tempo marks. (2) Popular name for a famous composition by Handel, originally the aria “Ombra mai fù” (“Shade never was”) from his opera *Serse* (*Xerxes*) but usually played in an arrangement for organ or other instruments. The title is taken from the original tempo indication for the piece.

**Lark Quartet.** Popular name for Haydn’s String Quartet in D major (op. 64, no. 5), so called because of the high passage of the first violin “soaring like a lark” at the opening of the first movement.

**Lassu.** See under *Verbunkos*; *Csárdás*.

**Latin America.** See individual entries Argentina, Bolivia, Brazil, etc.

Lit.: G. Chase, *A Guide to the Music of Latin America*, rev. ed. (1962); L. Saminsky, *Living Music of the Americas* [1949]; N. Slonimsky, *Music of Latin America* [1945]; R. V. García, L. C. Croatto, and A. A. Martin, *Historia de la Música Latino-americana* (1938); G. Duran, *Recordings of Latin American Songs and Dances*, rev. ed. (1950); J. Orrego-Salas, *The Young Generation of Latin American Composers* (1963).

**Laube Sonata.** See Moonlight Sonata.

**Lauda** [It., pl. *laude*; the less correct forms *laude* (sing.), *laudi* (pl.), are also used]. Hymns of praise and devotion in the Italian language, which from the 13th century to the middle of the 19th century played an important part in the religious life of the Italian people. Their origin and early development were closely connected with St. Francis of Assisi (c. 1182–1226) as well as with the many penitential fraternities (flagellants; see *Geisslerlieder*) of the 13th and 14th centuries. Later, numerous congregations, called *Companie de Laudesi* (or *Laudisti*), were founded to foster devotional singing among the Italian people. The musical and dramatic presentations held in their meeting halls led, in the 16th century, to the development of the \*oratorio. Till the mid-19th century the *laudesi* continued to be centers of religious life.

The *laude* of the 13th century are monophonic songs that to some extent show the influence of French troubadour music. Their textual structure is that of a refrain poem, consisting of several (two to ten or more) stanzas (S) of four or six lines each, alternating with a refrain (\*ritornello, R) of usually two lines: R S R S . . . S R. Music is provided for the refrain and the stanza, the latter usually including the former or a part of it, in a great variety of schemes, e.g., A B a b a b, A B c d a b, A B c d e b, A B c c d b, A B c c a b (capital letters indicate the refrain). The last scheme, which may also be represented as A b b a (or, with repetition of the refrain, A b b a A) is that of the French \*virelai (or the Italian \*ballata). This form, however, plays a much less prominent part in the *laude* than some

scholars have maintained. Only about a dozen *laude* are in the form of the virelai, and most of these show considerable modifications in the repeated phrases, which are not found in the virelai proper [see "Sancto Lorenzo" in *HAM*, no. 21c]. One of the few examples of strict virelai form is given in *HAM*, no. 21b. The usual transcription in 4/4 meter [Liuzzi; *BeMMR*, p. 153f] is, to say the least, hypothetical [see Y. Rokseth, in *Romania* (Paris) lxxv, 383; see also under *Vierhebigkeit*]. The original MSS give no indications for rhythm [see Monophonic notation].

The *lauda* poetry flourished in the 15th century, but only few remnants of the music—some monophonic, some in two parts—have survived. A new period of *lauda* composition began with Petrucci's two books of *Laude* (1507, '08), containing *laude* by some of the \**frottola* composers (Tromboncino, Marco Cara, Fogliano) as well as by an otherwise unknown composer, Dammonis. These are all polyphonic, in three or four parts, and in a simple chordal style borrowed from the *frottola* [ex. in *HAM*, no. 94]. In the second half of the 16th century Fra Serafino Razzi inaugurated a vast literature of *laude* in the popular styles of the *villanella* and *canzonetta* [ex. by G. Animuccia in *SchGMB*, no. 120]. Frequently, folksongs and dance melodies were used with the religious texts. The numerous publications of the 17th century are important sources of early Italian folksong [see under *Ruggiero*].

Lit.: F. Liuzzi, ‡*La Lauda e i primordi della melodia italiana*, 2 vols. (1935); G. Cattin, *Contributi alla storia della lauda spirituale* (1958); K. Jeppesen, *Die mehrstimmige italienische Laude um 1500* (1935); *id.*, "Die neuentdeckten Bücher der Lauden des . . . Petrucci" (*ZMW* xii); *id.*, "Ein venezianisches Laudenmanuskript" (*CP Kroyer*); D. Alaleona, "Le Laudi . . . nei secoli XVI e XVII" (*RMI* xvi); E. J. Dent, "The Laudi Spirituali" (*PMA* xliii); L. Cervelli, "Le Laudi spirituali di Gio. Animuccia" (*LRM* xx); J. Handschin, in *AM* x (review of Liuzzi's publication); F. Ghisi, in *CP Jeppesen* (14th and early 15th cent.); H. Anglés, in *CP Apel*.

**Laudes** [L.]. (1) Latin for \*Lauds. (2) Name for Gloria tropes. (3) In the \*Gallican and \*Mozarabic rites, the counterpart of the Roman Catholic Alleluia. (4) *Laudes regiae* (Praises of the king) is a medieval chant celebrating Jesus as the ruler of the world. It begins with the acclamation *Christus vincit, Christus regnat, Christus imperat*. See E. H. Kantorowicz and M. F. Bukofzer, *Laudes regiae* (1946).

**Laudon Symphony.** Haydn's Symphony no. 69 in C (c. 1778), composed in honor of the Austrian field marshal Baron von Laudon (1717–90).

**Lauds.** The second of the canonical hours. See under Office.

**Lauf** [G.; pl. *Läufe*]. A rapid passage, particularly in scales. For *Laufwerk*, see under Mechanical instruments III.

**Launeddas.** A Sardinian triple clarinet thought to be of Oriental (Phoenician?) origin [see Clarinet family IV]. It consists of three pipes made of cane and provided with single reeds. The two outer pipes are melody pipes with five or six holes, while the center pipe is an unchangeable bourdon. The music played on the launeddas, therefore, is in two parts over a sustained pedal. See G. Fara, in *RMI* xx, xxi, xxv. For the peculiar technique of blowing, see *SaHMI*, p. 91; also Oboe family III.

**Laute** [G.]. Lute. *Lautentabulatur*, lute tablature. *Lautenclavicymbel*, see Lute harpsichord.

**Lavolta.** See under Volta (1).

**Lay.** See Lai.

**Leader.** (1) Conductor (in America) or concertmaster (in England). (2) See Fugue I (g).

**Leading motive, motif.** See Leitmotiv.

**Leading tone, note** [F. *note sensible*; G. *Leiton*; It. *sensibile*; Sp. *sensible*]. The seventh degree of the scale, a semitone below the tonic, so called because of its strong tendency to "lead up" (resolve upward) to the tonic. This progression (b–c') is the characteristic step of the regular cadence in major as well as minor [see Ex. a] and therefore is extremely common in music of the 17th to 19th centuries.

The consistent and compulsory use of the leading tone is one of the chief features of modern major and minor, as opposed to the modes, most of which (Dorian, Phrygian, Mixolydian, Aeolian) have a whole tone (*subtonium*) below the tonic, not a semitone (*subsemitonium*) [see Ex. b]. The leading tone is practically nonexistent in Gregorian chant. Although in modal music the *subsemitonium*, i.e., the leading tone,

could be introduced by sharpening the *subtonium*, this did not result in a complete suppression of the diatonic seventh [see *Musica ficta*]. Thus, earlier music usually wavers between the natural and sharpened varieties, as illustrated in Ex. c. In the 14th and early 15th centuries the sharpened degrees were used more than during the ensuing period of Flemish music (1450–1600; see Landini cadence). See M. L. Mackey, "The Evolution of the Leading Tone in Western European Music to circa 1600 A.D." (diss. Catholic Univ. of America, 1962); L. H. Skrbensky, "Leitton und Alteration in der abendländischen Musik" (diss. Prague, 1928).

**League of Composers.** See under Societies I, 4.

**Lebendig, lebhaft** [G.]. Lively.

**Lectio** [L.]. See Lesson (1).

**Lectionary** [L. *lectionarium*] See under Liturgical books I (9).

**Ledger lines.** Short lines drawn through the stem of notes that are too high or too low to be represented on the staff. In early music they are usually avoided by introducing lower or higher clefs. The earliest source in which they are extensively used is M. A. Cavazzoni's organ book *Ricercari, motetti, canzoni* of 1523 [see *ApNPM*, pp. 3ff].

**Leere Saite** [G.]. Open string.

**Legato** [It.]. To be played without any perceptible interruption between the notes [Ex. a], as opposed to *leggero* or *nonlegato* [Ex. b], *portato* [Ex. c], and *staccato* [Ex. d]. *Legatissimo*, indi-

Written

Played

cated by the word and not with notational symbols, is either a more forceful indication of legato, or a sort of super-legato in which the preceding note is held for a short moment together with the following one (Ex. e). The first line in the illustration shows the notes as written; the second line shows the approximate effect.

In the musical practice of earlier centuries, legato playing was not always the normal man-

ner of performance, as it is today. For organ and violin music of the 17th and 18th centuries slightly detached playing is more suitable than a full legato.

**Legende, légende** [G., F.]. Romantic name for compositions based on, or suggestive of, a devotional or legendary narrative.

**Leger lines.** See Ledger lines.

**Leggiero, leggiro** [It.]. Light, nimble.

**Legno** [It.]. Wood. *Col legno* means, in violin playing, tapping the strings with the stick of the bow instead of bowing them. *Stromenti di legno*, woodwind instruments.

**Lehrstück** [G.]. Name for a type of German musical play of the 1920's designed to be educational for a working-class audience, particularly within the youth movement of that period. Typical examples are Hindemith's *Wir bauen eine Stadt* (We Build a Town) and Kurt Weill's *Der Jasager* (The Yes-Sayer).

**Leich** [G.]. See under Lai.

**Leidenschaftlich** [G.]. Passionate.

**Leier** [G.]. Usually, the \*lyre. In earlier usage, the \*hurdy-gurdy (*Drehleier*, *Radleier*, *Bettlerleier*). Schubert's song, "Der Leiermann," portrays a player of the hurdy-gurdy (not of the street organ, called *Leierkasten*).

**Leierkasten** [G.]. Street organ.

**Leise** [G.]. (1) Soft. (2) Medieval congregational hymns in the German language, so called because of their refrain, *kyrie eleis(on)*, which was abbreviated to *kirleis* or *leis*. The oldest specimen, *Unsar trohtin*, dates from the 9th century. Several Protestant chorales belong to this category, e.g., *Nun bitten wir den heiligen Geist*, and *Christ ist erstanden* [see *AdHM*, p. 448]. There is frequent confusion of the terms *Leise* and *Leich* [see *GD* i, 636; *GDB* ii, 270]. See O. Ursprung, in *MF* v.

**Leiter** [G.]. (1) Scale (*Tonleiter*); *leitereigen*, proper to the scale, diatonic. (2) Leader of an orchestra.

**Leitmotiv, leitmotif** [G.]. A term coined by R. Wagner's friend H. von Wolzogen ["Die Motive in Wagner's *Götterdämmerung*" (*Musikalisches Wochenblatt* ix, 1878)] to denote the fundamental method of composition in Wagner's later operas, that is, the representation of

characters, typical situations, and recurrent ideas by musical motifs. (Wagner himself had used the term *Grundthema*, basic theme.) In *Der Ring des Nibelungen*, for instance, there are motifs characterizing the Ring (Ex. 1), the Contract (Ex. 2), Valhalla (Ex. 3), the Sword (Ex. 4), etc. These leitmotifs are not rigidly fixed melodies but are used very flexibly with modifications in rhythm, intervals, etc., according to the requirement of the particular situation [see Transformation of themes]. It should be noted that the extensive "Tables of Leitmotifs" usually found in popular editions of Wagner's operas are not by him, nor are any of the names they bear.

Although Wagner was the first to make consistent use of the leitmotiv, his method is adumbrated in various earlier compositions. In Grétry's *Richard Coeur-de-Lion* (1784) the theme "Une fièvre brûlante" [see *AdHM*, p. 747; Beethoven wrote variations on it] appears nine times. In Méhul's *Ariodant* (1799) a characteristic theme called *cri de fureur* is used repeatedly to express the vengeance of the deceived lover [see *AdHM*, p. 748]. A well-known example outside opera is the *\*idée fixe* of Berlioz' *Symphonie fantastique*. There is also recurrent use of thematic material in Karl Loewe's *Balladen*. Many of the post-Wagnerian operatic composers (R. Strauss, Debussy, Pfitzner, D'Indy) adopted Wagner's procedure, which also had an influence on symphonic music, particularly the symphonic poem.

Lit.: R. Donington, *Wagner's Ring and Its Symbols* [1963]; D. Cooke, *The Language of Music* (1959); L. Windsperger, *Das Buch der Motive und Themen . . . Richard Wagner's*, 2 vols. [19—]; K. Wörner, "Beiträge zur Geschichte des Leitmotifs in der Oper" (diss. Berlin, 1931); *id.*, in *ZMW* xiv; M. Lamm, "Beiträge zur Entwicklung des musikalischen Motivs in den Ton-dramen Richard Wagners" (diss. Vienna, 1932); L. Sabaneev, "Remarks on the Leit-motif" (*ML* xiii, 200); G. E. H. Abraham, "The Leit-motif since Wagner" (*ML* vi, 175); E. Haraszti, "Le Problème du Leit-Motiv" (*RM* iv).

**Leitton** [G.]. Leading tone.

**Lemminkäinen's Homecoming**. Symphonic poem by Jean Sibelius, op. 22, no. 4 (1893-95, describing (after a story from the *\*Kalevala*) the hero's journey home from Pohjola [see *Pohjola's Daughter*].

**Leningrad Symphony**. A title sometimes used for Shostakovich's Symphony no. 7, op. 60, composed in 1941, when Leningrad was besieged by the Germans.

**Lento** [It.]. Slow. See under Tempo marks.

**Leonore Overtures**. The overtures Beethoven wrote for his opera *Fidelio*, prior to the final overture, known as *Fidelio Overture* (or, incorrectly, as *Leonore Overture* no. 4). *Leonore* nos. 1 and 2 were written in 1805, no. 3 in 1806. The name refers to the original title of the opera, *Leonore*. The *Fidelio* overture was written in 1814. See H. Braunstein, *Beethoven's Leonore-Ouvertüren* (1927).

**Les Adieux, l'absence, et le retour** [F.]. See *Adieux*, *Les*.

**Lesson** [L. *lectio*]. (1) In the Roman Catholic rites, a reading from the Scriptures and other sources, e.g., the writings of the church fathers. Matins includes nine lessons, three for each Nocturn. Mass includes two, one before the Gradual, the other after the Alleluia. The former is usually taken from the Epistles (*Lectio Epistolae . . .*) and so is called Epistle; the latter nearly always comes from the Gospels (*Sequentia sancti Evangelii . . .*; *sequentia* here means "continuation"), and so is called Gospel. (2) A 17th- and 18th-century name for a type of English instrumental piece, particularly for harpsichord or organ. The term does not imply any special form or style, nor necessarily a pedagogical purpose; in fact, it seems to have been just as general as the modern term "piece." In the 17th century the term was frequently used for a suite (Suite of Lessons), e.g., in Matthew Locke's *Melothesia . . . A Choice Collection of Lessons for the Harpsichord and the Organ* (1673). In the 18th century some organ verses as well as sonata-like compositions were called "lessons."

**Letter notation**. The use of letters for the indication of tones is restricted today to theoretical and instructive purposes; see Pitch names. In earlier periods they were also used for writing down music, e.g., in ancient Greece [see Notation II], in Arab and Persian music of the 13th

century [see *NOH* i, 453], and in the German organ tablature [see *Tablature* I]. Letters are also used in the French lute tablature, but here they indicate finger positions, not pitches [see *Tablature* IV].

In the Middle Ages there were several systems of letter notation based on the Roman alphabet. Several of these are shown here:

1.	A	B	C	E	H	I	M	O	X	Y	CC	DD	FF	KK	LL
2.	A	B	C	D	E	F	G	H	I	K	L	M	N	O	P
3.			A	B	C	D	E	F	G	H	I	K	L	M	N O P
4.	E	F	G	A	B	C	D	E	F	G	A	B	C	D	E F
5.	Γ	A	B	C	D	E	F	G	a	b	♭	c	d	e	f g a b c
Modern	G	A	B	c	d	e	f	g	a	b♭	b	c'	d'	e'	f' g' a' b' c''

System (1) is found in the "De institutione musica" of Boethius (c. 480–524) and may therefore be called *Boethian notation* (the missing letters, D, F, G, etc., are used for the additional tones of the chromatic and enharmonic genera of ancient Greek music). Systems (2) and (3) employ the letters from A to P for two octaves, the former from A to a', the latter from c to c''. The A-to-P series also occurs in Boethius but without reference to definite pitches [see *ReMMA*, p. 135n]. Hence the name "Boethian notation" is hardly justifiable for system (2), for which it is often used. In system (4) only the letters from A to G are used, without distinguishing higher or lower octaves. In both (3) and (4) the letter A stands for the present-day c. This method seems to have been employed chiefly in connection with certain instruments, such as the monochord, organ, or sets of bells (*nolae*, *tintinnabulae*). System (5), often called *Guidonian letters*, was used more than 100 years before Guido in a treatise by Odo of Clugny and therefore should be termed *Oddonic letters*. It includes two shapes of the letter b, one for b natural, the other for b-flat [see *Accidentals* II]. This system was universally adopted and, with certain modifications, persists to the present day. Of the others, system (2) is of particular interest because it was employed in various MSS of Gregorian chant to clarify the pitches of the neumatic signs, e.g., in the "bilingual" Codex Montpelier H. 159 [see Editions XLII A, 7 and 8; also *WoHN* i, opp. p. 44], as well as for writing down a famous two-part composition of the 11th cen-

tury, *Ut tuo propitiatus* [see *ApNPM*, p. 207f]. For source references for the various systems described above, see *ApNPM*, p. 21, and A. Auda, *Les Gammes musicales* [1947], p. 310. For other systems see Romanus letters; Hermannus letters.

Lit.: J. Smits van Waesberghe, *Muziekgeschiedenis der Middeleeuwen* (1939–42), vol. ii.

**Leuto** [It.]. Old spelling for *lauto*, lute.

**Levalto**. See under *Volta* (1).

**Levare, levate** [It.]. To take off (organ stops, mutes). *Si levano i sordini*, take off the mutes.

**Levatio** [L.], **elevazione, levazione** [It.]. \*Elevation.

**L.H.** Abbr. for left hand.

**L'Homme armé** [F.]. A 15th-century melody that became famous because of its frequent use as a tenor of polyphonic Masses [see *Mass C*, IIb, IIc]. The tune, with its recently discovered text [see D. Plamenac, in *Annales de la Fédération archéologique et historique de Belgique* (Bruges, 1925), p. 229f], is here reproduced. Pietro Aron (*Il Toscanello*, 1523) ascribed the tune to Busnois,

L'hom-me, l'hom-me, l'homme ar-mé, l'homme ar-mé, L'homme ar-mé doit on doub-ter, doit on doub-ter. On a fait par-tout cri-er Que chas-cun se viegne ar-mer D'un hau-bre-gon de fer

(d. c. 1490), but it is used in a chanson that very likely was written c. 1430–40 [see M. Bukofzer in *MQ* xxviii, 19]. There are more than thirty Masses based on this melody (*Missa L'Homme armé*). Among their composers are Dufay [see *HAM*, no. 66], Busnois, Caron, Ockeghem [*HAM*, no. 73], Obrecht, Tinctoris, Josquin [*HAM*, no. 89], Brumel, de La Rue [*HAM*, no. 92], Pipelare, Senfl, de Orto, Morales, Palestrina, and, in the 17th century, Carissimi [see O. Gombosi, *Jacob Obrecht*, p. 47]. In 1930, J. N. David composed a *Fantasia super L'Homme armé*. Ten 15th-century Masses are published in \*Editions XXXI. See M. Brenet, in *MfM* xxx; O. Gombosi and D. Plamenac, in *ZMW* x, xi, xii; O. Strunk, in *BAMS* ii; W. Apel, "Imitation Canons on L'Homme armé" (*Speculum* xxv).

**Liber usualis** [L.]. See under Liturgical books I, 5.

**Libraries.** Most of the great music libraries are located in western Europe, with a growing concentration in the United States and few collections of real importance elsewhere. In recent years, the books and manuscripts dating back through the centuries have been supplemented by valuable new resources such as photostats, microfilms, and phonograph and tape recordings. The International Association of Music Libraries (AIBM) is currently updating R. Eitner's *Quellen-Lexikon* [see under Bibliography] as an *International Inventory of Musical Sources* [see *RISM*]. The Music Library Association, founded in 1931, is of particular importance in North America, with its quarterly *Notes* (1934—). Important and useful listings are: S. De Ricci, ed., *Census of Medieval and Renaissance Manuscripts in the United States and Canada*, 3 vols. (1935–40; suppl. 1962); M. B. Stillwell, *Incunabula and Americana, 1450–1800* (1931); *id.*, *Incunabula in American Libraries* (1940); O. E. Albrecht, *A Census of Autograph Music Manuscripts of European Composers in American Libraries* (1953). Extensive lists of music libraries and their catalogues have been made by A. Ott in *MGG* ix, 1034ff, by C. Cudworth in *GDB* v, 160ff, and by V. Duckles in *Music Reference and Research Materials*, 2nd ed. (1967). See also the lists of contributing libraries in the volumes of the *International Inventory* (mentioned above). There follows a list of the most important libraries and collections with significant musical holdings of special interest. They are arranged in alphabetical order of countries within each continent (North America,

Central and South America, Europe, Asia,) and by cities within each country.

#### NORTH AMERICA.

CANADA. See M. Duchow, "Canadian Music Libraries: Some Observations" (*Notes* xviii).

Montreal: McGill University, Conservatory, music representative of 19th-cent. life in Montreal.

Ottawa: National Library.

#### UNITED STATES.

Ann Arbor, Mich.: University of Michigan, Stellfeld collection [see L. E. Cuyler, G. A. Sutherland, and H. T. David, "The University of Michigan's Purchase of the Stellfeld Music Library" (*Notes* xii)]. Early American music.

Berea, Ohio: Baldwin-Wallace College, Riemenschneider Memorial Bach Library [S. Kenney, *Catalog* (1960)].

Berkeley, Calif.: University of California Music Library, primary sources in early opera scores and librettos (Cortot opera collection), early Italian instrumental music [V. Duckles and M. Elmer, *Thematic Catalog of a Manuscript Collection of Eighteenth-Century Italian Instrumental Music* (1963)]; reference collections of Alfred Einstein and Manfred Bukofzer; MSS of Ernest Bloch [*Autograph Manuscripts of Ernest Bloch at the University of California* (n.d.)].

Bethlehem, Pa.: Archives of the Moravian Church [A. G. Rau and H. T. David, *A Catalogue of Music by American Moravians, 1724–1842* (1938)].

Bloomington, Ind.: Indiana University School of Music, photostats of keyboard sources.

Boston, Mass.: Public Library, Allen A. Brown Reference Collection [*Catalogue*, 3 vols. and suppl. (1910–16)].

Cambridge, Mass.: Harvard University, Isham Memorial Library, microfilms and photostats of MSS and prints of music from the 12th to 18th centuries; originally concerned with early keyboard music, but enlarged to include all kinds of monophonic and polyphonic vocal and instrumental, sacred and secular (early sample listing by W. Apel in *MD* i); Eda Kuhn Loeb Music Library, a strong reference collection of books, scores, recordings. The Houghton Library of rare books at Harvard University contains many music rarities.

Charlottesville, Va.: University of Virginia, Alderman Library, MacKay Smith Collection, strong in 18th-cent. chamber music, trio sonatas.

Chicago, Ill.: Newberry Library, hymnology,

theory, important rarities [*Handbook of the Newberry Library* (1933)].

Cincinnati, Ohio: Hebrew Union College, Jewish music.

Los Angeles, Calif.: University of California at Los Angeles, W. A. Clark Memorial Library, ballad opera, 17th–18th-cent. English music; University Music Library, 17th–18th-cent. librettos, ethnomusicology, American sheet music from 1800.

New Haven, Conn.: Yale University Library, American songbooks, folksongs, carols; Yale Music School Library, Lowell Mason collection, with hundreds of keyboard manuscripts from the library of J. C. Rinck.

New York, N.Y.: Music Division of the Research Library of the Performing Arts (at Lincoln Center), a very comprehensive collection, including early printed music, Americana, and musical portraits [*Catalogue of Jos. W. Drexel's Musical Library* (1869); *Dictionary Catalog of the Music Collection*, 33 vols. (1964), suppl. i (1966); [C. S. Smith], *Early Psalmody in America*, series 1–3 (1938–39); O. Kinkeldey, in *The Library Journal* xl]. Bartók Archives [V. Bator, *The Béla Bartók Archives, History and Catalogue* (1963)]. Columbia University, Music Department, Béla Bartók deposit of southeast European folk music. The Heineman Foundation music collection [E. Waters, in *Notes* vii].

Northampton, Mass.: Smith College, Philip Hale and Alfred Einstein collections (includes Einstein's MS scores of 16th- and 17th-cent. partbooks).

Philadelphia, Pa.: Curtis Institute, Burrell Wagner collection (Ileborgh keyboard tablature); Free Library, Edwin A. Fleisher music collection [*A Descriptive Catalogue*, rev. ed. (1965—)]. Library Company [E. Wolf, *American Song Sheets, Slip Ballads and Poetical Broad-sides, 1850–1870* (1963)].

Pittsburgh, Pa.: Carnegie Library; University of Pittsburgh Library; St. Vincent's College [T. Finney, *A Union Catalogue of Music and Books on Music Printed before 1801 in Pittsburgh Libraries*, rev. ed. (1963), suppl. (1964)].

Rochester, N.Y.: Eastman School of Music, Sibley Library, chamber music, French and Russian music, folksong, literature on the violin, rich in primary source materials.

St. Louis, Mo.: St. Louis University, Pope Pius XII Memorial Library [E. C. Krohn, "Music in the Vatican Film Library at Saint Louis University" (*Notes* xiv)].

Salem, Mass.: Essex Institute, Americana [H. E. Johnson, in *Notes* v].

San Francisco, Calif.: San Francisco State College, Frank V. De Bellis collection of Italian music, MSS, early printed music, theoretical works by Italian musicians.

San Marino, Calif.: Huntington Library and Art Gallery, incunabula, early English printed music, Americana [E. N. Backus, *Catalogue of Music in the Huntington Library Printed before 1801* (1949)].

Stanford, Calif.: Stanford University, Memorial Library of Music [N. van Patten, *A Memorial Library of Music* (1950)]. Stanford University Archive of Recorded Sound.

Washington, D.C.: Library of Congress, Music Division (est. 1897), the most notable music collection in the United States. A copyright deposit, it possesses many important manuscripts, old prints, opera scores and librettos, musical Americana, autographs of contemporary composers, as well as many sound recordings of American folk and primitive music. [Special catalogues: *Dramatic Music . . . Full Scores* (1908); *Orchestral Music . . . Scores* (1912); *Catalogue of Early Books on Music (before 1800)* (1913), suppl. (1944); *Catalogue of Opera Librettos Printed before 1800*, 2 vols. (1914)]. Notable acquisitions are cited in the *Report of the Librarian of Congress* (1903—), and in occasional special articles in the Library's *Quarterly Journal of Current Acquisitions* (1943—). The Library issues a series of monumental bibliographical tools in its *A Catalog of Books Represented by Library of Congress Printed Cards*, 167 vols., its *The National Union Catalog*, which maintains a separate cumulative listing of *Music and Phonorecords* (1953—), and its *Catalog of Copyright Entries, Part 3: Musical Compositions* (1906—), in which both published and unpublished music submitted for copyright registration is listed. [F. R. Goff, "Early Music Books in the Rare Books Division of the Library of Congress" (*Notes* vi); George Herzog, *Research in Primitive and Folk Music in the United States* (1936); *Check List of Recorded Songs in the English Language . . . to July 1940*, 3 vols. (1942)]. The Folger Shakespeare Library, Elizabethan printed music, MSS of operas and music related to Shakespeare and his time. Pan-American Union, music of North and South America, particularly folk music.

Watertown, Mass.: Perkins School for the Blind, information on blind musicians of the past, music in Braille circulated nationally.

Worcester, Mass.: American Antiquarian Society, Americana, especially hymn books.

**CENTRAL AND SOUTH AMERICA.** Cathedral and monastery archives in Mexico, at Mexico City, Morelia, and Puebla, and at Lima, Peru; 16th–18th-cent. church music [E. T. Stanford and L. B. Spiess, *Some Preliminary Information Concerning Mexican Musical Archives* (1966)]. The resources of these archives have been described in part by Robert Stevenson in *Music in Mexico* [1952] and *id.*, *The Music of Peru* [1960].

Rio de Janeiro, Brazil: Biblioteca Nacional [F. C. Lange, in *Revista de estudios musicales* i; C. S. Smith, "Music Publications in Brazil" (*Notes* iv)].

Santiago, Cuba: Cathedral archives [P. Hernández Balaguer, *Catálogo de Música de los Archivos de la Catedral de Santiago de Cuba y del Museo Bacardí* (1961)].

## EUROPE.

### AUSTRIA

Admont: Stiftsbibliothek, MS missals [J. Köck, *Handschriftliche Missalien in Steiermark* (1916)].

Göttweig: Benedictine Abbey, 16th-cent. Meistersinger MSS, 18th-cent. MSS, Merulo keyboard music, portions of the library of Aloys Fuchs [P. L. Koller, "Inventar der Göttweiger Kantorei 1612" (*Das Waldviertel*, 1955)].

Graz: University Library [A. Kern, *Die Handschriften der Universitätsbibliothek Graz* (1939–40, 1956)].

Klosterneuberg: Stiftsbibliothek, 12th–16th-cent. MSS, 16th-cent. printed music [H. Pfeiffer and B. Černik, *Catalogus codicum manuscriptorum*, 2 vols. (1922–31)].

Kremsmünster: Benedictine Abbey, liturgical music, 16th-cent. MSS and printed music, tablatures [R. Flotzinger, *Die Lautentabulaturen des Stiftes Kremsmünster* (1965)]; other sources cited in A. Kellner, *Musikgeschichte des Stiftes Kremsmünster* (1956)].

Melk: Benedictine Monastery Library, 13th–14th-cent. liturgical MSS, 16th-cent. Mass MSS, J. Haydn collection [*Catalogus codicum manuscriptorum*, i (1889)].

St. Paul (Lavant Valley): Benedictine Monastery Library, troubadour MSS, early treatises [H. Federhofer, in *KJ* xxxv].

Salzburg: Cathedral Chapter, MSS of 16th-cent. vocal polyphony; Mozart Museum and Mozarteum, Mozart MSS [*Katalog des Mozart-*

*Museums*, 4th ed. (1906)]; Abbey of St. Peter, compositions by M. Haydn; Museum Carolino-Augustum [J. Gassner, *Die Musikaliensammlung im Salzburger Museum Carolino Augustum* (1962)], Mozart MSS, Benevoli's 53-voice Mass.

Tulln: Church of St. Stephan [K. Schnürl, *Das alte Musikarchiv der Pfarrkirche St. Stephan in Tulln* (1964)].

Vienna: National Library [L. Nowak, "Die Musiksammlungen der Oesterreichischen National-Bibliothek" (*Musikerziehung* vi); *id.*, "Die Musikhandschriften" (*Die Oesterreichische Nationalbibliothek. Festschrift* (1948))]. Important holdings such as the Fugger music collection [R. Schaal, "Die Musikbibliothek von Raimund Fugger d. J." (*AM* xxix)], the d'Este music collection [R. Haas, *Die Estensischen Musikalien: thematisches Verzeichnis* (1927)], the Palatine Library [J. Mantuani, *Tabulae codicum manuscriptorum . . . in Bibliotheca Palatina Vindobonensi asservatorum* (1864–99), especially vols. ix and x]; an archive established by Heinrich Schenker and Anthony van Hoboken containing photofacsimiles of the works of the major Viennese composers. Gesellschaft der Musikfreunde, MSS, letters, portraits, etc., of Viennese masters [K. Geiringer, history of the collection, in *Anbruch: Monatsschrift für moderne Musik* xix; E. Mandyczewski, in *Zusatz-Band zur Geschichte der K.K. Gesellschaft der Musikfreunde in Wien* (1912), surveys the contents of the library, museum, and archive]. Schottenkloster, early liturgical MSS, 16th-cent. MSS and printings [A. Hübl, *Catalogus codicum manuscriptorum qui in bibliotheca Monasterii B.M.V. ad Scotos Vindobonae servantur* (1899); *id.*, *Die Inkunabeln der Bibliothek des Stiftes Schotten in Wien* (1904)]. University Library, 16th–17th-cent. lute music and theoretical works. City Library, Schubert MSS and 19th-cent. dance music. Minoritenkonvent, MSS and printed 17th-cent. organ and vocal music [F. W. Riedel, *Das Musikarchiv im Minoritenkonvent zu Wien* (1963), in *Catalogus musicus* i]. St. Peter's Church [C. Rouland, *Katalog des Musik-Archives der St. Peterskirche in Wien* (1908)].

**BELGIUM.** For general information, see J.-G. Prod'homme, "Les Institutions musicales (Bibliothèques et Archives) en Belgique et en Hollande" (*SIM* xv); C. van den Borren, "Inventaire des manuscrits de musique polyphonique qui se trouvent en Belgique" (*AM* v–vi); S. Clercx, in *Alumni* (Brussels) xvi.

Brussels: Royal Library, collections of C. J. E. van Hulthem [C. A. Voisin, *Bibliotheca Hulthemiana*, 6 vols. (1836–37)] and F. J. Fétis [Catalogue de la Bibliothèque de F. J. Fétis (1877)], MSS from monastery libraries and the Dukes of Burgundy [J. van den Gheyn, *Catalogue des manuscrits*, 12 vols. (1901–36); B. Huys, *Catalogue des imprimés musicaux des XVe, XVIe et XVIIe siècles* (1965)]. Conservatoire Royal de Musique, 16th-cent. MSS, 17th–18th-cent. opera librettos, K. P. E. Bach collection [A. Wotquenne, *Catalogue de la bibliothèque*, 4 vols. and suppl., incompl., (1898–1912)]; Holtenfeltz collection [C. van den Borren, "Les Fonds de musique ancienne de la Collégiale SS. Michel et Gudule à Bruxelles" (*Annuaire du Conservatoire*, 1930)].

Liège: Conservatoire Royal de Musique, Grétry collection, 17th–18th-cent. local composers, Fonds Terry [E. Monseur, *Catalogue*, 4 vols. in one (n.d.)].

Oudenarde: St. Walpurgakerk, 18th-cent. church music [*Liste générale de la musique appartenant à l'église parochiale de St. Walpurga à Audenarde* (n.d.)].

CZECHOSLOVAKIA. For general information, see D. Plamenac, "Music Libraries in Eastern Europe" (*Notes* xix). The University Library at Brün (Brno) publishes an accessions list for the principal music libraries of Czechoslovakia [*Přirůstky hudební v československých knihovnách* (1956—)]. M. J. Terrayová has compiled thematic catalogues of MSS in two Czech music archives, the Pfarrkirche of Púchov and the archive of the Prileský-Ostrolúcky family [*Hudobnovědné Studie* iv, 1960].

Prague: University Library, MSS and printings of 11th–17th-cent. treatises, Bohemian songs, and 14th–16th-cent. Easter Mysteries, lute books, Kubelik violin collection, Lobkowitz Archive [P. Nettl, "Musicalia der fürstlich Lobkowitzschen Bibliothek in Raudnitz" (*Verein für Geschichte der Deutschen in Böhmen, Mitteilungen des Vereines* . . . lviii)]; National Museum, music library of Emilián Trolidy [*Hudební sbírka Emiliána Trolidy*, catalogue by A. Buchner (1954)]; Conservatory of Music [R. Procházka, *Aus fünf Jahrhunderten: Musikschätze des Prager Konservatoriums* (1911)]; Municipal Library, Smetana Music Library, 78,000 printings of music, mostly Slavic; Cathedral Chapter Library [A. Podlaha, *Catalogus collectionis operum artis musicae* (1926)].

## DENMARK.

Aarhus: Statsbibliothek, copyright deposit library [*Fagkataloger* 3: *Musikaler*, rev. ed. (1951–57); 4: *Musik*, rev. ed. (1946—)].

Copenhagen: Royal Library, organ tablature, rare Antwerp and Copenhagen printings [E. Jørgensen, *Catalogus codicum latinorum medii aevi Bibliothecae Regiae Hafniensis*, 2 parts (1923, '26)]; University Library [A. Krarup, *Katalog over Universitetsbibliotekets Haandskrifter*, 2 vols. (1929–35)]; Museum of Music History, collection of historical musical instruments [A. Hammerich, *Das Musikhistorische Museum . . . beschreibender Katalog* (1911)]; Kommunebibliotekerne (Public Library) [*Katalog over musik og musiklitteratur*, 5 vols. (1954–56)].

ENGLAND. See GREAT BRITAIN.

## FINLAND.

Helsinki: University Library, collection of fragmentary MSS from medieval liturgical books [T. E. Haapanen, *Verzeichnis der mittelalterlichen Handschriftenfragmente in der Universitätsbibliothek zu Helsingfors*, I. Missalia (1922), II. Gradualia, Lectionaria Missae (1925), III. Breviaria (1932)].

Maggini, *Catalogo delle musiche stampate e manoscritte del fondo antico* (1965); A. Bonaccorsi, "Catalogo con notizie biografiche delle musiche . . . nelle biblioteche di Lucca" (*Collectanea Historiae Musicae* ii)].

Milan: [For general information, see *Le biblioteche milanesi* (1914); W. Rubsamen, "Music Research in Italian Libraries . . . Second Installment" (*Notes* vi)]. Biblioteca Ambrosiana, 10th–13th-cent. liturgical MSS, 16th–17th-cent. sacred printings, autographs [*Catalogo delle opere musicali . . . città di Milan*, in *Pubblicazioni dell'Associazione dei musicologi italiani*, series iii (1910–11)]; Conservatorio "G. Verdi," 16th-cent. printed sacred vocal music, autographs; copyright deposit [E. de' Guarinoni, *Indice generale dell'Archivio Musicale Nosedà . . . alla Biblioteca del R. Conservatorio di Musica di Milano* (1897)]; Cathedral Archive, 15th–18th-cent. MSS [C. Sartori, *La Cappella musicale del duomo di Milano. Catalogo delle musiche dell'archivio* (1957)]; La Scala, theatrical museum, auto-

graphs and pictures [S. Vittadini, *Catalogo del Museo teatrale alla Scala* (1940–58)].

Modena: Biblioteca Estense, 15th–18th-cent. MSS and prints [P. Lodi, *Catalogo delle opere musicali . . . città di Modena*, in *Bollettino dell'Associazione dei musicologi italiani*, series viii (n.d.); V. Finzi, "Bibliografia delle stampe musicali della R. Biblioteca Estense" (*Rivista delle biblioteche* iii–v); E. J. Luin, in *La Bibliofilia* xxxviii].

Monte Cassino: Monastery Library, liturgical MSS and treatises, Neapolitan operas [E. Dagnino, "L'Archivio musicale di Montecassino" (*Casinensia* i [1929]); P. Ferretti, "I manoscritti musicali gregoriani dell'archivio di Montecassino" (*Casinensia* i, 1929)].

Naples: Biblioteca Nazionale, 12th–13th-cent. liturgical MSS, 13th–15th-cent. Byzantine MSS, 16th–17th-cent. printings [A. Mondolfi, "Il fondo musicale cinquecentesco della Biblioteca nazionale di Napoli" (*Collectanea Historiae Musicae* ii)]; Regio conservatorio di musica (Conservatorio di San Pietro a Maiella), 16th–18th-cent. printings, 18th–19th-cent. Neapolitan operatic MSS [*Il Museo storico musicale di "S. Pietro a Majella"* (1930)]; Oratorio dei Filippini, 16th–17th-cent. church music [G. Gasperini and F. Gallo, *Catalogo generale . . . città di Napoli*, in *Pubblicazioni dell'Associazione dei musicologi italiani*, series x (1918–34); E. Mandarini, *I codici manoscritti della Biblioteca Oratoriana di Napoli* (1897)].

Padua: Biblioteca Nazionale, 16th–17th-cent. printings; Biblioteca Capitolare [A. Garbelotto, "Codici musicali della biblioteca capitolare di Padova" (*RMI* liii–liv)]; University Library, 14th-cent. French and Italian songs, MS organ tablatures [W. Rubsamen, "Music Research in Italian Libraries . . . Second [Third] Installment," (*Notes* vi, viii)]; Cathedral of San Antonio, Tartini printings and autographs [G. Tebaldini, *L'Archivio musicale della Cappella Antoniana* (1895); L. M. Minciotti, *Catalogo dei codici manoscritti* (1842)].

Parma: Conservatorio "Arrigo Boito," 16th–17th-cent. partbooks, MSS and early theory [R. Allorto, "Biblioteche musicali in Italia: La Biblioteca del Conservatorio di Parma e un fondo di edizioni dei sec. XVI e XVII non comprese nel catalogo a stampa" (*Fontes Artis Musicae*, 1955); M. Medici, "Osservazione sulla Biblioteca Musicale di Parma" (*Avvea Parma*, May–August 1964)].

Rome: Vatican Library, 10th–15th-cent. treatises, MSS, Barberini and Chigi collections, ar-

chives of San Pietro, Sistine Chapel [J. M. Llorens, *Capellae Sixtinae Codices musicis notis instructi sivi manu scripti sive praelo excussi* (1960); supersedes an earlier catalogue by F. X. Haberl (1885–88)]; Julian Chapel [see St. Louis University for microfilms and card catalogue of Vatican collection; H. Stevenson, *Bibliotheca Apostolica Vaticana . . . Inventario dei libri stampati Palatino-Vaticani*, 2 vols. (1886–91); G. B. de Rossi, *La biblioteca della Sede Apostolica ed i catalogi dei suoi manoscritti* (1884)]; Archives of St. John Lateran, Santa Maria Maggiore, and Santa Maria sopra Minerva; Biblioteca Corsiniana, Accademia Nazionale dei Lincei [V. Raeli, in *RMI* xxv–xxvii]; Biblioteca Casanatense, Baini collection, 11th–14th-cent. liturgies, 16th–17th-cent. printings; Accademia nazionale di S. Cecilia and Biblioteca del Conservatorio, copyright deposit, also rich in printed music and librettos [*Catalogo delle opere musicali . . . città di Roma*, in *Pubblicazioni dell'Associazione dei musicologi italiani*, series v (1912–13), theoretical works only; *Elenco delle opere musicali* (1896); *Catalogo delle opere di musica . . . della Congregazione ed Accademia di Santa Cecilia di Roma* (1846)]; Biblioteca Nazionale Centrale, 15th–17th-cent. liturgical music, 16th–19th-cent. MSS; Rolandi collection of librettos and vocal scores [U. Rolandi, *Il libretto per musica* (1951)]; Basilica Liberiana [V. Raeli, in *Musica d'oggi* (old series) ii]. The German Historical Institute in Rome maintains a well-stocked music reference collection.

Trent: Seven 15th-cent. codices [DFO 14/15, 22, 38, 53, 61, 76].

Turin: Biblioteca Nazionale, madrigal prints, 17th-cent. ballets, Foà and Giordano collections, 17th-cent. German organ tablature [*Esposizione nazionale di Torino M. DCCC. XCVIII: Manoscritti e libri a stampa musicati esposti dalla Biblioteca Nazionale di Torino* (1898); O. Mischiati, "L'Intavolatura d'organo tedesca della Biblioteca Nazionale di Torino. Catalogo ragionato" (*L'Organo* iv); A. Gentili, "La raccolta di antiche musiche Renzo Giordano alla Biblioteca Nazionale di Torino" (*Accademie e biblioteche d'Italia* ix); *id.*, "La raccolta Mauro Foà nella biblioteca nazionale di Torino" (*RMI* xxxiv)]; Accademia Filarmonica [A. della Corte, *Catalogo dell'archivio di musica* (1926)]; Cathedral, MS and printed 16th–18th-cent. sacred vocal music.

Venice: Biblioteca Marciana, MSS, madrigal partbooks, early Venetian operas, Canal and Contarini collections [*Catalogo delle opere mu-*

*sicali . . . città di Venezia*, in *Pubblicazioni dell'Associazione dei musicologi italiani*, series vi (1915–41); T. Wiel, *I codici musicali Contariniani del secolo XVII nella R. Biblioteca di San Marco* (1888); *Biblioteca musicale del Prof. P. Canal in Crespano Veneto* (1885)]; Biblioteca del Palazzo Giustinian Lolin [S. Cisilino, *Stampe e manoscritti preziosi e rari della Biblioteca del Palazzo Giustinian Lolin a San Vidal* (1966)]; Conservatorio Benedetto Marcello, later Venetian MSS of vocal and instrumental pieces; Biblioteca Querini-Stampaglia, late 17th-cent. vocal MSS [*Catalogo delle opere musicali . . . città di Venezia*, in *Pubblicazioni dell'Associazione dei musicologi italiani*, series vi (1913)].

Important music MSS are also at Aosta, Castell'Arquato, Faenza, Ivrea, and Monza.

## NETHERLANDS.

Dove, 2 vols. [1965]; A. Ott, "Die Musikbibliotheken" (in F. Milkau's *Handbuch der Bibliothekswissenschaft* ii, rev. ed., 1959; E. Vogel, "Musikbibliotheken nach ihrem wesentlichsten Bestande aufgeführt" (*JMP* i). rev. v.H.D.

**Libretto** [It.]. The text of an opera, oratorio, etc. Famous writers of librettos (librettists) include Ottavio Rinuccini (1562–1621; for Peri, Caccini, Monteverdi); Philippe Quinault (1635–88; for Lully); Pietro Metastasio (1698–1782; for A. Scarlatti, Hasse, Handel, Mozart); Ranieri di Calzabigi (1714–95; for Gluck); Lorenzo da Ponte (1749–1838; for Mozart's *Le Nozze di Figaro*, *Così fan tutte*, and *Don Giovanni*); Eugène Scribe (1791–1861; for Auber, Meyerbeer, Halévy, Boieldieu); Arrigo Boito (1842–1918; for Verdi's *Otello* and *Falstaff*); Hugo von Hofmannsthal (1874–1929; for R. Strauss); W. S. Gilbert (1836–1911; for A. Sullivan). Richard Wagner began a new practice by writing his own texts and by insisting upon a degree of unification between text and music theretofore unknown. His example was followed by Cornelius, Pfitzner, Schreker, Menotti, and others.

Large collections of librettos of early operas (17th and 18th centuries) are at the Library of Congress (Collection A. Schatz) and in the

libraries of Berlin, Vienna, Brussels, Paris, Bologna, Munich, Venice, etc.

Lit.: O. G. T. Sonneck, *Catalogue of Opera Librettos Printed before 1800*, 2 vols. (1914); E. Prunières, "I Libretti dell' opera veneziana nel secolo XVII" (*LRM* iii); T. M. Baroni, in *RMI* xii (Metastasio); M. Callegori, in *RMI* xxvi, xxviii (Metastasio).

**Libre Vermell.** See *Llibre Vermell*.

**Licenza, con alcuna** [It.]. Indication for some license in performance, or in composition, e.g., *canone con alcuna licenza*. In the 17th and 18th centuries *licenza* meant a passage or cadenza inserted by the performer; also, an operatic prologue designed as a dedication to a noble patron [see *Prologue*], such dedication being considered a "liberty" taken by the composer.

**Liceo** [It.]. Name of various Italian conservatories, e.g., Liceo Padre Martini (Bologna, also known simply as Liceo Musicale, famous for its library; see under *Libraries*), Liceo Rossini (Pesaro), Liceo B. Marcello (Venice), Liceo Verdi (Turin), etc.

**Lichanos** [Gr.]. See under *Greece II*.

**Liebesgeige; -oboe** [G.]. Viola d'amore; oboe d'amore.

**Liebeslieder** [G., Love Songs]. Two groups of eighteen (op. 52, 1869) and fifteen (*Neue Liebeslieder*, op. 65, 1875) short pieces by Brahms. Each is in the character of a waltz, for vocal quartet and piano duet in a chamber-music relationship. The texts are taken from Daumer's *Polydora*, except for the last song in op. 65, which is by Goethe.

**Lied** [G.; Pl. *Lieder*]. A song in the German vernacular. The history of the lied can be divided into the following periods: I. Minnesingers and Meistersinger (c. 1250–1550); II. Polyphonic lied (15th–16th century); III. Accompanied lied

("Generalbass-lied") of the baroque (1600–1750); IV. "Volkstümliches lied" (1775–1825); V. The "German lied" of the 19th century.

I. See *Minnesinger*; *Meistersinger*.

II. The 15th-century composers Oswald von Wolkenstein (1377–1445) and the Münch von Salzburg (fl. c. 1400) were the first to write polyphonic songs, rather primitive imitations of 14th-century French models or still earlier styles [see O. Ursprung, in *AMW* iv, v; *DTO* 18]. Important collections of 15th-century folksongs, some monophonic, some in polyphonic setting, are the Glogauer, Münchner, and Lochamer Liederbücher [see *Liederbuch*]. The polyphonic songs of Adam von Fulda (c. 1445–1505) and Heinrich Finck (1445–1527) show remarkable progress in style (true polyphonic treatment, imitation), thus leading to the masterly compositions of Heinrich Isaac (c. 1450–1517; see *DTO* 28; *HAM*, no. 87), Paul Hofhaimer (1459–1537; see H. J. Moser, *Paul Hofhaimer*, 1929; *HAM*, no. 93), Stoltzer (c. 1475–1526; see *DdT* 65; *HAM*, no. 108), and Ludwig Senfl (c. 1490–1543; see *DdT*, no. 34; \*Editions XVIII A, 10; *HAM*, no. 110). Isaac's "Innsbruck ich muss dich lassen" is one of the oldest and most beautiful German folksongs. Important sources of real German folksong are Senfl's \**quodlibets*, in which many popular songs of his day are cited. Important collections of polyphonic songs are G. Forster's five books *Ein Auszug guter alter und newer teutscher Liedlein* (Nuremberg, 1539–56; the second book, *Frische teutsche Liedlein*, repub. by Eitner; \*Editions XLVII, 29), and J. Ott's *115 guter newer Liedlein* (1544, repub. by Eitner; \*Editions XLVII, 1–4). In the second half of the 16th century Orlando di Lasso composed numerous German texts with consummate imagination and dexterity [*Neue Teutsche Liedlein mit fünff Stimmen*, 3 vols., 1567, '72, '76; *Neue Teutsche Lieder . . . mit vier Stimmen*, 1583, etc.; see compl. ed., vols. xviii, xx]. In the works of the foreigners, Mattheus Le Maistre (c. 1505–77), Antonio Scandello (1517–80), and Jacob Regnart (c. 1540–99), the lighter vein of the Italian *canzonette* and the *Bauernharmonie* (peasant harmony) of the \**villanella* superseded the polyphonic style of the earlier period [see Editions XLVII, 19; *SchGMB*, no. 139]. The two great masters from the end of the 16th century, Leonhard Lechner (c. 1550–1606; *Neue Teutsche Lieder*, 1582, new ed. by E. F. Schmid, 1926) and Hans Leo Hassler (1564–1612; *Canzonette a quattro voci*, 1590, and *Neue teutsche Gesäng*, 1596, new ed. in *DTB* 9; *Lustgarten*, 1601, new

ed., see Editions XLVII, 15) combine refinement of technique with depth of feeling and expression. The development of the polyphonic lied came to an end with Johann Hermann Schein (1586–1630; *Venus Kränzlein*, 1609; *Musica boscareccia*, 1621, '26, '28; see comp. ed. by A. Prüfer, vols. i, ii; also *SchGMB*, nos. 187, 188).

III. The accompanied solo lied of the baroque period ("Generalbass-lied," song with thoroughbass accompaniment) first appeared in J. Nauwach's (c. 1595–c. 1630) *Erster Theil teütscher Villanellen mit 1, 2 und 3 Stimmen* (1627), J. Staden's (1581–1634) *Hertzentrosts-Musica* (1630) and *Geistlicher Music-Klang* (1633), and T. Selle's (1599–1663) *Deliciarum Juveniliū decas Harmonica-bivocalis* (1634) and *Monophonetica* (1636) [see H. J. Moser, ed., ‡*Alte Meister des deutschen Liedes*, 1931]. With H. Albert's (1604–51) *Arien* (1638–50; *DdT* 12, 13; see also *HAM*, no. 205; *SchGMB*, no. 193) and A. Hammerschmidt's *Weltliche Oden* (1642–49; see Moser, *Alte Meister*; *SchGMB*, no. 194) it freed itself from the Italian model and became a truly German type, combining popular simplicity with artistic taste. This development reached its high point in the inspired songs of A. Krieger (1634–66; see *DdT* 19; H. Osthoff, *Adam Krieger*, 1929; *HAM*, no. 228; *SchGMB*, no. 209), who used the instrumental ritornello to be played at the end of each stanza. This "ritornello-lied" was also cultivated by J. E. Kindermann (1616–55; see *DTB* 21–24), J. Theile (1646–1724; see *SchGMB*, no. 210), and P. H. Erlebach (1657–1714; see *DdT* 46/47). Toward the end of the century the religious song found a master in J. W. Franck (1641–c. 1710; *Geistliche Lieder*, 1681–1700; new ed. *DdT* 45). The arias of Bach and Handel deserve only passing mention here since they do not properly belong to the category of lied. In fact, during the first half of the 18th century the lied practically ceased to exist, giving way to the elaborate treatment of the aria. On the other hand, a great number of lieder were written, under the name "aria," in the operas of J. S. Cousser [*SchGMB*, no. 250], R. Keiser [*SchGMB*, nos. 268, 269], Telemann, etc. Sperontes' *Singende Muse an der Pleisse* (1736–45; *DdT* 35/36; see *SchGMB*, no. 289) gives a good cross-section of the period of deterioration and disintegration of the *Generalbass-lied*. See also *DdT* 57 for songs (*Oden*) by Telemann and Görner.

IV. Matters took a new turn after 1750 when J. A. Hiller (1728–1804), the founder of the \*Singspiel, replaced the worn-out pathos of the

late baroque with an affected naïveté in songs that were often addressed to children [*Lieder für Kinder* (1769); *Fünzig geistliche Lieder für Kinder* (1774); *Sammlung der Lieder aus dem Kinderfreunde* (1782); see Moser, *Alte Meister*]. J. A. P. Schulz (1747–1800) found a more genuine expression of folklike simplicity (*Lieder im Volkston*; see *Volkstümliches lied*), while other members of the second \*Berlin school, such as J. F. Reichardt (1752–1814) and K. F. Zelter (1758–1832), introduced a new lyricism, particularly in their settings of Goethe's poems. In the songs of Haydn, Mozart ("Das Veilchen"), and the early Beethoven, this movement came to its artistic climax and end. See *DTB* 54 and 79 for a survey of the Viennese lied from 1778 to 1815.

V. The greatest period of the German lied began with Schubert (1797–1828), who, after a few preliminary songs in traditional style, opened a new era with his "Gretchen am Spinnrade" (Oct. 19, 1814, "the birthday of the German lied"), a miracle of musical art as well as of psychological intuition, being the work of a seventeen-year-old. There soon followed a flood of immortal masterworks, including the "Erlkönig" (1815), "Wanderer's Nachtlied" (1815), "Der Tod und das Mädchen" (1817), and "Der Wanderer" (1819), then the song cycles *Die Schöne Müllerin* (1823) and *Winterreise* (1827), and finally the collection *Schwanengesang* (1828). Measured by the artistic perfection of these songs, even the most beautiful lieder of Schumann and Brahms seem somewhat slight in imagination, and only Hugo Wolf's compositions stand the proof of comparison. For a complete outline of the development of the romantic lied, one must also add Mendelssohn, Liszt, Wagner, R. Franz (1815–92), P. Cornelius (1824–74), Mahler (1860–1911), R. Strauss (1864–1949), H. Pfitzner (1869–1949), and M. Reger (1873–1916).

The revolutionary tendencies of the 20th century found their first clear expression in Schoenberg's 15 Poems for high voice from *Das Buch der Längenden Gärten* by Stefan George (op. 15, 1908 and later) which, in addition to their novel harmonic style, show a new type of vocal (or, rather, unvocal) line, a speechlike declamation in which the rise and fall of the speaking voice is reflected. Anton von Webern, Josef Hauer, and Ernst Krenek have written songs in a similar vein, sometimes using serial techniques. In contrast to these is Hindemith's *Marinenleben* (op. 27, 1924), which is inspired by

the structural concept and polyphonic style of Bach. Traditional and progressive elements are combined in the songs of Hermann Reutter, Ernst Pepping, and Wolfgang Fortner.

**Liederbuch** [G.]. A term commonly applied to 15th- and 16th-century collections of German songs, mainly: (a) Lochamer Liederbuch, c. 1450 [fac. ed. by K. Ameln, 1925; description with transcriptions in *JMW* ii (1867); improved transcription by K. Escher and W. Lott (1926); see W. Salmen, *Das Lochamer Liederbuch* (1951);

O. Ursprung, in *AMW* iv, v, vi; H. Rosenberg, in *ZMW* xiv; J. Müller-Blattau in *AMF* iii; see also *Fundamentum*]. (b) Glogauer (formerly Berliner) Liederbuch, c. 1480 [new ed., see Editions XVIII A, 4 and 8; also in *MfM* vi, no. 5 and viii, Beilage]. (c) Münchener (also Walther's or Schedel's Liederbuch), 1461–67 [*MfM* xii–xv, Beilage; H. Rosenberg, ed., *†Das Schedelsche Liederbuch* (1933)].

The Lochamer Liederbuch is the most important source of early German folksong (some monophonic, some in three-voice composition). The Glogauer Liederbuch contains, in addition to vocal pieces, interesting instrumental dances [see Dance music II] and canons. For bibl. see under Lied (15th century); also *BeMMR*, p. 229.

In the 16th century a number of extensive collections of German songs in four (occasionally five) parts were published by: Arnt von Aich, *LXXV hupscher Lieder*, c. 1510 [see H. J. Moser and E. Bernoulli, *Das Liederbuch des Arnt von Aich*, 1930]; Erhart Öglin, 1512, without title [\*Editions XLVII, 9]; Peter Schöffler, 1513, without title [fac. ed. 1909; \*Editions VIII, 29]; *id.* and M. Apiarius, *Fünff und sechzig teutscher Lieder*, 1536; Johann Ott, *121 neue Lieder*, 1534 [see H. J. Moser, in *AM* vii]; *id.*, *115 guter neuer Liedlein*, 1544 [\*Editions XLVII, nos. 1–4]; Christian Egenolff, *Gassenhawerlin and Reutterliedlin*, 1535 [see *Gassenhauer*]; Wolfgang Schmelzl, *Guter, seltzamer und künstreicher teutscher Gesang*, 1544 [see *Quodlibet*]; Georg Forster, *Ein Ausszug guter . . . Liedlein*, 1539–56 [\*Editions XVIII A, 20]; *id.*, *Der ander Theil kurtzweiliger . . . Liedlein*, 1540 [\*Editions XLVI, 29]; *id.*, *Der dritte Theil schöner . . . Liedlein*, 1549; *id.*, *Der vierdt Theil schöner . . . Liedlein*, 1556; *id.*, *Der fünffte Theil schöner . . . Liedlein*, 1556. They contain compositions by Isaac, Senfl, Bruck, Hellinck, Paminger, Stoltzer, Lemlin, Othmayr, and others, as well as numerous anonymous settings.

**Liedercyclus, Liederkreis** [G.]. \*Song cycle.

**Lieder eines fahrenden Gesellen** [G., Songs of a Wayfarer]. Four songs for contralto and orchestra by Mahler (1883), set to his own poems. They were inspired by his youthful love affair with Johanna Richter.

**Lieder ohne Worte** [G., Songs without Words]. Forty-eight piano pieces by Mendelssohn, published in eight groups of six each (op. 19b, 30, 38, 53, 62, 67, 85, 102; 1830–45) and written in the form and style of a song, i.e., with a singable

melody and a simple, uniform accompaniment. The songlike character is also evident in the absence of contrasting middle sections such as are usually found in the \*character pieces of the 19th century. The individual titles given in modern editions ("Spring Song," "Hunting Song," "Spinning Song") are not authentic, except for the three called *Venezianisches Gondellied*, nos. 6, 12, and 29, the *Duetto*, no. 18, and the *Volkslied*, no. 23.

**Liedertafel** [G.]. A men's singing society, founded by Zelter in 1809, whose members first sat around a table [G. *Tafel*] for refreshments. Various similar societies sprang up during the 19th century.

**Liedform** [G.]. \*Song form.

**Liedmotette** [G.]. Song motet; see Motet B I.

**Lied von der Erde, Das** [G., The Song of the Earth]. A symphonic song cycle by Mahler (who called it a symphony), for mezzo-soprano, tenor, and orchestra, set to German translations (by Hans Bethge) of old Chinese poems: 1. *Das Trinklied vom Jammer der Erde* (The Drinking Song of Earth's Woe); 2. *Der Einsame im Herbst* (The Lonely One in Autumn); 3. *Von der Jugend* (Of Youth); 4. *Von der Schönheit* (Of Beauty); 5. *Der Trunkene im Frühling* (The Toper in Spring); 6. *Der Abschied* (The Farewell). The work, Mahler's last, was completed in 1908 and first performed in Munich in 1911, after his death.

**Lieto** [It.]. Gay, joyful.

**Lievo** [It.]. Light, easy.

**Life for the Czar, A** [Rus. *Zhizn za Tsarya*]. Opera in five acts by Glinka (libretto by G. F. Rozen), produced in St. Petersburg, 1836. Setting: Russia, 1612-13. An alternate title in current use in Russia is *Ivan Susanin*. The opera is a landmark in music history because it was the first popular opera in the Russian language, inaugurating a nationalist movement that has continued ever since.

**Ligatura** [It.]. (1) \*Ligature. (2) In the 17th century, a tied note; see under Durezza.

**Ligatures.** I. Notational signs of the 13th to 16th centuries that combine two or more notes in a single symbol. They developed in the late 12th century as square-shaped modifications of the neumes [see Ex.; see also Notation]. From these they inherited certain graphic peculiarities that

can only be understood if viewed as the result of this evolution, e.g., the initial stroke of the "descending" forms (1 and 3), which is lacking in the "ascending" forms (2 and 4). Although in plainsong and related bodies of monophonic music these signs are but graphic modifications of the neumes [see Monophonic notation], they adopted definite rhythmic meanings in polyphonic music. The first step in this direction was in the modal notation of the school of Notre Dame, in the early 13th century. Here, ligatures are the ordinary notational signs for all the parts, single notes being used only for special reasons (long notes of the tenor). Their rhythmic values depend entirely on their grouping, according to the different rhythmic \*modes [see Square notation]. The rise of the \*motet (c. 1225) greatly diminished the use of ligatures in the upper parts because they had a full text, whose syllables were sung, as a rule, to single notes. The final step in the development of the ligatures came c. 1250 with Franco of Cologne, who succeeded in assigning an unambiguous metrical significance (independent of the modes) to each of the various shapes. His rules remained unaltered throughout the ensuing period of mensural notation. The discussion below refers mainly to the period of white mensural notation (after 1450).

II. Ligatures are classified according to the number of notes they contain: *ligatura binaria* (two), *ternaria* (three), *quaternaria* (four), etc. In each of these categories there are various types distinguished by the terms *proprietas* and *perfectio*. The former term refers to the modifications concerning the initial notes, the latter to those of the final note. The various types of *ligatura binaria* are illustrated in the accompanying table in which *c.c.* means *cum* (with) *proprietas et cum perfectione*; *s.c.*, *sine* (without) *proprietas et cum perfectione*, etc., while *c.o.p.* designates a special type, known as *cum opposita proprietas* (B = *brevis*; L = *longa*; S = *semi-brevis*):

	Desc.	Asc.	Value
<i>c.c.</i>			B L
<i>s.c.</i>			L L
<i>c.s.</i>			B B
<i>s.s.</i>			L B
<i>c.o.p.</i>			S S

These principles cover also the various types of *ternaria* and *quaternaria*, since the middle notes occurring in these ligatures are (normally) always B.

As a further illustration, an example of ligatures together with a rendition in single notes is given. It should be noted that oblique writing has no rhythmical significance unless it occurs

at the end of a ligature, and that even here it affects only the last of the two notes comprised in its graph.

Lit.: *ApNPM*, pp. 87ff, 231ff, 312ff; L. Dittmer, in *MD* ix (Codex Montpellier); O. Ursprung, in *AM* xi; H. Rietsch, in *ZMW* viii. See also under Mensural notation.

**Lilliburlero.** A 17th-century political tune whose melody appeared first under the name "Quickstep" in *The Second Book of The Pleasant Musical Companion* (1686). This melody [see *GD* iii, 198; *GDB* v, 237] was, the following year, used with a political text, satirically directed against the Papists and the Irish Roman Catholics, which began as follows:

Ho, broder Teague, dost hear de decree,  
Lilliburlero, bullen a la.

The melody has been used for various other texts of the same type. It also appears under the name "A New Irish Tune" in *Musick's Hand-Maid . . . for the Virginals, Harpsichord, and Spinet* (1689), with H. Purcell given as the composer, of either the tune or the keyboard version. Purcell also used it as a ground in his play, *The Gordian Knot Unty'd* (1691).

**Limma** [Gr.]. See under Pythagorean scale.

**Limoges, school of.** Same as school of \*St. Martial.

**Linear counterpoint.** A term introduced by E. Kurth (*Grundlagen des linearen Kontrapunkts*, 1917) in order to emphasize the "linear" or horizontal aspects of counterpoint, as opposed to the

harmonic (or vertical) point of view that prevailed at the time the book was published. Today the "linear" character of counterpoint is generally recognized. The term is also used as a designation for what Germans call *rücksichtsloser* (reckless) *Kontrapunkt*, i.e., the modern type of counterpoint that takes little account of harmonic combination and euphony (Hindemith, Stravinsky).

**Lining (out).** In American and English psalm and hymn singing, the practice of having each line read by the minister or some other person before it is sung by the congregation. This custom, which sprang from people's insufficient familiarity with the texts, died out by about the middle of the 19th century, largely because of the introduction of singing schools and instruments. In England it was known as "deaconing." See Psalter.

**Linke Hand** [G.]. Left hand.

**Linz Symphony.** Mozart's Symphony in C, no. 36 (K. 425), composed at Linz, Austria, and first performed there by the private orchestra of Count Thun.

**Lip.** See Embouchure.

**Lippenpfeife** [G.]. Labial pipe.

**Liquescent neumes.** See under Neumes. See H. Freistedt, *Die liqueszierenden Noten des Gregorianischen Chorals* (1929); J. Pothier, in *RCG* ix; L. David, in *RCG* xxxiv; *Paléographie musicale* (Solesmes, 1889—) ii, 37ff; *ApGC*, p. 104.

**Lira.** A 15th- and 16th-century type of violin having a wide neck with front pegs, drone strings, and a slightly pear-shaped body. The *lira da braccio* was held in the arm, the larger *lira da gamba* (*lirone*) between the knees. See ill. under Violin; also see Violin II. See A. Hajdecki, *Die italienische Lira da braccio* (1892). For Haydn's *lira organizzata*, see Hurdy-gurdy.

**Lira sacro-hispana.** See Editions XXIV.

**Liscio** [It.]. Smooth, even.

**L'istesso tempo** [It.]. Same tempo.

**Litany.** In the Roman Catholic Church, solemn supplications addressed to God, the Virgin, or the Saints. They open with the \*Kyrie eleison, continue with numerous exclamations such as "Mater Christi, ora pro nobis," sung responsively to a short inflected monotone, and close

with the \*Agnus Dei. The most important litanies are those of Rogation Days [*LU*, p. 835], and the Litany of Loreto (*Litaniae Laurentianae*), named after Loreto, Italy, where it is supposed to have originated in the 13th century; *LU*, p. 1857). The latter is especially popular, being frequently used at processions, the presentation of the sacrament at Benediction, and many popular services where it is sung by the whole congregation (particularly in Italy). It has been frequently composed in a simple chordal style (*falsobordone*), e.g., by Festa, by Palestrina [comp. ed. by Haber (1886), vol. xxvi, and Bianchi (1955), vol. xx], by Lasso, and others. See A. Machabey, "Le Origini asiatiche della Litania cristiana occidentale" (*LRM* xxi, 279); K. A. Rosenthal, "Mozart's Sacramental Litanies and their Forerunners" (*MQ* xxvii).

The Anglican litany has the same basic structure as the Roman Catholic litanies. It consists of petitions interspersed with responses such as "Spare us, good Lord," "Good Lord, deliver us," etc.

**Liturgical books.** I. The most important books of the Roman Catholic rites are the following: (1) The *missale* (missal) contains all the texts for the Mass, the prayers, lessons, and the texts of the Mass chants. (2) The *breviarium* (breviary) is the corresponding collection of all the texts for the Office. (3) The *graduale* (\*gradual) contains the Mass chants, with their music. (4) The *antiphonale* or *antiphonarium* (\*antiphonal, antiphonary, or antiphoner) contains the Office chants (except Matins), with their music. (5) The *Liber usualis* is a modern combination of the four books just mentioned, with some additions and many omissions. It includes the spoken texts as well as the musical items for both the Mass and the Office, arranged in their proper order, giving a clear picture of the entire service from day to day. It also includes the service of Matins (for a few of the highest feasts), which is omitted in the *antiphonale* because it is held today only in monastic churches. On the other hand, a number of services that are very important, particularly from the historical point of view, are omitted from the *Liber usualis*, mainly the weekdays of Lent, and the Wednesdays and Fridays of the four Ember weeks. (6) The *kyriale* (kyrial) contains only the chants of the Ordinary of the Mass (beginning with the Kyrie). (7) The *vesperale* (vesperal) contains the service of Vespers and usually that of Compline as well. (8) The *processionale* (processional) is a collection of the chants

(mostly responsories and antiphons) sung during processions (within the church) before Mass. Such processions are customary mainly in monastic churches, particularly in France. (9) The *sacramentarium* (sacramentary), a very early type (6th to 8th century), contains only the texts spoken by the priest or the officiating bishop, mainly the prayers and the variable Prefaces for the \*Canon of the Mass. In this period the readings from the Scriptures and Gospels were also in separate books, the *lectionarium* (lectionary) and the *evangelarium* (evangelary or evangelistary). (10) The *tonarium* or *tonale* (\*tonary) is a medieval book in which the chants are arranged according to the eight church modes. (11) The *cantatorium* (cantatory), a 9th- to 10th-century prototype of the gradual, contains only the solo chants of the Mass, i.e., Graduals, Alleluias, and Tracts. (12) The *troparium* (\*troper) is a medieval book containing \*tropes. (13) The *pontificale* (pontifical), contains the services used in functions where a bishop or prelate officiates, e.g., consecration of a church, ordination of priests, etc. (14) The *Liber responsorialis*, a modern compilation, contains mostly \*responsories.

*Antiphonale* originally was the name for a gradual as well as for an antiphonary [see Antiphonal]. The earliest graduals and antiphonals (8th to 10th centuries) contain only the texts of the chants. The six existing graduals of this type are collated in Dom R. J. Hesbert's *Antiphonale missarum sextuplex* (1935).

II. Toward the end of the 16th century various books were published in which the traditional melodies were "reformed," mainly in the direction of simplification and, especially, elimination of the melismas on unaccented syllables. To this category belong a *Graduale* published by Liechtenstein and a *Graduale abbreviatum* published by Giunta (both Venice, 1580), as well as J. Guidetti's *Directorium chori* (Rome, 1582). Even more drastic changes were incorporated in the *Graduale de tempore et de sanctis . . . cum cantu Pauli V. Pont. Max. jussu reformato*, prepared by Anerio and Suriano, published by Raimondi (2 vols., Rome, 1614) and generally known as the "Editio Medicea" (because the press was owned by the Medici family). Throughout the 17th, 18th, and 19th centuries the publications of Liechtenstein and Giunta as well as those by Plantin (Antwerp) and Nivers (Paris) were generally used. The Editio Medicea was unfortunately revived in the so-called Ratisbon edition ("Editio Ratisbonensis"), a series published under the title "Medicea" by Pustet

(Regensburg, 1871). Meanwhile, studies of medieval manuscripts led to attempts to restore the authentic versions of Gregorian chant, the first tangible result being P. Lambillotte's *Antiphonaire de Saint Grégoire* (Brussels, 1851) and *Antiphonarium Romanum* (Paris, 1854). There followed Dom Pothier's *Liber gradualis a Gregorio Magno olim ordinatus* (Tournai, 1883) and *Liber gradualis juxta antiquorum codicum fidem restitutus* (Solesmes, 1895), and finally, under Dom Mocquereau's leadership, the Vatican edition ("Editio Vaticana"). Two of its four volumes are the *Graduale sacrosanctae Romanae ecclesiae* (Rome, Vatican Press, 1907) and the *Antiphonale sacrosanctae Romanae ecclesiae* (*ibid.*, 1912), usually known as *Graduale Romanum* and *Antiphonale Romanum*. Both books also appeared in versions known as the Solesmes editions (pub. by Desclée, Tournai), in which the chants are provided with the rhythmic signs of Solesmes, particularly the vertical stroke ("episema") indicating the \*ictus. The *Liber usualis* also belongs to this group of publications. See Gregorian chant VII; Solesmes; *Motu proprio*.

III. Liturgical books in the Anglican communion are divided into official and semiofficial. Owing to the autonomy of the various national churches, the few official books are binding only for the particular church by which they are issued. The official music books issued by the Protestant Episcopal Church in the U.S.A. include *The Hymnal 1940*, *The Choral Service*, *The American Psalter*, and *The Plainsong Psalter*. Among the semiofficial volumes are the American *St. Dunstan Kyrial*, the *Monastic Diurnal Noted* and other editions of C. W. Douglas, the *English Gradual*, and other publications from St. Mary's Convent in England.

Other Protestant churches combine their suggested order of worship with their hymnals. In most cases, this is a further simplification of the Anglican Morning Prayer and Communion Service. See the *Service Book and Hymnal of the Lutheran Church in America* (1958), *The Methodist Hymnal* (1939), *The Pilgrim Hymnal* (1958), etc.

III by V.P.D.

**Liturgical dances.** See Religious dances; Dance music I.

**Liturgical drama.** Medieval plays (chiefly 12th- and 13th-century) representing Biblical stories (in Latin) with action and, occasionally, monophonic music. Since they never actually were

part of the official liturgy, they might better be called "religious" drama.

Liturgical drama developed during the 10th and 11th centuries from \*tropes to the Introits for Christmas and Easter, which were written in the form of a \*dialogue (so-called dialogue tropes), i.e., question-and-answer form. One of the earliest examples is the trope "Hodie cantandus est" (possibly by Tuotilo, d. c. 915) to the Christmas Introit "Puer natus est" [Schubiger, p. 39; abridged in *SchGMB*, no. 3]. A more fully developed type—in fact, a real play—is the 10th-century trope "Quem queritis" to the Introit "Resurrexi" for Easter Sunday [*SchGMB*, no. 8]. For an account of its performance at Winchester in the middle of the 10th century, see *ReMMA*, p. 194. Later plays, mostly of French origin, deal with the story of Daniel, the massacre of the innocents (containing the "lament" of Rachel), the wise and foolish virgins (the 12th-century play, *Sponsus*), etc. Favorite subjects for other plays were the miracles of various saints, particularly St. Nicholas (the so-called miracle plays).

From the 14th to 16th centuries, liturgical drama developed into the mysteries or mystery plays [corruption of L. *ministerium*, service], coming under secular sponsorship and using the vernacular. These were dramatic representations based on Biblical subjects such as the life of Jesus, the Acts of the Apostles, the Creation, etc., elaborately staged and in some instances continuing over a period of 20 days or longer. They used music only incidentally, for processions, fanfares, and dances, occasionally including plainsong, popular songs, etc. In Italy they were known as *sacre rappresentazioni*, in Spain and Portugal as \*autos. It is chiefly from these plays that European drama developed. See also Opera II.

Bowles, "The Role of Musical Instruments in Medieval Sacred Drama" (*MQ* xlv).

**Liturgy.** The officially authorized service of the Christian churches, particularly of the Roman Catholic Church, as distinguished from extralitururgical services, such as the \*Benediction. See Gregorian chant; Mass; Office; Liturgical books; also Liturgical drama.

**Lituus.** (1) A Roman trumpet, possibly of Etruscan origin; see Brass instruments V (a). (2) A 17th-century Latin name for the cornett or cromorne [see Oboe family III]. The two *litui* in Bach's Cantata no. 118 are obviously tenor trumpets in B-flat [see *SaRM*, p. 244]. See C. Sachs, "Die Litui in Bachs Motette 'O Jesu Christ'" (*BJ* 1921).

**Liuto** [It.]. \*Lute.

**Livret** [F.]. \*Libretto.

**Lizenza** [It.]. "License," freedom.

**Llibre Vermell** [Cat.]. A late 14th-century Spanish MS from the monastery of Montserrat, containing, in addition to literary texts, a few pages with ten compositions. Among the latter are three entitled *caça*, which are three-part canons similar in structure to the French \**chace* of the early 14th century. Also of interest is a reference to \*religious dancing. In the 19th century the book was bound in red velvet, hence the name [Sp. *vermell*, vermilion]. See H. Anglés, in *AnM* x; O. Ursprung, in *ZMW* iv; *ReMMA*, p. 373f.

**Lo** [It.]. Abbr. for *loco* [It., place], used to indicate return to the normal octave after *all' ottava* or similar designations.

**Lochamer Liederbuch.** See under Liederbuch.

**Locrian, lokrian.** See under Church modes II; Greece II.

**Lohengrin.** Opera in three acts by Richard Wagner (to his own libretto, based on W. von Eschenbach and medieval legends), produced in Weimar, 1850. Setting: Antwerp, early 10th century. *Lohengrin* marks the transition from Wagner's early operas (*Rienzi*, *Der Fliegende Holländer*, *Tannhäuser*) to the late masterpieces (*Ring*, *Tristan*, *Meistersinger*, *Parsifal*). In it Wagner for the first time made consistent use of his "continuous melody" as opposed to the "number" style [see Number opera] that still occurs in *Tannhäuser*. There is also a modest use of \*leitmotifs to characterize the most important personages and emotions.

**Lombardic style** [It. *stile lombardo*]. (1) Unexplained name for inverted dotting; see Dotted notes III. (2) "Howling of the Lombards" is a term derived from the statement made in 1274 by Elias Salomonis that "the singing of the Lombards is like the howling of wolves" [*GS* iii, 60]. It is usually described as being "parallel organum of the second," on the basis of explanations and musical examples given by Gafurius in his *Practica musice* of 1496 (with reference to "Ambrosiani nostri," i.e., singers of the Ambrosian chant of Milan). Actually what is involved is the use of organum of the fourth ("Musica enchiriadis") but beginning and ending with a second rather than with a unison. Anon. IV says that the Lombards sometimes put the last note in unison with the tenor but not always [*CS* i, 358]. The example "Rex coeli" under Organum would illustrate the "Lombardic organum" if the lower part began on b-flat instead of c. See J. Handschin, in *AM* xv, 2; E. Ferand, in *MQ* xxv; H. Riemann, *Geschichte der Musiktheorie*, rev. ed. (1918), p. 348 (Eng. trans., *History of Music Theory*, by R. Haggh [1962], p. 296f); B. Stäblein, in *A Ettore Desderi* (1963).

**London Symphonies.** (1) Haydn's last twelve symphonies, nos. 93–104, written in 1791–95 for the Salomon Concerts in London [see Concert I], also known as the Salomon Symphonies. Particularly the last of these, no. 104 in D, is known as "The London Symphony." (2) *A London Symphony* is a composition by Ralph Vaughan Williams, composed in 1913. Although written largely in the form of a classical symphony, it incorporates programmatic elements (Westminster chimes, London street cries).

**Longa, long.** See under Mensural notation I.

**Long playing.** See under Phonograph and recorded music.

**Loop.** See under Acoustics V.

**Louise.** Opera in four acts by Charpentier (to his own libretto), produced in Paris, 1900. Setting: Paris, c. 1900. The opera is closely related to the \*verismo movement, particularly to Puccini's *La Bohème*.

**Lourd** [F.]. Heavy.

**Loure** [F.]. (1) A 16th- and 17th-century name for bagpipe [see *SaRM*, p. 245]. (2) A 17th-century dance (originally accompanied by the instrument loure?) in moderate 6/4 time and with dotted rhythms leaning heavily on the strong beats [see Dance music III]. Early examples are in Lully's opera *Alceste* of 1677; the loure in Bach's French Suite no. 5 is by far the most beautiful example of this dance type.

**Louré** [F.]. See under Bowing (f).

**Love for Three Oranges, The** [Rus. *Lyubov k trem Apelsinam*]. Farcical opera in four acts by Prokofiev (to his own libretto, based on a tale by C. Gozzi), produced (in French) in Chicago, 1921. Setting: fairy tale. Numerous set pieces, particularly the March and the Scherzo, have become standard concert works.

**Lovesong Waltzes.** See *Liebeslieder*.

**Low Mass.** In the Roman Catholic rites, the Masses of ordinary weekdays, celebrated without singing, as opposed to the High Mass of Sundays [see Mass].

**Lucernarium.** The first item of Vespers in \*Ambrosian chant. The text nearly always includes a reference to "light" [L. *lucerna*, lamp]. *Lucernarium* is an old term for the evening service, held when the lamps were lighted.

**Lucia di Lammermoor.** Opera in three acts by Donizetti (libretto by Cammarano, after Sir Walter Scott), produced in Naples, 1835. Setting: Scotland, end of 17th century.

**Ludus Tonalis** [L., Tonal Play]. A work for piano by Hindemith, composed in 1942 and designed as a 20th-century \*Well-Tempered Clavier. It consists of twelve fugues linked by eleven interludes and preceded by a prelude that serves, in retrograde inversion, as a postlude. The fugues are arranged according to Hindemith's principle of decreasing tonal relationship to the tonic of

C: C, G, F, A, E, etc., the interludes leading from one tonality to the next. The fugues explore the various contrapuntal devices (accompanied canon, double and triple fugue, crab motion, inversion, etc.) in a modern idiom. The work is one of the most characteristic products of \*neoclassicism.

**Luftpause** [G.]. Breathing rest.

**Lulu.** Unfinished opera in three acts by Alban Berg (to his own libretto, based on two plays by F. Wedekind), produced in Zurich, 1937. Setting: Germany, early 20th century. The music is in twelve-tone technique based on a single tone row throughout [see Serial music]. Through various devices, Berg succeeds in introducing simple folk melodies as well as involved Wagnerian lines, creating a work of infinite variety and great dramatic sensitivity.

**Lundu** [Port.]. Rural Brazilian folk dance, originally sung during harvest celebrations. At present this form has become a kind of serenade, also known as *aribú*, that still preserves its basic African characteristics. J.O-S.

**Lur** [Dan.; pl. *lurer*]. A prehistoric Nordic trumpet of bronze, preserved (especially in Denmark) in about 50 examples dating from the 12th to 6th centuries B.C. They are in the shape of a long twisted S, ending in a flat ornamental disk, and are usually found in pairs turned in opposite directions, resembling a pair of mammoth tusks. Archaeological evidence suggests that they were used not for military purposes or signaling but in connection with a religious cult. These instruments, being almost the sole evidence of Nordic musical activity of the pre-Christian era, have been the subject of much speculation and exaggerated claims (e.g., "three-voiced harmony, 3,000 years ago" in K. Grunsky, *Der Kampf um deutsche Musik*, 1933), which are generally considered untenable today. The tone of the lur is variously described as "rough and blatant" [GD iii, 251; GDB v, 43] and (rather euphemistically) as "sanft posaunenartig" [H. J. Moser, *Geschichte der Deutschen Musik* (1930), i, 32]. See ill. under Brass instruments.

Lit.: H. C. Broholm, W. P. Larsen, and G. Skjerne, *The Lures of the Bronze Age* (1949); A. Oldeberg, in *Acta Archaeologica* xviii (1947); H. C. Broholm, *Bronzelurerne i National Museet* (1958; Eng. summ. pp. 113-23); A. Hammerich, in *VMW* x; H. Schmidt, in *Prähistorische Zeitschrift* vii (1915).

**Lusingando** [It.]. Caressing.

**Lustig** [G.]. Merry, cheerful.

**Lustigen Weiber von Windsor, Die** [G., The Merry Wives of Windsor]. Opera in three acts by Otto Nicolai (libretto by S. H. Mosenthal, after Shakespeare's play), produced in Berlin, 1849. Setting: Windsor, 15th century.

**Lustige Witwe, Die** [G., The Merry Widow]. Operetta in three acts by F. Lehár (libretto by V. Léon and L. Stein), produced in Vienna, 1905. Setting: Paris, early 20th century.

**Lute** [F. *luth*; G. *Laute*; It. *lauto*, *liuto*, *leuto*; Sp. *laúd*; L. *testudo* or *chelys*, i.e., "turtle," a humanist misnomer referring to the tortoise shell of the ancient Greek \*lyra].

I. *General*. A plucked stringed instrument with a round body in the shape of a halved pear, a flat neck with 7 or more frets, and a separate pegbox set perpendicular to the neck. The instruments of the 16th century had 11 strings in 6 \*courses, tuned (in theory) G-c-f-a-d'-g' or A-d-g-b-e'-a', with the two lowest courses doubled, sometimes in the higher octave, and the three following courses doubled in the unison. (In practice the 16th-century lute was tuned to a convenient pitch, depending on the music to be played.) In the 17th century an increasing number of bass-courses (up to six) were added, running alongside the fingerboard and therefore being unalterable in pitch. They were normally tuned F E D C, etc. About 1640 another system of tuning, introduced by the great lutenist and lute-composer Denis Gaultier (c. 1600-72), was generally adopted, A-d-f-a'-d'-f'; called *nouveau ton*, it persisted as long as the lute was used (end of the 18th century).

II. *History*. The history of the lute is unusually long and interesting. There are two main types of early lute, the long lute, with a neck much longer than the body, and the short lute, with a neck slightly shorter than the body. The former is by far the older instrument. It appears on Mesopotamian figurines dating from about 2000 B.C. From Babylon it spread to Egypt (c. 1500 B.C.) and Greece, where it was called *pandoura*. This lute had a small body covered with parchment through which the long handle penetrated [see *SaHMI*, p. 102]. The later development of the long lute took place in Persia, where it was called *setār* ("two-strings"), *cartār* ("four-strings"), or *panctār* ("five-strings"), according to the number of strings,

and in Arabia, where it was named \**tanbur*. A European offshoot of the Arabian long lute was the *colascione* of the 16th and 17th centuries [see *WoHN* ii, 125], and the Russian \**domra* (*dombra*). The Japanese *shamisen* (*samisen*) has a nearly square body with rounded corners. It is covered with skin, has a long neck, and three silk strings tuned in fourths or fifths [see Japan VI].

The short lute appears first on Persian clay figures from about 800 B.C. and on Indian reliefs from the first centuries A.D. About the latter time we find it in China, under the name \**pyiba* [Jap. *biwa*]. In these early instruments the neck is formed by the tapering body, a shape still present in the Arabic short lute of medieval times, called 'ud (or *al 'ud*, Sp. *laúd*, hence lute). The transformation into the European lute, an instrument with a distinct neck and a central sound hole (the 'ud had two crescent-shaped sound holes, like the early viols) probably took place in Spain, not very long before the 15th century. From Spain, the instrument spread to other European countries.

III. *Other types*. Numerous varieties of lute were used during the 16th and 17th centuries. The *mandola* or *mandore* had a long pegbox slightly curved and with a head-scroll reminiscent of the violin's [see *SaHMI*, p. 245; *GD* iii, 252; *GDB* v, 433ff]. A diminutive form of this instrument is the \**mandolin*. The *angelica* was a 17th-century variety with 17 different strings for the tones of the diatonic scale, so that stopping was largely avoided. During the 17th century the increasing demand for bass instruments led to the construction of archlutes [G. *Erzlaute*; It. *arciliuto*; Sp. *archilaúd*], i.e., double-neck lutes with a second pegbox that carried the bass-courses. There was a "short" archlute, the *theorbo*, and a "long" archlute, the *chitarrone*. For a third type, the *liuto tiorbato*, see *SaHMI*, p. 372.

All the instruments above have the round back characteristic of the lute. The instruments with a flat back are treated under Guitar family. Only one of them, the Spanish \**vihuela*, should be mentioned here because its musical repertory is closely allied to that of the lute [see Lute music; Lute tablature]. The \**bandora* and the smaller \**orphanion* have a peculiar scalloped shape, usually forming three lobes (somewhat like an oak leaf).

The term "lute" is also used as a generic name for a large class of stringed instruments. See Instruments IV, B.

Lutes: 1. Pyiba. 2. Biwa. 3. Tanbur. 4. 'Ud. 5. Shamisen. 6. Colascione.

# LUTE

Lutes: 7. Mandola, 8. Mandolin. 9. Lute. 10. Orpharion. 11. Bandora (pandora). 12. Theorbo. 13. Chitarrone.

Lit.: J. Zuth, *Handbuch der Laute und Gitarre* (1926); N. Bessaraboff, *Ancient European Musical Instruments* (1941), pp. 220ff; J. Jacquot, ed., *Le Luth et Sa Musique* (1958); H. Sommer, *Die Laute in ihrer musikgeschichtlichen, Kultur- und Kunsthistorischen Bedeutung* (1920); H. Farmer, *An Old Moorish Lute Tutor* (1933); W. Stauder, in *CP Osthoff*; K. Behn, "Die Laute im Altertum und frühen Mittelalter" (*ZMW* i); M. Brondi, "Il Liuto e la chitarra" (*RMI* xxxii, xxxiii); G. Kinsky, "Alessandro Piccinini und sein Arciliuto" (*AM* x).

**Lute harpsichord** [G. *Lautenclavicymbel*]. A harpsichord with gut strings instead of the usual metal strings. The tone was very much like that produced by the gut strings of the lute (the reference to "checking by a damper of cloth—*GD* iii, 115; *GDB* v, 439—is evidently a confusion with the lute-stop of the ordinary harpsichord). Such harpsichords are mentioned as early as 1511 (*Virdung*). For the description of an instrument of 1718, see *SaRM*, p. 239f. In 1740 Bach had such an instrument made for his own use, which, according to Adlung (*Musica mechanica organoedi* ii, 139) produced a sound like a theorbo or, if damped by the lute-stop, like a lute. See O. Fleischer, in *ZIM* i.

**Lute music.** Lute music, as preserved in the numerous lute books (\*lute tablatures) of the 16th and 17th centuries, forms an important repertory of early instrumental music, second only to that of the organ and harpsichord. Particularly during the 16th century, the lute was the chief instrument used at home, much as the piano is today.

The surviving literature for the lute extends from 1507 to about 1770. It begins with four books, *Intabulatura de lauto*, published by Petrucci 1507–08 (I and II by Spinaccino, III lost, IV by Joan Ambrosio Dalza), containing intabulations of vocal music, dances, and free compositions called \*ricercar and *tastar de corde* (touching of the strings). A recently discovered MS of a slightly later date (c. 1517), by Vincenzo Capirola, contains the earliest instances of signs of ornamentation and dynamic indications [see Expression marks]. Beginning in the 1530's there followed a vast number of printed books and manuscripts of Italian, French, German, Spanish, and English origin [see the long lists in

*WoHN* ii, 47, 66, 95, and H. M. Brown, *Instrumental Music Printed before 1600* (1965)]. The sources of the 16th century contain dances (*bassadanza*, \*pavane, \*calata, \*piva, \*galliard, \*passamezzo, \*saltarello, etc.), \*ricercars and \*fantasias (contrapuntal and otherwise), \*variations (many in the Spanish guitar books), and free \*preludes (called "ricercars" in the earliest Italian books), in addition to a large number of \*intabulations of vocal music (motets, chansons, etc.). The most outstanding composers are the *Italians* Alberto da Ripa (Albert de Rippe), Marco d'Aquila, Francesco da Milano, Antonio Rotta, Pietro Paolo Borrono, Giacomo Gorzanis, Vincenzo Galilei, Fabritio Caroso, and Giovanni Antonio Terzi; the *French* Attaingnant (publisher), Adrian le Roy, and Guillaume Morlaye, to whom the *Hungarian* Valentin Bacfarc (pseud. Greff) may be added; the *Germans* Arnolt Schlick, Hans Judenkünig, Hans Gerle, Hans Newsidler, Wolff Heckel, Melchior Newsidler, Matthaeus Weisselius, and Sixtus Kargel; the *English* John Johnson, Anthony Holborne, Francis Cutting, John Dowland, Daniel Bachelor, and Robert Johnson. One might also include the great *Spanish* composers (who, however, wrote specifically for the \*vihuela) Luis Milan, Luis de Narváez, Enriquez de Valderrabano, Diego Pisador, and Miguel de Fuellana.

In the 17th century, lute music persisted chiefly in France and in Germany, while Italy and Spain turned to the more popular guitar. The repertory consisted chiefly of preludes and stylized dances (allemandes, courantes, sarabandes, etc.). Whereas in the books of the early 17th century these dances are compiled separately [see Jean-Baptiste Besard, *Thesaurus harmonicus*, 1603, which is divided into ten "books," one each for preludes, allemandes, courantes, etc.], later they were arranged according to keys in groups that resemble the \*suite [e.g., Denis Gaultier's *La Rhétorique des dieux*, c. 1655; new ed. by A. Tessier]. After 1650 the center of artistic activity shifted to Germany. The suites by Esajas Reusner (1636–79) and the sonatas of Silvius Leopold Weiss (1686–1750)—the latter astonishingly like Bach in style—represent the culmination of the entire literature. J. S. Bach wrote a number of pieces for the lute (ed. by Bruger).

**Lute tablature.** (1) The notational systems used for writing down lute music during the 16th, 17th, and 18th centuries; see Tablature III, IV, V. (2) The manuscripts and books in which this notation is employed; hence, practically all the lute books of the same period [see Lute music].

**Lutherie** [F.]. The art of making lutes or stringed instruments in general. *Luthier*, the maker of such instruments, today of violins, etc.

**Luttuoso** [It.]. Mournful.

**Lydian.** (1) See under Greece II. (2) The fifth \*church mode, represented by the segment f–f' of the diatonic scale, with f as the tonic. From the modern point of view it is a major mode (F major) with the augmented fourth (B natural, Lydian fourth, i.e., tritone) instead of the perfect fourth (B-flat). Owing to the presence of the tritone f–b in prominent position, examples of pure Lydian are rare in Gregorian chant. The Antiphon "Domine tu mihi" [LU, p. 673]

is one of them [Ex. 1]. Usually, Lydian occurs in Gregorian chant as a "mixed" tonality, using the B natural (preferably for descending motion) as well as the B-flat (for ascending motion). It should be noted, however, that the modern editions of the chant have many flats not found in the original MSS [see *ApGC*, pp. 153ff]. A similar situation exists in polyphonic music from c. 1200 to 1500. Ex. 2 shows a purely Lydian passage

from a 13th-century motet [see *SchGMB*, no. 19], while Ex. 3 [c. 1470; Buxheim Organ Book] illustrates the more frequent occurrence of a tonality of mixed F-major and Lydian idioms, melodic as well as harmonic. This mixed tonality, which is very characteristic of polyphonic music prior to 1500, should not be destroyed by editorial accidentals [see *Musica ficta* (Ex. 8); Partial signature]. An especially important Lydian formula is the Lydian cadence, characterized by the presence of two leading tones, one before the octave, the other before the fifth [see Cadence, Ex. 16–18]. This was used very frequently in 14th-century music (Machaut), usually in transposition on c, g, or d. Similar formulas were used sporadically throughout the 15th and 16th

centuries. Probably the latest example is found at the end of F. Tunder's chorale variations on "Jesus Christus unser Heiland" (c. 1660), where the piled-up leading tones produce a truly dramatic final intensification [see K. Straube, *Choralsvorspiele alter Meister* (1907), p. 135]. Beethoven revived the Lydian mode in the "Dankgesang" (slow movement) of his String Quartet op. 132. As a characteristic of Slavic folksong it appeared in Chopin's mazurkas [see Modality].

**Lyra.** (1) An ancient Greek stringed instrument, similar to the \*kithara but of simpler construction, smaller, and with the soundbox usually made of tortoise shell [see ill.]. It was played with a plectrum. Instruments of the same design

Lyres: 1. Kithara (Greek). 2. Kithara (Egypt, Mesopotamia). 3. Lyra. 4. Crwth. 5. Rotta.

appear on Egyptian wall paintings from c. 1500 B.C. See H. Hickmann, *Musicologie pharaonique* (1956), pp. 158ff. In the Middle Ages the name "lyre" was adopted for several instruments only remotely like the Greek lyra, namely: (2) A medieval fiddle similar to the rebec (hence the name \*lira for a 16th-century violin; see Violin II). (3) The \*hurdy-gurdy, particularly in the names *lyra rustica* (peasant's lyra) and *lyra mendicorum* (beggar's lyra). (4) In modern German usage, the military \*glockenspiel, on account of the shape of its frame, which is similar to the Greek lyra. The "Lyra" called for in several compositions by Haydn is not the *lira da braccio* but the \*hurdy-gurdy. See also Lyre; Kithara; Crwth; *Rotta*. See H. Panum, "Harfe und Lyra im alten Nordeuropa" (*SIM* vii).

**Lyra piano** [G. *Lyraflügel*]. An early 19th-

century variety of upright piano, with a case shaped like a Greek lyre.

**Lyra viol.** See under Viol IV, 3. For ill. see under Violin.

**Lyra way.** See under Viol IV, 3 (lyra viol).

**Lyre.** As a specific instrument, see Lyra. As a generic term for a class of instruments, see Instruments IV, C, and illustration, p. 495.

**Lyric Suite.** Suite in six movements for string quartet by Alban Berg (1926). Although all of the movements are in a dissonant and \*expressionist idiom, only the first and last adhere throughout to the twelve-tone technique [see Serial music]. A subtle unity is achieved by introducing the main theme of each movement in the preceding movement.

## M

**M.** In organ music, manual or manualiter. See also Metronome.

**Maatschappij.** See under Societies II, 6.

**Macbeth.** (1) Opera in three acts and a prologue by E. Bloch (libretto by E. Fleg, after Shakespeare's play), produced in Paris, 1910. Setting: Scotland, 11th century. (2) Opera in four acts by Verdi (libretto by F. M. Piave, after Shakespeare's play), produced in Florence, 1847; rev. version (in French) in Paris, 1865. Setting: Scotland, 11th century.

**Machete.** See under Guitar family; Ukulele.

**Machicotage** [F.]. A French practice of ornamenting plainsong by inserting improvised grace notes or coloraturas between the authentic notes of Gregorian chant. The practice of *machicotage* is documented as far back as 1391 [see F. Godefroy, *Dictionnaire de l'ancienne langue française* (1961)] and continued throughout the 18th and early 19th centuries. Usually *machicotage* was used with the solo songs while the chants of the *schola* (choir) remained unadorned. The adoption of the Solesmes versions ended this practice.

**Macumba.** Secret religious ceremony accompanied by songs and dances, performed by Brazilian Negroes. It combines Christian sym-

bols with others originating in Africa and passed on by Amazon Indian tribes. The music in these ceremonies is valued for its magical powers rather than its intrinsic beauty. The term *macumba* is employed mainly in the State of Guanabara. In other states these ceremonies are known as *candomblé* (Baia), *babacué* (Pará), *tambo* (Maranhão), and also *catimbó* or *pagelança*.  
J.O.S.

**Madama Butterfly.** Opera in three acts by Puccini (libretto by G. Giacosa and L. Illica, based on a story by John L. Long and D. Belasco's dramatization), produced in Milan, 1904. Setting: near Nagasaki, Japan, about 1900.

**Madrasha.** See under Syrian chant.

**Madrigal.** Name for two different types of Italian vocal music, one of the 14th century, the other of the 16th century (to which the term more often refers). A number of etymologies of the name have been given: *mandrialis*, from *mandra*, flock (pastoral song); *materialis*, from *materia*, secular (as opposed to *spiritualis*); *matricialis*, from *mater*, mother (interpreted as "in the mother tongue," "motherly, affectionate," or "belonging to the Mother Church," hence, "of liturgical origin"); cf. *ReMMA*, p. 362; J. Wolf, in *SIM* iii and *PMA* lviii; N. Pirrotta, in *RMI* xlviii, xlix, and *MD* ix; J. Handschin,

*Musikgeschichte*, p. 207; W. T. Marrocco, in *Speculum* xxvi.

I. *The 14th-century madrigal*. As a poetic form the madrigal consists of two or, more rarely, three strophes of three lines each, which are followed by a final strophe of two lines, called \*ritornello. In each strophe, two lines rhyme with one another. The lines are usually in iambic pentameter with 7 or 11 syllables. Below is the beginning of an 8-line (3 + 3 + 2) madrigal by Petrarch as well as its complete rhyme scheme [see *HAM*, no. 49]:

Non ál so amánte piú Diána piáque  
Quandó per tál ventúra túta nuda  
La vídi in méço déle gélid' áque

I	II
... piaque	... cruda
... nuda	... vello
... aque	... chiuda

*Ritornello*  
... cello  
... gello

The subject of the madrigal is often amatory and pastoral, as in the example above: "Nor did Diana ever please her lover / So much as when through good fortune he saw her naked / In the midst of the cool waters," etc. Often the poems present fantastic images of animals or birds (white lamb, leopard, lizard, snake, falcon, white peacock) symbolic of men or women in pursuit of love.

Music for these texts was composed usually in two, sometimes in three voice-parts, in a form that closely follows that of the poetry, the same music (a) being provided for the strophes and different music (b) for the ritornello, so that the two-stanza (8-line) madrigal has the form a a b, and the three-stanza (11-line) madrigal the form a a a b (for an example of the latter, see *HAM*, no. 50, where the same music is used for the first and second lines of the ritornello, resulting in the form a a a b b). The normal form, a a b, is similar to but probably not derived from that of the French \*ballade [see also *Bar* form]. Madrigals were composed chiefly by the members of the early Italian school, e.g., Jacopo da Bologna and Giovanni da Cascia, whereas in the second half of the 14th century the madrigal was largely abandoned in favor of the \*ballata. Landini, for instance, wrote only 12 madrigals and 140 ballate.

The style of the *trecento* madrigal is best described as an ornamented \*conductus style, con-

trasting sharply with the genuinely polyrhythmic style of contemporary French music (Machaut). Its impressively designed ornamenting lines foreshadow the Italian coloraturas of the 17th century. Nonetheless, A. Schering's interpretation of the madrigal as "koloriertes Orgelmadrigal" (*SIM* xiii) is historically untenable, regarding both the implied method of "added coloraturas" and the organ as the proper medium. It is interesting to note that Landini, in his nine two-voice madrigals, adheres rather strictly to the type just described but uses a freer treatment in his three-voice examples. These are all through-composed and show French influence in their polyrhythmic texture as well as, in one instance (the wonderful "Musica son"), simultaneous use of three different texts after the fashion of the motet, the three stanzas of the poem being sung at the same time. Examples in: *WoGM* ii, iii, nos. 38-44, 47, 49, 50, 54, 55; L. Ellinwood, ‡*The Works of Francesco Landini* (1939), nos. 1-12; *HAM*, nos. 49, 50, 54; *SchGMB*, no. 22; *ReMMA*, p. 363; *AdHM* i, p. 287; *BeMMR*, p. 156. The "Madrigale" in J. Wolf, ‡*Sing- und Spielmusik aus älterer Zeit* (1931), no. 6, is a ballata.

II. *The 16th-century Italian madrigal*. As a literary type, the madrigal of the 16th century is a free imitation, without any strict form, of the 14th-century madrigal, which Italian humanists (Cardinal Bembo and his followers) used as a point of departure in their endeavors to develop a more refined poetry than that of the previous period (\*frottola, \*strambotto). Although these attempts were not very successful from the literary standpoint, the movement was a great stimulus to musical activity. The musicians of the early 16th century, at first Netherlands composers working in Italy (Verdelot, Willaert, Arcadelt), cooperated with the poets in order to achieve a new style of artistic refinement and expression. Naturally, they did not take their cue from 14th-century music, which was entirely forgotten. In fact, it was only the literary bond that justified the use of the old name for the new compositions. As a musical composition the madrigal of the 16th century is an outgrowth of the *frottola*, more specifically, the *canzona* [see *Canzona* (4)]. Indeed, the style of the earliest madrigals, published in *Madrigali de diversi Musici* of 1530 (including pieces by Verdelot, Carlo, C. and S. Festa, et al.), differs little from that of the late *frottole* (1531; cf. *SchGMB*, nos. 72 and 98).

The development of the madrigal in Italy is usually divided into three phases. (a) *The early*

*madrigal*: Philippe Verdelot (d. c. 1550), Costanzo Festa (c. 1490–1545; the first Italian composer of madrigals), Jacob Arcadelt (c. 1505–c. 1560). The style is, in spite of considerable imitation, prevailingly homophonic; the writing is in three or four parts; the expression is quiet and restrained. (b) *The classic madrigal*: Adrian Willaert (properly intermediate between a and b), Cipriano de Rore, Andrea Gabrieli, Orlando di Lasso, Philippe de Monte, Palestrina (publications 1550–80). Here the writing is in four to six (usually five) parts and the style is more genuinely polyphonic and imitative, approaching that of the contemporary motet, the expression being more intense and closely allied to the text in meaning as well as pronunciation. A collateral type of this period is the *madrigale spirituale*, intended for devotional use (e.g., by Palestrina; compl. ed., vol. xxix). (c) *The late madrigal*: Luca Marenzio, Carlo Gesualdo, Claudio Monteverdi (publications 1580–1620). Here, the development leads to a highly elaborate type of music, even exaggerated and mannered, manifesting all the experimental tendencies of the *fin de siècle*—chromaticism, word-painting, coloristic effects, declamatory monody, virtuosity of the vocal soloist, dramatic effects. Particularly important is the fact that, at this late date, the madrigal was flexible enough to drop its traditional polyphonic texture and adapt itself to the new monodic style. The transition is particularly apparent in the madrigals of Monteverdi, whose books i, ii, iii, and iv (1587, '90, '92, 1603) are purely polyphonic and *a cappella*, whereas in the following books (v, 1605; vi, 1614) the style becomes increasingly soloistic and the accompaniment often requires *basso continuo*; book vii, called *Concerto* (1619), is entirely in *stile rappresentativo* with *basso continuo*. Caccini's *Nuove musiche* of 1602 contains "madrigals" for solo voice that are through-composed, in contrast to his strophic "arias" [see *Aria II*].

III. *The English madrigal*. Outside Italy, the madrigal was cultivated chiefly in England. A few isolated pieces such as Richard Edwards' "In Going to My Naked Bed" (composed not later than 1564) make it probable that the influence of the Italian madrigal was felt in England shortly after 1550. William Byrd (1543–1623) seems to have been the first English composer to grasp fully the importance of the madrigal [see Editions XVI, 14, 15]. He, together with Thomas Morley (1557–1602), represents the earlier period of the English madrigal, whose style corresponds to a certain extent to that of the second

Italian school. Nevertheless, the English madrigal soon acquired native characteristics resulting from the peculiarities of the English language, the frequent use of false relations and other harmonic acerbities, and a propensity for an unmistakably English touch of merriment or melancholy. The *Musica Transalpina* (a collection of Italian madrigals provided with English text, published by N. Yonge in 1588, a few months after the appearance of Byrd's first book) gave the movement new impetus and a different direction. The younger Englishmen, notably Thomas Weelkes and John Wilbye, leaned further toward Italy and exploited the innovations of Marenzio and Gesualdo, though somewhat more conservatively. The English madrigals appeared under a variety of names, such as Song, Sonet, Canzonet, and Ayre. See Editions XVI.

IV. *Other countries*. In Germany, the influence of the madrigal appears to some extent in the works of Le Maistre, Scandello, Regnart, and Lasso [see *Lied II*], all foreigners, a fact that may account for the failure of the madrigal to attain the artistic significance it achieved in Italy or England. Hans Leo Hassler [*DTB* 20] is the outstanding German madrigalist, although many of his madrigals have Italian texts. Spanish madrigals were published by Pedro Vila (1561), Juan Brudieu (1585), and Pedro Rimonte (Ruimonte; 1614) [see *LavE* i.4, 2015ff].

**Madrigal comedy.** Modern designation for a late 16th-century type in which an entire play [It. *commedia*] was set to music in the form of madrigals and other kinds of contemporary polyphonic vocal music. Among the first and most famous examples is *L'Amfiparnaso* by Orazio Vecchi (performed in Modena, 1594; printed 1597). It has been suggested that the inner contradiction between the ensemble character of the music, which is in five parts throughout, without instrumental accompaniment, and the soloistic demands of a theatrical performance was resolved by a strange compromise: when the plot called for single characters, the singers of the other parts were made to sing behind a curtain. This surmise, however, is unlikely, not only for practical considerations but because Vecchi states expressly in the Preface that this spectacle (*spettacolo*) appeals to the imagination (*mente*) through the ear (*orecchie*), not the eye (*occhi*). *L'Amfiparnaso*, therefore, is not, as has been alleged, a pre-operative type, but an idealized presentation of a loosely knit dramatic plot, somewhat comparable to the presentation of an oratorio. The plot is more clearly outlined here than in other, similar works by Vecchi—the *Selva di varia ricreatione* (1590), *Convito musicale* (1597), and *Le Veglie di Siena* (1604)—each of which, however, includes a number of dramatic "scenes." *L'Amfiparnaso* is a mixture of comic and sentimental portions. Alessandro Striggio's *Il Cicalamento delle donne al bucato* (The Babbling of the Women on Washday, 1567) may be considered a predecessor of the former, and Simone Balsamino's *Novelletta* (after Tasso's *Aminta*, printed 1594) of the latter. Other models exist in the *greghesche* of Andrea Gabrieli and other Venetian composers. Imitators of Vecchi included, among others, Adriano Banchieri [ex. in *HAM*, no. 186].

Lit.: E. J. Dent, in *SIM* xii; A. Heuss, in *SIM* iv, 175, 404. Republications of *L'Amfiparnaso* and other madrigal comedies in \*Editions III, 4, and XLVII, 26; also by Perinello (fac. and transcr., 1938).

A.E.

**Madrigalism.** A term commonly used for word-painting and related devices, such as are found particularly in the madrigals of Luca Marenzio.

**Maestoso** [It.]. Majestic.

**Maestro.** Honorary title for distinguished teachers, composers, and conductors.

**Magadis.** An ancient Greek harp, which seems to have had ten pairs of strings, each pair consisting of the fundamental and its octave. The term "magadizing" is sometimes used to describe singing in octaves, which is considered by some writers the "beginning of polyphony."

**Magelone Romances.** See *Romanzen aus L. Tieck's Magelone*.

**Maggiolata** [It.]. Popular song for the month of May. For 16th-century examples composed in the style of the \*villanella, see A. Bonaventura, in *RMI* xxiv; F. Ghisi, *Musique et poésie au XVI<sup>e</sup> siècle* (1954), s.v. "Maggiolata."

**Maggiore** [It.]. Major key.

**Magic Flute, The.** See *Zauberflöte, Die*.

**Magnificat.** The \*canticle of the Virgin, text ("Magnificat anima mea Dominum," My soul doth magnify the Lord) from Luke 1:46-55. It consists of twelve verses, including the \*Doxology at the end. In the Roman Catholic rites it is sung at the Office of Vespers by alternating choruses to one of eight *toni*, recitation chants similar to the psalm tones [see *LU*, pp. 207ff], in connection with an antiphon (Magnificat antiphon) that is usually somewhat more elaborate in style than the psalm antiphons. See O antiphons.

From the 15th through the 18th centuries the Magnificat was frequently set, for voices or for organ. Aside from an English 14th-century setting, the earliest composers of the Magnificat were Dunstable, Dufay, and Binchois. Each of them composed the entire text, including the Doxology at the end, using one or the other of the Magnificat tones. Thus, Dunstable wrote a *Magnificat secundi toni* (\*Editions XXXIV, 8, p. 95); Binchois, Magnificats in tones 1, 2, 3, 4 [see J. Marix, *Les Musiciens de la cour de Bourgogne*, p. 131ff; no. 2 also in *SchGMB*, no. 43]; Dufay, in tones 1, 3, 5, 6, 8 [two in *DTO* 14/15, 169ff]. After 1450 it became customary to compose only the even-numbered verses, the others being sung in plainsong. This practice of alternating occurs in Obrecht (comp. ed. by J. Wolf) and in the numerous Magnificats preserved in the Eton MS from about 1500, and was generally adopted by 16th-century composers such as Senfl, Lasso, Palestrina, J. de Kerle, Le Maistre,

Mahu, and Morales, who often wrote complete sets of Magnificat verses, usually six for each of the eight tones. Later composers of the Magnificat are Schütz, S. Bernardi (*DTO* 69), R. Ahle (*DdT* 5), and J. S. Bach, who composed it as a cantata.

The alternating method of composition, applied to the eight tones, was also used by organ composers. Such Magnificat \*versets for the organ occur in Attaignant's *Magnificat sur les huit tons* (1531; \*Editions XLIX, 1); G. Cavazzoni's *Intavolatura* (1543); A. de Cabezón's *Obras de música* (1578); J. Titelouze's organ works (\*Editions I, 1); J. E. Kindermann's *Harmonia organica* (1645; *DTB* 32); and J. K. Kerll's *Modulatio organica* (1686). J. Pachelbel's 95 Magnificat fugues (*DTO* 17) are essentially free compositions (not based on the plainsong *toni*), which seem to have served primarily as intonations (preludes), not as versets proper.

The Magnificat in English translation ("My soul doth magnify the Lord") was taken over into the Anglican \*Service, where it forms a part of the Evening Prayer. The Magnificat, set to the melody of the *tonus peregrinus* [see Psalm tones], was used for organ chorales by Scheidt, Pachelbel, J. S. Bach, and others.

Lit.: C.-H. Illing, *Zur Technik der Magnificat-Komposition des 16. Jahrhunderts* (1936); J. Meinholz, "Untersuchungen zur Magnificat-Komposition des 15. Jahrhunderts" (diss. Cologne, 1956); J. Schmidt-Görg, in *Gesammelte Aufsätze zur Kulturgeschichte Spaniens* v (1935; Gombert); T. W. Werner, in *AMW* ii (Adam Renner); H. Osthoff, in *AMW* xvi (Josquin); E. R. Lerner, in *MQ* 1 (15th-cent. Italy); G. Reese, in *JAMS* xiii.

**Magnum opus musicum.** Title of a publication containing 516 compositions (motets) of O. di Lasso (1532-94), published in 1604 in six volumes by his sons.

**Magnus liber organi** [L.]. According to Anon. IV (CS i, 342), title of the collection of two-voice organa for the entire ecclesiastical year written c. 1175 by Leoninus, with additions and modifications by his successor Perotinus (c. 1200; see *Ars antiqua*). The full title was "Magnus liber organi de gradali et antiphonario pro servitio divino multiplicando." The complete collection includes 59 pieces for the Mass ("de gradali") and 34 pieces for the Office ("de antiphonario"), all composed "to enrich the divine service." Three 13th-century MSS from Florence and Wolfenbüttel contain the "Magnus liber organi"

in a more or less complete form, together with numerous other pieces (three- and four-voice organa, clausulae, conductus, motets). A list based on the collection in the Florentine Codex (Florence, Bibl. Laur. *plut.* 29.i [F]) is given in F. Ludwig, *Repertorium organorum... et motetorum*, rev. ed. (1964), pp. 65–75, where the letters O and M refer to the pieces for the Office and the Mass respectively [see *ApNPM*, pp. 201, 230n]. The Leoninus collection is transcribed in W. G. Waite, *The Rhythm of Twelfth-Century Polyphony* (1954). See *Ars antiqua*; Mass B; Organum IV; Square notation; Sources, no. 3. Also see W. G. Waite, in *JAMS* xiv; H. Husman, in *JAMS* xvi; *id.*, in *MQ* xlix.

**Magrepha.** An organ of the ancient Hebrews, used in the last period of the Third Temple as a signaling instrument. See J. Yasser, in *JAMS* xiii.

**Magyar music.** The indigenous folk music of \*Hungary.

**Maid as Mistress, The.** See *Serva Padrona, La*.

**Main** [F.]. Hand. *Main droite* (*gauche*), right (left) hand. *À deux* (*trois, quatre*) *mains*, for two (three, four) hands.

**Maîtres musiciens de la renaissance française, Les.** See Editions XXV.

**Maîtrise** [F.]. The choir school and choir of a French church. These institutions, which date from the 15th century if not earlier, were under the direction of a “maître de chapelle” and provided board as well as education, both general and musical. In organization and purpose they resembled the *conservatorii* of Italy. During the French Revolution (1791) they were suppressed and replaced by the *conservatoires*. Today the name means simply “church choir.”

**Majeur** [F.]. Major.

**Major, minor** [F. *majeur, mineur*; G. *Dur, Moll*; It. *maggiore, minore*; Sp. *mayor, menor*]. Terms used (1) to distinguish intervals, e.g., major second (c–d), and minor second (c–d<sup>b</sup>) [see Interval]; (2) for two types of scale, triad, or key, which are distinguished mainly by their third, this being a major third (c–e) in the major scale (triad, key) and a minor third (c–e<sup>b</sup>) in the minor scale (triad, key). The major scale is the same ascending and descending [Ex. 1]. The descending minor scale, however, has a flattened seventh (b<sup>b</sup>) and sixth (a<sup>b</sup>) in addition to the flattened third of the ascending scale [Ex. 2]. The justification for this is that, without the flattened seventh and

sixth, the descending minor scale would sound like a major scale until its sixth tone was reached. Since the minor scale just described rests on melodic considerations (upward and downward movement), it is called “melodic minor scale.” There is another minor scale that, ascending as well as descending, combines the flattened sixth with the unaltered seventh [Ex. 3]. This scale is called the “harmonic minor scale” because it is built from the tones contained in the three main harmonies of the minor key [Ex. 5].

A key is called “major” or “minor” according to whether it is based on the major or minor scale. In the major key, the three main triads, tonic (T), dominant (D), and subdominant (S; see Scale degrees), are all major triads [Ex. 4]. In a minor key, T and S are minor, D is major [Ex. 5]. See also Mode.

The definite establishment of major and minor as the tonal basis of music took place during the 17th century [see Harmony II, B (6)]. Prior to this, music was based on the church modes, all of which differ from major or minor in some of their degrees. Glareanus’ enlarged system of twelve modes (\**Dodecachordon*, 1547) is usually considered the first theoretical system including both major and minor, the former in his Ionian (diatonic scale on c), the latter in his Aeolian (diatonic scale on a). Actually, the latter differs from minor mainly in that it does not have the leading tone (g<sup>#</sup>). Zarlino seems to have been the first to recognize that there are only two modes, one with the major third, the other with the minor third (*L’Istitutioni harmoniche*, 1558; see R. W. Wienpahl, in *JAMS* xii, 30). In musical practice the situation was quite different. Particularly in monophonic music it is not difficult to find 12th- and 13th-century examples of major melodies, by the troubadours, trouvères, or minnesingers, either on c (*HAM*, nos. 19b, d, 20a), on f with b-flat (*HAM*, no. 19e), or on g (*HAM*, no. 17b). Their number is greatly increased if, as in many modern editions, editorial accidentals are added, resulting in leading tones

such as f♯ to g. A Dorian melody can easily be changed into D minor by the addition of sharps (for c) and flats (for b). Whether or not such changes are admissible is another question. The same statement applies, *a fortiori*, to polyphonic music, in which another problem arises, i.e., whether or not "modal harmonies" (extensive use of the II, III, VI degrees) are compatible with major or minor. Examples in point are the two-part *ductiae* reproduced in *HAM*, no. 41, or the famous \*"Sumer is icumen in." A definite trend toward a major-type of melody and harmony is noticeable in the works of Dunstable and Dufay (*HAM*, nos. 62, 65). It may be noted, however, that often a composition beginning in C major will close in a different tonality, e.g., D minor (*HAM*, no. 62). In the 16th century, particularly during the second half, most compositions were written in an idiom that, aside from the occasional use of modal progressions, is very close to either major or minor. See also Tonality.

Sachs, "The Road to Major" (*MQ* xxix); A. H. Fox Strangways, "The Minor Chord" (*ML* iv, 26); Dom J. Jeannin, "Etude sur le mineur et le majeur" (*RMI* xxii); H. J. Moser, "Die Entstehung des Durgedankens, ein kulturgeschichtliches Problem" (*SIM* xv).

**Malaguena** [Sp.]. According to available information, term for three different types of southern Spanish folk music, all localized in the provinces of Malaga and Murcia: (1) Usually a local variety of the \*fandango. (2) A type of highly emotional song, in free style and rhythm [see *LavE*, 1.4, 2390]. (3) An older type of dance music, based on the ostinato-like repetition of the harmonies VIII-VII-VI-V (in minor), played in parallel triads and with an improvised melody on top; thus, a passacaglia on the descending tetrachord, like those written frequently during the 17th century [see Chaconne and passacaglia, Ex. 2].

**Malincònico** [It.]. Melancholy.

**Mamelles de Tirésias, Les** [F., The Bosom of Tirésias]. Musical farce in two acts and a prologue by F. Poulenc (libretto by G. Apollinaire, after his play), produced in Paris, 1947.

**Ma Mère Poye** [F., Mother Goose (*Suite*)]. Suite by M. Ravel based on fairy tales by C. Perrault (1678-1703). Originally written (1908) for piano

duet, it was scored for orchestra by Ravel and produced as a children's ballet in 1915.

**Man.** Abbr. for \*manual.

**Manche** [F.]. Neck of the violin, etc.

**Mandola, mandora.** See under Lute III.

**Mandolin.** The most recent instrument of the lute family and the only one in general use today, chiefly in southern Italy. The Neapolitan mandolin has four double courses (eight steel strings) tuned g d a e. It is played with a plectrum of tortoise shell or another flexible material. The tones are rendered as a sustained tremolo, which is produced by a quick vibrating movement of the plectrum. See ill. under Lute. The mandolin has been used occasionally in art music, e.g., in Handel's oratorio *Alexander Balus* (1748), Grétry's *L'Amant jaloux* (1778), G. Paisiello's *Il Barbiere di Siviglia* (1782), Mozart's *Don Giovanni* (1787), Verdi's *Otello* (1887), Mahler's Symphony no. 7 (1908), and four pieces by Beethoven for mandolin and piano (two in suppl. vol. of B.-H. ed.; see also *BSIM* viii, no. 12, p. 24). More recent works using the mandolin include Schoenberg's *Serenade* op. 24, Webern's *5 Stücke für Orchester* op. 10, and Stravinsky's *Agon*.

Boss, *Die Mandolinmusik vor und nach dem (Welt-) Kriege im In- und Auslande* (1924); J. Zuth, "Die Mandolinhandschriften in der Bibliothek der Gesellschaft der Musikfreunde in Wien" (*ZMW* xiv); G. de Saint-Foix, "Un Fonds inconnu de compositions pour mandoline" (*RdM* 1933, p. 129).

**Maneria** [L.]. A term used by some 12th-century writers on plainsong (Guido of Cherlieu; see *CS* ii, 157a) to denote the \*church modes in their authentic as well as plagal variety. Thus there are four *maneriae*: *protus*, *deuterus*, *tritus*, and *tetrardus*. The term is very useful in connection with melodies that, because of their limited or excessive ambitus, cannot be classified as either authentic or plagal. See *ReMMA*, p. 153; *ApGC*, p. 135.

**Maneries** [L.]. A 13th-century term for *modus*, i.e., rhythmic \*mode, mentioned by Garlandia (*CS* i, 175), Pseudo-Aristotle (*CS* i, 279), and Anon. IV (*CS* i, 327).

**Manfredina.** See Monferrina.

**Mangulina** [Sp.]. A traditional dance that was popular in the Dominican Republic c. 1855. It is said to have evolved from the Spanish \**zortziko*, which was in 5/4 and 5/8 meter. Nevertheless, most of the examples preserved and occasionally still performed today show a closer connection with either the Spanish \**seguidilla* or the \**mui-ñeira*. Many composers, among them Esteban Peña Morell (1897–1939) and Juan Francisco García (b. 1892), have employed the *mangulina* in art music. J.O.-S.

**Manica** [It.]. Shift of position in violin playing.

**Manico** [It.]. Fingerboard of the violin, etc.

**Manicordion, manichord**. A 16th-century name for \*clavichord.

**Maniera** [It.]. A 16th-century term used by numerous theorists to denote the aesthetic basis of contemporary musical composition. See L. Schrade, in *ZMW* xvi.

**Manieren** [G.]. An 18th-century name for ornaments of restricted melodic range, approximately equivalent to \**agrément*.

**Männergesangverein** [G.]. Male choral society in Germany, similar to the American \*Apollo Club and the French \*Orphéon.

**Mannheim school**. An important group of German composers of the mid-18th century, centered at Mannheim and associated with the orchestra of Karl Theodor (1724–99), Elector of Pfalzbayern (Palatinate), hence also known as *Pfalzbayerische Schule*. Johann Stamitz (1717–57), who joined the orchestra in 1745 and soon became its conductor, inaugurated an entirely novel style of orchestral music and performance, thereby laying the foundation for the symphonic style of the Viennese classical school during the same period when the tradition of baroque music culminated in the late works of Bach and Handel. Conspicuous features of the new style were: melodic prominence of the violins in an essentially homophonic, noncontrapuntal texture; abandonment of imitation and fugal style; presto character of the quick movements; use of dynamic devices such as extended crescendos and unexpected fortes and fortissimos; complete rests (\**Generalpausen*); a novel type of subject and figure that quickly rise over a wide range, usually in broken chords, the so-called *Raketen* [G., rockets, Roman candles]; orchestral effects such as the tremolo and broken chords in quick notes; replacement of thoroughbass accompani-

ment by written out orchestral parts. Johann Stamitz' activity was continued by Ignaz Holzbauer (1711–83; came to Mannheim in 1753), Franz Xaver Richter (1709–89; came to Mannheim in 1747), and a younger generation including Anton Filtz (1730–60), Franz Beck (1723–1809), Christian Cannabich (1731–98), and Johann Stamitz' sons Karl Stamitz (1745–1801) and Anton Stamitz (1754–1809).

The importance of the Mannheim composers lies in their historical position as forerunners of the classical period rather than in the intrinsic value of their works. The symphonies of Johann Stamitz, typical products of a single-minded innovator, are artistically even less satisfactory than those of the later Mannheimers, who turned from Stamitz' fragmentary and incoherent mosaic style (somewhat like that of Domenico Scarlatti) to a more continuous and melodic manner, which, however, is not free from the sentimentalities of the gallant style and which, needless to say, is inferior to that of their noted contemporaries, Haydn and Mozart. Mozart's father referred to the extravagant novelties of this school as the "vermanirierte Mannheimer goût" (the mannered Mannheim taste).

The importance of the Mannheim school as the founders of the modern symphony and chamber music was strongly emphasized by their discoverer, H. Riemann. More recently his claims to precedence and superiority have been challenged by other historians who have pointed to similar tendencies in Vienna (Georg Monn, 1717–50; Georg Wagenseil, 1715–77; see G. Adler in preface to *DTO* 31), Italy [see F. Torrefranca, *Le Origini italiane del romanticismo musicale*, 1930], and Bohemia [see V. Helfert, in *AMW* vii]. No doubt the novel ideas of style and form were "in the air" about 1740, and a great many musicians, among whom G. B. Sammartini (1701–75) deserves particular mention, worked in the same direction, laying the foundation for Haydn, Mozart, and Beethoven. Perhaps some of the contradictory claims can be settled if a clearer distinction is made between the various features of the classical sonata or symphony. The early Viennese composers were definitely much more advanced than the Mannheimers in the establishment of the formal principles of the sonata. On the other hand, the importance and true meaning of the new principles of symphonic style [see the description above] were more clearly understood in Mannheim than elsewhere, probably owing to the

favorable conditions there. See also Sonata III; Sonata form; Symphony II.

**Manon.** Opera in five acts by Massenet (libretto by H. Meilhac and P. Gille, based on Prévost's novel, *Histoire de Manon Lescaut*), produced in Paris, 1884. Setting: France, early 18th century.

**Manon Lescaut.** Opera in four acts by Puccini (libretto in Italian by M. Praga, P. Oliva, and L. Illica, based on Prévost's novel), produced in Turin, 1893. Setting: France and Louisiana, early 18th century. (Also, an opera by Auber.)

**Manual.** On the organ, any of the keyboards provided for the hands, as opposed to the pedal [see Organ III]. The two keyboards of the harpsichord are also distinguished as first and second manual. *Manualiter* means playing with the hands only.

**Manualkoppel** [G.]. Manual coupler; see Organ IV.

**Manubrio** [It.]. The knobs and handles of the organ stops.

**Manus musicalis** [L.]. \*Guidonian hand.

**Maqam** [Arab.; pl. *maqamat*]. See under Arab music; Melody type.

**Maraca.** A gourd or calabash shell shaker filled with dry seeds, typical of the Caribbean countries but known throughout Latin America under different names, such as *alfandogue*, *carángano*, *guazá* (Colombia); *asson*, *tcha-tcha* (Haiti); *bapó*, *caracaxá* (Brazil); *chinchin* (Guatemala); *dadoo* (Venezuela); *huada* or *wada* (Chile); *Maruga* (Cuba); *nasisi* (Panama); *sonajas* (Mexico). It is often used in pairs. J.O.S.

**Marcando, marcato** [It.]. Marked, stressed.

**Marcellus Mass.** A famous Mass by Palestrina, named after Pope Marcellus II (*Missa Papae Marcelli*) and long thought to have played a decisive role at the \*Council of Trent. The work is exceptional among Palestrina's Masses because it is almost completely in homorhythmic (note-against-note) style, resulting in a clearly audible declamation of the text. According to recent research (Jeppesen, in *AM* xvi-xvii, 38) it was composed 1562-63, long after the death of Marcellus, who ruled for only three weeks in 1555. During his short pontificate Marcellus instructed the singers of the papal choir to sing so that the words could be clearly understood, and this probably explains the name of the Mass. See K. Jeppesen, in *CP Adler* and *AM* xvi-xvii.

**March.** Music originally designed to promote orderly marching of a large group, especially of soldiers. Marches are generally in simple, strongly marked rhythm and regular phrases. The standard form, derived from the minuet-with-trio, is that of a march repeated after one or several trios of a more melodious character: M T M, or M T M T M. Military marches can be divided into four categories: (1) funeral march; (2) slow march—75 steps per minute, 2 steps per bar; (3) quick march—108 to 128 beats per minute; (4) double-quick march—140 to 160 beats per minute. In the United States the standard military march is the quick march, the finest examples having been written by John Philip Sousa, known as "the March King."

The earliest traces of the march as an art form are the numerous \*battaglias of the 16th century. William Byrd wrote a "Battell" (in *My Ladye Nevells Booke*; see Virginal music) consisting of "The March of Horsmen," "The March of Footemen," etc., as well as "The Earle of Oxfords Marche" (in *The Fitzwilliam Virginal Book*, no. cclix). Many examples of march music, usually dignified and ceremonial rather than military in character, are found in the operas of Lully, Handel, etc. (Handel's *Scipione*

contains a march that is to the present day the parade march of the British Grenadier Guards.) There are three charming little marches—probably not by Bach—in the *Klavierbüchlein für Anna Magdalena Bach* of 1725. Similar pieces occur in the suites of J. P. Krieger, J. K. F. Fischer, etc. Mozart used two different types of march music in *Figaro* (“Non più andrai”) and *The Magic Flute* (March of the Priests). The movement “Lebhaft. Marschmässig” in Beethoven’s Sonata op. 101 is a superb example of stylization. Schubert’s *Marches militaires* deserve mention for their admirable variety and ingenuity. The processional march of Wagner’s *Die Meistersinger* is a distinguished example of the numerous marches in 19th-century opera. A special type is the funeral march (*marcia funebre*), of which well-known examples occur in Beethoven’s *Eroica* and Wagner’s *Götterdämmerung*. Among modern composers of marches are Barber (*Commando March*), Shostakovich (“Festive Overture” op. 96), Prokofiev, Hindemith, Vaughan Williams, and Stravinsky. Also see Band; Military music.

Farmer, *The Rise & Development of Military Music* [1912]; G. Kandler, *Deutsche Armeemärsche* (1962); W. C. White, *A History of Military Music in America* (1945); K. Strom, “Beiträge zur Entwicklungsgeschichte des Marsches” (diss. Munich, 1926).

**Marcha** [Sp.]. In Spain, term used essentially for music designed to accompany marching groups [see March], but in Latin America, name for various kinds of folk dance, in fast or slow tempo and in major or minor mode or following Indian scale patterns. In Brazil the *marcha* is essentially a carnival dance whose steady rhythms are occasionally broken by Afro-Brazilian syncopation. In Haiti the *marche* [F.] is an urban dance considerably more ardent and intense than examples from other places. In Central America the *marcha* is halfway between a military march and a street dance.

J.O-S.

**Marche** [F.]. \*March. Also see under *Marcha*. *Marche harmonique*, F. for \*sequence I.

**Marcia** [It.]. \*March. *Marcia funebre*, funeral march. *Alla marcia*, in the manner of a march.

**Mariachi** [Sp.]. Mexican ensemble of folk musicians, composed of two violins, *jarana* (guitar), *arpón* (harp), and *guitarrón* (large guitar). The

number of players is variable, ranging from groups of four players to the size of a regular band. The word *mariachi* or *mariache* is also used for a single folksinger.

J.O-S.

**Marian antiphon**. Name used for the antiphons B.M.V.; see Antiphon (2).

**Marimba**. An African and Central and South American \*xylophone, consisting of a number of wooden plates of different size and thickness. Underneath the plates are resonators made of gourds. The instrument has been modernized (first by Sebastián Hurtado of Guatemala c. 1895) and is now made with bars of hardwood of uniform thickness and with tuned tubular metal resonators, encompassing up to six or seven octaves. Of warm and mellow tone, it is played with rubber- or felt-headed mallets, often by two to five players. Marimba concertos have been written by Creston (1940) and Milhaud (1949). For ill. see under Percussion instruments.

The marimba is especially popular in Central America and is considered the national instrument of Guatemala, where marimbas of all sizes are made, ranging from those played by a single player to models so large as to need seven players. Sounds produced by the Dominican marimba are low enough to be employed as the bass in the \**merengue* and other dances.

Lit.: V. Chenoweth, *The Marimbas of Guatemala* (1964); D. Vela, *La Marimba: estudio sobre el instrumento nacional* (1962); S. F. Nadel, *Marimba-Musik* (1931); S. N. Coleman, *The Marimba Book* (1930).

add. by J.O-S.

**Marimbaphone**. Several varieties of marimba, designed and made by J. C. Deagan of Chicago between 1915 and 1920. Percy Grainger prescribed them in his suite *In a Nutshell* (1916).

**Marinera** [Sp.]. Dance form that is an offspring of the Chilean \**cueca*, which was very popular in Peru before the War of the Pacific between the two countries (1879–84). At that time it was known in Peru as *chilena*. The name *marinera* was adopted about 1880 in homage to the marines who fought in the war. On the northern coast of Peru the dance is known as *tondero*.

J.O-S.

**Marine trumpet**. See Tromba marina.

**Marizápalos** [Sp.]. According to J. Pena and H. Anglés (*Diccionario de la música labor*, 1954), a popular song (17th-century?) of Spain. Three MSS of c. 1700 (Municipal Lib. of Oporto, Portugal, no. 1577, Loc. B, 5; Martín y Coll, Bibl.

nat., Madrid, *M-1358*, ff. 74<sup>v</sup>–75<sup>v</sup>, and *M-1359*, pp. 584–87) contain three *marizápalos* for keyboard, all of which have a bass similar to that of the \*folia.

**Markiert** [G.]. Marked, stressed.

**Markig** [G.]. Vigorous.

**Marqué** [F.]. Marked, stressed.

**Marriage of Figaro, The.** See *Nozze di Figaro, Le*.

**Marsch** [G.]. \*March.

**Marseillaise, La.** See under National anthems.

**Martelé** [F.]. A special method of violin bowing; see Bowing (c). *Martellando*, *martellato* [It.] means either the *martelé* of the violin or a somewhat similar technique of piano playing in which the hands act like hammers, usually in rapidly alternating octaves.

**Martellement** [F.]. In the 17th century, a \*mordent performed on stringed instruments. In the 18th century, a mordent or a short trill preceded by a long appoggiatura.

**Martha.** Opera in four acts by F. von Flotow (libretto by F. W. Riese), produced in Vienna, 1847. Setting: Richmond, England, about 1710.

**Martyrion.** See under Byzantine chant III.

**Mascherata.** See under Villanella.

**Masculine, feminine cadence.** A cadence or ending is called "masculine" if the final chord of a phrase or section occurs on the strong beat [Ex. 1] and "feminine" if it is postponed to fall on a weak beat [Ex. 2, 3]. The masculine ending

must be considered the normal one, while the feminine is preferred in more romantic styles. Feminine endings appeared for the first time about 1600, becoming one of the various novel features of the baroque era. One of the earliest examples is a "Sarabrand" by Gibbons [see Ex. 2 above; see M. H. Glyn, *Orlando Gibbons 1583–1625, Complete Keyboard Works*, vol. ii]. It may well be this novel feature to which Shakespeare alludes in his famous line: "That strain again, it had a dying fall." Feminine endings are common

in Froberger and are a typical feature of the \*polonaise. Beethoven showed a marked preference for feminine endings in his late works.

**Masked Ball, A.** See *Ballo in maschera, Un*.

**Masque, mask.** A stage production of the 16th and 17th centuries, designed for the entertainment of the nobility and combining poetry, vocal and instrumental music, dancing, acting, etc., lavishly applied to the presentation of mythological and allegorical subjects. The masque originated in Italy and France, where members of the court played an active part in their preparation as well as performance. B. de Beaujoyeulx's famous *Balet comique de la Royne* [see Ballet I], performed in the Louvre in 1581, was one of the first plays with a unified plot that continued through all scenes.

The masque was introduced into England during the 16th century and remained in great favor during the 17th century. The best-known writer of masques was Ben Jonson, who from 1605 to 1631 provided them for the court. A specialty of his plays was the "antimasque," i.e., intermediate scenes of a grotesque character (similar to the operatic \*intermezzo). The earliest known composers of music for masques are Thomas Campion (1567–1620), Alfonso Ferrabosco II (1575–1628), Robert Johnson (c. 1583–c. 1633), and John Coperario (c. 1570–1627). Whereas the music for these masques consists of \*ayres and *balletti*, later composers, such as Nicholas Lanier (1588–1666), Henry Lawes (1596–1662), and William Lawes (1602–1645), introduced the *stile recitativo*. Henry Lawes wrote the music to Milton's masque *Comus*, produced in 1634 [repub. by the Mermaid Society, 1904; ex. in *HAM*, 204]. After the civil war (c. 1660) opera gradually superseded the masques, which deteriorated into mere fancy-dress balls. A late revival was *Frey's Gift*, text by J. Oxenford, music by G. A. Macfarren, which was produced at the wedding of Edward VII (1863). See Opera VI.

**Mass** [F. *messe*; G. *Messe*; It. *missa*; L. *missa*; Sp. *missa*]. The most solemn service of the Roman Catholic Church, representing the commemoration and mystical repetition of the Last Supper. The name is derived from the words "Ite, missa est (congregatio)"—literally, "Depart, the congregation is dismissed"—sung at the end of the service [see, e.g., *LU*, p. 19]. The discussion following refers to the full form known as High Mass [see *Missa solemn*], as opposed to the \*Low Mass. Liturgically, the Mass falls into two parts, the Mass of the Catechumens and the Mass of the Faithful; the former ends with the Gospel, while the latter goes from the Offertory to the end. (The Credo, a later addition, belongs to neither.)

A. *The Mass in Gregorian chant*. The Mass consists of a number of items whose texts vary from day to day (Proper of the Mass, *proprium missae*) and others having the same text in every Mass (Ordinary of the Mass, *ordinarium missae*). Another classification can be made according to whether an item is (a) recited to a \*monotone or spoken, or (b) sung to a distinct melody. The former category is entrusted to the celebrant priest and his assistants, the latter to the choir (*schola*). The following table shows the normal structure of the Mass, with the items classified under four categories: Ia, Proper sung; Ib, Ordinary sung; IIa, Proper recited (or spoken); IIb, Ordinary spoken.

Sung		Recited or Spoken	
Ia Proper	Ib Ordinary	IIa Proper	IIb Ordinary
1. Introit	2. Kyrie 3. Gloria	4. Collect 5. Epistle	
6. Gradual 7. Alleluia or Tract	9. Credo	8. Gospel	
10. Offertory	11. Secret 12. Preface		
	13. Sanctus		14. Canon
	15. Agnus Dei		
16. Communion	17. Post-Communion		
	18. Ite missa est or Benedicamus Domino		

For the texts of items Ib and IIb (and other texts not included below), see the *Ordo Missae*, given in *LU*, pp. 1–7. The variable texts (\*Collect, \*Epistle, etc.) are given with the different Masses, e.g., *LU*, pp. 317ff, while the recitation tones of items 4, 5, 8, and 12 are found in *LU*, pp. 98–111. The items Ia with their melodies are given with the different Masses, e.g., *LU*, pp. 317ff, while those for Ib are found in *LU*, pp. 11–97.

The items of classes Ia and Ib are those of most interest from the musical point of view, and it is to these exclusively that the subsequent discussion refers. What is usually known to music students as "Mass" are the items of the rubric Ib, the (sung) Ordinary of the Mass. The reason for this narrow and actually misleading view is the fact that these alone (with the exception of the "Ite missa est") were composed polyphonically after 1300 [see under B]. From the standpoint of Gregorian chant, the Proper of the Mass (Ia) is much more important and musically interesting. These chants and their texts are much older than those of the Ordinary. Also, many of them are derived from the psalms [see *Psalmody*]. Thus, the Introit originally was a *psalmus ad introitum*, the Communion a *psalmus ad communionem*, etc. About A.D. 500, the Mass consisted only of the chants of the Proper, alternating with lections from the Epistles, etc. Gradually, the chants of the Ordinary were introduced, probably in the following chronological order: Sanctus, Kyrie, Gloria, Agnus Dei, Credo. A number of Masses have a musical structure differing from the normal one [see *ApGC*, pp. 28ff].

For each item of the Ordinary there exist numerous melodies (e.g., about 300 for the Agnus Dei), the earliest of which date from the 11th century. From this large repertory a small number has been selected for present-day use and organized into eighteen cycles, each of which is assigned to a specific category of feasts and is named after the \*trope formerly associated with its Kyrie. Thus, the *Liber usualis* has a "Mass I: In Paschal Time (Lux et origo)," "Mass II: For Solemn Feasts. 1. (Kyrie fons bonitatis)," etc. [see *LU*, pp. 16ff]. The Credos, being late additions, are listed separately [*LU*, pp. 64ff]. The earliest of these cycles, Mass IV (*Cunctipotens Genitor Deus*), dates from the end of the 13th century, others are from the 14th and 15th centuries, and still others were put together at \*Solesmes in the 19th century [see *ApGC*, p. 419f].

B. *The polyphonic Mass Proper*. In early polyphonic music, prior to c. 1250, the chants of the Mass Proper were composed much more frequently than those of the Ordinary. The MS Reg. 586 of the Vatican Library (originally from Fleury or Tours) contains three Graduals ("Viderunt omnes," "Omnes de Saba," "Gloriosus deus") composed in a style very close to that described in Guido's "Micrologus" of c. 1030. The Winchester Troper of c. 1050 includes, among its 150 organa, 3 Introits, 53 Alleluias, 19 Tracts, and 7 sequences, in a notation that unfortunately cannot be accurately read. An 11th-century Alleluia from Chartres is reproduced in *HAM*, no. 26c. The "de gradali" section of the \**"Magnus liber organi"* contains 59 Mass Propers, all Graduals or Alleluias. (For details regarding the composition, see *Organum*, particularly the scheme for "Viderunt.") Under Perotinus (c. 1160–1225), the repertory of compositions for the Proper was considerably enlarged by the numerous \*clausulae, many of which were transformed into \*motets. Thus, all the clausulae and motets with the tenor \**"In seculum"* form a part of the Easter Gradual "Haec dies." About 1250, the composition of the Proper practically died out, but it reappeared in the 15th century. The \*Trent Codices contain more than 250 settings of the Mass Proper, among them a number of complete cycles consisting of Introit, Gradual, Alleluia, Offertory, and Communion [see Editions XXXI, ser. ii, 1, where several of these cycles are ascribed to Dufay]. See also Plenary Mass. The most famous collection of Mass Propers, all arranged in liturgical cycles, is Isaac's \**Choralis Constantinus*. Numerous other settings from about the same period are preserved in two MSS of the University Library of Jena (nos. 30, 35) and in an anonymous publication of 1528, *Contrapunctus seu figurata musica super plano cantu missarum solennium totius anni*. The last publication in this field is William Byrd's *Gradualia* of 1605–07, which includes thirteen almost complete settings of the Mass Proper. In organ music, the Introit and Offertory were composed most frequently, the latter especially in England during the 16th century. See Felix namque.

C. *The polyphonic Mass Ordinary*. I. To 1400. Settings of the Mass Ordinary, mostly Kyries and Glorias, appeared about the same time as the earliest compositions of the Proper but much less frequently. Among the organa of the Winchester Troper are twelve Kyries and eight Glorias, most of them troped. The 11th-century

treatise "Ad organum faciendum" contains a Kyrie trope in the style of free organum, i.e., in contrary motion [*HAM*, no. 26]. Two-voice settings of Sanctus and Agnus tropes, probably of English origin, are in fasc. 11 of the Wolfenbüttel Codex *W<sub>1</sub>* [see *HAM*, no. 37]. Two-part compositions of troped and plain Kyries as well as a three-voiced "Et in terra" are in the Codex Huelgas of c. 1275 [see H. Anglés, *El Codex Musical de las Huelgas*, 3 vols. (1931)]. The first example of a complete Mass (Ordinary) is the *Messe de Tournai* of c. 1300, which, however, is probably a compilation of individual compositions written at different periods [new ed. in E. Coussemaker, *Messe du XIIIe siècle* (1861), and in \*Editions XII, 13; also in L. Schrade, *Polyphonic Music of the Fourteenth Century*, i (1956), which in addition contains two recently discovered cycles known as the Mass of Toulouse and the Mass of Barcelona]. Machaut's Mass (now available in editions by Ludwig-Besseler, De Van, Schrade, Chailley, and Hübsch) was formerly believed to have been composed for the coronation of Charles V in 1364 but is probably one of the earlier works of Machaut, judging from its *ars antiqua* style and some striking similarities to the Mass of Tournai. A considerable number of individual items (Kyries, Glorias, etc.) are preserved in various 14th-century MSS [Codex Ivrea, Apt, Torino, etc.]. In England, the practice of writing single Mass movements (sometimes paired, e.g., Gloria and Credo) prevailed throughout the 15th century (Dunstable; numerous composers of the Old Hall MS).

II. 1400–1600. This was the main period of Mass composition, during which the term "Mass" assumed its present-day meaning, i.e., a polyphonic setting of the entire Mass Ordinary. Nearly always the composition was in the form of a "cycle," the various movements being held together by a liturgical association or, more commonly, by some musical device. The earliest indisputable example of a Mass cycle in the proper sense of the word is Lionel Power's *Missa super Alma redemptoris mater*, probably composed shortly after 1400. Dufay (c. 1400–74) and Palestrina (c. 1525–94) are the first and the last in a long succession of composers who wrote mainly Masses. The following main types of Mass composition can be distinguished:

a. Plainsong Mass [*L. missa choralis*]. This represents the most obvious and natural procedure, i.e., the polyphonic setting of a Gregorian Mass Ordinary, such as the Mass I or the Mass IV [see under A above], with each move-

ment drawing its musical material from the corresponding item of the plainsong Mass. Such a Mass is cyclical from the liturgical point of view, since it fully corresponds to one of the plainsong cycles, each of which is assigned to a specific liturgical situation (Paschal Time, Solemn Feasts, Sundays throughout the Year, etc.). This genre is found throughout the period, but to a far lesser extent than might be expected. Examples are Isaac's *Missa Solemne*, *Missa Pascale*, etc. [see L. Cuyler, ed., *Five Polyphonic Masses by Heinrich Isaac* (1956)], Josquin's and Morales' *Missa de Beata Virgine*, Palestrina's *Missa pro defunctis* [see Requiem Mass], as well as all the \*organ Masses of the 16th century (Girolamo Cavazzoni, Merulo).

b. *Cantus firmus* Mass. This is a Mass in which all the movements are based on one and the same melody, usually in the tenor [see Tenor Mass]. (The terms "plainsong Mass" and "*cantus firmus* Mass" are far from being correct designations; the "plainsong" of the former is a *cantus firmus*, and the "*cantus firmus*" of the latter is frequently taken from plainsong.) This cyclical type is perhaps the most common of all. According to the source of the *cantus firmus*, three species can be distinguished: Masses based on (a) a liturgical, (b) a secular, and (c) an invented *cantus firmus*. Among the liturgical *cantus firmi* the antiphons B.M.V. [see Antiphon (2)] and hymns are most often used. Examples are Lionel Power's *Missa super Alma redemptoris mater*, Dufay's *Missa Ave regina* and *Missa Ecce ancilla Domini*, Ockeghem's *Missa Ecce ancilla Domini*, Josquin's *Missa Pange lingua*, and Palestrina's *Missa Panem nostrum*. This type, although found throughout the period, is more characteristic of the 16th century than the 15th, when secular *cantus firmi* were preferred. Particularly popular were French chansons, above all the famous \*L'Homme armé. Other examples are Dufay's *Missa Se la face ay pale*, Ockeghem's *Missa De plus en plus* and Obrecht's *Missa Fortuna desperata*. In England the tune \*"Western Wynde" was popular [Shepherd, Taverner, Tye]. Isaac's *Missa carminum* is an example of the \**quodlibet* Mass, in which several secular melodies are combined. About 1500 "invented" *cantus firmi* were occasionally used, either a \**soggetto cavato*, e.g., Josquin's *Missa Hercules Dux Ferrariae*, or the \*hexachord, e.g., Palestrina's *Missa Ut re mi fa sol la* (*Missa super voces musicales*).

c. The motto cycle (motto Mass). In this type unification is achieved by—and normally restricted to—the use of an identical motif at the

beginning of each movement. This device occurs in a number of Gloria-Credo pairs from the early 15th century [see Bukofzer, *Studies in Medieval and Renaissance Music* (1950), pp. 219ff] and, applied to a full cycle, in a Mass by Arnold de Lantins [see C. van den Borren, *Polyphonia sacra* (1932), nos. 1–5]. It was also used in conjunction with the *cantus firmus* method, e.g., in Dufay's *Missa Caput*.

d. Parody Mass. See separate entry.

e. The freely invented Mass. For freely invented Masses, which constitute a relatively small group, general designations such as *Missa quarti toni* (Vittoria), *Missa cuiusvis toni* (Ockeghem), *Missa sine nomine* (Obrecht), and *Missa brevis* (Palestrina) were used. It must be noted, however, that the complete originality of any Mass written during the period is open to question, and that a *cantus firmus* is often used where none is indicated in the title. This is especially true for Masses composed after the \*Council of Trent, which forbade the use of secular *cantus firmi*. For instance, Palestrina's *Missa quarta* (1582) is based on *L'Homme armé*.

Naturally, within each of these categories the treatment varies considerably according to the period of composition. The earliest type (though by no means restricted to the early period) uses the *cantus firmus*, without alterations, in long notes (\**cantus planus*) in the tenor. Later the *cantus firmus* is shared among the other voices but omitted in certain sections, e.g., in the "Christe eleison" and Credo. Another modification is the use of a melodically and rhythmically altered *cantus firmus*, a sort of free variation on the borrowed melody, which was used not only as a tenor but also as a soprano melody [see Discant Mass]. By the end of the 15th century the techniques of variation upon a borrowed tune were extremely highly developed; the *cantus firmus* sometimes was completely absorbed throughout the polyphonic texture, so that a derivative Mass is indistinguishable in style from a freely composed one. A noteworthy example is Josquin's *Missa Pange lingua* [see Paraphrase (3)].

III. 1600–present. After 1600 Mass composition lost its former importance. In Italy [see Roman school] the *a cappella* tradition of Palestrina (*stile antico*) was continued by composers such as Steffano Bernardi (c. 1576–1636; see DTO 69), Antonio Draghi (1635–1700; see DTO 46), and Antonio Lotti (c. 1667–1740; see DdT 60), while others enlarged the vocal resources to huge choirs of 32 and 48 voice-parts

(Orazio Benevoli, 1605–72; see *DTO* 20). In Germany the development followed more progressive trends with the inclusion of the orchestra and of the 17th-century styles of the concerto, aria, etc. (*stile moderno*). The Masses of Biber, Schmeltzer, and Kerll [see *DTO* 46] are landmarks on the road leading to Bach's B-minor Mass (1733–38). Concomitant with the tendency to a greater variety of styles was the division of the Mass into a greater number of movements, particularly within the Gloria and the Credo. Following is the structure of Bach's Mass:

#### Kyrie

*Kyrie eleison* (Lord, have mercy)  
*Christe eleison* (Christ, have mercy)  
*Kyrie eleison* (Lord, have mercy)

#### Gloria

*Gloria in excelsis Deo* (Glory to God in the highest)  
*Laudamus te* (We praise you)  
*Gratias agimus tibi* (We give you thanks)  
*Domine Deus* (Lord God)  
*Qui tollis peccata mundi* (Who take away the sins of the world)  
*Qui sedes ad dexteram patris* (Who sit at the right hand of the Father)  
*Quoniam tu solus sanctus* (For you alone are holy)  
*Cum Sancto Spiritu* (With the Holy Spirit)

#### Credo

*Credo in unum Deum* (I believe in one God)  
*Patrem omnipotentem* (Father almighty)  
*Et in unum Dominum* (And in one Lord)  
*Et incarnatus est* (And he became flesh)  
*Crucifixus* (Crucified)  
*Et resurrexit* (And rose again)  
*Et in Spiritum Sanctum* (And [I believe] in the Holy Spirit)  
*Confiteor unum baptisma* [I confess one baptism]

#### Sanctus

*Sanctus* (Holy)  
*Hosanna in excelsis* (Hosanna in the highest)  
*Benedictus qui venit* (Blessed is he who comes)

#### Agnus

*Agnus Dei* (Lamb of God)  
*Dona nobis pacem* (Grant us peace)

The Masses by Francesco Durante (1684–1755), Johann Adolf Hasse (1699–1783), Haydn (1732–1809), and Mozart (1756–91) show the trend toward secularization of the music for the Mass, and not until Beethoven's *Missa solemnis*

(op. 123, 1819–23) was a work created that stands the test of comparison with Bach's Mass. Beethoven treats the text in a more continuous manner than Bach but uses, in the Credo, a separate movement for "Et homo" (after "Et incarnatus") and "Et vitam" (after "Confiteor"), this being treated as an extended closing fugue.

Cherubini (1760–1842) wrote several Masses between 1809 (Mass in F for three voices and orchestra) and 1825 (Coronation Mass) that deserve more attention than is given them, as do the six Masses of Schubert. Mass composition was continued by Weber (2), Liszt (5, including the *Graner Mass*, 1855), Franck (2), and Gounod (9), culminating in the Masses of Bruckner, particularly his F-minor Mass (1866), one of the truly great Mass compositions after Bach and Beethoven. In the 20th century, Masses have been written by Villa-Lobos (Mass of St. Sebastian, 1937), Poulenc (1937), and Stravinsky (1948).

D. The musical items of the Anglican Mass (also called Communion) include all the parts of the Ordinary, often with the \*Decalogue as an alternative for the Kyrie. Although the Offertory texts are the only ones of the Proper that are given in the Prayer Books, the places for all the Propers have been retained, and they are widely sung. The Lutheran services retain all of the Ordinary and part of the Proper. The Methodist Communion Service provides for the Kyrie, Sanctus, Agnus Dei, and Gloria. Settings of the Mass in English range from the monophonic versions of John Merbecke's *The Booke of Common Praier noted* (1550) to contemporary compositions, e.g., by Vaughan Williams. See Service.

Adler, "Zur Geschichte der Wiener Messkompositionen" (*StM* iv, 5–45). For C IV: A. Schnerich, *Messe und Requiem seit Haydn und Mozart* (1909); B. A. Wallner, in *ZMW* viii (Weber).

**Mass of the Presanctified.** The Mass for Good Friday, so called because the elements (bread and wine) are consecrated the day before. The only musical items for this Mass are two Tracts, the \**Improperia*, and the hymn "Crux fidelis" [see *LU*, p. 742].

**Mastersingers.** See Meistersinger.

**Mastersingers of Nuremberg, The.** See *Meistersinger von Nürnberg, Die*.

**Matasin, matassin, mattachin.** A 16th-century dance performed by costumed dancers, representing men in armor or other costume [see *Bouffons*; Dance of death; *Moresca*]. An example called "Mattasin oder Toden Tantz" is in Nörmiger's tablature of 1598 [see W. Merian, *Der Tanz in den deutschen Tabulaturbüchern* (1927), p. 256]. A similar melody, called "Matachina," is found in a French gittern tablature of 1570 [see W. Tappert, *Sang und Klang aus alter Zeit* (1906), p. 39]. The name "matachin" survives in the American Southwest and Mexico as a designation for ritual folk dances of various

kinds (for rain, crops, etc.). See J. D. Robb, in *Western Folklore* xx.

**Mathis der Maler** [G., Mathias the Painter]. Opera in seven tableaux by Hindemith (to his own libretto), finished in 1934 and produced in Zurich, 1938. Setting: in and near Mainz, Germany, c. 1525. The story deals with the life of the German painter, Mathias Grünewald (c. 1480–1528), who supported the peasant revolution in the early days of the Protestant Reformation. Three extracts (the overture, the scene at the painter's deathbed, and a crowd scene from the second act) were combined into a three-movement symphony for which Hindemith provided descriptive titles referring to the panels in Grünewald's famous Isenheim Altar in Colmar, Alsace.

**Matin, Le:** [F., The Morning]. Nickname of Haydn's Symphony no. 6 in D, which, together with *Le Midi* (Noontime), no. 7 in C, and *Le Soir* (The Evening), no. 8 in G, forms a well-known group of Haydn's earliest symphonies, all having been composed about 1761.

**Matins.** The first of the canonical hours. See Office. In the Anglican Church, Morning Prayer.

**Matrimonio Segreto, Il** [It., The Secret Marriage]. Opera in two acts by D. Cimarosa (libretto by G. Bertati, after the play *The Clandestine Marriage* by G. Colman and D. Garrick), produced in Vienna, 1792. Setting: Italy, 18th century.

**Maultrommel** [G., \*Jew's-harp].

**Maundy music.** Generally, the Antiphons sung during the ceremony of the Washing of the Feet on Maundy Thursday of Holy Week. The name is a corruption of L. *mandatum*, which in turn refers to the first Antiphon of the ceremony, "Mandatum novum do vobis" [*LU*, p. 671].

**Má Vlast** [Cz., My Fatherland]. Cycle of six symphonic poems by Smetana, composed 1874–79, based on various subjects pertaining to his country: 1. *Vyšehrad* (the old citadel of Prague); 2. *Vltava* (the river Moldau); 3. *Šárka* (an Amazon of Czech legend); 4. *Z českých luhův a hájův* (From Bohemia's Meadows and Forests); 5. *Tábor* (an ancient city); 6. *Blaník* (a mountain near Prague where, according to legend, the old heroes slumber, ready to rise again).

**Mavra.** Opera in one act by Stravinsky (libretto by B. Kochno, based on Pushkin's story "The Little House of Kolomna"), produced in Paris,

1922. Setting: living room in a Russian village long ago. The music is in a \*pandiatonic style with many accompanying figures reminiscent of early *opera buffa*. It consists of solo and ensemble numbers without recitative.

**Maxima.** See under Mensural notation I.

**Maxixe** [Port.] Old Brazilian urban dance, in moderate duple meter, danced by couples. It is derived from the \**lundú*, but today it shows both Negro and Latin American influences, among them that of the Argentine \*tango. J.O-S.

**Mazeppa.** Symphonic poem by Liszt, composed 1851, based on a poem by Victor Hugo describing the insurrection (1708) and death of the Ukrainian Cossack chief, Mazeppa. The music incorporates elements from Liszt's *Mazeppa Etude* for piano, one of the \**Études d'exécution transcendante* (1851).

**Mazurka.** A family of Polish folk dances. The mazurka is in triple meter and is performed at several speeds from moderately slow to quite rapid. One type is the \**kujawiak* (not to be confused with *krakowiak*), so named because it originated in the province of Kujawy. Another is the \**obertas*. Characteristic of these dances is the heavy accenting of normally weak beats [see Ex. 1].

Mazurkas are generally danced by couples in multiples of four (i.e., eight, twelve, or sixteen couples), with few basic steps and positions but a multitude of variations. A good deal of both musical and choreographic improvisation is traditionally applied. The mazurka spread throughout Europe in the 18th and 19th centuries, first as a dance and later as a source for art music. For the latter, Chopin's piano mazurkas dominate the literature. These pieces are highly stylized, sometimes submerging the folk-dance character; they range from slow, contemplative works (op. 17, no. 4, and op. 68, no. 4) to *kujawiaks* and even *obertas* (op. 56, no. 2), exhibiting modal characteristics and sometimes displaying very advanced chromatic techniques. Many of Chopin's most puzzling expressive pianistic devices appear in the mazurkas.

Outstanding uses of the mazurka by non-Polish composers are in Glinka's *A Life for the Tsar* and Mussorgsky's *Boris Godunov*,

where the dance is used to portray what the Russian composers saw as the brilliant decadence of 17th-century Polish court life (during this period Poland was a European power while Muscovy was struggling for stability). In these pieces the composers explored extremes of chromatic expression that even exceed some of Chopin's most daring examples [Ex. 2, from *Boris*, Act III, Scene 2, marked "alla Polacca"].

**M.d.** Abbr. for *main droite* [F.] or *mano destra* [It.], i.e., right hand.

**Meane, mene.** In 15th- to 17th-century English music, a middle part of a polyphonic composition. See, e.g., the following passage from a 15th-century MS [see G. Schad, *Musik und Musikausdrücke in der mittelenglischen Literatur* (1911), p. 13]: "Primus pastor: 'Let me syng the tenory.' Secundus pastor: 'And I the tryble so hye.' Tertius pastor: 'Then the meyne fallys to me.'" Several organ compositions of the pre-virginalist period show inscriptions such as "Salvator withe a meane." Sometimes such a middle part is written in black notes, in contrast to white notes in the other parts [see *ApNPM*, pp. 10ff]. John Redford (d. 1547) wrote a long poem on the *mene* [in C. Pfatteicher, *John Redford* (1934), p. 64], which unfortunately does little to clarify the term. In most cases the part referred to as *meane* is shared by the right and left hands.

The earliest use of the term is in connection with the 15th-century practice of \*sight. It was also applied to instruments (viols) playing the middle part as well as to the two middle strings (small meane, great meane) of the viol.

**Mean-tone system.** See under Temperament II.

**Measure** [F. *mesure*; G. *Takt*; It. *misura*; Sp. *compás*]. A group of beats (units of musical time), the first of which normally bears an accent. Such groups, in numbers of two, three, four, or, occasionally, five or more, recur consistently throughout a composition and are marked off from one another by \*bar lines. The basic scheme of note values within a measure is called \*meter or time (duple, triple, 6/8 meter, etc.). Occasional deviations from the regularity of accent, e.g., \*syncopation, emphasize rather than destroy the general scheme of measure and meter.

The concept of measure is based on the principle of regular accent, which is of primary importance in almost all music generally known today. However, music has by no means always embodied this principle. Disregarding dance music, which for obvious reasons is nearly always "measure-music," the history of European music may be divided into four periods alternating between "measure-free music" and "measure-music": (a) 500–1200; no measure (plainsong, *organum purum*); (b) 1200–1450; measure based on the rhythmic \*modes, the mensurations, or, in Italy, the \**divisiones*; (c) 1450–1600; prevalence of measure-free (Flemish) polyphony; (d) 1600–1920; measure based on the regular (four-measure) melodic phrases that often reflect the influence of dance music. With respect to period (c), the reader must be warned not to confuse "measure-music" (as defined above) with "measured music" in the sense of \*mensural music. Mensural music, which prevailed throughout the period in question, embodies the principle of regular groups of beats (*tempus perfectum*, *imperfectum*, etc.) but frequently lacks the most important characteristic of "measure-music," i.e., the normal accent on the first beat of such a group. See also Bar line; Rhythm II (a).

**Mechanical composition.** Composing by means of some mechanical device. Athanasius Kircher (1602–80) invented an *arca musarithmica*, a box with slides that was supposed to compose music by means of mathematical combinations. In the second half of the 18th century mechanical com-

position was a sort of parlor game, in which a polonaise, minuet, or waltz was "composed" from a number of written out measures that were selected by the throwing of dice [see Aleatory music]. Strange as the method might appear, it produced perfectly acceptable results, neither better nor worse than hundreds of traditionally composed minuets of that period. D. N. Winkel (1780–1826), the inventor of the \*metronome, built a *componium*, an enormous machine (now in the Brussels Conservatory) that automatically produces variations based on changes in weather and temperature. These innocent jests of the past represent interesting forerunners of the present-day \*computer.

**Mechanical instruments.** I. Appliances designed to produce musical performance mechanically, i.e., without an actual performer. Prior to the end of the 19th century such apparatus was always based on a barrel-and-pin mechanism. The hand, or a mechanical clockwork, turned a cylinder bearing pins acting against levers or similar gadgets, which in turn operated the hammers of a keyboard instrument, the clappers of a set of bells, the mouthpieces of organ pipes, etc. As early as the 14th century, carillons were operated by such a mechanism. In the 16th century the same principle was applied to harpsichords and organs. In the collection of instruments left by Henry VIII at his death in 1547 was a "virginal that goethe with a whele without playing uppon." An instrument sent by Queen Elizabeth to the Sultan of Turkey in 1593 included an organ, a carillon, "trumpeters," "singing byrds," etc., and went into action automatically every six hours. About the same time Hans Leo Hassler took an active interest in the fabrication and sale of musical clockworks. Athanasius Kircher, in his *Musurgia universalis*, vol. ii (1650), pp. 312ff, described various elaborate musical mechanisms, e.g., a *Cylindrum phono-tacticum* that could play *Toccatas sive Ricercatas* by Kerll and others. Of particular interest is a mechanical spinet, which is preserved with six pieces from the early 18th century, probably the earliest extant examples of "phonograph" music [see P. Nettl, in *ZMW* ii, 523]. Mozart wrote several compositions for the mechanical organ, an Adagio in F minor and an Allegro in F major (K. 594), a Fantasia in F minor (K. 608), and an Andante in F major (K. 616).

II. The only instrument of the barrel-and-pin type that attained considerable practical importance was the English barrel organ. This was a

small organ connected with an arrangement of interchangeable barrels, each containing a number of the most popular psalm and hymn tunes. These automatons enjoyed great popularity in rural English churches during the 18th and 19th centuries. William Mason, in his *Essays, Historical and Critical, on English Church Music* (1795), said he preferred "the mechanical assistance of a Cylindrical or Barrel Organ to the fingers of the best parochial organists," a statement that probably reflects more the skill of the parochial organists than the qualities of the barrel organ. See also Serinette; *Orgue* (*Orgue de barbarie*).

III. Toward the end of the 18th century various small instruments called *Flötenuhr* (flute-clock) were made by P. Niemecz, librarian to Prince Esterhazy. They combined an ordinary clock with a set of small pipes and bellows operated by a clockwork. For these instruments (also called *Laufwerk*) Haydn wrote a number of charming pieces [see E. F. Schmid, *†Werke für Laufwerk* (1931), and in *ZMW* xiv].

Passing reference may be made to the well-known "music boxes" [*F. boîte à musique, tabatière de musique; G. Spieldose*], whose high, thin tones have frequently been imitated in piano pieces, e.g., by A. Liadov, T. Leschetizky, and, with irony, by Stravinsky in *Petrouchka* (Valse). A truly remarkable specimen was a "musical bustle" that was presented to Queen Victoria in 1887; it was "so designed as to provide a performance of the National Anthem (God Save the Queen) whenever the wearer sat down."

In the early 19th century a number of instruments were built for the mechanical reproduction of entire orchestras, e.g., J. N. Maelzel's Panharmonicon (1804), for which Beethoven originally wrote the "Sieges-Symphonie" of his *\*Wellingtons Sieg* (1813), the Appollonicon built by Flight and Robson (1817), the Orchestrion of Friedrich Theodor Kaufmann (1851), and numerous others, whose descendants are still found in taverns throughout Europe, playing the same role as the American "jukebox."

IV. An important advance over the barrel-and-pin mechanism was the perforated paper-roll of the late 19th century. A roll of cardboard is pierced with small openings corresponding in position and length to the pitch and duration of the tones of the composition to be reproduced. This passes over a cylinder furnished with numerous small apertures (similar to those of the mouth harmonica), which are connected by pipes to the action of a piano. As often as an opening in the cardboard passes over the cylin-

der, a stream of air is pushed (or drawn) through the corresponding pipe, setting the hammer in motion. This principle has been applied with a considerable degree of accomplishment in instruments such as the player piano, the Welte-Mignon, the Pianola, the Phonola, etc. The player-rolls are usually reproductions of performances by famous virtuosos. In most of the instruments the rendition can be modified according to the taste of the player, who can regulate to a certain degree the speed and dynamics. Needless to say, the possibility of beating the speed record of world-famous pianists has added considerably to the commercial value of these instruments. Some modern composers (Hindemith, Toch) have written original compositions for such mechanical pianos, availing themselves of the possibility of producing sound effects not obtainable by a live pianist, e.g., chords consisting of thirty and more notes, or the simultaneous use of the lowest, middle, and highest registers.

The \*phonograph and radio have largely eclipsed such attempts at reproduction.

Chapuis, *Histoire de la boîte à musique et de la musique mécanique* (1955); A. Protz, *Mechanische Musikinstrumente* (1941); O. E. Deutsch, in *ML* xxix, p. 140; E. Simon, *Mechanische Musikinstrumente früherer Zeiten und ihre Musik* (1960); H. Leichtentritt, in *MQ* xx, p. 15; *LavE* ii.3, 2117; G. C. A. Jonson, in *PMA* xlii, p. 15.

**Mechanik** [G.]. The action of a piano, etc.

**Medesimo tempo** [It.]. The same tempo.

**Media caña** [Sp.]. An urban dance of Argentina that played an important role prior to 1900. Most of the traditional examples preserved consist of five parts and show melodic and rhythmic elements characteristic of other Argentine folk dances, such as the *\*pericón*, *zamacueca*, and *\*gato*.  
J.O-S.

**Medial cadence**. See under Cadence I.

**Mediant**. See under Scale degrees.

**Mediation** [L. *mediatio*]. See under Psalm tones.

**Medicean edition** [L. *Editio Medicea*]. See under Liturgical books II.

**Medicinale**. See under Psaltery.

**Medieval music.** See Middle Ages.

**Medio registro** [Sp.]. \*Divided stop.

**Medium.** *Cantus per medium* is, in 16th-century theory, singing in "halved" values, i.e., in *proportio dupla* [see Proportions] or, in modern parlance, *alla breve*.

**Medium, The.** Opera in two acts by Gian Carlo Menotti (to his own libretto), produced in 1946 at Columbia University. Setting: outside a large city, the present. The music is accompanied recitative with occasional expressive arias.

**Medley.** Same as \*potpourri. The term was already used by the virginalists.

**Meerestille und glückliche Fahrt** [G., Calm Sea and Prosperous Voyage]. Orchestral overture by Mendelssohn (op. 27, 1828), based on two short poems by Goethe. The same poems were set by Beethoven as a cantata for chorus and orchestra (op. 112, 1815).

**Mehr-** [G.]. More, several. *Mehrchörig*, polychoral; *Mehrsätzig*, in several movements; *Mehrstimmig*, in more than one part, i.e., polyphonic; *Mehrstimmigkeit*, polyphony.

**Meistersinger** [G., mastersinger]. I. A literary and musical movement of the 15th and 16th centuries that was cultivated by the guilds of German craftsmen and represents the middle-class continuation of the aristocratic \*minnesingers of the 12th to 14th centuries. The desire of the Meistersinger to emphasize such a lineage led to a store of naïve legends concerning their origin. For example, A. Puschmann, in his *Gründlicher Bericht des deutschen Meistergesanges und der Tabulatur* (1571; new ed. by R. Jonas, 1888), relates that the *Meistergesang* was founded, on the initiative of the Emperor Otto I, at Paris in A.D. 962 by twelve "first masters," among whom were Walther von der Vogelweide and Heinrich Frauenlob—men who actually lived c. 1200 and c. 1300 respectively. The statement that Heinrich Frauenlob was the first Meistersinger is still frequently found in modern writings, although the accuracy of this tradition was already questioned by the German professor J. C. Wagenseil, in his *De . . . civitate Noribergensi commentatio* (1697), the source for Wagner's \*Meistersinger libretto. Actually, it is not until the early 15th century that names such as Muskatblüt, Harder, and Der Zwinger suggest greater participation by commoners. Even Michel Behaim (1416–74), who might be more

properly regarded as the first Meistersinger, falls outside the category proper, since he led a traveling life—like the bards—whereas the Meistersinger were resident members of reputable city guilds, united in local schools. Among the actual Meistersinger were Conrad Nachtigall, Hans Sachs (1494–1576), Georg Hager (1552–1634), Hans Folz (all in Nuremberg), Sebastian Wilde (in Augsburg), and Adam Puschmann (1532–1600, in Breslau). In the 16th century the movement spread over most of Germany, but it declined rapidly during the 17th century. Certain schools existed throughout the 18th century; that of Ulm was dissolved in 1839.

II. Characteristic of the *Meistergesang* were the rigid and pedantic rules that regulated the procedure of their weekly meetings (on Sunday, after church), the establishment of competitions and prizes, the promotion of members into various classes (*Schüler*, *Schulfreund*, *Singer*, *Dichter*, *Meister*, i.e., pupil, friend, singer, poet, master), etc. The rules were set down in the so-called *Tabulatur* (tablature). The title *Dichter* was given for the invention of a new poem (called *Lied*, *Gesang*), the title *Meister* for a new melody (called *Ton*, *Weise*). Most of the numerous poems were sung to standard melodies whose names referred to their composers (e.g., "Brant-weise; Der Wilde Ton") or to other more or less obscure characteristics (e.g., "Rosenton," "Grasmückenweise"—warbler-melody), while names such as "Schwartz-Dintenweis" (black ink melody) and "Kurtze-Affenweis" (short monkey melody) show that the Meistersinger did not wholly lack humor. The whole setup has been vividly (and accurately) described by Wagner in his *Die Meistersinger von Nürnberg* (particularly Act I, David and Kothner).

III. The musical repertory of the Meistersinger, as it is preserved, consists of a large number of melodies, written in \*monophonic notation in a more or less free rhythm. Practically all of them are in \**Bar* form, the traditional form of the minnesingers. Among the songs of Hans Sachs are several attractive melodies [see *HAM*, no. 24; *EiBM*, no. 9; *BeMMR*, p. 271; *SchGMB*, no. 78]. On the whole, however, the Meistersinger melodies are clumsy and barren, often crowded with meaningless coloraturas [G. *Blumen*].

The Meistersinger probably derived elements of their ritual not only from the minnesingers but also from the procedure of medieval doctoral examinations, from pious fraternities similar to the Italian *laudesi* [see *Lauda*; note the prevail-

ingly Biblical repertory of the Meistersinger], and possibly from the French \**pays*.

Münzer, "Hans Sachs als Musiker" (*DM* v.19); P. Runge, et al., "Über die Notation des Meistergesangs" (*CP* 1906, p. 17; *CP* 1909, p. 84); *MGG* viii, s.v. "Meistergesang."

**Meistersinger von Nürnberg, Die** [G., The Mastersingers of Nuremberg]. Opera in three acts by Richard Wagner (to his own libretto, based on Goethe, E. T. A. Hoffmann, and others), produced in Munich, 1868. Setting: Nuremberg, 16th century. The plot, based on careful studies of original sources, presents a true and lively picture of the life and customs in the mastersinger guilds of the 16th century [see Meistersinger]. *Die Meistersinger* represents an artistic peak in Wagner's work. In its balance of means, its "C-major atmosphere," and its variety of scenes and expressions, the opera offers a striking contrast to the earlier *Tristan* (1865), with its exuberant chromaticism and passionate expression of tragic love-madness. The overture, frequently performed in concerts, is one of the great examples of 19th-century instrumental music. See Opera X. See H. Thompson, *Wagner & Wagenseil* (1927).

**Mejorana** [Sp.]. Song of Spanish origin that was brought to Panama during the 18th century. It may be vocal, in which case it is sung exclusively by men and never danced, or instrumental and danced. Its melodies are mainly descending and proceed by disjunct intervals, using leaps of major sixths, sevenths, and ninths, and frequently also augmented fourths. Characteristic of its harmonic structure is the use of I–IV–V chords, I and IV in inverted position and V in root position. The *mejorana* is in 6/8 meter with a free alternation of duple and triple divisions in a moderate tempo. The vocal *mejorana*, also

called *socavón*, begins with an improvised vocalization, sung partly in falsetto, which is repeated after each stanza of the poem. J.O-S.

**Mejoranera** [Sp.]. Panamanian five-stringed guitar that is used to accompany the folksongs and dances of this country and is also a leading instrument in a popular band, along with a *rabel* (three-stringed violin), *tambora* (large drum), *pujador* (medium-sized drum), *repicador* (small drum), *guaracha* (gourd shaker), and *almirez* (brass mortar). J.O-S.

**Melisma.** (1) An expressive vocal passage sung to one syllable, as opposed to the virtuoso-like and frequently stereotyped \*coloratura. The term is used particularly with reference to Gregorian chant but may also be applied to expressive or characteristic passages in other vocal styles. The distinction between melismatic style and syllabic style is of fundamental importance in Gregorian chant [see Gregorian chant III] as well as in 13th-century polyphonic music [see *ApNPM*, pp. 212ff]. (2) The term has occasionally been used (F. Ludwig) for the more common term \*clausula because the clausulae are polyphonic elaborations of plainsong melismas (vocalizing passages in the Graduals and Alleluias).

**Mellophone.** A brass instrument, similar to an althorn but in circular form, pitched in E<sup>b</sup> and F. It was used in marching bands in place of the French horn, which it resembles. See *MaMI*.

**Mélodie** [F.]. Solo song with accompaniment, corresponding to the German lied. See Song III. See F. Noske, *La Mélodie française de Berlioz à Duparc* (1954).

**Melodrama.** A stage presentation intermediate between play and opera, consisting of spoken text and background music. If only one or two actors are involved, the terms "monodrama" or "duodrama" may be used. Melodramatic presentation seems to have played an important role in Greek drama. It became very popular in the second half of the 18th century. The earliest known examples are melodramatic scenes in a Latin school play, *Sigismundus*, by J. E. Eberlin (1753; see *DTO* 55). The first full melodrama was J.-J. Rousseau's *Pygmalion* (1762), followed by Georg Benda's *Ariadne auf Naxos* (1775; new ed. by A. Einstein, 1920; see *AdHM* ii, 752) and *Medea* (1778). In all these works, spoken text and music do not sound simultaneously but alternate, the music sometimes being used as a

background for pantomime gestures. Benda's plays made quite a sensation and caused Mozart to use two long melodramatic monologues in his *Zaïde* (1780). Well-known examples of melodramatic style are the gravedigging scene in Beethoven's *Fidelio* and the incantation scene in Weber's *Der Freischütz*. In Spain, Tomás de Iriarte (1750–91) wrote a melodrama, *Guzmán el Bueno* (1790). In the early 19th century ballads often were recited to a piano accompaniment. An interesting example, by Beethoven's pupil F. Ries, is reproduced in *TaAM* xiv. Here the music no longer consists of fragments that alternate with words but becomes a continuous background for the delivery of the text, as it is in Schubert's "Abschied von der Erde," Schumann's "Schön Hedwig," and Liszt's "Der traurige Mönch." Modern examples of melodrama include R. Strauss' *Enoch Arden* (1898), Schoenberg's *Erwartung* (1909), and Stravinsky's *Perséphone* (1934), as well as sections of A. Bliss' *Morning Heroes*, D. Milhaud's *Christophe Colomb*, and the part of Joan in A. Honneger's *Jeanne d'Arc au bûcher*. What might be called a semimelodramatic style was introduced by Schoenberg in his *Pierrot Lunaire* (1912), in which he replaced plain speech by a half-musical speech known as *\*Sprechstimme*.

Lit.: J. F. Mason, *The Melodrama in France* (1912); P. H. Lang, *Music in Western Civilization* (1941), p. 583f; J. van der Veen, *Le Mélodrame musical de Rousseau au Romantisme* (1955); E. Istel, *Die Entstehung des deutschen Melodramas* (1906); *id.*, in *DM* v.9–12; E. C. van Bellen, *Les Origines du mélodrame* (1927); R. Augsten, *Les Premiers Mélodrames français, comparés aux modèles allemands* (1912); M. Steinitzer, *Zur Entwicklungsgeschichte des Melodrams und Mimodrams* (1918); H. Martens, *†Das Melodrama* (1932).

**Melodramma** [It.]. A 17th-century term for opera (not *\*melodrama*).

**Melody**. I. In the broadest sense, a succession of musical tones, as opposed to *\*harmony*, i.e., musical tones sounded simultaneously. Melody and harmony represent the horizontal and vertical elements of musical *\*texture*. By its very nature melody cannot be separated from rhythm. Each musical sound has two fundamental qualities, pitch and duration, and both of these enter into the successions of pitch-plus-duration values known as melodies. To consider melody and rhythm separate or even mutually exclusive phenomena—as is often done—is mis-

leading. If a distinction between the pitch quality ("high–low") and the time quality ("long–short") is needed, the proper terms are *\*motion* and *rhythm*. Melody may thus be said to consist of motion plus rhythm, and every melody can be separated into a motion skeleton and a rhythm skeleton, as the accompanying example illustrates.

In musical composition, melody may occur either without any additional element of texture (*\*monophonic music*), or in combination with one or more other melodies (*\*polyphonic music*), or supported by harmonies (*\*homophonic music*). These three categories roughly describe the entire development of music: the first embraces the period from its beginnings through the first millennium of the Christian era (Greek music, Gregorian chant; up to the present in primitive and non-Western music and in folk-song); the second, from 1000 to about 1750 (Middle Ages, Renaissance, baroque; see *History of music*); the third, from 1750 to the present day. In the last period, particularly during the 19th century, there has been an increasing tendency to make melody subservient to harmony, or at least to consider it the mere result of harmonic progressions. The current description of melody as the "surface of harmony" clearly illustrates this point of view. Writers have gone so far as to maintain that a melody that cannot be interpreted harmonically is incomprehensible. It should suffice to point to the great treasure of purely melodic music in Gregorian chant in order to refute so utterly false a conception.

II. Although the present interest in polyphonic music has resulted in a revision of the worst misconceptions, the real importance of melody is still far from being fully and generally recognized. Among the various components of musical composition, such as melody, harmony, rhythm, and orchestration, melody is, from the historical as well as from the creative point of view, by far the most important. The 19th-century development of music, with its growing emphasis on the exploitation of novel harmonies, orchestral colors, and rhythm as an inde-

pendent element, temporarily obscured the fact that melody is the only element in common to music of all times and all peoples, and that, moreover, it is the cornerstone and touchstone of artistic quality. Harmony, orchestration, and rhythm are subject to certain rational premises, and many composers of mediocre artistic rank have exploited them with great skill. Only true artists, however, possess the imagination and creativity that produce a great melody. It is significant as well as deplorable that since 1900 hundreds of books on harmony and on orchestration have been written, and that courses on these subjects have formed an indispensable part of the curriculum of all educational institutions, while the study of melody has been almost completely neglected.

III. It is encouraging, however, to see that in the past decades several writers have turned their attention to the study of melody, not as mere ornamentation of a harmonic structure but as an element in its own right. General characterizations such as "tuneful," "simple," "touching," "expressive," "dramatic," etc., are not entirely without significance but are too vague to provide a basis for thorough study. A more promising approach—indeed the one most likely to prove successful—is that derived from the fact that a melody consists of successive notes of varying pitch. This leads to a consideration of a melody as a "geometrical" design including upward and downward steps and, still more important, as a "physical" phenomenon reminiscent of a moving body subject to forces that regulate its motion. A very important concept of such a theory is that of "musical gravity," a term implying that the "natural" movement of a musical line is downward [see the scales of \*Greek music], while an ascending motion always has the connotation of tension and energy. Of course, practically all melodies combine ascending and descending

movements, but the greater emphasis on or prevalence of one or the other is a point of prime importance, as may readily be seen from a comparison of melodies by Bach and Beethoven with those of Mendelssohn, for example. The preceding illustration [Ex. a, Bach; b, Mendelssohn] shows two graphs of opposite musical gravity, melodies that differ markedly in their physical as well as artistic "weight."

IV. Another consideration of basic importance is that of the steps in which a melody moves, i.e., narrow (conjunct) or wide (disjunct). This distinction is of prime interest in the study of primitive and non-Western music. For instance, Japanese music is prevailingly conjunct—hence, emotional, expressive—while ancient Chinese music is disjunct—hence, static, reserved [cf. also the two scales, *sléndro* and *pélog*, of \*Javanese music]. In European folksong it has frequently been noted that the French and Italians prefer narrow steps and ranges, while the northern peoples (English, German, etc.) prefer wider ones.

In art music this dichotomy becomes one between scalar and chordal progressions, i.e., progressions through the tones of the scale or of a chord (triad, seventh chord). Influenced by the current preoccupation with harmony, writers usually consider the latter the more important and often regard scalar progressions as mere passing-notes between main notes forming a chordal progression. In order to refute this point of view, it suffices to point to the theme of Beethoven's first Piano Sonata [Ex. 3a], which, with the "ornamental" notes suppressed [Ex. 3b], loses its character entirely, while it is not fundamentally affected by a substitution of scalar instead of chordal motion for the initial notes [Ex.

3c]. In fact, scalar motion is not only much older and more common than chordal motion but also more important from the musical and artistic point of view. Only the scale possesses that character of "logical continuation," of "variety and unity," that is the lifeblood of melody. In fact, in a progression such as c'-b-a-g-a-b-c' each tone

has a significance and function, leading from one level to another, while a similar chordal progression, such as  $c'-g-e-c-e-g-c'$ , is, in spite of its greater range, a mere reiteration of one element. Many melodies of the great composers begin with a chordal motion and continue with scalar motion, thus showing a progression from a "static" beginning to a "dynamic" continuation [see Ex. 4-6, by Mozart (Piano Sonata, K. 284b, also K. 309), Beethoven (*Eroica*), and Bruckner (Symphony no. 7)].

Lit.: A. C. Edwards, *The Art of Melody* (1956); J. Smits van Waesberghe, *A Textbook of Melody* (1955); R. Faith, *Creative Musicianship; the Tonal Materials and Rhythmic Structure of Melody* (1941); F. M. Ralston, *Melodic Design* (1930); B. Szabolcsi, *A History of Melody* (1965); W. Woehl, *Melodielehre* (1923); W. Danckert, *Personale Typen des Melodiestils* (1931); *id.*, *Ursymbole melodischer Gestaltung* (1932); E. Hoffmann, *Das Wesen der Melodie* (1925); H. Zingerle, *Zur Entwicklung der Melodik von Bach bis Mozart* (1937); T. Dunhill, "The Evolution of Melody" (*PMA* xxxiv); F. Kidson, "The Vitality of Melody" (*PMA* xxxiv); A. Loulié, "An Inquiry into Melody" (*MM* vii); A. H. Fox Strangways, "Tune" (*ML* iii, 90); H. J. Watt, "Melody" (*ML* v, 272); O. Bie, "Melody" (*MQ* ii, 402).

**Melody chorale.** A type of \*organ chorale in which the chorale tune is placed in the top part, as a clearly audible melody accompanied by contrapuntal parts of individual design. An exceptionally early and also exceptionally beautiful example is Arnolt Schlick's *Maria zart* (in *Tabulaturen etlicher Lobgesang*, 1512; new ed., G. Harms [1957], p. 32). Almost all the chorales of J. S. Bach's *Orgelbüchlein* are melody chorales.

**Melody type.** A term used in modern writings on non-Western and early European music for a practice of fundamental importance in the more primitive stages of music, i.e., a repertory of traditional melodies, melodic formulas, stereotyped figures, tonal progressions, ornamentations, rhythmic patterns, etc., that serve as a model for the creation of new melodies. Evidently such a procedure is in complete contrast to the modern ideal of "free invention" and "originality." An imaginary school of musicians writing deliberately in "Beethoven-style" would be approximately analogous to what still is the normal procedure among Arab and Indian musicians—a procedure that largely accounts for the absence of the evolutionary element in Oriental music. To the category of melody types belong the ancient Greek *nomos*, the *echos* of Byzantine and Armenian church music, the Syrian *risqolo*, the Javanese *patet*, the Hindu *rāga*, the Arabian *maqam* and, in Europe, the Russian *popievki* and the *Weisen* or *Töne* of the Meistersinger [see the entries Greece, etc.].

Scholars formerly considered the *rāgas*, *maqamat*, *echoi*, etc., the "modes" of Hindu, Arab, Byzantine, etc., music. Actually, they represent an earlier stage of development in which the "model" prescribes not only a scale with a given ambitus and center tone—as does a mode—but also typical motifs and tone progressions. [For an example, see under India V; a Syrian example is given in *GD*, *Sup. Vol.*, p. 175; *GDB* ii, 864.] The medieval system of eight church modes probably developed through a process of rationalization from an earlier system of melody types, possibly from the Byzantine \**echos*.

**Mélophone.** A free-reed instrument shaped like a guitar or hurdy-gurdy, about 32 inches long, with a broad neck and bellows housed in the body. The player activates the bellows by pushing and pulling a metal handle with the right hand, while his left hand depresses the desired keys, placed on the neck in seven rows of twelve keys each. The instrument was invented in the 1830's in Paris. See ill. under Wind instruments.

**Melopiano.** See under Sostenente piano.

**Membranophone.** See under Instruments.

**Memby.** Generic name for a set of native wind instruments (pipes, vertical flutes) of the Guarani Indians, which are still widely used in Paraguay and in the Brazilian states of Mato Grosso and Paraná. The instruments belonging to a set are

tuned so as to produce perfect fifths or octaves when played together. I.O.-S.

**Mendelssohn Scholarship.** See under Scholarships II.

**Mene.** See Meane; also Sight.

**Ménéstrandise** [F.]. Early term for a guild of professional musicians [*ménestrel*, i.e., minstrel]. François Couperin pictured a procession of minstrels, jongleurs, beggars, and acrobats with their bears and monkeys in a piece called “Les Fastes de la grande et ancienne Mxnstrxndxsx” [see his *Pièces de clavecin*, ed. J. Brahms and F. Chrysander, ii, 208].

**Meno** [It.]. Less. *Meno mosso*, less quickly.

**Mensur** [G.]. (1) Meter, mensuration. (2) In organ building, same as scale, \*scaling.

**Mensural music** (also **mensurable**, **mensurate**). Translation of L. *musica mensurata* (*cantus mensurabilis*), which in early theory (13th–16th centuries) is used in contrast to *musica plana*, i.e., plainsong. It means polyphonic music in which every note has a strictly determined value, as distinct from Gregorian chant with its free rhythm. See Mensural notation; also under Measure.

**Mensural notation.** The system of musical notation that was established c. 1250 by Franco of Cologne and remained in use until 1600. Actually, this period embraces a variety of systems differing from each other in many particulars [see under Notation]. The following discussion concerns the final stage of the development (c. 1450–1600), called *white mensural notation*, with reference to the white shapes of the larger note values used instead of the earlier black shapes.

I. *Notational signs.* These fall into two classes; single notes and ligatures. The single notes are

*maxima* (Mx), *longa* (L), *brevis* (B), *semibrevis* (S), *minima* (M), *semiminima* (Sm), *fusa* (F), and *semifusa* (Sf). The accompanying table shows the single notes and corresponding rests, together with the modern forms derived from them.

For the transcription into modern notation it is advisable not to use the exact equivalents (S = whole note, etc.), but smaller values that

	<i>Mx</i>	<i>L</i>	<i>B</i>	<i>S</i>	<i>M</i>	<i>Sm</i>	<i>F</i>	<i>Sf</i>
Notes:								
Rests:								
Modern:								

conform more closely to the actual temporal duration of the old signs. In the subsequent description a reduction 1:4 is used so that the S is rendered as a quarter note. For the ligatures, see the separate article.

II. *Mensuration*. Mensuration is the general term for the temporal relationships between the note values, comparable to the different meters of the modern system. Special terms are: *\*modus* (relationship between L and B), *tempus* (B and S), and *prolatio* (S and M). While in modern notation a note (unless dotted) is invariably equal to two notes of the next smaller value, in mensural notation the chief notes, namely L, B, and S, may equal either two or three. This dichotomy is indicated by the terms *imperfect* and *perfect*. Omitting the *modus*, which is usually imperfect, there result four combinations of *tempus* and *prolatio* (e.g., *tempus perfectum cum prolatione imperfecta*), which constitute the four main mensurations of mensural notations and are indicated by special signs. They are the exact equivalent of four basic meters of modern notation, as shown below:

Tempus	Prolatio	Sign.	Value of		Example
			<i>B</i>	<i>S</i>	
I. Imperfect	Imperfect				
II. Perfect	Imperfect				
III. Imperfect	Perfect				
IV. Perfect	Perfect				

The subsequent explanations refer chiefly to mensuration II. As a matter of fact, in I the metrical relationships between the various notes are the same as in modern notation; this mensuration, therefore, presents no problems, aside from the use of ligatures and coloration [see V below]. The principles for mensuration III can easily be derived from those for II by replacing each note by the next smaller note, e.g., the B by the S, the *tempus* by the *prolatio*, etc. Mensuration IV practically never occurs in the sources of white notation and is rare even in the 14th century.

III. *Imperfection and alteration*. The normal values of the B and S, i.e., three and one S respectively, are frequently modified according to principles known as imperfection and alteration. By imperfection the B is reduced from three S to two S, and by alteration the value of the S is doubled. The following rules cover the most common cases: If a B is followed by one or by more than three S, it is imperfected. If a B is followed by two S, the second of these S is altered [Ex. 1]. The last of these examples shows that a B may also be imperfected by a preceding S, a

process called *imperfectio a parte ante*, in contrast to the more common *imperfectio a parte post*. Rests cannot be imperfected or altered but may cause imperfection or alteration of a note [Ex. 2].

IV. *Punctus divisionis, punctus additionis*. In order to indicate deviating groupings and also in cases of ambiguity, a dot called *punctus divisionis* is used. This is equivalent to the modern bar line in 3/4 meter, as it always marks off groups of three S (perfection). Other terms, such as *punctus perfectionis*, *imperfectio*, or *alterationis*, are both superfluous and confusing. The dot is also used, however, with an entirely different meaning, i.e., as a *punctus additionis*, which is identical to the dot of modern notation. In the accompanying example the first and fifth

dots are *puncti divisionis*, while the others are *puncti additionis*.

V. *Coloration*. Coloration is the use of black notes (B, S, M) instead of the normal white forms (originally, red ink was used for this purpose):

The general principle of coloration is that three black notes are equal to two white notes. The result is different according to whether the black notes replace two imperfect or two perfect notes. In the former case [Ex. a, b] triplets result, while in the latter case [c, d] the effect is a change of rhythm similar to that encountered frequently in the courantes of the 17th century [see *Hemiola*]:

A special case of coloration is the so-called *minor color*, that is, the combination S-M in black notes. Originally, this indicated triplet rhythm, as above under (b). Owing to the shortness of the notes, however, its meaning changed into a dotted rhythm, as illustrated under (e). It is frequently followed by a series of Sm, as under (f). In a combination like this it should be observed that, notwithstanding their identity in shape as well as rhythmic value, the first of the stemmed notes is a black M while the others are "white" (i.e., normal) Sm.

The following example illustrates the principles explained above. It also includes passages in \*proportion. For further details of mensural notation the reader is referred to specialized books on the subject. See also Notation; Score II.

**Mensurstrich** [G.]. See under Bar line.

**Mente, alla** [It.]. Improvised.

**Menuet** [F.], **Menuett** [G.]. See Minuet.

**Mer, La** [F., The Sea]. Three symphonic poems by Debussy, composed 1903–05: 1. *De L'Aube à midi sur la mer* (From Dawn to Noon on the Sea); 2. *Jeux de vagues* (Play of the Waves); 3. *Dialogue du vent et de la mer* (Dialogue of the Wind and the Sea). The work represents the culmination of \*impressionist pictorialism and

technique, with its tendency toward constant change of melodic material and orchestral color, a technique eminently suited to the rendition of a "musical seascape."

**Mère l'oye, Ma.** See *Ma Mère l'oye*.

**Merengue** [Sp.]. One of the most popular dances of Santo Domingo in moderate duple time and with the basic rhythmic pattern:

It consists of two sections of sixteen measures each, the second in the key of the dominant or of the relative minor of the first.

The *merengue* can be traced back to Spanish traditions imported during the Conquest. In the 19th century it took on features of the waltz, the mazurka, and the contredanse, often modified by Negro influence. Because of its sensual character, the upper classes of Santo Domingo were reluctant to adopt it. J.O.S.

**Mescolanza** [It.]. \*Medley.

**Mese.** See under Greece II.

**Mesopotamia** (Babylonia, Sumeria, Assyria). Knowledge of the musical culture of the ancient inhabitants of Mesopotamia is restricted chiefly to information about their musical instruments from pictorial, architectural illustrations and religious texts. The chief instruments of the Sumerian period (c. 3000–2000 B.C.) were the harp, usually without forepillar, and the lyre. Both existed in a great variety of shapes and sizes. The music was strictly liturgical. During the Babylonian rule (2000–1000 B.C.) the use of lutes, flutes, oboes, and drums seems to point to greater refinement. During the Assyrian rule (1000–605 B.C.) music and musical instruments were brought in by foreign musicians. C. Sachs' attempt [*AMW* vii] to interpret certain signs on a Babylonian clay tablet dating from about 800 B.C. as harp notation, and his consequent reconstruction of a Babylonian hymn, were withdrawn by him in an article [*MQ* xxvii; also *CP* 1939] in which he also refutes another interpretation given by F. W. Galpin.

W. Stauder, *Die Harfen und Leiern Vorderasiens in babylonischer und assyrischer Zeit* (1961); H. Hartmann, *Die Musik der Sumerischen Kultur* (1960); M. Duchesne-Guillemin, "Découverte d'une Gamme Babylonienne" (*RdM* 1963, pp. 3-17); bibl. in *Notes* v, 179ff.

**Mesotonic.** Same as mean-tone (system); see under Temperament II.

**Messa di voce** [It.]. A special vocal technique of 18th-century *\*bel canto*, consisting of a gradual crescendo and decrescendo over a sustained tone; see Expression. Modern singers use it extensively for training but sparingly in performance. The term should not be confused with *\*mezza voce*. See also *Filar il tuono*.

**Messanza** [It.]. See under *Quodlibet* III.

**Messe** [F., G.]. Mass. *Messe des morts* [F.], Requiem *\*Mass*.

**Messel.** Corruption of *mathal*, a term used in Arab theory to indicate fractions of the type  $\frac{n+1}{n}$ , e.g., *mathal wa thuluth* =  $\frac{4}{3}$ , *mathal wa subu* =  $\frac{5}{4}$ , etc. [see R. d'Erlanger, *La Musique arabe* ii, 264]. It corresponds exactly to the Latin term *\*sesqui-*. All intervals represented by such fractions were considered consonant by the Arabs. The messel has nothing to do with an early recognition of the third or the sixth as consonances, as was formerly believed (R. G. Kiesewetter, *Die Musik der Araber* [1842] and many others after him). The third ( $\frac{4}{3}$ ) is simply one in the long series of consonant *mathal* intervals, while the sixth ( $\frac{5}{4}$ ) does not occur in this series and hence was not a consonance.

**Messiah.** Oratorio in three parts by Handel (libretto by C. Jennens, based on various books of the Bible), produced in Dublin, 1742, later revised, and published in 1767. It is Handel's most popular work. Particularly famous are the "Pastoral Symphony" and the alto aria, "He shall feed His flock" from the first part, and the "Hallelujah Chorus" from the end of the second part.

**Messine neumes.** The neumatic script of Metz. See Neumes II (table, col. I).

**Mesto** [It.]. Sad, mournful.

**Mestres de l'Escolania de Montserrat.** See Editions XXVI.

**Mesure** [F.]. Measure or meter.

**Metamorphosis.** See Transformation of themes.

**Meter.** The pattern of fixed temporal units, called *\*beats*, by which the timespan of a piece of music or a section thereof is measured [see Rhythm II (a)]. Neither meter nor rhythm is exactly equivalent to patterns of note values [see Rhythm I]. Meter is indicated by *\*time signatures*. For instance,  $\frac{3}{4}$  meter (or  $\frac{3}{4}$  time) means that the basic values are quarter notes and that every third quarter note receives an accent.

Such metric groupings are indicated by *\*bar lines* that mark off measures. According to whether there are two, three, or four units to the measure, one speaks of duple ( $\frac{2}{2}$ ,  $\frac{2}{4}$ ,  $\frac{2}{8}$ ), triple ( $\frac{3}{2}$ ,  $\frac{3}{4}$ ,  $\frac{3}{8}$ ), and quadruple ( $\frac{4}{2}$ ,  $\frac{4}{4}$ ,  $\frac{4}{8}$ ) meter,  $\frac{4}{4}$  also being called "common" meter. All these are simple meters. For  $\frac{4}{4}$  and  $\frac{2}{2}$  the signs C and  $\text{C}$  are used [see *Alla breve*]. Compound meters are simple meters multiplied by three: compound duple ( $\frac{6}{2}$ ,  $\frac{6}{4}$ ,  $\frac{6}{8}$ ), compound triple ( $\frac{9}{4}$ ,  $\frac{9}{8}$ ), and compound quadruple ( $\frac{12}{4}$ ,  $\frac{12}{8}$ ,  $\frac{12}{16}$ ). *\*Quintuple meter* ( $\frac{5}{4}$ ) is either  $\frac{2}{4} + \frac{3}{4}$  or  $\frac{3}{4} + \frac{2}{4}$ , depending on where the secondary accent lies. An example of septuple meter, written  $\frac{3}{4} + \frac{4}{4}$ , occurs in Brahms' *Variations* op. 21, no. 2. For the history of meter, see Rhythm III. See also Poetic meter; Time signatures. For bibl. see under Rhythm.

rev. G.C.

**Metrical psalms.** See under Psalter.

**Metronome.** An apparatus that sounds regular beats at adjustable speed and is used to indicate the exact tempo of a composition. The instrument in general use today was invented c. 1812 by Dietrich Nikolaus Winkel of Amsterdam but is named after Johannes N. Maelzel, who usurped and exploited Winkel's invention. The Maelzel Metronome (M.M. or M.) is based on the principle of a double pendulum, i.e., an oscillating rod with a weight at each end, the one at the upper end being movable along a scale. By adjusting this weight away from or toward the axis, the oscillations can be made slower or faster respectively. An indication such as M.M. 80 means that the pendulum makes 80 oscillations per minute: In a piece marked M.M.  $\text{♩} = 80$ , the duration of the half note will be  $\frac{60}{80} = \frac{3}{4}$  second.

Metronomic indications can be used to estimate the approximate duration of a piece. The formula is  $\frac{n \times t}{M}$ , where *M* is the metronome fig-

ure,  $t$  the number of measures of the piece, and  $n$  the number of notes—those to which the metronome figure refers—in a measure. For instance, a piece of 160 measures in  $3/4$  time with the metronome mark M.M.  $\text{♩} = 90$  will last  $\frac{3 \times 160}{90} = 5\frac{1}{3}$  minutes, or 5 minutes and 20 seconds.

The first composer to use the metronome was Beethoven. In 1817 he published metronomic indications for all the movements of his (then) eight symphonies (*Allgemeine Musikalische Zeitung*, no. 51). Unfortunately, the tempi indicated in his "Hammerklavier" Sonata and Ninth Symphony are almost impossibly fast, as are those indicated in the works of Schumann. See Tempo.

After more than a hundred years, during which it kept the pyramid shape fashionable in Napoleonic days, the Maelzel metronome gradually began to be replaced by devices resembling a watch, often built with an electric motor.

**Mexico.** Mexico's history of music can be divided into three main periods: the pre-Columbian, which dates from the rise of the Maya culture c. 200 A.D. to the end of the Aztec Empire, marked by Cuauhtemoc's defeat by Cortes (1521); the colonial, from 1521 until the declaration of independence from Spain in 1810; and independence, from 1810 to the present.

Information about pre-Hispanic music comes from the writings of early Spanish chroniclers, as well as from systematic study of native instruments known to have been used before Cortes' arrival and from melodies collected today among Indian groups supposedly not influenced by the European tradition. Such sources have led to the following conclusions: pre-Hispanic music was

always linked to ritual and ceremonial occasions; it was monophonic and prevailingly pentatonic; instrumental performance was always combined with singing; certain instruments, e.g., the \**huehuetl*, \**teponaztli*, and \**tlapitzalli* (a four-hole flute), were considered divine or endowed with supernatural powers and were worshiped as idols; music was a means of communal rather than individual expression. To date no indication of musical notation has been found.

With the arrival of the Spaniards, music in Mexico underwent a profound change. From the very beginning of the Spanish conquest, music was used to help convert the people to Christianity, and European musical methods were introduced along with education in other arts. In 1523 the first school for teaching European music to the Indians was established by a Franciscan missionary, Pedro de Gante (1480–1572). The students were trained in the construction and playing of instruments and were taught the elements of plainchant.

Secular forms of music were developed at the same time by a number of instrumentalists who had accompanied Cortes' first expedition to Mexico. Chronicles mention a guitar player, Juan Ortiz, who shortly after 1521 taught Indians to play the guitar and perform European dances.

A printing press established in Mexico in 1539 issued an *Ordinarium* in 1556, the first book with music printed in the New World. Between 1560 and 1589 eleven more liturgical books, containing portions of the Mass, antiphons, hymns, psalms, and Passion music, were printed in Mexico. This relatively large production indicates the existence of a considerable number of Indian choirs. Besides plainchant, polyphonic psalms, motets, and *villancicos* were performed as far back as 1538. Choirbooks preserved in the cathedrals of Mexico City and Puebla, containing works by the Spanish composers Cristóbal de Morales (c. 1500–53) and Francisco Guerrero (1527–99) that were brought to Mexico in manuscript copies before 1550, further indicate that part singing was widely practiced during this period. In 1539 Juan Xuárez, who had come to Mexico in 1530, was appointed the first choir director of the Cathedral of Mexico City.

The repertory of polyphony preserved in the codices of Mexican archives includes works by several noted composers, ranging from the mid-16th century to the early 18th century. Juan de Lienas (16th cent.) is represented in the archives of the Mexico City and Puebla cathedrals and

the Convento del Carmen by three Masses (one a Requiem), a Magnificat, several motets, and sets of Lamentations; Hernando Franco (1532–85), by seven Magnificats, two Salve reginas, psalms, hymns, and responsories [see Guatemala]; Fructos del Castillo by one motet; Pedro Bermudez (fl. 1605) by four Salvereginas and one psalm; Bernardo de Peralta (fl. 1640) by a Magnificat; Francisco Lopez y Capilla (fl. 1645) by three Masses, two Magnificats, twelve motets, and a set of Lamentations; Juan de Padilla (fl. 1650) by five Masses, five Magnificats, a Passion according to St. Matthew, motets, and *villancicos*; Antonio de Salazar (fl. 1690), choirmaster at the Cathedral of Mexico from 1685 to 1715, by seven hymns, two psalms, and a number of *villancicos*; and Manuel Zumaya (fl. 1720), composer of the first opera produced in the New World, *La Parténope* (1711), and a musical drama *El Rodrigo* (1708), by three Magnificats, two Misereres, two sets of Lamentations, and several *villancicos*.

Other colonial composers were Miguel Matéo Dallo y Lana (fl. late 17th cent.), musical director in Puebla, known for his part setting of *Sor Juana Ines de la Cruz' Villancicos*, printed in Mexico in 1690; José de Torres (fl. 1703), whose *Missarum Liber* was printed in Madrid in 1703; José María Aldana (d. 1810), composer of *villancicos*, a Mass in D, and instrumental music influenced by late 18th-century Italian examples; and Antonio Juanas (d. 1817).

In the 19th century, music in Mexico was strongly influenced by Italian opera. The predominant types were short theatrical farces and comedies and instrumental pieces based on dances. The former is represented by the *\*zarzuela*, the latter by the *minuet*, *contradanza* (*\*contredanse*), and *\*jarabe*. During the first half of the century a group of composers, inspired by the spirit of national independence and romanticism, were active. Members of this group were José Mariano Elízaga (1786–1842), author of two books on theory, *Elementos de la Música* (1822) and *Tratado de la Armonía y Melodía* (1835), and composer of two Masses, a Miserere, Lamentations, Responses, and a *Valse y variaciones* for piano; Joaquín Beristáin (1817–39), precocious composer of a *Sinfonia* and an orchestral fantasy, *La Primavera*; Luis Baca (1826–55), the first opera composer after independence; Cenobio Paniagua (1821–82), composer of the operas *Catalina di Guisa* (1845) and *Pietro d'Abano* (1863), the oratorios *Siete Palabras* (1869) and *Tobias* (1870), and several Masses; Melesio

Morales (1838–1908), who wrote the operas *Ildegonga* (1869), *Cleopatra* (1891), and *Anita* (1867), and a large number of piano pieces; Aniceto Ortega (1823–75), a gifted amateur composer of piano music and a short opera, *Guatimozin* (1871); and Tomás León (1826–93), a noted piano virtuoso, teacher, and composer.

During the long period when Porfirio Díaz was in power (1872–1911), Mexican composers continued to produce operas in the Italian style and at the same time cultivated virtuoso pieces, mainly for piano, strongly influenced by European romanticism. Among them were Julio Ituarte (1845–1905), a noted virtuoso and composer of several Fantasias for piano; Ernesto Elorduy (1853–1912), cultivator of the stylized type of Mexican *danza* for solo piano; Felipe Villanueva (1862–93), known for his opera, *Keofar* (1893); Gustavo E. Campa (1863–1934), who followed the French tradition in his piano compositions and his opera, *Le Roi Poète* (1901); and Ricardo Castro (1864–1907), successful pianist and composer of orchestral works, two operas, *Atzimba* (1901) and *La Legende de Rudel* (1906), and numerous compositions for piano.

At the time of the revolt against Porfirio Díaz (1910), two important figures emerged in Mexico's musical life, both pioneers of 20th-century music. One was Julián Carrillo (1875–1965), a noted composer and theorist who devised a microtone system called *\*Sonido trece*, according to which he wrote a number of chamber and orchestral works, using third, quarter, eighth, and sixteenth tones. In addition, he wrote numerous works in the vein of the coeval German school. His contemporary, Manuel M. Ponce (1882–1948), wrote a large number of compositions in which he gradually proceeded from the French impressionist style to a type of nationalism combined with 20th-century neo-classical elements. In addition to a very popular song, "Estrellita," he wrote more than a hundred songs and as many piano pieces, compositions for solo guitar, several concertos for solo instrument and orchestra, a number of orchestral compositions, and an opera, *El Patio Florido* (1913).

The contemporary Mexican school is headed by two composers of international renown, Silvestre Revueltas (1899–1940), who developed a highly original and unaffected style deeply rooted in Mexican folk music, and Carlos Chávez (b. 1899), who has combined a brilliant career as composer with that of conductor, lecturer, and leader of Mexico's musical life since the late 1920's.

Other important Mexican composers born before 1900 are Juan B. Fuentes (1869–1955), composer of a *Sinfonia Mexicana*, songs, and piano music; Rafael Tello (b. 1872), composer of several operas (*Juno, Nicolas Bravo, Due Amore, El Oidor*) and a *Sonata Trágica* for violin and orchestra; Candelario Huízar (b. 1888), a nationalist who exploited Indian materials in his music, which includes four symphonies, a string quartet, and several tone poems; José Rolón (1883–1945), a disciple of Nadia Boulanger, who wrote orchestral works in the French manner; Estanislao Mejía (b. 1882), another nationalist; and José F. Vasquez (b. 1895), composer of five operas, ballets, and numerous instrumental works.

Contemporary Mexican music is further represented by a group of composers whose influence began to be felt in the early 1930's. One of them is Miguel Bernal Jiménez (1910–56), composer of church music, an opera, *Tata Vasco* (1941), and orchestral compositions. Another is Spanish-born Rodolfo Halffter (b. 1900), who came to Mexico in 1939 and played an important role as a promoter of contemporary music. He has written a number of orchestral works, chamber and choral music, and solo instrumental compositions in a neoclassical manner. Other notable members of this group are Salvador de Elías (b. 1902), composer of several orchestral works; Luis Sandi (b. 1905), whose works include an opera, *Carlota*; and Vicente T. Mendoza (1894–1964). In addition, there is the well-known *Grupo de los Cuatro* (Group of the Four), all pupils of Chavez who banded together to promote Mexican music: Salvador Contreras (b. 1912), Daniel Ayala (b. 1908), Pablo Moncayo (1912–58), and Blas Galindo (b. 1910), the most important of them all. In his early works, Galindo was strongly attached to nationalist principles; later he gradually turned to more international trends and became considerably freer in his use of harmonies.

Already beginning to win recognition are such members of the younger generation as Mario Kuri-Aldana (b. 1931), Manuel Enriquez (b. 1926), Leonardo Velasquez (b. 1936), Eduardo Mata (b. 1942), and Joaquín Gutiérrez Heras (b. 1927).

Many Mexican composers of popular music are extensively recognized abroad. Of these, the best known is Agustín Lara (b. 1900).

Most of the folk dances and songs of contemporary Mexico are of Spanish derivation. The *\*huapango*, *\*jarabe*, *\*jarana*, and *zandunga*

exemplify the development of original Spanish dance patterns into strongly individual Mexican forms. The same is true of the *\*corrido*, which is a remarkable native development of the Spanish *romance*. Also characteristically Mexican is the *\*mariachi*, the typical band that serves to entertain people in cafés and at village and country dances and celebrations.

J.O.S.

**Meyo (meio) registro** [Port.]. See Divided stop.

**Mezzo, mezza** [It.]. Half. *Mezzo forte* (abbr. *mf*), half loud, moderately forte. *Mezza voce*, with "half voice," i.e., with restrained volume of tone [see, however, *Messa di voce*]. *Mezzo legato*, half legato. *Mezzo-soprano*, see Voices, range of.

**Mf.** [It.]. Abbr. for *mezzo forte*, half loud.

**M.g.** [F.]. Abbr. for *main gauche*, left hand.

**Mi.** See Solmization; Pitch names; Hexachord. As the third degree of the hexachord, *mi* in the Guidonian system takes on the meaning of the leading tone (e, b; see *Mi-fa*).

**Micanon.** See under Psalter.

**Mi contra fa.** See *Mi-fa*.

**Micrologus.** A treatise by Guido d'Arezzo (c. 990–1050) of c. 1030 [*GS* ii, 2ff; new ed. by J. Smits van Waesberghe, 1955; G. trans. M. Hermesdorff, 1876]. It contains a famous description of the principles of melodic motion (*motus*; ch. xvi) and a curious method of inventing melodies on the basis of the text (ch. xvii; see under *Soggetto cavato*). It also is an important source for the development of organum [see *Organum I*]. It may be noted that Guido's most famous contributions to musical progress, the

\*hexachord and the \*staff, are not in the "Micrologus" but in his "Epistola de ignoto cantu," written in the form of a letter to the monk Michael [GS ii, 43–50; SSR, pp. 121ff]. The term "Micrologus" was also used by A. Ornithoparchus in his *Musice active micrologus* (1517).

**Microtone.** An interval smaller than a semitone. Long a structural feature of Asian music, the use of microtones in Western music, although far from new, has been—aside from traditional, empirical performance practice involving microtonal adjustment of intervals for expressive purposes—far less extensive. The enharmonic system of Greek music, which gained temporary importance in the period of Euripides (c. 480–06 B.C.), included \*quarter tones [see Greece II]. Martianus Capella (fl. 4th to 5th cent.), in his *De nuptiis Mercurii et Philologiae* or *Satyricon* (Book ix, "De musica"), mentions third tones (*tristemoria*) and quarter tones (*tetrastemoria*) [see ed. F. Eyssenhardt (1866), p. 349; similarly Regino of Prüm, in GS i, 232, no. 4]. Several of the "ornamental" neumes of Gregorian chant probably involved quarter tones [see Neumes I]. There is incontestable evidence of the practical use of quarter tones in the 11th-century Gradual of Montpellier [see *WoHN* i, 44f; *ApGC*, p. 122f, pl. vi]. In the 16th century, the enharmonic system of the Greeks was revived by N. Vicentino [see Arcicembalo]. At the end of the 17th century, Christiaan Huygens proposed a division of the octave into thirty-one equal parts, permitting transpositions of the diatonic scales in just intonation.

The adoption of the equal-tempered twelve-note scale for keyboard instruments rendered such efforts as Huygens' supererogatory, and it was not until music began approaching a state of chromatic saturation that composers once again considered the introduction of microtones into the resources of Western music [see Serial music].

In 1895, the Mexican Julián Carrillo wrote a string quartet using quarter tones [see *Sonido trece*]. Between 1903 and 1914 Charles Ives wrote a Quarter-tone Chorale for Strings. In 1907, Busoni was considering the use of third tones (*Entwurf einer neuen Ästhetik der Tonkunst* [1906?]). Ives used quarter tones in at least two other works, Quarter-tone Pieces for Two Pianos and his Fourth Symphony. Similar experiments were made in the first half of the 20th century by Hans Barth (Concerto for quarter-tone piano and strings, 1930), I. Vyshnegradsky (*Dithy-*

*ramb*, 1926; Prelude and Fugue, 1929), and Alois Hába, whose extensive list of compositions includes works using both quarter tones and sixth tones. Both Carrillo and Harry Partch have written a considerable number of pieces using even smaller intervals, Partch dividing the octave into forty-three unequal steps, Carrillo, into ninety-six equal ones. Several Dutch composers (H. Badings, H. Kox, P. Schat, *et al.*), holding, like Partch, that further subdivision of the equal-tempered twelve-note scale merely compounds the harmonic errors inherent in it, have written pieces using the 31-note scale advanced by Huygens and, in this century, by Adriaan Fokker. Recently, many younger composers, stimulated at least in part by \*electronic music, have been using microtones to a considerable extent.

Notation of microtones, even in the case of the fairly commonly used quarter tones, has not been standardized. Perhaps the best known system is that established by Hába. His system for quarter tones is found in his String Quartet op. 12, no. 2 [Ex. 1]; for sixth tones, it is found in his String Quartet op. 87, no. 11 [Ex. 2]; another fairly common system for quarter tones is used by Krzysztof Penderecki in *Anaklasis*

The image contains three musical examples, labeled 1, 2, and 3, each showing a scale on a five-line staff. Example 1 shows a scale with quarter tones, indicated by a '1' above the staff. Example 2 shows a scale with sixth tones, indicated by a '2' above the staff. Example 3 shows a scale with quarter tones, indicated by a '3' above the staff. Below example 3 is a diagram showing the intervals between notes, with vertical lines and dots indicating the positions of the notes on a scale.

(1959/60). One typical objection to these systems is that the symbols for the quarter and sixth tones are too easily misread for the conventional sharps and flats. Also, that used by Hába makes

it impossible to use both sixth and quarter tones in the same composition, while that used by Krzysztof Penderecki makes no provision for sixth tones at all. One system that attempts to overcome these drawbacks prefixes the ordinary accidentals with  $\sqrt{\phantom{x}}$  and  $\int$  for quarter tones and  $\sqrt{\phantom{x}}$  and  $\int$  for sixth tones (Ezra Sims, *Octet for Strings*, 1964; see Ex. 3). There is also the special system devised by Carrillo for his pieces using sixteenth tones, in which numerical fractions replace conventional staff notation ("Preludio a Cristobal Colón," in *New Music* xvii, no. 3, 1944).

A few instruments for performance of micro-tonal music have been built. A quarter-tone piano was patented first in 1892 (G. A. Behrens-Senegalden). In 1924, Förster of Löbau/Georgswalde built a piano with two manuals, the second a quarter tone higher than the first; later, Hans Barth, in the United States, built a similar instrument [see N. Slonimsky, *Music since 1900*, rev. ed. (1949), p. 337]. In the Teyler Museum, Haarlem, there is an organ designed for performance of 31-note music [see R. Orton, "The 31-note Organ," *The Musical Times* cvii, 1966]. Both Carrillo and Partch have built special instruments for the performance of their music.

**Middle Ages, music of the.** The music of the period preceding the Renaissance, roughly from 500 to 1450. In view of the length of this period it is helpful to divide it into shorter periods comparable to those of other times, such as the Renaissance and the baroque. See History of music and the separate entries Gregorian chant; *Ars antiqua*; *Ars nova*; Burgundian school. Also the initial portions of France; Italy; England; etc.

Lit: *ReMMA*, *passim*; M. F. Bukofzer, *Studies in Medieval and Renaissance Music*

(1950); A. Seay, *Music in the Medieval World* [1965]; H. Gleason, *Examples of Music before 1400* (1942); *BeMMR*, *passim*; J. Chailley, *Histoire musicale du moyen âge* (1950); G. H. M., T. Gérold, *La Musique au moyen âge* (1932); J. Smits van Waesberghe, *Muziekgeschiedenis der Middeleeuwen*, 2 vols. (1939-42; theory); G. S. Bedbrook, "The Nature of Medieval Music" (*ML* xxvi, 78-88).

**Middle C.** The C near the middle of the keyboard, i.e., c' [see Pitch names]. It is represented on the first ledger line below the violin staff, or on the first ledger line above the bass staff.

**Midi, Le** [F.]. See under *Matin, Le*.

**Midsummer Night's Dream, A.** (1) Incidental music by Mendelssohn to Shakespeare's play, first performed in 1843. The overture is the most popular excerpt and is perhaps his most inspired composition, fascinating for its elfin lightness and orchestral colors. (2) Opera in three acts by B. Britten (libretto by the composer and P. Pears, after Shakespeare's play), produced in Aldeburgh, England, 1960. Setting: a wood near Athens and Theseus' palace in Athens, legendary times.

**Mi-fa.** In the medieval theory of \*hexachords, a general expression for cautioning the singer against special or dangerous intervallic progressions. From the following table, showing the mi's and fa's of the three hexachords, it appears that the combination mi-fa designates a semitone if the two syllables are taken from the same hexachord, and a tritone if from successive hexachords (see the diagonal lines):

	Mi	Fa
<i>Hexachordum durum</i> (on G):	B	c
<i>Hexachordum naturale</i> (on C):	e	f
<i>Hexachordum molle</i> (on F):	a	b <sup>b</sup>

It is particularly to the \*tritone, the \**diabolus in musica*, that the warning *mi contra fa* (*mi contra fa, diabolus in musica*) refers.

**Mignon.** Opera in three acts by A. Thomas (libretto by J. Barbier and M. Carré, based on Goethe's *Wilhelm Meisters Lehrjahre*), produced in Paris, 1866. Setting: Germany and Italy, 18th century.

**Migrant cantus firmus.** See *Cantus firmus*.

**Migrant melisma.** A term (introduced by P. Wagner, G. Wandermelismen) for phrases in Gregorian chant that recur in a number of melodies

of the same type (e.g., the tracts of mode 8), migrating, as it were, from one chant to another. Such phrases are not melismas in the proper sense of the word, but carry a text that, of course, varies from one chant to another. If, however, the variable text is disregarded, a melisma results. See under Cento.

**Milanese chant.** See Ambrosian chant.

**Military music (bands).** Music for military purposes (signaling, marching into battle, etc.) was employed by the Jews (hasosra), Romans (\*tuba, cornu, \*lituus), and other ancient peoples. In the Middle Ages (11th century and later) the Herhorn, Stierhorn, and \*oliphant were used to warn of the enemy's arrival. Instrumental groups including trumpets, pipes, drums, and cymbals were used by the Saracens in their battles with the Crusaders, who soon adopted this practice. In Scotland the \*pibroch (a kind of bagpipe music) was used to rouse the soldiers' spirit. With the rise of organized armies during the 15th and 16th centuries, certain standard practices developed, e.g., the use of trumpets and kettle-drums for the cavalry, and of fifes and drums for the infantry. The military trumpeters were organized in guilds [*G. Feldtrompeter*] and were endowed with many privileges. The kettle-drummers used extravagant and affected gestures, such as survive to the present day in the movements of drum majors and majorettes [see *SaHMI*, p. 330]. The music of these groups was limited to a repertory of signals, each for a special purpose [see *Fanfare*].

Toward the end of the 17th century, melody instruments were introduced, leading to the establishment of military bands and a broader repertory, including marches and similar pieces. The bands of Louis XIV (1638–1715), organized by Lully, consisted of oboes, bassoons, and drums, while those of Frederick II (1712–86) included oboes, clarinets, horns, and bassoons. About 1800, the vogue of Turkish music [see *Janizary music*] led to the adoption of other percussion instruments, such as cymbals, triangles, the military glockenspiel, and the crescent. Infantry regiments under Napoleon had bands consisting of one piccolo, one high clarinet and sixteen ordinary clarinets, four bassoons, two serpents, two trumpets, one bass trumpet, four horns, three trombones, two side drums, one bass drum, one triangle, two pairs of cymbals, and two crescents. A landmark in the development of military music was a performance given in honor of the Russian Emperor by W. F. Wie-

precht, the organizer of Prussian military music, in Berlin on May 12, 1838, where he conducted the united bands of sixteen infantry and sixteen cavalry regiments, totaling 1,000 wind instruments and 200 drummers. About 1850, Adolphe Sax reorganized the French military bands by introducing his novel valve brass instruments.

The history of military bands in America parallels the European development. The first use of instruments in battle came after the capture of Fort Ticonderoga in 1775, when a fife and drum are reported to have been played. Routine "calls" or "beats" were played by drum alone. Massachusetts regiments were among the first to employ bands in 1792, but it was not until 1812 that the regular army increased its allotment to two musicians for each regiment or company, and not until 1847 was the size of the standard band increased to sixteen men. Outstanding figures in this development were Patrick Sarsfield Gilmore (1829–92) and John Philip Sousa (1854–1932), both bandmasters skilled as promoters as well as musicians. Gilmore took his 22nd Regiment Brass Band on a world tour, and Sousa, after resigning as head of the Marine Band, followed suit with his own group. With little exception the bands of Sousa and Gilmore, as well as the military bands of today, were fairly similar to those developed immediately after the French Revolution. Today's larger groups, connected with or representing specific branches of the armed services, are highly polished ensembles, able to perform deftly the most difficult contemporary wind literature. Indeed, in England, the term "military band" has become synonymous with the "concert" or "symphonic" band of the United States, since only the larger branches of the service can support an adequate instrumentation. Among the outstanding military bands today are those of the Scots Guard Royal Artillery, United States Marines, Army, Navy, and Air Force, as well as the Garde Républicaine band of France.

Brenet, "French Military Music in the Reign of Louis XIV" (*MQ* iii, 340-57). See also Brass band. rev. J.W.

**Military Polonaise.** Familiar name for Chopin's most popular polonaise, op. 40, no. 1, in A major (pub. 1840).

**Military Symphony.** Popular name for Haydn's Symphony in G, no. 100 (no. 8 of the \*Salomon Symphonies), composed 1794. The second movement, Allegretto, employs triangles, cymbals, and bass drum in imitation of Turkish music [see Janizary music], and also contains a trumpet fanfare.

**Milonga** [Sp.]. A very popular dance in the suburbs of Buenos Aires during the last decades of the 19th century. Together with the *tango Andaluz* and the \**habanera*, it is one of the most important sources of the Argentine \*tango, which by 1900 had completely absorbed the *milonga*. J.O.S.

**Mimodrame** [F.]. Older name for \*pantomime.

**Mineur** [F.]. Minor.

**Miniature score.** An open score of orchestral or chamber music, inexpensive and pocket-size, designed chiefly for the student or for the amateur who wants to read the music while listening to a performance. This important and successful publishing enterprise was started by A. Payne in Leipzig and was taken over in 1892 by E. Eulenburg of Leipzig, who developed it greatly. Later publications were issued that include a large number of scores in one volume, e.g., all the symphonies of Beethoven. These are the size of ordinary music but contain on each page four pages of miniature score. See R. Upton, *Index of Miniature Scores* (1956).

**Minim** [L. *minima*]. (1) British name for the half note. (2) See Mensural notation I.

**Minnesinger** [G. *Minnesänger*]. German poet-musicians of noble birth who flourished from the 12th to 14th centuries. Inspired by the French \*troubadours (not the \*trouvères), the minnesingers became the leading—in fact, practically the sole—representatives of German music during the Middle Ages. The start of the move-

ment is usually traced to the marriage of Frederick Barbarossa to Beatrix of Burgundy in 1156. The close relationship of the minnesingers to the troubadours is demonstrated by, among others, a Provençal *vers* of the troubadour Guyot de Provins that also exists with a German text by Friedrich von Husen, who flourished in the 12th century [see *BeMMR*, pp. 106, 108]. Following is a tentatively chronological list of the most important minnesingers whose melodies are preserved (1, 2, etc. = number of melodies; *J* = *Jenaer Handschrift*; *C* = *Colmarer Handschrift*, Cgm 4997, in Munich):

Before 1200: Spervogel (3; *J*, *C*).

Early 13th century: Walther von der Vogelweide, d. 1230 (3 "Töne" with new texts in A. Puschman's "Das Singebuch," in Breslau, *Bohn* no. 356; 3 in *C*); Neidhardt von Reuenthal, c. 1180-1240 (55 in *DTO* 71); Brüder Wirner (6; *J*); Meister Alexander (5; *J*).

Mid-13th century: Tannhäuser (3; *C*, *J*); Konrad von Würzburg (7; *C*, *J*); Rumsland or Rume-lant (10; *J*, *C*); Der Meissner or Mysnere (17; *J*, *C*).

Late 13th century: Heinrich von Meissen, called Frauenlob, d. 1318 (28; *C*, *J*); Wizlav von Rügen, d. 1325 (13; *J*); Hermann der Damen (6; *J*).

14th century: Heinrich von Müglin (4; *C*); Hermann Münch von Salzburg, c. 1350-1410 (10; *C*); Hugo von Montfort, 1357-1423. The Münch von Salzburg also wrote the earliest extant German polyphonic pieces, which, like those of Oswald von Wolkenstein (1377-1445), are not part of the minnesinger repertory.

In spite of the French influence, the music of the minnesingers differs considerably from that of the troubadours and trouvères. The texts are narrative rather than amorous or idyllic (Neidhardt von Reuenthal being a notable exception) and usually devotional, many of them being songs in praise of the Virgin. The melodies are more markedly modal (church modes) than the French ones, and many of them make extensive use of the interval of a third [for an example, see under Third]. Textual considerations as well as a certain "massiveness" of the musical line forbid the application of \*modal interpretation (3/4 meter) that is generally accepted for the trouvère songs. Finally, the French refrain forms, the \*virelai and the \*rondeau, are absent in the German repertory, which uses only two forms, the \**Bar* form, derived from the French \**ballade*, and the *Leich*, derived from the French \**lai*.

Owing to the large number of surviving songs and the individual charm of his melodies, Neidhardt von Reuenthal stands out as the central figure of minnesinger music, though from the literary point of view he represents a decline from refined courtly lyricism (Walther von der Vogelweide) to a realistic and occasionally slightly vulgar naturalism. Ex. in *HAM*, no. 20.

**Minor.** See Major, minor.

**Minstrel.** Originally and properly, the professional musician (instrumentalist) of the Middle Ages, especially one employed in a feudal household. Today the term is used generically for the entire field of popular musical entertainment, from the mimes of antiquity to the show business of the present day.

The earliest musical entertainers in Western Europe were the mimes (*mimus*), the actors of the Greek and Roman theater. After the fall of Rome, during the barbarian invasions, the mimes, who in Roman law were already considered outcasts (*infami*), devoted themselves to various activities—frequently of a dubious nature—that included the playing of instruments. The efforts of church and state authorities to suppress them are documented in numerous edicts. Nevertheless, the mimes or, as they were later called, *joculatores* [from L. *jocus*, jest; F. *jongleur*; E. juggler; G. *Gaukler*], survived and

gradually became more secure and respectable—at least those who were willing to abandon their dissolute life. It is reasonable to assume that they were the bearers of a tradition of folk music that occasionally crept into art music. In the 11th and 12th centuries the *jongleurs* were employed by the troubadours and trouvères [see Troubadour]. In the 14th century the name *jongleur* was replaced by *ménéstrier*, probably in order to distinguish a class of higher social standing and professional repute. They became organized in guilds known as *\*ménestrans*, similar to those of the medieval craftsmen.

In England, a class of acrobat-musicians was known as "gleemen," and in Germany as *Gaukler*. A vivid description of their activities is given in a German report of the 12th century, according to which they were expected "to play the drum, the cymbals, and the hurdy-gurdy; to throw small apples and to catch knives; to perform card-tricks and to jump through four hoops; to play the citole and mandora, the manichord, the guitar, and many other instruments." In the early 14th century the term "minstrel" appeared. Guilds and fraternities were gradually formed, whose history can be traced at least to the beginning of the 17th century [see Wait]. The German counterpart of these guild-musicians were the *Stadt Pfeifer*. For the minstrel show, see Negro music I.

To include the *\*bards* in the same category as minstrels is somewhat misleading since they always held a high social position in their countries, notably in Wales and Ireland.

Lit.: E. Duncan, *The Story of Minstrelsy*, rev. ed. (1950); J. J. Jusserand, *English Wayfaring Life in the Middle Ages* (1888 and later); E. Faral, *Les Jongleurs en France au moyen âge* (1910); W. Grossmann, "Frühmittelenglische Zeugnisse über Minstrels" (diss. Berlin, 1906); P. Aubry, in *RMC* iv; *id.*, in *TG* vi; J. Sittard, in *VMW* i; W. Salmen, in *CP Anglès* ii; *ReMMA*, p. 241.

**Minuet** [F. *menuet*; G. *Menuett*; It. *minuetto*; Sp. *minué*, *minuete*]. A French country dance that was introduced at the court of Louis XIV about 1650. The King himself is said to have danced "the first" minuet, composed by Lully in 1653. The minuet, with its choreographic floor-pattern in the shape of a Z or S, was soon adopted as the official court dance of the régime of the Sun King, and it quickly spread throughout Europe, completely superseding the older types (*courantes*, *pavanes*) and establishing a new period of dance and dance music. The fact

that a number of early minuets (e.g., those contained in the Collection \*Philidor) include phrases of three measures suggests that the minuet may have been derived from the \**branle à mener*, or \**amener* [ex. in *HAM*, no. 229]. Lully introduced the minuet into his ballets and operas, and G. Muffat, J. Pachelbel, and J. K. F. Fischer used it in their suites (c. 1700). Many of these minuets already show the *alternativement* arrangement of two minuets,  $M_1-M_2-M_1$ , which is the origin of the minuet and trio movement of the sonata [see Trio].

The minuet was the only one of the baroque numerous dance types that did not become obsolete after the decline of the suite (c. 1750). The statement that Haydn was the first to introduce the minuet into the symphony is far from correct. The operatic sinfonias of Alessandro Scarlatti (1660–1725) and others usually close with a minuet, as do many of the independent symphonies and sonatas of the pre-Haydn period. The minuet with trio as the next to last movement is found in practically all the symphonies of the \*Mannheim school [see Sonata B III (a)].

The minuet is in 3/4 meter and, originally, in moderate tempo. The accompanying example (Lully's minuet "Dans nos bois," as given in D'Anglebert's *Pièces de clavecin* [\*Editions

XLIX, I, 8, p. 29]) shows the graceful dignity of the early minuet, which survives in the famous minuet in Mozart's *Don Giovanni*. In the symphonies of Haydn and Mozart, however, the minuet became faster and more humorous or whimsical in character, gradually leading into the \*scherzo. See also Dance music III and, for the internal structure of the minuet, Binary and ternary form II. See E. Blom, in *ML* xxii, 162–80.

**Minuta** [It.]. See under Ornamentation III.

**Minute Waltz.** Popular name for Chopin's Waltz in D-flat, op. 64, no. 1, derived from the fact that it lasts approximately one minute when played at an excessively rapid tempo.

**Miracle play.** See under Liturgical drama.

**Mirliton** [F.]. An instrument consisting of a pipe closed at one end by a membrane. By directing the natural voice against the membrane, the tone is altered, the timbre becoming quite nasal. In the 17th century the instrument was known as *flûte-eunuque* (eunuch flute) and was admired by men of such high standing as Mersenne for its "new charm." Today it is a musical toy, shaped approximately like a cigar and commonly known as "kazoo." See Instruments II.

**Miroirs** [F., Mirrors]. A group of five piano pieces by Ravel, composed 1905: 1. *Noctuelles* (Moths); 2. *Oiseaux tristes* (Mournful Birds); 3. *Une Barque sur l'océan* (A Boat on the Ocean); 4. *Alborada del gracioso* (Morning Music of a Minstrel-Clown); 5. *La Vallée des cloches* (The Valley of the Bells).

**Mirror composition.** The principle of mirror reflection can be applied to a composition in two ways: (a) with the mirror placed at the end, producing its retrograde form; (b) with the mirror placed underneath, resulting in its inverted form. Usually but not always the term refers to (b). Thus a mirror composition is one that, if changed according to the principle of melodic inversion [see Inversion (2)] leads to an acceptable result. A mirror canon (mirror fugue) is a canon (fugue) so constructed. Among the few mirror compositions found in actual music is a setting of the chorale "Mit Fried und Freud ich fahr dahin," which Buxtehude included in his *Fried- und freudenreiche Hinfarth*, written in 1674 for the burial of his father [see Ex.]. Much better known are the two mirror fugues in Bach's *Art of Fugue* (BG, vol. xxv, pt. i, Contrapunctus

12 [also *BG*, vol. xlvii, no. 18] in four parts; Contrapunctus 13 [no. 16] in three parts, also a Fugue on p. 85 [Contrapunctus 17, p. 93] with the addition of a "non-mirrored" voice). It should be noted that the term "mirror canon" is often used for what is more properly called "canon by inversion" [see Canon I (d)]. Occasionally it is used to mean retrograde canon [see Canon I (e)].

**Misattributed compositions.** See Spurious compositions.

**Miserere** [L.]. Psalm 50 [51]: "Miserere mei, Deus, secundum magnam misericordiam tuam" (Have mercy upon me, O God, according to thy loving kindness). In the Roman Catholic rites it is sung as the first psalm of Lauds on Maundy Thursday, Good Friday, and Holy Saturday [see *Tenebrae*]; also at Lauds of the Office for the Dead and during the Burial Service. It is one of the \*penitential psalms and has been composed as such, but also independently, owing to the impressiveness of the text. The earliest example is a setting by Costanzo Festa (1517) for two choruses, one in four parts, the other in five, in familiar style (*falsobordone*). Various other compositions in the same style, usually retaining the "traditional" number of nine parts, were written, among them the celebrated composition by Gregorio Allegri (c. 1582–1652) that remained in use at the Papal Chapel until 1870, alongside Palestrina's \*Improperiae and \*Lamentations for the same service. A host of legends—including that of the young Mozart copying it from memory, against the express law of the Church—have arisen, all intended to elevate this work to the realm of divine inspiration and beauty. Actually it is a rather undistinguished composition in a plain *falsobordone* style whose monotony is somewhat relieved by "abbellimenti" (probably 18th-century additions) at the end of each verse. The mediocrity of Allegri's *Miserere* does not, of course, prevent it from being very effective when performed with the solemnity of the pontifical rites. A much more beautiful and imaginative composition of the text is the *Miserere* by Josquin, published in 1519.

**Missa** [L.]. \*Mass. *Missa solemnis* (solemn Mass, High Mass) is the Mass in its full form, with all the items (except for lections, etc.) sung, while in the *Missa lecta* (read Mass, Low Mass) there is no music, except perhaps hymn singing. *Missa cantata* (sung Mass) is, from the musical point of view, identical with the High Mass but is celebrated in a less elaborate manner. From the

above it appears that the title *Missa Solemnis* chosen by Beethoven for his Mass (op. 123) carries no connotation that would not also apply to a Mass by Palestrina or Bach. *Missa pro defunctis*, Mass for the Dead, Requiem Mass. *Missa Papae Marcelli*, see Marcellus Mass. *Missa L'Homme armé*, see *L'Homme armé*.

**Missal** [L. *missale*]. See under Liturgical books I (1).

**Mistaken authorship.** See Spurious compositions.

**Mistic(h)anza** [It.]. \**Quodlibet*.

**Misura** [It.]. Measure, beat. *Alla misura*, in strict time; *senza misura*, without strict time.

**Mit Andacht.** See *Andächtig*.

**Mit Ausdruck.** See *Ausdrucksvoll*.

**Mit Eile.** See *Eilend*.

**Mit Empfindung.** See *Empfindung*.

**Mit Wärme.** See *Wärme*.

**Mixed cadence.** See under Cadence I.

**Mixed mode.** See under Church modes III.

**Mixed voices.** A combination of men's and women's voices [see Equal voices].

**Mixolydian.** (1) See under Greece II. (2) The seventh \*church mode (*septimus tonus*; *tetrartus*), represented by the segment g–g' of the diatonic scale, with g as the tonic. From the modern point of view it is a major mode with a minor seventh (f instead of f#). See also Modality.

**Mixture stop.** See under Organ VI, IX (f).

**M.M.** See under Metronome.

**Modal.** Pertaining to a mode, either a church mode (e.g., in modal harmony, \*modality) or the rhythmic modes of the 13th century (modal notation, modal interpretation, modal rhythm).

**Modality.** The use of harmonic and melodic formations based on the \*church modes, as opposed to those based on the major and minor modes (\*tonality). In particular, the term refers to the use of modal idioms in the prevailingly tonal music of the 19th and 20th centuries. This phenomenon may be traced to three different sources: (a) the desire to imitate the tonal language of 16th-century sacred music; (b) the influence of Slavic or other folksong having modal features; (c) a reaction against the system of

classical harmony. Examples of (a) are Beethoven's "Dankgesang an die Gottheit in der lydischen Tonart" (String Quartet in A minor op. 132, 1825)—probably the earliest example of 19th-century modality—and the compositions of Vaughan Williams; examples of (b) occur in Chopin's mazurkas and in numerous compositions by Mussorgsky, Tchaikovsky, and other \*nationalist composers; the last-mentioned tendency is conspicuous in the works of Debussy [see Impressionism] and 20th-century neoclassical composers. The accompanying examples illustrate the use of modality. Ex. 1 (Chopin, Mazurka no. 15) is Lydian (B natural instead of B-flat); Ex. 2 (Franck, Symphony) is

transposed Dorian (major sixth D-sharp instead of minor sixth D); Ex. 3 (Brahms, Symphony no. 4) combines Phrygian (minor second F instead of F-sharp) with Mixolydian (minor seventh D, instead of the leading tone D-sharp); Ex. 4 (Sibelius, Symphony no. 2) is Aeolian (minor sixth and seventh, F and G instead of F-sharp and G-sharp). See J. Vincent, *The Diatonic Modes in Modern Music* (1951); J. d'Almeida, *Les Modes grégoriens dans l'œuvre de Claude Debussy* [1950].

**Modal notation.** A notational system used mainly in the organa and clausulae of the school of \*Notre Dame (c. 1175–1250), so called

because it is based on the system of rhythmic \*modes. The parts are written in \*ligatures, whose value depends on the mode used. Thus, a single three-note ligature (*ligatura ternaria*) may have the value *L-B-L* in mode 1, *B-L-B* in mode 2, *L-L-L* in mode 5 (*L* = *longa*, *B* = *brevis*, corresponding to the quarter note and eighth

note in modern transcriptions). See Ex. This ambiguity was eliminated in the Franconian notation (c. 1260). See Notation III, Ex. 2; also Square notation.

**Modal rhythm.** A rhythm based on the rhythmic \*modes. See also Rhythm III (b).

**Modal theory.** A theory according to which compositions (mostly of the 13th century) should be interpreted in modal rhythm, although the original notation gives no evidence of such rhythm. This theory has been applied to (a) the \*conductus and (b) the melodies of the troubadours, trouvères, and minnesingers, nearly all of which are notated in uniform note values [Ex. a] but are thought to have been performed with a regular alternation of long and short values [Ex. b].

The modal theory was proposed simultaneously (c. 1907) by P. Aubry, F. Ludwig, and J. B. Beck (concerning the question of priority, see J. Chailley, in *AMW* x, 213ff). In its original form it called for the strict application of one of the rhythmic modes (in practice only modes 1, 2, and 3), the proper mode to be selected on the basis of the metrical structure of the text (number of syllables, distribution of accents). This, however, is a rather nebulous criterion, since in numerous cases a single melody has been interpreted differently by different scholars [see, e.g.,

*HAM*, no. 18c, showing three versions of Guiraut de Bornelh's *Reis glorios*, to which at least two others could be added]. Originally an ardent champion of modal theory, F. Gennrich has since advocated a freer application of modal rhythm, aiming at an even closer agreement between the musical rhythm and details or variants of the accentual structure of the text. This often involves highly personal judgment as to which word or syllable is strongly accented, particularly since French is not an "accentuating" language like English or German. See Monophonic notation; Poetic meter IV.

Gennrich, ‡*Troubadours Trouvères Minne- und Meistergesang* (in *Das Musikwerk*, ed. K. G. Fellerer [1951]); F. Ludwig, "Zur 'modalen Interpretation' von Melodien des 12. und 13. Jahrhunderts" (*ZIM* xi); *ReMMA*, pp. 206ff; *ApNPM*, pp. 258ff (conductus); F. Gennrich, in *MF* i, *MF* vii, *CP Anglès* i; H. Husmann, in *AMW* ix, *AMW* xi, *MF* v. See also the summaries by J. Smits van Waesberghe in *KJ* xlvii, 20, and xlviii, 15.

**Mode.** A term used for two entirely different concepts, both rooted in medieval music, namely (1) one of scale formation, and (2) one of rhythm.

(1) Mode, in the widest sense of the word, denotes the selection of tones, arranged in a scale, that form the basic tonal substance of a composition. In any given key (i.e., for any given center tone or tonic, e.g., E) a large number of modes are possible, some of which are indicated in the accompanying illustration: 1 is the "Dorian mode" (transposed from D to E); 2 is the "Phrygian mode" (untransposed); 3 is the "major mode" (usually called major key); 4 is the "minor mode" (usually called minor key); 5 is a "pentatonic mode"; 6 is the "whole-tone mode." See Scale III. In a narrower sense, the term "mode" refers only to those scales that go back to the medieval \*church modes (modes 1

and 2 of the example). It is with reference to these that the terms "modal" and "modality" are commonly used. For the use of the term "mode" with reference to Oriental (Indian, Arab, etc.) music, see Melody type.

(2) See Modes, rhythmic; also *Modus*.

**Moderato** [It.]. In moderate speed, i.e., between andante and allegro.

**Modern music.** A term used so loosely that it is virtually meaningless. The dates of the period so described vary with each writer. Some people might agree that modern music started about 1890, when composers such as Elgar, R. Strauss, and Sibelius (all born c. 1860) produced their first significant works. Others would restrict it to the music of contemporary (living) composers. See Impressionism; Twentieth-century music; Neoclassicism; Atonality; Expressionism; Serial music; Electronic music; etc. See A. Cohn, *Twentieth-Century Music in Western Europe* [1965]; *LBCM*, *passim*; J. Machlis, *Introduction to Contemporary Music* (1961); N. Slonimsky, *Music since 1900* (1937); G. Perle, *Serial Composition and Atonality* (1962); W. Austin, *Music in the 20th Century* [1966]; A. Salazar, *Music in Our Time* (1946).

**Modes, rhythmic.** A 13th-century system of rhythm, characterized by the consistent repetition of certain simple rhythmic patterns in ternary meter. Usually six modes are distinguished, as shown below. The Greek names (added in parentheses) were not used until relatively late (W. Odington, c. 1290; see Theory II, 12) and do not imply that the modes are derived from the feet of ancient Greek poetry [see Poetic meter].

In musical compositions, the patterns were reiterated a number of times, depending on the

First (trochaic)	♩ ♩   ♩ ...
Second (iambic)	♩ ♩   ♩ ...
Third (dactylic)	♩. ♩ ♩   ♩. ♩.   ...
Fourth (anapestic)	♩ ♩   ♩. ♩. ♩.   ...
Fifth (spondaic)	♩. ♩.   ♩. ♩.   ...
Sixth (tribrachic)	♩ ♩ ♩   ♩ ...

length of the phrase or, in medieval terminology, on the *ordo*. The *ordo* indicated the number of times a pattern was repeated without interruption, e.g.:

First mode, third ordo 

Third mode, second ordo 

The modes are the rhythmic basis of the organa, clausulae, and motets of the 13th century, which are therefore said to be written in \*modal notation [see also Square notation]. Usually the first, second, and sixth modes occur in the upper parts (sometimes also the third), and the third and fifth in the lower (the fourth mode was rarely used). In practice, certain modifications of the normal patterns were admitted, such as occasional omission of a weak beat (*extensio modi*) or breaking up of one note into two or three (*fractio modi*). See also under Perfect, imperfect.

Lit.: *ApNPM*, pp. 220ff; A. Michalitschke, *Die Theorie des Modus* (1923); H. Sowa, in *ZMW* xv; H. Husmann, in *AMW* xi; F. Chailley, in *CP Anglès* i; E. H. Sanders, in *JAMS* xvii, 261ff.

**Modinha** [Port.]. Urban song of European traditions, chiefly Italian opera, that was developed mainly during the 19th century in Brazilian salons. Its music, lyrical and very sentimental, is usually set for a solo voice accompanied by a chamber group and reflects the influences of both Portuguese folksongs and *bel canto*. Since the peak of its development was reached under the Brazilian Empire, it is also known as *modinha imperial*. J.O-S.

**Modulamen, modulatio, modulus.** Humanist (16th-cent.) misnomers for motet.

**Modulation.** Change of key within a composition. Such changes are among the most common devices of harmonic variety and are found in practically every work of some length. For an effective modulation, the initial as well as the new key should be established by a cadence.

I. *Theory.* A modulation is effected by means of a "pivot chord," i.e., a chord that is common to both the initial and the new key. For instance, in Ex. 1, the third chord is the pivot chord, being I in the old key (C) and IV in the new key (G); hence it is designated  $\begin{smallmatrix} C:I \\ G:IV \end{smallmatrix}$ . In Ex. 2, the same chord adopts the function of VII in D (properly, D minor), while in Ex. 3, V of C is reinterpreted as III of E (properly, E minor).

Usually three types of modulation are distinguished: diatonic, chromatic, and enharmonic. A diatonic modulation is one made through a chord that is diatonic in both keys. Ex. 1-3 be-

1  
C: I V<sup>6</sup> I G: IV V<sup>4</sup> I D: VII V<sup>6</sup> I

2  
C: I V<sup>6</sup> I C: I V<sup>6</sup> I D: VII V<sup>6</sup> I

3  
C: I V<sup>6</sup> E: III<sup>6</sup> V I C: I V<sup>6</sup> A $\flat$ : IV<sup>6</sup> V<sup>5</sup> I C: I V<sup>6</sup> A: V<sup>9b</sup> I

4  
C: I IV D: III IV C: II II<sup>6</sup> I $\frac{5}{4}$  V I

5  
C: I V<sup>6</sup> C: I  $\flat$ II<sup>6</sup> C: I V<sup>6</sup> E: III<sup>6</sup> V I A $\flat$ : IV<sup>6</sup> V<sup>5</sup> I C: I V<sup>6</sup> A: V<sup>9b</sup> I

C: I IV D: III IV C: II II<sup>6</sup> I $\frac{5}{4}$  V I

7  
C: I IV D: III IV B $\flat$ : III II<sup>6</sup> I $\frac{5}{4}$  V I

long to this category. A chromatic modulation is one made through a chord that is chromatically altered in one or both keys, a very common example being the modulation through the Neapolitan sixth [Ex. 4]. The field of chromatic modulation is very large, and its exploitation has been one of the main achievements of 19th-century harmony. Enharmonic modulation is one that involves the enharmonic change of one or several notes. This is frequently achieved through the diminished seventh chord [Ex. 5].

If the new key is touched upon only momentarily, leading quickly into a third key, the modulation is said to be "false" or "passing." The former term is used if the third key is the initial key [Ex. 6], the latter if it is still another key [Ex. 7]. The latter occurs mainly in sequential progressions (sequential modulation). Naturally, the interpretation of a modulation as "real," "false," or "passing" depends largely on the impression of permanence (to the second key) and therefore is frequently a subjective judgment.

Aside from the above-described "pivot modulations," change of key is often effected simply by juxtaposing the old and new keys, a very effective device that some writers claim is not really "modulation." Ex. 8, by Schubert, under Harmony, illustrates this method, which usually involves a shift of a whole tone or semitone. Even in these cases, however, the harmonic relationships can be analyzed on the basis of pivot chords. See Harmonic analysis VI.

II. *History*. Obrecht (c. 1450–1505) and Josquin (c. 1450–1521) seem to have been the first composers to make deliberate use of modulation, always in short passages involving five or six passing modulations to the lower fifth, e.g.: D–G–C–F–B<sup>b</sup>–E<sup>b</sup>–D. Similar passages occur sporadically throughout the 16th century. An interesting early experiment in chromatic (and, in a sense, enharmonic) modulation is Willaert's duo "Quidnam ebrietas" [see J. S. Levitan, in *TV* xv; E. E. Lowinsky, in *TV* xviii]. Naturally, the chromatic madrigals of the late 16th century (Marenzio, Gesualdo, Monteverdi) abound in chromatic modulations of various types. A particularly interesting landmark in the history of modulation is John Bull's organ fantasia *Ut, re, mi, fa, sol, la* [see Hexachord VI], not only because of its unusual modulatory scheme—always a whole tone upward—but also because the modulations serve to establish a succession of different keys, which later was to become their main function. This seems to have taken place chiefly with the establishment of fixed repeat forms, the binary form of the dance movements of the suite and the ternary form of the *da capo* aria [see Aria IV]. With Bach, a modulatory scheme became an essential trait of the fugue. In the late 18th century, the \*sonata form was treated (and explained by theorists) primarily as a harmonic-modulating form, involving certain standard changes of key [see Lit., Ratner]. In this period the term "to modulate" [G. *modulieren*] often meant "exploiting a key" rather than "change of key."

Rogers, "The Development of a Concept of Modulation in Theory from the 16th to the Early 18th Century" (diss. Indiana Univ., 1955); F. Turrell, "Modulation: An Outline of Its Prehistory from Aristoxenus to Henry Glarean" (diss. Univ. of Southern California, 1956); L. Ratner, "Harmonic Aspects of Classic Form" (*JAMS* ii);

H. Ausubel, "Aspects of Modulation Practice in the Period between 1890 and 1910" (*MR* xvi, 218ff). See also under Harmony.

**Modulator**. See Tonic sol-fa.

**Modus** [L.]. (1) \*Church mode; see also Tonus (2). \*Mode, rhythmic. (3) In \*mensural notation, *modus major* (*modus maximarum*) denotes the relationship between the *maxima* and the *longa*, and *modus minor* (*modus longarum*), or simply *modus*, that between the *longa* and the *brevis*. In English books, Morley's translations "greater mood" and "lesser mood" are frequently used in this sense. Both *modi* could be either perfect or imperfect [see Mensural notation II; also Perfect, imperfect]. The *modus longarum* often occurs in the tenors of 14th- and 15th-century motets and Masses, while the *modus maximarum* is much rarer [see *ApNPM*, p. 124]. The *modus longarum* developed from the six rhythmic modes of the 13th century [*ibid.*, pp. 242ff].

**Modus lascivus** [L.]. Medieval name for the tonality of C major, which was avoided in plain-song but was frequently used in secular music.

**Moldau, The**. English title of the second (*Vltava*) of Smetana's symphonic poem cycle \**Má Vlast*.

**Moll** [G.]. Minor key; *G moll*, G minor. See *Dur*.

**Molto** [It.]. Very. *Molto allegro* (*adagio*), very quick (slow).

**Moments musicaux** [F., Musical Moments, correctly *Moments musicaux*]. Title of Schubert's six piano pieces, op. 94 (1828?). See under Character piece.

**Monacordo** [It.]. A 16th-century name for the \*clavichord.

**Mondscheinsonate** [G.]. \*Moonlight Sonata.

**Monferrina**. A country dance from Piedmont (north Italy) in 6/8 time, which became fashionable in England c. 1800, where it usually was called *monfrina*, *monfreda*, or *manfredina*. Examples are found in Wheatstone's *Country Dances for 1810* and similar collections.

**Monochord**. A device consisting of a single string stretched over a long wooden resonator to which a movable bridge is attached so that the vibrating length of the string can be varied. The monochord was widely used in antiquity (under the name \*kanon) and in the Middle Ages for the investigation and demonstration of the laws of

musical acoustics, a purpose for which it is still used today [see Acoustics II]. Detailed descriptions are given by Odo of Clugny [GS i, 252], Hieronymus de Moravia [CS i, 74], and others. In the later Middle Ages the number of strings was increased to two or three, so that intervals and chords could be made audible. Such monochords, sometimes called "polychords," were the ancestors of the \*clavichord, which as late as the 16th century was called *monacordo* in Italy. In the 17th and 18th centuries the monochord was widely used by organ tuners.

Lit.: S. Wantzloebe, *Das Monochord als Instrument und System* (1911); W. Nef, "The Polychord" (GSJ iv, 20ff); *GéHM*, p. 407; J. Chailley, "La Monocorde et la théorie musicale" (CP Waesberghe).

**Monocordo.** In violin playing, the performance of a piece or passage on a single string. This effect was used first by Paganini in his Sonata "Napoleon" for the G string.

**Monodrama.** See under Melodrama.

**Monody.** A term occasionally used as a synonym of \*monophonic music or for accompanied solo song in general, but more properly denoting a particular type of accompanied solo song that developed about 1600 in reaction to the polyphonic style of the 16th century and that is characterized by recitativo-like design of the voice-part and thoroughbass accompaniment.

The illustration shows one of the earliest examples of true monody, from Caccini's *Le Nuove musiche* (1601; for others, see *HAM*, nos. 182–85; *SchGMB*, nos. 169, 171–73, 176, etc.; see also *Nuove musiche*; Aria III; Cantata; Recitative).

Forerunners of the monodic style are the numerous 16th-century songs with lute or vihuela accompaniment (Schlick, *Tabulaturen etlicher lobgesang und lidlein*, 1512; Milán, *El Maestro*, 1535; Enriquez de Valderrabano, *Libro de música de vihuela*, 1547) and polyphonic madrigals arranged for a solo singer with an accompanist for the lower parts (e.g., Luzzascho Luzzaschi; see *SchGMB*, no. 166). Bottrigari, in his *Desiderio* (1594; new ed. by K. Meyer, 1924), wrote about a widespread practice of solo song in the *laude*, the *intermedii* [see Intermezzo (1)], and in folk singing.

Lit.: P. Aldrich, *Rhythm in Seventeenth-Century Italian Monody* [1966]; N. Fortune, "Italian Secular Song from 1600 to 1635. The Origins and Development of Accompanied Monody" (diss. Cambridge Univ., 1953); *id.*, "Italian Secular Monody from 1600 to 1635" (*MQ* xxxix); A. Schering, "Zur Geschichte des begleiteten Sologesangs im 16. Jahrhundert" (*ZIM* xiii); E. Schmitz, "Zur Frühgeschichte der ... Monodie" (*JMP* xviii); P. Nettel, "Über ein handschriftliches Sammelwerk von Gesängen italienischer Frühmonodie" (*ZMW* ii); C. MacClintock, "The Monodies of Francisco Rasi" (*JAMS* xiv); A. Einstein, "Firenze, prima della monodia" (*LRM* vii); L. Torchi, "Canzoni ... ad una voce nel secolo XVII" (*RMI* i).

**Monophonic notation.** The notation of early monophonic music, e.g., Chinese, Indian, Greek, Byzantine, Gregorian, sequences, troubadours, trouvères, minnesingers, Meistersinger, etc. Since this repertory has widely differing origins, monophonic notation is simply a generic term for a number of entirely different systems of notation, each of which requires individual study. In Oriental as well as in ancient Greek music the pitches are indicated by symbols derived from the literary script (syllables, letters), while the neumatic notation of Christian and ancient Jewish chant employs special signs of purely musical significance [see Ecphonic notation; Byzantine chant III; Neumes]. After A.D. 1000 the neumes of Gregorian chant became "heighted" and were written on a staff, a development that led to a permanent solution for notating pitch. The 12th-century neumatic script of France, characterized by the use of

square-shaped characters [see Square notation], was adopted for the notation of polyphonic music [see Notation III] as well as for writing down the monophonic repertory of secular songs. The melodies of the troubadours and trouvères and the Italian *laude* and Spanish *cantigas* all are written in this notation, essentially that employed in modern editions of Gregorian chant. Some of the earliest (12th-century) sources of troubadour and trouvère song, especially the *Chansonier de Saint-Germain des Près*, employ the somewhat different symbols of Messine script, which was adopted in Germany (minnesingers, Meistersinger).

The main deficiency of these notational systems is their failure to indicate note values. This gives rise to the question of rhythm, not only in Gregorian chant [see Gregorian chant VI] but also for the repertory of secular song, in which, however, it is distinctly different because of the presence of poetic texts. The use of nonmensural symbols for writing down presumably measured melodies has led to various theories, most of them based on a consideration of the poetic meter of the text. While Riemann advocated the principle of *\*Vierhebigkeit* and duple meter, P. Aubry and others proposed an interpretation in triple meter based on the rhythmic modes of the 13th century [see Modal theory; also Poetic meter IV]. The validity of the modal theory has been challenged by A. Machabey and especially by H. Anglés, who maintains that the Spanish *cantigas*, the Italian *laude*, and some troubadour and trouvère MSS are written in a mensural notation that is partly modal, partly nonmodal (binary meter). This important discovery may well lead to new results in the field of secular song.

Aubry, *Trouvères and Troubadours* (1914); A. Machabey, *Notations musicales non modales* (1957); H. Riemann, in *JMP* xii; J. Handschin, in *AM* x and *Medium Aevum* iv (1935); H. J. Moser, in *ZMW* vii, 367ff; E. Jammers, in *ZMW* vii, 265ff; H. Anglés, in *CP* 1949, pp. 45ff, and *CP* 1958, pp. 56ff. See also under Modal theory.

**Monophony, monophonic.** Music consisting of a single melodic line without additional parts or accompaniment, as opposed to *\*polyphony*, *\*homophony*, etc. [see Texture]. Monophonic music is the purest realization of the melodic element [see Melody]. It is the oldest type of

music, being the only kind employed in ancient Greece, in the various branches of early church music (Gregorian chant, Byzantine chant), the music of the troubadours, trouvères, minnesingers, and Meistersinger, the Spanish *cantigas* and Italian *laude* of the 13th century, and universally in non-Western and primitive music as well as in European folk music. Also see remark under Monody.

**Monothematic, polythematic.** Terms describing compositions based on one theme (e.g., a fugue) or several themes (e.g., a sonata or a movement in sonata form). They are applied particularly to the imitative forms of the 16th and 17th centuries, such as the fantasia, *ricercar*, etc. It was formerly maintained that the fantasia was monothematic and the *ricercar* polythematic [see M. Seiffert, *Geschichte der Klaviermusik* (1899), p. 33f]. Actually, both forms may have one or several themes.

**Monotone.** The recitation of a liturgical text on an unchanged pitch, as in psalms, prayers, lessons (reading from the Scriptures), etc. Usually, monotonic declamation is modified by inflections, i.e., a few ascending or descending tones at the beginning, middle, or end of the phrase of the text. See Psalm tones. The term “inflected monotone” has also been used for rather elaborate chants that have been interpreted as highly ornamented variants of a recitation.

**Montirande.** A 16th- and 17th-century variety of the *\*branle*, mentioned by Arbeau (*\*Orchésographie*, 1589) as “branle de monstierandel,” and by Mersenne (*Harmonie universelle*, 1636) as “branle de montirandé.” A manuscript in Uppsala contains a number of Montirandes for instrumental ensemble, in 4/4 meter and with dotted rhythms. See J. J. S. Mráček, “Seventeenth-Century Instrumental Dances in Uppsala, Univ. Libr. I Mhs 409” (diss. Indiana Univ., 1965).

**Montonero** [Sp.]. Counterpart of the French minuet that developed in the La Plata River region during the first half of the 19th century. It is also known as *minué montonero* or *el Nacional* (the national). While retaining the a b a structure of the European model, the *montonero* became a characteristic New World dance

through the inclusion of numerous folk devices, e.g., the use of shoe-tapping and of many Latin American figures, as well as melodic ornamentation common to folksongs of this area. Examples based on popular melodies and on national anthems have been preserved. A well-known one from 1837 is the *Minué Republicano*, based on Antonio Sáenz's Uruguayan national anthem.

J.O-S.

**Montpellier, Codex.** Name of two important early manuscripts, both in the library of the *Faculté de médecine* of the University of Montpellier in southern France: (1) *Cod. H 159*, an 11th-century MS of Gregorian chant, unique for its arrangement of the chants according to modes (*Tonale missarum*) and for its double ("bilingual") notation in nondiastematic neumes and \*letter notation [\*Editions XLII A, 7 and 8]; (2) *H 196*, the most important source of 13th-century motets; see Sources, no. 4.

**Monumenta, Monumenti, Monuments.** See Editions XXVII to XXXIII.

**Mood.** See *Modus* (3).

**Moonlight Sonata** [G. *Mondscheinsonate*]. Popular name for Beethoven's *Sonata quasi una fantasia* op. 27, no. 2. The name probably comes from a review written by Heinrich Rellstab (1799–1860), in which the first movement was likened to a boat floating by moonlight on Lake Lucerne. Another name is *Laube Sonata* [G. *Laube*, "bower"], referring probably to a fancied place of composition. The latter name is not known at all in Germany. See under Mute.

**Morceau** [F.]. Piece, composition.

**Mordent** [G.; F. *mordant* (Old F. *pincé*, *pincement*); It. *mordente*; Sp. *mordiente*]. A musical ornament consisting of the alternation of the written note with the note immediately below it. It is indicated by one of the signs given in Ex. 1 (the third sign is used only in music for bowed

instruments). In performance the mordent always occupies part of the value of the written note and should not be introduced before it. The alternations of the written note and the auxiliary may be either single or double [Ex. 2]; there is a special sign for the latter [Ex. 3], but it is not often used and the choice between these executions is generally left to the performer, who bases his decision chiefly on the duration of the written note. If two mordents occur in close succession, contemporary authorities recommend that one should be made single and the other double, as in Ex. 4 (Bach).

In the works of J. S. Bach the mordent often is fully written out [Ex. 5, Adagio of the C-major organ toccata]. All of Bach's mordents, except for those in pieces with a particularly vigorous rhythm, should be performed comparatively slowly, as in Ex. 6 [a. Italian Concerto; b. *Well-Tempered Clavier* ii, no. 1]. When a mordent and an appoggiatura occur on the same note, the mordent must be delayed until the appoggiatura has been held for its normal duration, as in Bach's chorale prelude, "Wenn wir in höchsten Nöten sein" [Ex. 7]. After 1750 all mordents were performed more rapidly than in Bach's time. The ornament apparently was absorbed by the ordinary notation before the classical period, for it is not found in the works of Mozart and Beethoven.

The mordent occurs in the German organ tablatures of the 15th and 16th centuries, where

it is indicated by the signs illustrated (a. Buxheim Organ Book, c. 1470; b. Kotter, Buchner, c. 1520). It was executed somewhat differently, however, since the main note was held and only the lower auxiliary was quickly repeated [see

WoHN ii, 24; ApNPM, p. 24]. According to Ammerbach (*Orgel oder Instrument Tabulaturbuch*, 1583), the mordent was performed with the lower or upper neighboring note depending on whether it occurred in ascending or descending motion [see WoHN ii, 29]:

Also see Inverted mordent. See the general books on ornamentation. P.A.

**Morendo** [It.]. Fading away.

**Moresca, morisca.** A. pantomimic dance of the 15th and 16th centuries, which was executed in Moorish costume and other grotesque disguises, the dancers having their faces blackened and small bells attached to their legs. Arbeau, in his *\*Orchésographie* (1589), reports that he saw the *moresca* danced in his youthful days (c. 1530) by "un garçonnet machuré et noircy, des grelotières aux jambes." The *moresca* was easily the most popular dance for the ballets and mummeries of the Renaissance. There were two types, a solo dance and a dance of two groups that represented a sword fight between Christians and Moslems. The latter was known also as *danse des \*bouffons* [see also *Matasin*]. Dances of this kind are still known today in Spain, Corsica, and Guatemala. In England they survived under the name "Morris dance," partly in a continuous tradition, partly as the result of a conscious revival c. 1900. The Morris dance was performed chiefly as part of the May games. It included, in addition to six male dancers in two groups, certain solo characters, such as the "Mayde Maryan," represented by a boy disguised as a girl, or by a dancer with a hobbyhorse. For the vocal *moresca* (Lasso), see under Villanella. See C. Sachs, *World History of the Dance* (1937); O. Gombosi, in *PAMS* 1940, p. 91; P. Nettl, in *AMW* xiv.

**Morris dance.** See under *Moresca*.

**Moses und Aron.** Opera in three acts by Schoenberg (to his own libretto), produced in Hamburg, 1954, concert performance; Zurich, 1957, stage performance. Setting: Mt. Sinai, Biblical times.

**Mòsso** [It.]. Moved, agitated.

**Motectum.** A 16th-century latinized term for motet.

**Motellus** [L.]. A 13th- and 14th-century term for motet.

**Motet.** The most important form of early polyphonic music, particularly during the Middle Ages and Renaissance. Since it underwent numerous changes during the more than five centuries of its existence (c. 1220–1750), it is impossible to formulate a general definition that covers all the phases of its development. As a rule, a motet is an unaccompanied choral composition based on a Latin sacred text and designed to be performed in the Roman Catholic service, chiefly at Vespers. There are, however, side developments into the secular field (13th-century French motet; 15th-century ceremonial motet), as well as motets for soloists (13th-century motet; also in the late 17th century) or with orchestral accompaniment and to texts in the vernacular (17th century, Germany and France; the English motets of this period are called *\*anthems*). The history of the motet may be divided into three periods: A. medieval motet (c. 1220–1450); B. Flemish motet (1450–1600), named for its inaugurators, although it became international property after 1550; C. baroque motet (1600–1750).

A. *The medieval motet.* I. The medieval motet originated in the early 13th century, possibly as early as 1200, through the addition of a full text to the upper part (*duplum*) of the *\*clausulae* of the Perotinus period, a development strikingly similar to the one that, in the 9th century, led from the vocalized melismas of the Alleluias to the full-text sequences. Owing to the addition of "mots," the *duplum* with text was called *motetus*, a name that was adopted for the entire composition. The tenor of a motet (like that of a *clausula*) is practically always a melismatic (vocalized) passage taken from a Gregorian chant (usually a Gradual, Alleluia, or responsory) and identified by the word or syllable (*\*incipit*, usually capitalized in modern writings) with which it occurs in the original plainsong. The only change is in rhythm, from the free rhythm of plainsong to a strict modal pattern [see Modes,

rhythmic]. The accompanying example shows the motet "O Maria—Nostrum" [see *ApNPM*, p. 285, for a facsimile of the original notation] and the Easter Alleluia [see *LU*, p. 779] from which the tenor NOSTRUM is taken. It is im-

NOSTRUM

portant to realize that originally a motet was not an independent composition but, like the clausulae, a polyphonic interpolation (polyphonic \*trope) of the chant to which it is allied by its tenor. The following scheme—a modification of that given under Clausula—shows two motets in their proper liturgical position (ordinary print indicates plainsong; capital letters the motet tenors; italics the added text of the upper part):

*O Maria . . .*  
Alleluia, alleluia. X. Pascha NOSTRUM  
*Radix venie . . .*  
immo-LATUS est Christus.

II. There are a few specimens of a 12th-century type of motet, the *organal motet*, so called because it is based on a complete Gregorian melody so that, except for the text of its upper part, it is an organum rather than a clausula. Examples are "*Stirps Jesse—Benedicamus Domino*" and "*Amborum sacrum spiramen—Benedicamus Domino*," the latter remarkable for its text, a medley of Latin and French [see J. Handschin, "Über den Ursprung der Motette," in *CP* 1924]. To this type belongs a version of Perotinus' *organum quadruplum*, "*Viderunt omnes*," in which the *duplum* is provided with a full text, "*Vide prophecie*" [see *AdHM* i, 229].

The first step in the development of the 13th-century motet probably was to supply clausulae

with a text that represents a paraphrase of the tenor incipit, e.g., *Domino fidelium omnium* for the tenor DOMINO [see *HAM*, no. 28f]. Frequently, however, not only unrelated Latin texts but also French secular texts were employed. An important step was the addition of a third voice-part (*triplum*), in either Latin or French (a Latin *triplum* was used only in connection with a Latin motetus). There also exist a few motets in four parts. A special type is the *conductus motet* in three (occasionally four) parts, in which the upper parts have an identical text and identical rhythm, as in a conductus. Motets with two (three) different texts are called double (triple) motets. The Latin double motet may be regarded as the classical type of 13th-century motet. While most of the earlier motets are based on clausulae, those of a later date (after 1250?) consist of freely invented parts added to the tenor.

The use of a French text in connection with a liturgical tenor is a startling incongruity, since these texts usually deal with amorous and occasionally even lascivious subjects. Needless to say, such motets were never sung in church but served as an entertainment at social gatherings. The Latin motet, on the other hand, far from being incongruous, is a perfect expression of the universalism of Thomas Aquinas and other medieval philosophers. At any rate, the mixture of sacred and secular, the merging of the Gregorian tradition with the trouvère movement, the frequent exchanges and substitutions, both musical and textual, are what make the development of the motet so fascinating. Examples illustrating the extraordinarily manifold relationships within the repertory of the 13th-century motet are found in *AdHM* i, 237, 240 (F. Ludwig), and *HAM*, no. 28h, 28i. A limited number of motets are musical \**quodlibets* including combinations of different pre-existent melodies [see Refrain III; *Enté*].

III. The rhythmic structure of the motet is based on the rhythmic \*modes, the upper parts frequently employing a quicker pattern (first, second, sixth mode) than the tenor (third, fifth mode), as illustrated (schematically) in our example. In the early motets (before 1250?) sub-

divisions of the breve (represented by a quarter note in the example) into two or three notes (eighth notes, eighth-note triplets) occur only as ornamenting groups sung to one syllable. Franco of Cologne recognized these shorter notes as a new value, the semibreve, thereby introducing a new type, the Franconian motet, in which each semibreve could be sung to a separate syllable, resulting in a more lively declamation [see *HAM*, no. 28i, 2; also no. 33b]. This tendency was carried to an extreme in the Petronian motet of the late 13th century (named after Petrus de Cruce), in which the breve is subdivided into four to seven notes, sung syllabically in a rapid *parlando* style [see *HAM*, nos. 34, 35].

IV. In the 14th century the motet lost its dominant position [see *Ars nova*] but grew in length, elaboration, and rhythmic variety. A feature of special interest is the introduction of the \*isorhythmic principle. Practically all the motets of Machaut (c. 1300–77) are isorhythmic [ex. in *HAM*, no. 44], and a number of them apply this principle not only to the tenor but also, with a certain amount of freedom, to the upper parts [see *ReMMA*, p. 354]. The final stage of the development is represented by the strictly panisorhythmic motet (in which *all* parts are strictly isorhythmic), used a few times by Machaut but predominantly by his successors until c. 1430 (Dunstable, Dufay). There are a considerable number of early 14th-century English motets, many of which combine a conservative 13th-century style with an extended use of \*voice exchange [ex. in *HAM*, no. 57a; see Worcester, school of].

Beginning in the 15th century, novel methods of composition were used for motets. The two characteristics of the medieval motet, polytextuality and a *cantus firmus* tenor, were abandoned in favor of free composition with the same text in all the parts. The earliest examples of this type are by J. Ciconia (c. 1335–1411), e.g., his “O felix templum,” composed c. 1406. In the works of Dunstable and Dufay, free motets appear side by side with the last representatives of the isorhythmic type. They are usually in three voice-parts and in \*cantilena style, with only the upper part (sometimes the two upper parts) carrying the text. In this period it is very difficult to draw a line between motets on the one hand and polyphonic settings of hymns or Marian antiphons on the other. For instance, an “Ave Regina caelorum” may in one edition be included among the motets [e.g., Bukofzer’s edition of Dunstable, in \*Editions XXXIV, 8]

but not in another [e.g., De Van and Besseler edition of Dufay].

B. *The Flemish motet*. I. The return to sacred music that characterizes the \*Flemish school brought the motet back to prominence as a musical form second in importance only to the Mass. The motet now became a choral setting of a Latin religious text, in four to six or more voice-parts. Its texture became much more unified, all the parts being vocal and having approximately the same degree of rhythmic animation. In not a few motets, however, one part (usually the tenor) is made to stand out from the others by having a *cantus firmus* in slower motion, sometimes in long-held values, e.g., one note to the measure [see *Cantus planus* style]. Such *cantus firmus* motets, as they might be called, often have a different text for the main voice, a striking revival of the polytextuality of the 13th-century motet. Examples are Obrecht’s “Laudemus nunc Dominum” (with “Non est hic alius”), Josquin’s *Stabat Mater* (with “Comme femme”), and Cristóbal de Morales’ “Emendemus in melius” (with “Memento homo”; see *HAM*, no. 128). Others are based on a short motif that is repeated in the manner of an \*ostinato. Beginning with Ockeghem, motets are usually divided into two or three sections (*Prima, Secunda, Tertia pars*). In contrast to these fairly long compositions is a type often referred to as “song motet” [G. *Liedmotette*], which was particularly cultivated in the late 15th century and which was shorter and simpler in style [see *ReMR*, p. 94]. For an attempt to distinguish between different types of motet on the basis of their liturgical derivation (sequence, antiphon, responsory), see O. Strunk, in *CP* 1939.

II. The stylistic development of the Flemish motet is of great importance, because from c. 1450 to 1550 the motet provided the most fertile soil for all developments and innovations in style. The most interesting aspect is the ever-increasing use of imitation, a process that culminated in the \*through-imitative style (also called “pervading imitation”). This style has been so much identified with the motet that it is often referred to as “motet style.” Actually, its application was more limited than is usually thought. The motets of the 15th century (Ockeghem, Obrecht) make only sporadic use of imitation. Josquin often introduced full points of imitation [see Point (3)] but in alternation with sections in homophonic (\*homorhythmic) style, in free counterpoint, and in \*paired imita-

tion. It was Nicolas Gombert (c. 1490–1556) who introduced fully imitative treatment in the motet [see *HAM*, no. 114]. In the second half of the 16th century motets were often composed in eight or more voice-parts, particularly in connection with \*polychoral treatment. This style led to a new type of motet, the “Venetian motet,” so called to distinguish it from the “Netherlands motet.”

III. About 1550 the motet spread throughout Europe, and the Flemish masters (Josquin, Gombert, de Monte, Lasso) found disciples of equal rank in Italy (A. Gabrieli, Palestrina, G. Gabrieli), Spain (Morales, Victoria), England (Tallis, Byrd), Germany (Senfl, Handl, Hassler), and France (Goudimel). In England the adoption, c. 1560, of texts in the vernacular led to a special type of motet, the \*anthem.

Important collections of 16th-century motets are: *Motetti A B C* (printed by O. Petrucci, 1502, '03, '04); *Motetti de la corona*, 4 books (Petrucci, 1514–19); *Motetti del frutto*, 4 collections (A. Gardano, 1538, '39, '49); *Motetti del fiore*, 4 books (J. Moderne, 1532–39); *Novum et insigne opus musicum*, 2 vols. (H. Formschneider, 1537, '38); *Thesaurus musicus*, 5 vols. (J. Montanus and U. Neuber, 1564); *Novus Thesaurus musicus*, 5 vols. (ed. P. Joanelli, 1568); *Promptuarium musicum*, 4 vols. (ed. A. Schade, C. Vincent, 1611–17); *Florilegium selectissimarum cantionum* (ed. E. Bodenschatz, 1603; repub. as *Florilegium Portense*, 1618).

C. *The baroque motet*. After 1600 the style of the motet changed considerably. The pure *a cappella* style was abandoned, and solo voices as well as instrumental accompaniment were used. This does not mean that the 16th-century style was completely forsaken. Both the “stile antico” of Palestrina and the Venetian style with its massive sound were continuously cultivated in the motets of the baroque, sometimes in almost unchanged manner, as, e.g., in numerous motets written by members of the \*Roman school (cf. the motets by J. J. Fux, c. 1700, in *DTO* 3). Usually, however, the old methods were modified according to the stylistic devices of the 17th century, such as instrumental participation, solo voices, aria style, *basso continuo*, recitativo, etc.

The earliest examples of the new practice are in Viadana's *Concerti ecclesiastici* (1602, '07, '09), containing motets for one, two, three, and four voices with organ accompaniment. While organ accompaniment is already prescribed in the *Concerti di Andrea et di Gio. Gabrieli* (1587) and

the *Concerti ecclesiastici* of A. Banchieri (1595), Viadana's innovation is the use of solo voices instead of chorus, a novelty that is particularly conspicuous in the pieces for one or two voices [see *SchGMB*, no. 168; *HAM*, no. 185]. The solo motet for two or three singers with organ accompaniment prevailed in Italy throughout the baroque era, side by side with the choral style of the Roman or Venetian tradition; not a few motets of this period made use of both styles, such as soloistic treatment in the first part and choral treatment in the second (e.g., G. Carissimi). Antonio Caldara (1670–1736) seems to have been one of the first in Italy to use instruments in addition to the organ [*DTO* 26]. There is a large repertory of 18th-century motets (A. Scarlatti, F. Durante, D. Terradellas, N. Jommelli) about which very little is known. Some of them are written in a highly virtuosio, quasioperatic style [see *HAM*, nos. 298, 299].

More interesting is the development in Germany, whose beginning and end are marked by two composers of the highest rank, Schütz (1585–1672) and J. S. Bach (1685–1750). Schütz' *Symphoniae sacrae* (1629, '47, '50) are a treasure of masterpieces written in a great variety of styles, incorporating instrumental participation, solo voices, expressive coloraturas, characteristic motifs in rapid notes, echolike alternation of two singers or instruments, realistic effects, trumpet calls, etc. Most of these pieces, particularly those from the later collections, are written to German texts, as are the majority of motets written by Schütz' successors. It goes without saying that this practice makes it even more difficult, if not impossible, to draw a line between the German motet and other types of church music, such as the cantata, spiritual song, *geistliche Konzert*, etc. As a rule, the use of the chorus marks the German form, since in Germany (unlike Italy) the motet remained choral and frequently *a cappella*. Continuing with Hamerschmidt, Johann Christoph Bach, Johann Michael Bach, Buxtehude, Pachelbel, and others, the German motet reached its peak in the six motets by J. S. Bach, four of which are written for double chorus of eight voices, while one (“Jesu meine Freude”) is for five voices and one (“Lobet den Herrn”) for four voices with continuo.

An important but little-known development took place in France, beginning with Charpentier (1634–1704) and continuing with Lully (1632–87), Michel-Richard de Lalande (1657–1726), Campra (1660–1744; see *HAM*, no. 257),

F. Couperin (1668–1733; *HAM*, no. 266), and Rameau (1683–1764). Some of these motets are for one voice and continuo, and others (*grand motet*) for soloists, chorus, orchestra, and organ.

For the development in England, see Anthem.

After J. S. Bach the motet declined. Motets were written by Hasse, Graun, K. P. E. Bach, Mozart ("Ave verum"), Mendelssohn, Schumann, and, particularly, Brahms (op. 29, 74, 110). A somewhat more continuous development took place in France, with Gounod, Saint-Saëns, Théodore Dubois, Franck, Charles Bordes, D'Indy, and other members of the \**Schola cantorum*. Twentieth-century composers of motets include Vaughan Williams, H. Distler, Pepping, and Krenek.

For C: J. E. Richards, "The Grand Motet of the Late Baroque in France" (diss. Univ. of Southern California, 1950).

**Motet-chanson.** A term for certain 15th-century French chansons employing a Latin text in the tenor, resembling in this respect the French-Latin motet of the 13th and 14th centuries.

**Motet style.** See under Motet B, II.

**Motetus** [L.]. (1) Latin for motet. (2) In the medieval motet, the voice above the tenor; see Motet A, I; *Duplum*.

**Mother Goose Suite.** See *Ma Mère l'oye*.

**Motif, motive** [F. *motif*; G. *Motiv*; It., Sp. *motivo*]. A short figure of characteristic design that recurs throughout a composition or a section as a unifying element. A motif is distinguished from a theme or subject by being much shorter and generally fragmentary. In fact, motifs are often derived from themes, the latter being broken up into shorter elements. As few as two notes may

constitute a motif, if they are sufficiently characteristic melodically and/or rhythmically, e.g., the descending fourth at the beginning of Beethoven's Piano Sonata in A major op. 2, no. 2. More than anyone, Beethoven used a highly developed motif technique, which gives his works a unique quality of logical coherence. His most eminent successor in this respect was Brahms. The technique of motifs is particularly important in sonatas and symphonies, whose development sections often are largely based on motifs derived from the various themes of the exposition. The accompanying example shows the various motifs derived from the main theme of

Beethoven's Pastoral Symphony. An exceptionally early use of motifs as an integrating device is found in the works of Machaut (c. 1300–77); see G. Perle, "Integrative Devices in the Music of Machaut" [*MQ* xxxiv]. See also Leitmotiv; Motto.

**Motion.** The pattern of changing pitch levels (high-low) in the melody, as distinguished from rhythm, which is the pattern of different durations (long-short). Any melody can be separated into a motion-pattern and into a rhythm-pattern, as shown under Melody. Motion may be ascending or descending, in the narrow steps of the scale (conjunct) or in the wider steps of a chord (disjunct). The study of these features is of prime importance in melodic analysis. See Melody I, IV.

The term "motion" is also used to describe the relative changes of pitch in two or more simultaneous voice-parts. Two such parts are said to be in "parallel" motion if they remain in the distance of the same interval [Ex. a]; in "similar" motion if they move in the same direction but change their distance [b]; in "contrary" motion

if they move in opposite directions [c]; in "oblique" motion if one part remains stationary on the same pitch [d].

**Motion picture music.** See Film music.

**Mòto** [It.]. Motion. *Andante con moto*, somewhat faster than *andante*.

**Motto** [It.]. In music, the term is used in connection with (a) 15th- and 16th-century Masses using an identical opening motif ("motto," also called "head-motif") for each of the movements (see Mass C II c); (b) 17th- and 18th-century arias that begin with a preliminary statement of the initial motif of the melody and continue with the full melody. Usually, the initial motif ("motto") appears twice, first sung and then echoed by the instruments. Such a composition is called a *motto aria* [G. *Devisenarie*]. The motto aria occurs sporadically in the cantatas of Luigi Rossi (1597–1653) and became established c. 1660 in the cantatas and operas of the Venetian composers Cesti (1623–69) and Legrenzi (1626–90). Many of Bach's arias begin with a motto. See Aria IV. The accompanying example is taken from Cesti's opera *L'Argia* [see

*SchGMB*, no. 203]. For additional examples, see *HAM*, nos. 244 (Steffani), 258 (A. Scarlatti).

**Motu proprio** [L.]. Generally, a papal decree concerning the administration of the Church. Particularly, a decree issued by Pope Pius X in 1903 that contained new regulations for the music in the Roman Catholic service. The most important points were: (a) abolition of the theatrical and worldly style of church music that had spread during the 19th century, particularly in the Latin countries; (b) return to Palestrina's music as the model for polyphonic church music; (c) restoration of Gregorian chant according to the principles of the monks of \*Solesmes; abolition of the "Editio Medicea" and introduction of the "Editio Vaticana" [see Liturgical books II]; (d) suppression of instrumental music except for special occasions and reduction of organ playing to a modest role; (e) the admission of modern vocal compositions provided their character was in agreement with the spirit of the service and the liturgical functions. For the complete text (English) see N. Slonimsky, *Music Since 1900* (1937), pp. 523ff.

**Motus** [L.]. See under "Micrologus."

**Mount of Olives, The.** See *Christus am Ölberge*.

**Mouth organ.** See Harmonica (2).

**Mouthpiece** [F. *embouchure*; G. *Mundstück*; It. *bocchino*, *bochetta*; Sp. *boquilla*]. The part of a wind instrument that is inserted into the player's mouth or applied to his lips. In a way, the mouthpiece is the most characteristic part of an instrument, since it indicates to which family an instrument belongs. Four main types can be distinguished:

(a) Cupped mouthpiece, used for the \*brass instruments. This is an enlargement of the bore to which the player's lips are applied to form a kind of double reed. Cupped mouthpieces exist in a great variety of shapes, varying from the true "cup" of the trumpet to the "funnel" of the horn. See ill. in *SAHMI*, p. 418.

(b) Single-reed mouthpiece, used for the \*clarinets. This mouthpiece [F. *bec*, G. *Schnabel*] consists of a beak-shaped chamber with an opening on the underside to which a single reed is fixed.

(c) Double-reed mouthpiece, used for the \*oboes (usually not considered a "mouthpiece" but included here for the sake of completeness and comparison). It consists of two reeds that form a narrow ( )-shaped slit at the top. Older oboes had much larger reeds (approaching the size of bassoon reeds) than the modern instrument. In certain 16th-century types, e.g., the cromornes, the reed was covered with a wooden cap that acted as a windchest (similar to the reed pipes of the organ; see Reed).

(d) Fipple mouthpiece, used for \*recorders. It consists of a beak-shaped chamber that is stopped by a plug, leaving only a narrow flue to conduct air toward the sharp edge of a side hole. The principle is the same as in the flue pipes of the organ.

**Mouvement** [F.]. (1) Movement. (2) Tempo.

**Movable Do(h).** Generally, any system of \*solmization so designed that the syllables can be used in transposition for any key, as distinguished from Fixed Do(h), in which the syllables correspond to invariable pitches of notes. See also Tonic sol-fa.

**Movement** [F. *mouvement*; G. *Satz*; It. *movimento*; Sp. *movimiento*]. The various complete and comparatively independent divisions of the \*sonata, \*symphony, etc. One speaks of a "first" or "second" movement, or a "fast" or "slow"

movement. The \*suite also consists of various movements, each in the character of a dance. See Cyclic (1).

**Movie music.** See Film music.

**Mozarabic chant.** The chant of the medieval Christian Church of Spain [see Chant]. The name refers to the Mozarabs, the Christians living in Spain (particularly in Aragon, Castile, and León) while it was under Mohammedan rule. Another name for it is *Visigothic chant*, referring to the Visigoths, who conquered Spain in the 5th century. St. Leander (d. 599), St. Isidore (c. 570–636), and St. Ildefonsus (d. 667) played an important role in the development of the chant, which remained in use, untouched by the Gregorian reforms, until about the 11th century. The Mozarabic liturgy has many details in common with the \*Gallican, e.g., the name *praelegendum* for the Introit, and *laudes* for the Alleluia. The music of the Mozarabic rites has been preserved in a number of MSS dating from the 9th to 11th centuries, the most important of which is the celebrated antiphonal (for both Mass and Office) of the Cathedral of León, recently published in a facsimile edition. Unfortunately all these sources are written in a very unusual neumatic notation that has not yet been deciphered. They do, however, reveal a proximity of style similar to that found in Ambrosian chant. Particularly interesting are the extremely long Alleluia melismas, which often show a clearly discernible repeat structure (aa bb cc . . . ; see fac. ed., f. 187), similar to that of the Gregorian Alleluia melismas (and sequences). Only about twenty chants survive in a legible script, among them a very archaic recitation for the "Pater noster" and a number of \*preces.

Lit.: ‡*Antifonario visigótico mozárabe de la Catedral de León* (fac. ed. 1953; ed. of text, 1959); P. Wagner, *Der mozarabische Kirchengesang* (1928); C. Rojo and G. Prado, *El Canto mozárabe* (1929); A. Gastoué, *Cours . . . de chant grégorien* (1917; ex. on pp. 71, 79); C. W. Brockett, "Antiphons, Responsories and Other Chants of the Mozarabic Rite" (diss. Columbia Univ., 1965); *ReMMA*, pp. 110ff (bibl. p. 436); *NOH* ii, 81ff; P. Aubry, in *SIM* ix, 157ff; M. Sablayrolles, in *SIM* xiii; R. P. German Prado, in *Speculum* iii; J. M. Roqueta, in *AnM* v; L. Brou, in *AnM* v, vi, x; *id.*, in *CP* 1950, p. 183; E. Werner, in *CP Anglés* ii.

**Mozarteum.** An institute at Salzburg, Austria, headquarters of the *Mozart-Gemeinde*, devoted to the memory of Mozart and study of his works.

**Mp.** [It.]. Abbr. for *mezzo piano*.

**M.s.** [It.]. Abbr. for *mano sinistra*, left hand.

**Muance** [F.]. Same as mutation. See Hexachord IV.

**Mudanza** [Sp.]. See under *Mutazione*; *Villancico*.

**Muineira, muñeira** [Sp.]. A dance of the province of Galicia (northwest Spain), in quick 6/8 meter and evenly flowing motion. See *LavE* i.4, 2368.

**Mulliner Book.** An important source of English organ music of the Tudor period. The MS (Brit. Mus. add. Ms. 30513) was compiled c. 1550–70 and is named after Thomas Mulliner, who owned it and made additions to the original collection. It contains 120 compositions for organ or harpsichord and 11 pieces for the cittern and gittern, written in lute tablature. Among the composers represented are Redford, Tallis, Blitheman, Shepherd, and Allwood. New ed. by D. Stevens, *The Mulliner Book* (1962; \*Editions XXXIV, i) and *Commentary* (1952).

**Multimetric.** A metric scheme wherein the meter changes frequently, e.g., two measures of 3/4 followed by one measure of 2/4 followed by three measures of 3/8. It is common in the works of Stravinsky, Hindemith, Bartók, and other 20th-century composers. See Poly-, multi-.

**Mundharmonika** [G.]. Mouth organ. See Harmonica (2).

**Muñeira.** See *Muineira*.

**Munter** [G.]. Merry, cheerful.

**Murciana** [Sp.]. A local variety of \*fandango named for Murcia, a town in southern Spain.

**Murky.** An 18th-century name of unknown origin, given to pieces with a bass accompaniment in broken octaves [murky bass; see *SchGMB*, p. 289 (2), from Sperontes (J. H. Scholze), *Die singende Muse an der Pleisse* (1736)]. This unimaginative accompaniment was widely used in the second half of the 18th century (\*rococo). An early instance of broken octaves is found in F. Couperin's "La Triomphante" (*Pièces de Clavecin*, ordre X), where it serves a pictorial purpose. It may be compared with the highly dramatic "murky" in the first movement of Beethoven's *Pathétique* Sonata. See C. R. Halski, "Murky: A Polish Musical Freak" (*ML* xxxix, 35ff).

**Musette.** (1) The French \*bagpipe of the 17th and 18th centuries. It had two chanters and a

number of drones and arm-operated bellows. The instrument became fashionable, along with the *vielle* [see *Hurdy-gurdy*], in French society when, under Louis XIV (1643–1715) and Louis XV (1715–74), the court circles indulged in a sophisticated craze for "Arcadia," dressing up as shepherds and peasants. The instruments of this period were splendidly decorated, the bags being covered with elaborate needlework and the pipes made of ivory and inlaid with precious stones. A selection of pieces for musette and vielles is in H. Expert, *Amusements des musiciens français du XVIIIe siècle* (Sénart, Paris), which includes compositions by Jacques Aubert (1689–1753), Charles Bâton (d. 1758), and Nicolas Chédeville. See also *GDB*, s.v. "Anet"; "Boismortier." (2) Dancelike pieces of a pastoral character with a long-held drone, such as could easily be played on the instrument described above. Well-known examples are found in Bach's English Suites nos. 3 and 6, where they are marked "gavotte." An amusing piece in the same style occurs in Mozart's *Bastien et Bastienne*, where it announces the arrival of the Sorcerer. (3) French name for the flageolet, an instrument similar to the recorder [see *Whistle flute*].

Lit.: E. Thoinan, *Les Hotteterre et les Chédeville* (1894); De Bricqueville, *Les Musettes* (1894).

**Music.** The term is derived from Gr. *μουσα*, muse, and more specifically from *μουσική τέχνη*, the art (technique) of the Muses. Originally this term included all the cultural endeavors represented by the nine Muses but later it became associated with Polyhymnia, the Muse of "many songs." Some medieval writers believed the word to be derived from the Egyptian word *mōys* (water), construing from this a connection with Moses (whose name indeed may be derived from *mōys*). Besides Moses, Jubal and Pythagoras were considered the "inventors" of music. Of basic importance throughout the Middle Ages was Boethius' concept of music as an all-embracing "harmony of the world," divided into *musica mundana* (harmony of the universe), *musica humana* (harmony of the human soul and body), and *musica instrumentalis* (music as actual sound; see Aesthetics of music II). Boethius' contemporary Cassiodorus (c. 485–c. 580) took a more down-to-earth view, adopting Plato's distinction between *scientia harmonica* (high and low sounds), *metrica* (different meters), and *rhythmica* (relation to text?). Even closer to musical practice is the classification of

St. Isidore of Seville (c. 570–636), with his *musica harmonica* (vocal), *organica* (*ex flatu*, i.e., organ, flutes, trumpets, etc.) and *rhythmica* (*ex pulsus digitorum*, i.e., drums, kithara, etc.). In the 14th century, Theodoricus de Campo divided music into *mundana*, *humana*, *vocalis* (animal voices) and *artificialis*, subdividing the latter as follows:

	<i>artificialis</i>		
<i>armonica</i> (vocal)	<i>instrumentalis</i>		
<i>prosaica metrica rhythmica</i>	<i>cordae</i>	<i>ventus</i>	<i>pulsus</i>
	strings	wind	percussion

As early as 300 B.C., Aristoxenos had divided music into theoretical and practical music. It was not until about 1500 that this classification, still valid, was reintroduced.

**Musica** [L.]. Music. The term was used in early writings in the following ways: *Musica divina* or *sacra*, church music; *musica vulgaris*, secular music; *musica mensuralis*, \*mensural (measured, i.e., polyphonic) music; *musica plana*, \*plain song; *musica figurata*, \*figural music; \**musica ficta* or *falsa*, music involving chromatic tones. See also the classifications under Music.

**Musica Britannica.** See Editions XXXIV.

**Musica divina.** See Editions XXXV.

**Musica enchiriadis.** An important treatise of c. 900, formerly attributed to the monk Hucbald (c. 840–930), more recently to Hoger of Werden (d. 905), Otger of St. Pons (d. 940), Otgerus of St. Amand, and others [repr. in *GS* i, 152–73]. A companion treatise, written in the form of a dialogue, is the “*Scholia enchiriadis*” [repr. in *GS* i, 173–212]. They are the earliest treatises dealing with polyphony (called *symphonia*) and containing examples of parallel \*organum as well as organum at the fourth with oblique motion. They also provide important information on various aspects of Gregorian chant and include the earliest readable melodies (alleluias, hymns), written in \*daseian notation. See Theory II.

Lit.: H. Müller, *Hucbalds echte und unechte Schriften über Musik* (1884); P. Spitta, in *VMW* v; G. trans. by Schlecht, in *MfM* vi, vii, viii; A. H. Fox-Strangways, in *ML* xiii, 183; H. Sowa, in *ZMW* xvii; *SSR*, pp. 126ff; *ReMMA*, *passim*; W. Apel, in *RBM* x; L. Spiess, in *JAMS* xii.

**Musica ficta, musica falsa** [L.]. I. In the music of the 10th to 16th centuries, the theory of the chro-

matic or, more properly, nondiatonic tones, i.e., tones other than those in the diatonic scale. At an early time the B-flat was admitted in practice (Gregorian chant) as well as in theory (Odo of Clugny; see under Letter notation) and was, therefore, frequently regarded as not part of *musica ficta*. The introduction of the nondiatonic tones resulted from melodic modifications or

from transpositions of the church modes. For instance, a C-sharp may occur either as an artificial leading tone in (untransposed) Dorian, or as the normal third of Mixolydian, transposed a second above. The distinction between these two provinces is useful, although it was not made in medieval terminology as has been maintained by R. von Ficker, according to whom the former type was called *musica falsa* and the latter *musica ficta* [see his “*Beiträge zur Chromatik des 14. bis 16. Jahrhunderts*,” in *StM* ii]. *Musica falsa* is simply the older term (13th century), which was supplanted by the other in the 14th century, probably because its implication of falseness became objectionable.

II. The earliest reference to nondiatonic tones is found in the “*Scholia enchiriadis*” of c. 900 [see *Musica enchiriadis*], where formations such as c–d–e<sup>b</sup>–f–g and c–d–e–f<sup>#</sup>–g (also downward) are described under the name *absonia* [L., lit. “off-sound”; see *GS* i, 176f; *WoHN* i, 33]. A slightly later treatise by Odo of Clugny (d. 942) contains a table showing transpositions of the fundamental gamut G–e<sup>b</sup>, with b-flat and b natural, up a whole tone, a fourth, and a fifth [see *GS* i, 274]. This involves the degrees c<sup>#</sup>, f<sup>#</sup>, and e<sup>b</sup>, which, however, Odo always represents by the letter *m* (*mysticum*?), thus emphasizing their speculative character. There is ample evidence that at least the f<sup>#</sup> and e<sup>b</sup> were also used in Gregorian chant [see *ApGC*, pp. 160ff]. Nothing definite is known about the development of the altered tones during the next two centuries, when the name *musica falsa* apparently was introduced. As early as 1250 Pseudo-Aristotle (Magister Lambert) turned against this name, declaring that “*falsa musica non est inutilis, immo necessaria*”—not useless but even necessary [*CS* i, 258]. Walter Odington (c. 1300) already knew the e<sup>b</sup> and b<sup>b</sup>, as well as c<sup>#</sup> and f<sup>#</sup>. For more details concerning the treatises on

*musica falsa*, see *WoGM* i, 109ff. In the 13th century the writers on *musica falsa* discuss the chromatic tones primarily with reference to the single line, emphasizing chiefly the *subsemitonium* (leading tone) and the avoidance of the \*tritone in progressions such as: g-f(#)-g, c-e-f(#)-g, f-a-b(b)-a, etc. In the 14th century Johannes de Muris (c. 1325) approached the problem from the point of view of simultaneous voice-leading, forbidding the tritone as a

chordal formation [see Tritone] and postulating that the third or sixth before a fifth or octave should be major if the upper voice ascends and minor if it descends [see Ex.; *WoGM* i, 116f].

III. In modern musicological writings, *musica ficta* denotes not so much the theory of early chromaticism but the problems arising from the fact that chromatic alterations rarely are indicated in musical sources prior to 1600. Considering the fact that Odington already discussed most of the chromatic tones, it is disconcerting indeed to find throughout the 15th and 16th centuries many long compositions completely lacking any indication of accidentals. Beginning with H. Riemann, musicologists have shown a strong inclination to emend the original texts by adding accidentals, which, in reliable scholarly editions, are placed above the notes in order to distinguish them from those given in the original sources. Although generally speaking the necessity for such emendations cannot be denied, matters were carried much too far in many editions published between 1900 and 1930. An extreme position was taken by Riemann, who maintained that, except in the rare case of the Phrygian mode, all compositions of the 15th and 16th centuries were either major or minor [see his "Verloren gegangene Selbstverständlichkeiten in der Musik des 15.-16. Jahrhunderts" (1907), in *Musikalisches Magazin* xvii] and accordingly presented Baude Cordier's "Belle bonne" of c. 1400 as a composition in D major [see *RiHM* i.2, 354ff, and *HAM*, no. 48b]. Some other editors, although they have not gone to such extremes, have shown a tendency, often clearly formulated in the prefaces of their publications, to translate by means of numerous editorial accidentals the tonal language of the Middle Ages and the Renaissance into that of major and minor. Since about 1940, however, musicolo-

gists have approached the problem from a more critical and, no doubt, historically more accurate point of view by "diminishing the number of suggested accidentals" [see *NOH* ii, 373] or "adding only those which seem to be indispensable" [W. Rehm, *Die Chansons von Gilles Binchois* (1957), p. 14\*: "Akzidentien wurden nur hinzugefügt, wo es unbedingt erforderlich schien"].

IV. With a problem of such subtlety and flexibility, it is obviously futile to strive for an answer that would apply equally to Gregorian chant, to music of the *ars antiqua*, and to compositions of the 16th century. Concerning Gregorian chant, it may be noted that the formula d-a-b-a frequently found at the beginning of Introits and antiphons and usually presented as d-a-b<sup>b</sup>-a [e.g., *LU*, p. 353] is now recognized as being a purely diatonic progression [see *ApGC*, p. 153] and that, on the whole, the earliest MSS suggest a much more restricted use of the b<sup>b</sup> than the later ones. In the 12th and 13th centuries the tonal resources of polyphonic music are so limited, the harmonies so clearly modal, that very seldom are accidentals needed in addition to those indicated in the original sources [see Partial signature]. Thus, nearly all the sharps and many of the flats suggested in Aubry's edition of the Codex Bamberg (*Cents Motets du xiii<sup>e</sup> siècle*, 3 vols., 1908) would probably be considered unnecessary by present-day scholars [cf., e.g., motet no. 57 with the version in A. Auda, *Les "Motets Wallons"* (1953), no. 27]. From the 14th century on the situation becomes much more complex, as appears from a comparison of different editions (all recent). For example, the figure a b-a-g-f e, which recurs frequently in the Gloria of Machaut's Mass, appears consistently with a b<sup>b</sup> in the edition of L. Schrade and without it in that of Ludwig and Besseler. The closing passage of the *caccia* "Or qua, compagni" has editorial b-flats and f-sharps in the edition of Marrocco (*Fourteenth-Century Italian Cacce*, 1942), none of which is considered necessary by H. Husmann (*Die mittelalterliche Mehrstimmigkeit*, c. 1955). For further illustration, seven passages of this kind are shown here. (This

1. Landini, *Somma felicità* (J. Wolf, *Der Squarcialupi-Codex*, 1955; without accidentals in L. Ellinwood, *The Works of F. Landini*, 1939). 2. Same. 3. Landini, *Dappo ch'a te* (same). 4. Dunstable, *Quam pulcra es* (Besseler, *Capella i*, 1959; without accidentals in Bukofzer, *\*Editions XXXIV*, 8). 5. Same (Bukofzer; without accidentals in Besseler). 6. Ockeghem, *Missa Mi-Mi, Sanctus* (Plamenac, *Johannes Ockeghem*, 1947, ii; without accidentals in *\*Editions VIII*, 4, ed. by Besseler). 7. Barbireau, *Osculetur me* (B. Meier, *Jacobi Barbireau: Opera omnia*, 1957, ii; without accidentals in A. Smijers, *Van Ockeghem tot Sweelinck*, 1952, ii).

writer in every case favors the version without the editorial accidentals.) Valuable relevant material is found in the German organ tablatures of the 16th century (Schlick, Kotter, etc.), because they employ a notation that, unlike mensural notation, provides for a largely unequivocal indication of altered tones. Following are some excerpts from these sources showing unusual but entirely legitimate formations. See also Cross relation; Leading tone; Lydian.

**Musical Antiquarian Society.** See Editions XXXVII.

**Musical bow.** A primitive instrument found in widely distant places, including New Mexico, Patagonia, Central and South Africa, etc. Like a hunter's bow, from which it probably was derived, it consists of a flexible stick whose two ends are connected by a string. In order to intensify the sound, a gourd is often attached or the string is held in the mouth. The string is

plucked with the hand or struck or scraped with a stick. The musical bow is one of the few chordophones found in primitive cultures. See H. Balfour, *The Natural History of the Musical Bow* (1899).

**Musical glasses.** See Glass harmonica.

**Musical Offering.** See *Musikalisches Opfer, Das.*

**Music and mathematics.** The German philosopher and mathematician Leibnitz described music as an "unconscious exercise in arithmetic" [see Aesthetics of music II]. The relevance of this statement is evident in the fact that all the elements of music are defined numerically: material = 7 or 12 tones; measure = 3 or 4 beats; staff = 5 lines; standard pitch = 440 vibrations; fifth =  $\frac{3}{2}$ , third =  $\frac{5}{4}$ , whole tone =  $\frac{9}{8}$ ,  $\sqrt[12]{2}$ , 1,000 cents; loudness = 50 decibels; etc. No less close are the relationships of music to geometry, as appears from the "up and down" character of the scale, or the "horizontal and vertical" aspect of musical \*texture. In the Middle Ages, music was quite properly grouped with arithmetic, geometry, and astronomy in the \*quadrivium. Methods of higher mathematics enter into the calculation of \*intervals, which require the use of logarithms, and in problems of \*temperament, which require the solution (by means of continued fractions) of the equation  $2^x \times 3^y \times 5^z = 1$ . Still another aspect of this relationship is \*number symbolism. Recently, mathematical methods have been applied to musical analysis (works of Bach, Josquin) and to composition [see Aleatory music]. See also Computer; Number symbolism.

**Music appreciation.** A type of musical training designed to develop the ability to listen intelligently to music. This type of musical education is very common in the United States and Britain but practically unknown in Germany and France. Courses in music appreciation have been criticized as superficial, but like all academic courses they can be well or poorly devised. The amateur listener has often demonstrated an analytic and critical faculty quite the equal of that of many professional performers. The art of listening with "activity of thought," which is the aim of appreciation courses, can be as demanding and as satisfying as performing. Training in appreciation should begin in elementary school and can continue through a lifetime.

**Musica reservata** or **riservata** [L.]. A term first used by Adrian Coclico in his *Compendium musices* (1552) to describe the music of Josquin and his followers as opposed to that of the preceding period (Ockeghem, Obrecht, Isaac). In the same year Coclico also published a collection of motets under the title *Musica reservata*. The literal meaning of the term has been much disputed. The word *reservata* has been explained as referring to the greater "reserve" (restraint) of the newer style in the use of figurations and ornamental design; or as pointing to some "reserved" secrets of musical technique (improvisation, expression of the text by musical motifs, chromaticism not indicated by accidentals); or as indicating the "reserved" (exclusive) character of music written for audiences of high cultural standing. In later writings the term *musica reservata* occurs as a designation for expressive interpretation of

the text (S. Quickelberg, c. 1560, with reference to Lassus), for a continuous flow of the melodic line (anon. treatise of Besançon, 1571), etc. [see *ReMR*, pp. 513ff]. Thus no single definite meaning can be assigned to it.

**Music box.** See under Mechanical instruments III.

**Music criticism.** I. Music criticism today is the reviewing of public performances in a newspaper or periodical. Before describing this important activity, however, we should briefly consider the less conspicuous but no less important criticism of musical compositions found in a number of books. Long before the era of newspapers, Glareanus in his *Dodecachordon* (1547) offered profound critical analyses, still worth reading, of the works of Josquin, Isaac, and other masters. About two centuries later there was a more aggressive type of criticism in Mattheson's *Critica musica* (1722/3, '25), Scheibe's *Der critische Musicus* (1737–40), and Marpurg's *Der critische Musicus an der Spree* (1749–50). Burney wrote an "Essay on Musical Criticism" (prefixed to Book III of his *A General History of Music* [1789]). Johann Adam Hiller founded one of the earliest music \*periodicals, the *Wöchentliche Nachrichten und Anmerkungen, die Musik betreffend* (1766–70), in which he wrote for the general public rather than for the learned professionals. F. M. Grimm, a German who lived in Paris, edited (together with Diderot and others) the *Correspondance littéraire* (1753–90), which contains some interesting material about the much discussed question of Italian versus French opera [see War of the Buffoons]. At the beginning of the 19th century came the reviews of E. T. A. Hoffmann (1776–1822), written for the *Allgemeine musikalische Zeitung* (Leipzig, 1809–19), which include admirable analyses of Beethoven's C-minor Symphony, Coriolanus Overture, Trios op. 70, and *Egmont* [see comp.

ed. of Hoffmann, by W. Harich (1921), vol. xii]. An important landmark in the development of music criticism are the reviews of Robert Schumann (in *Neue Leipziger Zeitschrift für Musik*) who, in addition to his creative abilities, had the faculty of understanding and appreciating other artists. In fact, he had uncanny foresight, as is shown by his numerous reviews, favorable or adverse, of an op. 1 or op. 2, including those of Chopin, Berlioz, and Brahms. Other great composers who were also active as critics—although not with so much success as Schumann—were Weber, Berlioz, Liszt, Wagner, Hugo Wolf, and Debussy. Among more modern writers of critical studies D. F. Tovey of England and A. Halm of Germany deserve special mention.

II. Music journalism, i.e., the activity of the professional music critic, represents a quite different phase of music criticism. Whereas books and music journals are addressed mainly to professionals, serious students, or the musical amateur, the newspaper critic speaks to the general public. Until the French Revolution music had developed under the auspices of the church or aristocracy. In the 19th century, however, the middle class became the prime supporter and patron of musical performance, which created a new demand to see public concerts critically discussed in the daily papers. Thus a new profession came into being. Eduard Hanslick, who wrote from 1864 for the *Neue Freie Presse* (Vienna), may justly be called the father of music journalism, if only for the reason that, in his one-sided feelings against Wagner and for Brahms, he introduced into music criticism elements of personal prejudice, which, unfortunately, were imitated by numerous later critics. Hanslick's successor as critic for the *Neue Freie Presse* in 1902 was Julius Korngold, who, until the rise of Hitler, exercised great power.

In the early 20th century Berlin became a world center of music and also of music criticism. The leading Berlin critics were the Wagnerian Wilhelm Tappert, one of the first musicologist-critics; Leopold Schmidt of the *Berliner Tageblatt* and his successor, Alfred Einstein; Adolph Weissmann, a champion of modern music; and Herman Springer of the *Deutsche Tageszeitung*. Authoritative voices in the influential *Frankfurter Zeitung* were those of Karl Holl and Paul Bekker; the latter was later active in New York, until his death in 1937.

Music in London before the turn of the century was subjected to the brilliant invective and enthusiasm of George Bernard Shaw, whose

lively style in *The Star* (1888–89) under the pen name “Corno di Bassetto” and in *The World* (1890–94) still makes delightful reading. The activity of Ernest Newman for more than fifty years, principally in the London *Sunday Times* from 1920, and that of Neville Cardus in *The Manchester Guardian* from 1917, represent a consistently high level of views of the English musical scene.

III. American music criticism began with J. S. Dwight, editor of *Dwight's Journal of Music* (1852–81), and William Henry Fry, a musician-writer for the New York *Tribune* who was among the first to express enthusiasm for American composers. About 1900 a galaxy of writers was active in the Eastern cities, with points of view ranging from sober conservatism to intense subjectivity. Among this generation James Huneker (New York *Sun*, *World*), H. E. Krehbiel (40 years with the *Tribune*), W. J. Henderson (35 years with the *Sun*), Lawrence Gilman, Philip Hale, H. T. Parker, and Richard Aldrich lent great esteem to the profession. The next generation presented a great diversity of views on modern music, musical institutions, and the repertory suitable for American tastes. The important positions in New York were held by Olin Downes (the New York *Times* until his death in 1955, Virgil Thomson (*Herald Tribune*, resigned 1954), Samuel Chotzinoff (New York *World* and *Post*), Leonard Liebbling, Oscar Thompson, and Paul Rosenfeld. In addition, music criticism in other cities grew more important, with Alfred Frankenstein (San Francisco), Cecil Smith (Chicago), and John Rosenfield (Dallas) winning positions of authority.

IV. Dr. Burney in his “Essay on Musical Criticism” [see under I] pleaded for “a liberal, enlarged and candid mind,” a qualification still called for, though many famous critics have been interesting particularly because of their biases. Criticism is an echo of musical life. Perhaps the critic's main duty is to become involved in the strongest artistic currents, of both composition and performance, and develop a keen sense of public taste. He may interpret either to the other while giving information, opinion, analysis, disagreeing with all, or simply recording events. As Virgil Thomson said, “Nobody has to be right.”

Music criticism today is practiced with varying degrees of competence by composers, musicologists, performers, newspapermen, and musical amateurs. The role of critic is as diverse as the backgrounds these men bring to the profession, and no single kind of preparation can

be said to be the best. Efforts to reform this unsystematic profession have been made by various writers. M. D. Calvocoressi described a general method that might separate the three main considerations of a critic's activity: (1) “predispositions”; (2) “direct data”; (3) “indirect data.” The critic's predispositions are formed by his personality, temperament, education, experience—the individual taste without which a critic is valueless. Direct information comes from the composition and its performance, with clear distinctions required between these. “Indirect data” include the accessory facts that may illuminate the occasion: the relation of the composer and his work to other composers and other music, the performance to other performances and to tradition, the occasion itself to the social environment of music, past and present. Calvocoressi suggests that the critic's main responsibility is to avoid the undue prevalence of “predisposition” over “data.”

Journalistic criticism as it is practiced everywhere falls too often into routine—obligatory notices of debuts, endless repetition of judgments on the standard pieces, descriptive panegyrics of famous personalities. Critics with a sense of the newsworthy might remove some of the faults of the profession by ignoring these formulas in favor of observations worth saying freshly. Such a step would correct the imbalance between the critics' too great authority in a few large musical centers and too little authority in smaller communities where musical taste is still at a formative stage.

For a list of living critics, see Pierre Key's *Music Year Book*.

**Music drama.** Designation for Wagnerian type of opera. See Opera X.

**Music education in the United States.** This article is concerned principally with formal music education in elementary and secondary schools and in institutions of higher learning. Education provided in the home, through group activities in the community, or by private teachers is not included.

I. *History.* Music first became part of the school curriculum in 1838, when Lowell Mason was engaged to teach singing in the Boston schools. During the next two decades other cities followed this example, but progress was slow. Early music education used the methods of the privately operated singing schools, which flourished in many parts of the United States from the early 18th century into the 19th. Although choral singing in colleges had been carried on from the mid-18th century and the first college instrumental society was founded in 1808, music in higher educational institutions during this period continued on an extracurricular basis. The establishment of a professorship in sacred music at Oberlin (1835) was an isolated case.

After the Civil War music education increased concurrently with the acceleration of American musical activity. Between 1865 and 1868 six major conservatories were established (Boston, Cincinnati, New England, Oberlin, Peabody, Chicago Musical College). In 1870 music became a recognized course of study in college (at Harvard); professorships and college departments of music began to multiply. Pioneering efforts in training public-school music teachers at Potsdam, New York (1884) were slowly duplicated by other teachers' colleges and normal schools. The development of private music teaching as a profession is reflected in the founding of the Music Teachers' National Association in 1876. Emphasis in schools in the last quarter of the 19th century was heavily on sightreading

and the development of teaching methods. The growth of music in schools led, of necessity, to an increasing use of general classroom teachers to teach music.

From the last decade of the 19th century the child-study movement and an increased understanding of psychology began to affect educational procedures. This "new education" led to a shift from artificial sightreading exercises to the "song approach." The *Modern Music Series* (1898) reflects this change in emphasis. To meet the growing need for teachers, normal schools and (from 1903) colleges assumed more responsibility for pedagogic training in music and also began to offer summer music courses. In 1900 the first school music magazines appeared, and the professional organization for school music teachers, the Music Supervisors' (now Educators') National Conference, was founded in 1907.

High-school music, aside from isolated extracurricular performance activities, has been largely a 20th-century development. The first comprehensive high-school music course (1906, in Chelsea, Mass.) included credit for both school activities and private study. About this time the music-appreciation movement was gaining support, partly influenced by the development of the phonograph. The second and third decades of the 20th century witnessed notable expansion of high-school music education, particularly in instrumental music. Class instruction, first for the violin, soon was used for all band and orchestral instruments and piano. Bands multiplied after World War I as men trained in service bands entered the teaching profession. Many school administrators were won over to supporting instrumental music by the performance of the first National High School Orchestra (1926). In the 1920's and 1930's the contest-festival movement helped establish performance standards for choirs, bands, orchestras, small ensembles, and soloists.

During the 20th century college music departments and professional schools continued to grow in size and number. Several nationally known conservatories are products of this century, including Eastman (1919), Juilliard (1919), and Curtis (1924), and there was a definite trend toward the affiliation of conservatories with universities. [See Conservatory.] Notable among modern developments are: broadening of the college music curriculum; emphasis on degrees in music [see Degrees and diplomas]; growth of graduate music study; development of courses for the general college student; the opera-work-

shop movement; growth of musicology; acceptance of performance study for credit; emphasis on teacher training; and growing size and competence of performing organizations. The National Association of Schools of Music (1924) continues as a standardizing influence in higher education.

Among educators who had considerable influence on music education, Hollis Dann (New York University) influenced a generation of choral teachers, Peter Dykema (Wisconsin and Columbia) and Karl Gehrkens (Oberlin) contributed to music pedagogy, and James Mursell (Columbia) applied psychological insights to the development of a philosophy of music education. In the postwar years, coincident with a growing awareness of music-education methods in other countries, educators have been influenced by C. Orff and E. Jaques-Dalcroze in rhythmic and creative activities, Kodály in the use of folk material, and Suzuki in the teaching of violin to very young children. Growing concern that music instruction has become too professionalized has resulted in a strengthening of courses in music for the non-performing student as a part of general education.

II. *Public and private schools.* Since the responsibility for education in the United States is, by constitutional provision, entrusted to the states, and economic, social, and geographical conditions vary throughout the country, there is considerable diversity among music programs in both public and private schools.

Although singing still occupies a key role throughout elementary school, rhythmic activities involving bodily movement, listening, the writing of simple songs, and the use of simple instruments like \*recorders and \*zithers have been introduced. From kindergarten through third grade, emphasis tends to be on awakening the child's awareness of and sensitivity to music through rhythmic responses and group singing. At higher levels (grades 4 to 6), activities become more specialized, with the gradual introduction of reading music, part singing, and class instruction in instruments. It is common to have, in addition to one or more choruses, an orchestra or a band.

Because of differences among music educators as to ways of dealing with adolescents, the junior high school does not always effectively facilitate the transition from elementary to secondary school. In the seventh grade music is customarily a required subject, but from the eighth grade into high school the subject becomes optional.

Thus music must compete with "academic" subjects for a place in the curriculum. Recent emphasis on science and technology has been a matter of serious concern to teachers in all areas of the arts.

In the junior and senior high schools, emphasis shifts toward performance. It is common—although by no means universal—practice to hold rehearsals of a chorus, orchestra, or band during school hours. Some of the high-school ensembles attain near-professional standards. Junior groups are available for less experienced musicians, and small vocal and instrumental ensembles provide a variety of experience.

The emphasis on group performance, however, is not exclusive. Courses in "general music," particularly in junior high, stress the historical, theoretical, and cultural aspects of music and provide opportunity for some performance. In this area more attention is given to non-Western music, jazz, and folksong. A high-school program might also include courses in "music appreciation," history of music, harmony, and even orchestration. An encouraging aspect of music education is the use of "live" performances, not only for the benefit of music students but for the whole school. Generous grants, notably from the Ford Foundation, have made it possible for young composers to work among and write for school musicians. Commissions to composers from school and college ensembles, professional organizations, and individuals are increasingly being awarded. Partly as a result of these developments, interest in contemporary music and its performance by educational groups has grown substantially. Finally the socializing influence of music is strengthened through festivals, select performing organizations such as "all-state" ensembles, and a nation-wide network of summer camps devoted to music and the fine arts.

III. *Higher education.* Most advanced music instruction in the United States is now provided by colleges and universities. This system is in contrast to European practice, in which the theoretical and scholarly aspects of the subject are taught at universities while performance and pedagogy are the concern of conservatories [see Degrees and diplomas]. Broadly speaking, advanced instruction in music may be divided into two categories: (1) music for general (liberal arts) education and (2) professional training. In the liberal arts, the emphasis is on presenting music for cultural enrichment as well as on the scholarly or theoretical point of view. Profes-

sional training includes performance (instruments, voice, church music, opera, conducting, etc.), theory and composition, history, and allied fields such as therapy and ballet, major attention being directed toward both the preparation of elementary and secondary teachers and performance [see Profession of music I].

An important contribution to the cultural life of the nation is being made through college and university sponsorship of resident string quartets and other chamber groups and the creation of positions for composers- and artists-in-residence. Choirs, orchestras, bands, and glee clubs in institutions of higher learning draw members from the entire student body, the faculty, and the community, thus performing a unifying function. The quality of performance is often high, even when few music majors participate. College music groups not only contribute to cultural life, but also to church services, athletic events, and ceremonial occasions.

IV. *Adult education.* Social changes in American life, especially increasing leisure, favor the growth of adult education and encourage the recreational uses of music. Extension courses in music appreciation and other aspects of music, sponsored by colleges, boards of education, and community organizations, are popular; group lessons in piano, recorder, and other instruments are frequently available. Adults take part widely in nonprofessional community orchestras, concert bands, choral societies, operettas, and small vocal and instrumental ensembles. Public libraries provide record-listening facilities and lend records in the same way as books.

V. *Conclusion.* The rapid growth of music education in the United States is a development without parallel. There has been both enthusiastic praise and searching criticism of the movement. One devastating charge leveled is that much of the music performed is of mediocre quality or worse; another is that the repertory for both performance and listening is limited historically and stylistically. There is severe criticism of the percentage of time spent in purely entertainment functions, of the apparently passive, perhaps eager, acquiescence of teachers in utilitarian music-making under the aegis of education. Critics complain that too much stress in teacher training is placed on developing pedagogical skills and not enough on producing teachers who are musically and academically literate. The product of school and college music courses has been examined by some and found wanting in "musicianship."

Music education is charged on the one hand with neglecting the scholarly and theoretical aspects of music, and on the other with producing graduates whose performing skills do not meet professional standards. The flourishing music industry has received some of the blame for education's shortcomings, although there is considerable evidence of the service rendered by publishers and manufacturers of instruments and equipment. Unfavorable comparisons have been made between the number of students receiving music instruction and the small number of adult performing groups. Some feel that the influence of music should be extended to more students rather than concentrating on ensembles in which relatively few are involved. Music education is seen to be suffering from the lack of a logical and continuous plan.

Some of the most searching criticism has come from music educators themselves. This is an encouraging sign, for it indicates an awareness within the profession of the need for continuous re-examination of means and objectives.

**Music history.** See History of music.

**Musicology.** A term adopted from French (*musicologie*) to denote the scholarly study of music. It is the equivalent of the German term *Musikwissenschaft* (science of music), which was introduced by F. Chrysander in the preface to his *Jahrbücher für musikalische Wissenschaft* (1863) to emphasize the idea that musical studies, particularly historical ones, should be raised to the same standards of seriousness and accuracy that had long been adopted for the natural sciences as well as the humanities. Guido Adler, in the first volume of the *Vierteljahrsschrift für Musikwissenschaft* (1885), wrote an article, "Umfang, Methode und Ziel der Musikwissenschaft" (Scope, Method and Aim of the Science of Music), which included a comprehensive table of the entire province of music study. The table included paleography (musical notation), historical art forms, history of composition and of instruments, harmony, rhythm, melody, theory, aesthetics, and teaching, as well as a final category, *Musikologie* (research). Similar programs have been outlined by other writers, e.g., Waldo S. Pratt in "On Behalf of Musicology" (*MQ* i). The modern interpretation of musicology is illustrated by the following quotations: "Musicology must include every conceivable discussion of musical topics" [Pratt, *ibid.*, p. 3]; "the whole body of systematized knowledge about music, which results from the application of a scientific method of investigation or research, or of philosophical speculation and rational systematization to the facts, the processes and the development of musical art, and to the relation of man in general (or even animals) to that art" [O. Kinkeldey, "Musicology," in O. Thompson, *The International Encyclopedia of Music and Musicians*, 1952]; "Musicology unites in its domain all the sciences which deal with the production, appearance and application of the physical phenomenon called sound" [H. Lang; see L. Harap, "On the Nature of Musicology," in *MQ* xxiii].

This wide domain is usually subdivided into three main fields: historical, comparative, and systematic musicology. The first deals with history of music. The second comprises what is now generally known as \*ethnomusicology, the study of folk music and non-Western music. The third field includes a variety of more or less independent studies: acoustics, physiology, psychology, aesthetics, sociology, pedagogy, and theory (melody, rhythm, harmony, counterpoint, etc.).

G. Haydon, in his *Introduction to Musicology*, includes comparative musicology among the various subdivisions of systematic musicology.

Briefly, musicology is generally thought to include everything that is not clearly in the domain of "practical" or "applied" music, i.e., composition and performance. Perhaps the most debatable aspect of such a broad concept is the inclusion of musical theory, which means that such elementary disciplines as music notation, sightreading, harmony, and counterpoint are considered part of musicology. The resulting dilemma is illustrated by the fact that in Haydon's above-mentioned book harmony and counterpoint are treated in a chapter somewhat speciously termed "The Theory of Music Theory," as well as under "Musical Pedagogy."

A very important area of musicology is Adler's last-named field, *Musikologie* [*VMW* i, 17], which plays a vital role in all of the musical disciplines and may well be considered the ingredient that turns "musical study" into "musicology." If "musicology" is interpreted as research, then it means work—in any of the areas mentioned—that involves the discovery of unknown or the clarification of obscure matters, an activity comparable to research in the natural sciences. The musicologist, then, is the pioneer of music study. If the result of this research is valid and important, it will, sooner or later, become general usage, i.e., it will pass from the field of musicology to the domain of the theorist, the essayist, the biographer, the performer, and perhaps even the composer. An example illustrating this process is the case of Bach. About 1850, his work was largely forgotten, most of his compositions preserved only in scattered manuscripts. The men who undertook to "discover Bach" (among them K. F. F. Chrysander) were musicologists in the true sense of the word. The result of their research was the complete edition of the Bach-Gesellschaft. A student who now examines, e.g., a partita by Bach, is no more a musicologist than is the performer who plays it or the composer who derives new inspiration from it. This does not mean that musicological study of Bach was finished after the publication of the *BG*. There were—and still are—many aspects of his works that remain to be investigated, examples in point being F. Spitta's studies of their historical background, or E. Kurth's work on Bach's counterpoint, or C. S. Terry's thorough investigation of the details of his life, or the new edition [1954—] based on new research.

Musicology in the sense of historical research was a product of the 18th century. The first attempt in this direction was the *Historische Beschreibung der edlen Sing- und Klingkunst* (1690) of W. K. Printz, written in the form of an anecdotal chronicle. In 1715 Jacques Bonnet published *Histoire de la musique, et de ses effets, depuis son origine jusqu'à présent* (based on the research of his uncle, Abbé Pierre Bourdelot), which deals with the history of the dance and dance music. Padre G. Martini's *Storia della musica* (3 vols., 1757–81) deals only with the music of antiquity, which is treated on the basis of original research and with critical evaluation. M. Gerbert, in his *De cantu et musica sacra* (2 vols., 1774), deals in a similar manner with the history of church music. Deservedly famous are C. Burney's *A General History of Music* (4 vols., 1776–89) and J. Hawkins's *A General History of the Science and Practice of Music* (5 vols., 1776). The latter in particular is remarkable for its historical orientation and scientific approach. Equally universal in scope are J. B. de Laborde's *Essai sur la musique* (4 vols., 1780) and J. N. Forkel's *Allgemeine Geschichte der Musik* (2 vols., 1788, 1801), which, however, carries the development only to about 1500.

All these works suffered from an insufficient knowledge of primary source material, particularly in music from Gregorian chant to Palestrina, which was *terra incognita* mainly because of its unfamiliar notation. The interest in medieval culture that played such an important role in the romantic movement (J. L. Tieck, A. W. von Schlegel) spurred music historians on to specialized studies. The pioneer in this field was R. G. Kiesewetter, who wrote on Guido d'Arezzo, Arab music, and the music of the early Netherlands masters (*Die Verdienste der Niederländer um die Tonkunst*, 1829). A. Bottée de Toulmont published in 1836 a study of the *Chanson en France au moyen-âge* (troubadours, trouvères), and Kiesewetter, in his *Schicksale und Beschaffenheit des weltlichen Gesanges vom frühen Mittelalter bis zu . . . den Anfängen der Oper* (1841), traced the development of secular music from the 12th to 17th centuries, illustrating it with examples of 13th-century motets and compositions by Landini, Machaut, Dufay, Binchois, Busnois, Regis, Marco Cara (*frottola*), and others. On the basis of such investigations and extensive studies of his own, Kiesewetter's nephew, A. W. Ambros, wrote his *Geschichte der Musik* (5 vols., 1862–78; to Frescobaldi), the first music history that comes up to present-day

standards and in some respects is still unsurpassed. The pathfinding work of German scholars such as H. Riemann, H. Kretzschmar, P. Wagner, F. Ludwig, and J. Wolf and the subsequent spread of musicological research to numerous other countries requires no further description.

**Music therapy.** Music and medicine have been associated since the beginning of recorded history. One of the earliest Egyptian documents on music is, in effect, a prescription for music therapy. The healing powers of music were recognized by the Chinese, Hindus, ancient Greeks, and Arabs, as well as in primitive cultures. Numerous references to these powers are found in both musical and medical writings of the 16th and 17th centuries [see Tarantella]. In 1807 P. Lichtenthal published a famous book, *Der musikalische Artz* (The Musical Physician), which four years later was translated into Italian. Since that time there has been increasing scientific research on the psychophysiological effects of music. Interest in clinical music therapy developed particularly in military hospitals during World Wars I and II. The National Association for Music Therapy, established in 1950, has set up programs for the advancement of research, distribution of helpful information, establishment of training standards for therapists, etc. Several colleges and universities in the United States now offer four-year courses with an

additional six months of clinical training leading to a baccalaureate degree in music therapy.

Music is widely used in the treatment of mental illnesses and, to a lesser extent, certain physical ailments, such as cerebral palsy, tuberculosis, infantile paralysis, etc. Such therapy, extensively used for children, is a valuable means for working with patients toward specific therapeutic or rehabilitation goals.

A related aspect of music therapy is the consideration of occupational diseases of musicians, e.g., throat and lung ailments of singers and wind instrumentalists, or skin, muscle, and joint diseases of string players and keyboard performers.

Flesch, *Berufs-krankheiten des Musikers* (1925); D. K. Antrim, in *MQ* xxx; E. Werner, in *CP Sachs* (Greece). A.W.

**Musikalische Denkmäler.** See Editions XXXVIII.

**Musikalischer Spass, Ein** [G. A Musical Joke]. A sextet (\*divertimento) by Mozart, K. 522 (1787), for strings and two horns, in which he pokes fun at the incompetent provincial musicians of his day by using all sorts of faulty devices, such as dissonances, parallel fifths, etc.

**Musikalisches Opfer, Das.** [G., The Musical Offering]. One of J. S. Bach's latest works, composed and published in 1747 and dedicated to Frederick the Great of Prussia. It contains a number of highly academic contrapuntal pieces, all based on a theme of the King's invention upon which Bach had extemporized during his visit to Potsdam in 1747. The dedication copy bears the inscription "Regis Iussu Cantio Et Reliqua Canonica Arte Resoluta" (Upon the King's Demand, the Theme and Additions Resolved in Canonic Style), which forms the acrostic RICERCAR, emphasizing the learned character of the work. In fact, together with the \**Art of Fugue*, *Das Musikalisches Opfer* represents the summary and consummation of three centuries of contrapuntal art. The work consists

of thirteen compositions: no. 1, *Ricercar a 3*; nos. 2–7, six *Canons*; no. 8, *Fuga canonica*; no. 9, *Ricercar a 6*; no. 10, *Canon a 2 quaerendo invenietis*; no. 11, *Canon a 4*; no. 12, *Trio*; no. 13, *Canone perpetuo*. Five of the canons (nos. 3, 8, 10, 11, 13) involve canonic treatment of the *Thema regium* (royal theme), while the other five (nos. 2, 4, 5, 6, 7) employ the theme as a *cantus firmus* against which two contrapuntal parts form a canon [see Canon II]. The two types might be distinguished as "canon of the theme" and "canon on the theme."

*Das Musikalisches Opfer* was composed and printed in four sections (I. nos. 1–2; II. nos. 3–8; III. nos. 9–11; IV. nos. 12–13). Sections I and II seem to constitute the original "Offering," to which the other pieces were added later the same year. Evidently the collection originated without any preconceived plan. Nonetheless, a considerable number of editions have been published in which the pieces are rearranged according to some "higher plan" that is supposed to underlie the work, as has been done with *The Art of Fugue*. In fact, aside from the BG edition (vol. 31.2), no edition agrees entirely with the original in this respect.

Lit.: P. Spitta, *Bach*, Eng. trans., iii, 191–97, 233, 292ff; A. Orel, in *DM* xxx, 2 and 3; H. David, in *MQ* xxiii; W. Pfannkuch, in *MF* vii (survey of all the editions).

**Musikwerk, Das.** See Editions XXXIX.

**Musikwissenschaft** [G.]. See under Musicology.

**Musique concrète** [F., concrete music]. A musical development introduced c. 1948 by Pierre Schaeffer in Paris, which derived from experiments with recorded sounds and broadcasting in the Studio d'Essai of the French radio. Its basic idea is to replace the traditional material of music (instrumental or vocal sounds) with recorded sounds obtained from many different sources, such as noises, voice, percussion, and others. As a rule this material is subjected to various modifications: a recorded sound may be played backwards, have its attack or resonance cut off, be reverberated in echo chambers, be varied in pitch by changing the speed of the record or playback, be modulated in various ways, etc. The montage of the resulting sounds on a final single or multi-track tape has been compared to the collages of certain 20th-century painters. It eliminates the performer, and hence also the *raison d'être* of a score.

It was Schaeffer who named this development

*musique concrète*, i.e., music made directly on tape with real sounds, as opposed to *musique abstraite*, where the sounds (of instruments) are notes (pitch abstractions) composed into an abstract system of signs (score). Also, according to Schaeffer, *musique concrète* deals with acoustically evident, directly perceptible phenomena. In \*electronic music, on the other hand, the sounds are the result of purely theoretical combinations of sound-parameters (frequency, amplitude, duration), elements that, according to Schaeffer, could by no means alone be responsible for the effect of the whole. Schaeffer's method of investigation, classification, and eventually association of sounds (which is not and does not pretend to be a method of *composition*), called *solfège concret*, is based on description and comparison, in plain language, of the sounds (*objets sonores*) as perceived. This method discards the scientific approach (in terms of physical acoustics) as inadequate; it may be considered one of the first—although still primitive—attempts to arrive at a contemporary “phenomenology of sound” (not to be confused with a phenomenology of music). It is the principle of *solfège concret* that best defines both the theoretical basis of *musique concrète* and how it differs from other contemporary trends in music.

Schaeffer, “Musique concrète et connaissance de l'objet musical” (*RBM* xiii); G.-W. Baruch, “Was ist Musique concrète?” (*Melos*, 1953). A.B.

**Musique mesurée** [F.]. See *Vers mesuré*.

**Mustel organ**. See under Harmonium.

**Muta** [It.]. Indication for a change of tuning in the orchestral parts for kettledrums and, in earlier scores, a change of crooks for horns and natural trumpets. For instance, “*muta in G/d*” means that the two kettledrums should be tuned in G and in d.

**Mutanza** [It.]. Rare 16th-century term for variation.

**Mutation**. (1) The change from soprano or alto to tenor or bass that takes place in a boy's voice during adolescence, usually between the ages of 14 and 16. (2) The term is occasionally used for the shift in violin playing. (3) See under Hexachord IV.

**Mutation stops**. See under Organ VI. Also Foot (2).

**Mutazione** [It.]. A 15th-century term for the *piedi* of the \*ballata or the \*barzelletta. The corresponding Spanish term is *mudanza* [see *Villancico*].

**Mute** [F. *sourdine*; G. *Dämpfer*; It. *sordino*; Sp. *sordina*]. A device for softening or muffling the tone of a musical instrument. In violins, etc., the mute is a clamp with three (occasionally two or five) prongs that is placed on the bridge and makes the tone veiled and somewhat nasal. It is usually called for by the phrase *con sordini*. It has been frequently used to convey a mysterious or uneasy atmosphere, one of the earliest examples being in Act II, Scenes iii and iv of J.-B. Lully's *Armide* (1686), marked “sourdines.” Beethoven used muted violins in the prison scene of *Fidelio*, and Berlioz for the “Ballet des Sylphes” of his *La Damnation de Faust*, to mention only a few of the earlier instances. Muted cellos and double basses are used very effectively at the beginning of Stravinsky's *L'Oiseau de feu*. Brass instruments are muted by inserting a pear-shaped piece of wood or metal into the bell. The French horn, however, is usually muted by inserting the player's hand. Kettledrums were formerly muted by placing a cloth over the parchment; today sponge-headed drumsticks are generally used instead. In pianos, the sound is muted by the left pedal (soft pedal), which causes the whole keyboard with the hammers to shift a little to the right [G. *Verschiebung*, shift], so that the hammers strike only one string instead of two or three (hence the Italian term *una corda*, one string); see Piano I. In upright pianos a similar effect is achieved by reducing the ambit of the hammer.

The term “mute” is often identified or confused with \*damper. Properly, a damper is a device that deadens a sound. The difference between mute and damper is particularly clear on the piano, where the left pedal is a mute whereas the right pedal releases the dampers from the string, allowing the string to keep on sounding. The same ambiguity exists with the Italian word *sordino*, which is applied to the muting of violins as well as to the dampers of the piano, while muting the piano is called *una corda*. The confusion has been compounded by editors (German and English) who, reading the indication *senza sordini* in the first movement of Beethoven's Moonlight Sonata, considered it an error and changed it to *con sordini* or *una corda*.

Actually, Beethoven's *sordini* are the dampers of the piano, and his indication *senza sordini* means "without dampers," i.e., "with the right-hand pedal." See *Una corda*.

**M.v.** [It.]. Abbr. for *mezza voce*; see under *Mezzo*.

**My Country (Fatherland).** See *Má Vlast*.

**Mystery play.** See under Liturgical drama.

**Mystic chord.** A chord invented by A. N. Scriabin, consisting of a series of five fourths: c-f#-b-e'-a'-d". It forms the harmonic basis of his *Prometheus* (1910), op. 60, and the Seventh Piano Sonata, op. 64. In other compositions Scriabin used similar chord formations, e.g., c-f#-b-e' (op. 57, no. 1), and A-d#-g-c#-(f')-b'-e" (Eighth Piano Sonata, op. 66). See A. Eaglefield-Hull, in *PMA* xliii. See Fourth chord.

## N

**Nabla, nablum, nablium.** A stringed instrument mentioned by Greek writers, probably the nebel (nevel) of the ancient Hebrews [see Jewish music I].

**Nabucco or Nabucodonosor** [It., Nebuchadnezzar]. Opera in four acts by Verdi (libretto by T. Solera), produced in Milan, 1842. Setting: Jerusalem and Babylon, 568 B.C.

**Nacaire.** See under Drum II.

**Nacchera** [It.]. (1) Kettledrum. See Drum II. (2) In present-day usage, *nacchere* (pl. form) means castanets.

**Nachahmung** [G.]. Imitation.

**Nachdrücklich** [G.]. Emphatic, expressive.

**Nachlassend** [G.]. Relaxing, slackening.

**Nachschlag** [G.]. (1) In modern German terminology, the two terminating notes that are usually played at the end of a trill [see Trill IV].

(2) In 17th- and 18th-century music, an ornament consisting of one or several short notes attached to the preceding main note. The ornamenting notes constitute a melodic movement away from the preceding note and are to be performed as a part of it, i.e., *before* the next main note. Thus the Nachschlag is the exact opposite of the *\*appoggiatura*, which is a melodic movement toward, and a part of, the following note. The accompanying illustration shows the simplest method of notating the Nachschlag, together with the correct rendition.

In French music of the 17th and 18th centuries the most common form of Nachschlag is the *agrément* variously called *accent*, *aspiration*, or *plainte*, which consists of raising the pitch a half-tone or whole tone at the end of a sustained note. The *accent* was indicated by several different signs: an inverted V, a short vertical stroke, or a tiny grace note. All these signs are invariably suppressed in modern editions. Ex. 1, from Rameau's opera *Hyppolyte et Aricie*, shows the notation (on upper line) and the approximate effect of the *accent* (on lower line); its 17th-century English equivalent is called the *springer*. It was used chiefly in music for the lute or viol, and was performed by lightly touching the string at a higher fret (without plucking it again) at the end of a sustained note. The sign for the *springer* is an ascending oblique stroke placed slightly to the right of the written note (or letter, in the case of tablatures), as in Ex. 2.

The Nachschläge described above were rarely used in Germany, but a similar ornament was used in German music of the baroque period. It always appears between a series of descending thirds and is indicated by a curved hook extending to the right of the main note, as in the accompanying example by J. S. Bach [Ex. 3]. Although this ornament had no sign in French music of the period, its use was taken for granted by French musicians, and it should be inserted, in performance, in all passages where thirds descend in notes of equal value. This practice was known as *couler les tierces*.

A special type of Nachschlag is one that anticipates the following note, i.e., the "anticipation" of modern composition [see Nonharmonic tones]. The descending anticipation was

a very common ornament in the 17th century, known in France as a *cheute* and in England as a *cadent*. Its sign is the same in both countries—a descending oblique line to the right of the written note [Ex. 4] (with proper execution below). In the 18th century the most common use of this type of Nachschlag was as an anticipation of the final note of a phrase [Ex. 5]. The Nachschlag in this position is usually written as an ordinary note or else left to the discretion of the performer. Particularly common was the Nachschlag as the closing note (or notes) of a trill. In modern German usage the term Nachschlag usually refers to this practice [see (1)].

Romantic composers returned to some extent to the earlier custom of writing Nachschläge as grace notes. Since they generally did not bother to slur the grace note to the preceding note, there is some danger of confusing it with an appoggiatura, unless the composer is careful (as Schumann always was) to place the Nachschlag before the bar line [Ex. 6, "Warum"]. There is no strict rule that will eliminate this confusion entirely, but it may at least be assumed that whenever the grace note is identical with the following note (as in Ex. 7, from Chopin's Nocturne op. 32, no. 2) the ornament is a Nachschlag.

P.A.

**Nachspiel** [G.]. Postlude.

**Nachtanz** [G.]. After-dance. In the instrumental music of the 16th century, a quick dance in triple meter that immediately followed a slower dance

in duple meter [see Dance music II]. Combinations occurring very often were *basse danse—tourdion* (1530), *pavane—galliard* (c. 1520–1600), and *passamezzo—saltarello* (c. 1550–1620). Other names for such dances were *Sprungk* (jump, jumping dance), *Hupfauf* (hopping up), and *Kerabe* (*Kehrab*, *Kehraus*, lit. sweep off, sweep out, i.e., closing dance). Frequently the *Nachtanz* is a rhythmic variation of the main dance, employing the same melody but in triple meter. In such instances it was often called *\*Proportz* or *tripla* with reference to the *proportio tripla* [see Proportions] involved in this modification. Some of the 14th-century *istanpitte* [see *Estampie*] have a *Nachtanz* called *\*rotta*. Ex. in *HAM*, nos. 83b; 102b; 105a and b; 137, no. 2; 154a; 179.

**Nachtmusik** [G.]. \*Serenade.

**Nachtstück** [G.]. \*Nocturne. The pieces by Schumann and Hindemith (1922 *Suite für Klavier*) bearing this title are much more suggestive of night visions and dreams than Chopin's nocturnes are.

**Nagarah**. See under Drum II.

**Nagelgeige** [G.]. \*Nail violin.

**Nagelschrift, Hufnagelschrift** [G.]. A German variety of neumes used during the 14th and 15th centuries, so named because the characters resemble the type of nail used with horseshoes [G. *Nagel*, nail; *Huf*, hoof]. Another name is Gothic neumes. See Neumes II (table, col. V).

**Nail violin, nail harmonica**. An instrument consisting of a flat, round wooden soundboard with a set of nails or U-shaped iron pins of various lengths driven around the rim. The nails are made to vibrate with a violin bow. The nail violin (invented by J. Wilde, c. 1740) belongs to the same period of *Empfindsamkeit* (late 18th and early 19th cent.) that produced the \*Aeolian harp and the \*glass harmonica as a result of its general penchant for ethereal, supernatural sound. Ill. in *SaHMI*, p. 403, and *AdHM* i, 632. [See ill. under Percussion instruments.] F. W. Rust wrote a quartet for nail violin, two violins, and cello [see Editions XVIII B 13].

**Naked fifth**. Same as \*open fifth.

**Nakers, nakeres**. See under Drum II.

**Napoletana**. See under Villanella.

**Naquaires**. Same as *nacaires* [see Drum II].

**Narrator** [It. *testo*]. In oratorios, Passions, cantatas, and occasionally operas, a character who tells the basic story, usually in recitative. In Passions, he is called *Evangelista* or *Chronista*. A famous early example of a stage presentation employing a narrator is Monteverdi's *Combattimento di Tancredi e Clorinda* (1624); a modern one is Stravinsky's *L'Histoire du Soldat* (1918).

**National anthems.** The songs adopted by various nations to be played on official occasions and to represent them in international gatherings. Those written up to 1830 are given below in chronological order (if both author of the text and composer are known, the former is indicated first, the latter second). *Netherlands*: "Wilhelmus von Nassouwe" (Philip van Marnix, c. 1570; music in A. Valerius, *Gedenck-Clanck*, 1626). *England*: "God Save the King" (appeared in its present-day form in *Thesaurus musicus*, London, 1744); its melody is used in the American song "My Country 'Tis of Thee," as well as in the German prewar anthem "Heil dir im Siegerkranz," in the Swiss anthem "Rufst Du, mein Vaterland," and in those of Sweden and Liechtenstein. *Denmark*: "Kong Kristian" (J. Ewald; D. L. Rogart, 1779). *France*: "Allons, enfants de la patrie," known as "La Marseillaise" (text and music by Rouget de Lisle, 1792). *Poland*: "Jeszcze Polska nie zgineta" (J. Wybicki; K. Oginski, c. 1795). *Austria*: "Gott erhalte unsern Kaiser" to 1919 (L. L. Haschka; J. Haydn, 1797); Haydn's famous melody was used in Germany with the text "Deutschland, Deutschland über alles," by H. A. Hoffmann von Fallersleben, 1841. *Venezuela*: "Gloria al bravo pueblo" (V. Salias; J. Landaeta, c. 1810). *Argentina*: "Oid, mortales" (V. López y Planes; J. Blas Parera, 1813). *United States of America*: "The Star-Spangled Banner" (Francis Scott Key, 1814; tune by England's John Stafford Smith, composed originally for "To Anacreon in Heaven"). *Peru*: "Somos libres, seámos-lo siempre" (J. de la Torre Ugarte; J. Bernardo Alzedo, 1821). *Chile*: "Dulce patria, recibe los votos" (B. de Vera y Pintado, rev. 1847 by E. Lillo; Ramón Carnicer, 1828). *Greece*: "Se gnorizo apo ten kopsi" from 1864 (D. Solomós; N. Mantzaros, 1828). *Belgium*: "Après des siècles d'esclavage," known as "La Brabançonne" (L. A. H. Dechet, pseud. Jenneval; F. van Campenhout, 1830).

The political changes following World Wars I and II have led to a number of new anthems, particularly in the following countries: *Soviet*

*Union*: "Gimn Sovetskogo Susa" (Hymn of the Soviet Union; S. Mikhalkov and E. L. Registan; A. V. Alexandrov, 1943). *West Germany*: "Einigkeit und Recht und Freiheit" (2nd stanza of "Deutschland, Deutschland über alles"; see above, under Austria). *East Germany*: "Auferstanden aus Ruinen" (J. R. Becher; H. Eisler, 1949). *Austria*: *Land der Berge, Land am Strome* (P. Preradović; sung to the last part of Mozart's *Kleine Freimaurer-Kantate*, K. 623). *Italy*: "Fratelli d'Italia" (G. Mameli; M. Novaro, 1847).

Lit.: M. Shaw and H. Coleman, *National Anthems of the World* [1960]; P. Nettl, *National Anthems* (1952); S. A. Rousseau, *Les Chants nationaux de tous les pays* (1930); E. Bohn, *Die Nationalhymnen der europäischen Völker* (1908); E. Murillo, ed., *National Anthems of the Countries of North, Central and South America* (1935); D. R. Wakeling and G. de Fraigne, "National Anthems" (MR iii; complete list); H. Abert, "Eine Nationalhymnen-Sammlung" (ZIM ii).

**Nationalism.** In music, a movement beginning in the second half of the 19th century that is characterized by a strong emphasis on national elements and resources of music. It is based on the idea that the composer should make his work an expression of national and ethnic traits, chiefly by drawing on the folk melodies and dance rhythms of his country and by choosing scenes from his country's history or life as subjects for operas and symphonic poems. Nationalism, therefore, represents a contradiction of what was previously considered one of the chief prerogatives of music, i.e., its universal or international character, which meant that the works of the great masters appealed equally to any audience.

To defend their cause, champions of the nationalist movement hold that music always has been and always will be national. They point out that the music of Bach, Beethoven, Schumann, and Wagner is thoroughly German, that of Scarlatti, Rossini, and Verdi is unmistakably Italian, and that of Byrd or Sullivan is unequivocally English. No doubt there is some truth in such statements. Although it is difficult—maybe impossible—to point out in detail what is German, Italian, or French in musical style and expression, one could perhaps indicate some general characteristics, such as "idealistic" for German music, "corporeal" for Italian, or "spirited" for French. However, such generalizations have nothing to do with nationalism as

defined here. Nationalism is essentially a matter of intention. No composer can help inheriting, together with his language, certain national ideas, views, and feelings. The difference between the "international" and "national" composer of, e.g., Italian ancestry, is the difference between someone who cannot help speaking Italian and someone who wants to speak Italian. It is the latter who belongs to the nationalist movement in music.

The nationalist movement began as a reaction against the supremacy of German music. It was started by talented musicians who found themselves forced to compete with men like Beethoven, Wagner, and Brahms, and who, in their national treasure of melodies, dances, etc., found a potentially strong weapon. For this reason the nationalist movement is practically nonexistent in Germany, nor has there been much of one in France. Debussy entered the arena with purely musical weapons, which, though very "French," were in no way nationally inspired. The absence of a strong nationalist movement in Italy has been ascribed to the fact that Italy has no folk-song tradition. A more likely reason is that Italy, like Germany and France, had an old musical tradition to draw upon and did not need to resort to the somewhat extraneous resources of the nationalist movement.

Nationalism was principally embraced by the "peripheral" European nations, for which it proved, in most cases, the first opportunity to advance to the center of the musical scene. It found its first full realization in Glinka's opera *A Life for the Czar* (1836). About 1860 the movement gained fresh impulse in Bohemia, Norway, and Russia, with Smetana's *The Bartered Bride* (1866), Grieg's first book of *Lyric Pieces* (op. 12; e.g., "Folk Song," "Norwegian Melody"), and Borodin's *Prince Igor* (1869–87). In Russia, the group known as The \*Five formed a strong bulwark of nationalism against the internationally inclined Tchaikovsky and Rubinstein. Mussorgsky's *Boris Godunov* (1872) in particular is a landmark in the nationalist movement. In Bohemia, Smetana's work was carried on to some extent by Dvořák (1841–1904) and more wholeheartedly by Janáček (opera *Her Foster-Daughter*, 1894–1903). Toward the end of the 19th century the movement spread to Spain, where it found ample nourishment in the immense wealth of Spanish dance rhythms and melodies. Albéniz (1860–1909), Granados (1867–1916), and De Falla (1876–1946) are the outstanding representatives. In Finland, Sibelius (1865–1957)

first was an ardent supporter of nationalism but later turned to "absolute" music, which, nonetheless, remained largely Finnish in character. In England the national movement was championed by Elgar (1857–1934) and Vaughan Williams (1872–1958), in Hungary by Bartók (1881–1945) and Kodály (1882–1967), and in Rumania by Georges Enesco (1881–1955). Outstanding nationalist composers of Latin America are Brazil's Heitor Villa-Lobos (1887–1959) and Mexico's Carlos Chávez (b. 1899).

In the United States the nationalist movement started with H. F. Gilbert (1868–1928), whose compositions have a racy flavor derived largely from Negro music (*Negro Rhapsody*, 1913). Frederick Converse (1871–1940) drew inspiration from the American landscape (*California; American Sketches*). Among later composers Roy Harris (b. 1898) and Gershwin (1898–1937) are prominent champions of nationalism.

By about 1930 the nationalist movement had lost its impact nearly everywhere in the world. The pendulum swung back to supranational idioms, so much so that nationalism was called "the last illusion of people without talent" (A. Lourié, in *MQ* xxvii, 241). During its century of life, however, it produced a number of works of undisputed artistic value.

Lit.: C. Forsyth, *Music and Nationalism* (1911); R. Vaughan Williams, *National Music and Other Essays* [1963]; *GrHWM*, pp. 583–97, 612–25; D. Hussey, "Nationalism and Opera" (*ML* vii, 3); G. Seaman, "The National Element in Early Russian Opera, 1779–1800" (*ML* xlii, 252ff); F. Toye, "A Case for Musical Nationalism" (*MQ* iv).

**Natural.** (1) A note that is neither sharp nor flat, e.g., G natural as opposed to G-sharp or G-flat. (2). The sign  $\natural$ , which indicates the natural note in cases where the note would otherwise be altered, according either to the signature or to a previous accidental. See Accidentals.

**Natural horn, trumpet.** A horn or trumpet consisting only of a pipe without side holes operated by keys or additional tubing operated by valves. Such instruments can produce only the natural tones, aside from certain artificial chromatic alterations produced by stopping (stopped notes). They were used until the end of the 18th century, when the first keyed instruments were invented (key trumpets, key bugle). See Horn II; Trumpet II; Fanfare.

**Natural tones.** See under Wind instruments II.

**Naturhorn, Naturtrompete** [G.]. \*Natural horn, natural trumpet.

**Neannoe.** See Noeane.

**Neapolitan school.** I. "Neapolitan" is a term somewhat loosely applied to a school of composition in the 18th century that is thought to have originated in Naples and cultivated particularly in that city or by composers who studied there. It included a great many composers of greater or lesser importance, e.g., F. Provenzale (1627–1704), A. Scarlatti (1660–1725), N. Porpora (1686–1768), L. Vinci (1690–1730), F. Feo (1691–1761), L. Leo (1694–1744), N. Logroscino (1698–1765), G. B. Pergolesi (1710–36), G. Latilla (1711–91), D. Pérez (1711–78), D. Terradellas (1713–51), N. Jommelli (1714–74), P. Anfossi (1727–97), T. Traetta (1727–79), P. Guglielmi (1728–1804), N. Piccinni (1728–1800), A. Sacchini (1730–86), G. Tritto (1733–1824), G. Paisiello (1740–1816), and D. Cimarosa (1749–1801). A. Scarlatti's German pupil J. A. Hasse (1699–1783) also belongs to this group.

Most of these composers were known chiefly for their operas, and because many of them were born in or near Naples and received their musical education in one of the famous *conservatorii* of that city, the general type of opera they represent has frequently been called "Neapolitan." The composers mentioned, however, were active in many different parts of Europe: Rome (Scarlatti, Anfossi, Piccinni), Lisbon (Pérez), Paris (Piccinni, Sacchini), St. Petersburg (Paisiello), Stuttgart (Jommelli), Vienna, Milan, etc., and there is not sufficient evidence to show that the Italian *opera seria* of the 18th century was peculiar to Naples. It was rather a general type, cultivated all over Italy and extending to other countries, and it underwent gradual changes in style, especially after 1760. Under the poet-dramatists Metastasio and Hasse, its leading representatives toward the middle of the century, the type of plot, number of characters, and musical characteristics were rather rigidly set. In form, it consisted of a series of recitatives alternating with arias (mostly *da capo*), with occasional duets but seldom any larger ensembles. Aria types (*cantabile*, *mezzo carattere*, *bravura*, etc.) and the order of their succession were governed by conventional rules. In the latter part of the century the earlier rigidity of form and style was gradually relaxed, especially in the works of Jommelli and Traetta composed for non-Italian audiences, while the influence of

the French *tragédie lyrique* became evident in the greater use of choruses and ballets. The 18th-century *opera seria* was the chief medium through which virtuoso singing underwent an unparalleled development, particularly by the famous *\*castrati* of the period. Comic opera (*intermezzo*, *opera buffa*) also flourished at Naples from the early 18th century and spread to other centers. See Opera VIII; Comic opera II B; Aria IV; Overture.

II. About 1600 there existed in Naples a school of keyboard composers who represent an important transitional link from the keyboard style of the 16th century (A. Gabrieli, Cabezón) to that of the early baroque (Frescobaldi). To this group belonged A. Valente (publications of 1576, '80), R. Rodio (c. 1530–1610), G. Macque (c. 1550–1614), S. Stella, F. Lambardi (1587–1642), G. M. Trabaci (c. 1580–1647), and A. Mayone (d. 1627). Macque was a Belgian who, after stays in Vienna and Rome, came in 1586 to Naples, where he entered the service of Fabrizio Gesualdo, the father of Carlo Gesualdo. Both Trabaci and Mayone were his pupils, as was Luigi Rossi. The works of Macque and his successors are most remarkable for novel and experimental traits typical of early baroque style and expression.

I by D.J.G.

**Neapolitan sixth.** The \*sixth chord of the lowered supertonic,  $f-a^b-d^b$  in C. It is often used in cadential formations of the type IV–V–I, replac-

ing IV [see Functional harmony]. Although frequently found in the works of the \*Neapolitan school, the Neapolitan sixth was an established idiom throughout the second half of the 17th century (Carissimi, Corelli). Ex. 1 shows an example from Carissimi's duet "Il mio core," and Ex. 2 one from the "Frost Scene" in Purcell's *King Arthur* (1691). See Harmonic analysis V.

Example 1: Musical notation for a duet from Carissimi's "Il mio core." The top staff is labeled "Il mio core" and the bottom staff is labeled "Il mio co-re è un mar di pian - ti". The music is in G major, and the example illustrates the Neapolitan sixth chord (F#-A-C#).

Example 2: Musical notation for a "Frost Scene" from Purcell's *King Arthur* (1691). The music is in D major, and the example illustrates the Neapolitan sixth chord (B-D-F#).

**Nebel, neble.** See Nabla.

**Neben-** [G.]. Auxiliary, secondary. *Nebenthema*, *Nebensatz*, second theme (of a sonata). *Nebendreiklang*, any triad other than I, IV, and V. *Nebennote*, a note other than those conditioned by the harmony, i.e., auxiliary notes, passing notes, appoggiaturas, etc. *Nebentonart*, a key other than the main key of a composition, e.g., the dominant and subdominant, the relative keys, etc. *Nebenstimme*, subordinate or accompanying part.

**Neck.** The projecting portion of a violin, lute, guitar, etc., by which the instrument is held.

**Negro music.** I. The term "Negro music" is generally applied to music composed by Negroes, either folk music or pieces by individual composers. It is not to be confused with the Negro-dialect songs that have been composed largely by white men: the "plantation songs" of Stephen Foster, the "coon songs" of the late 19th century, and the commercialized imitations of \*blues. However, so many Negro composers work in the commercial "jazz" and "swing" industry that it is often impossible to distinguish between genuine Negro music and its imitation by white men.

References to Negro music date back to the 18th century. The opera, *The Disappointment* [pub. libretto 1767], contains the earliest Negro dialect song. Thomas Jefferson wrote of the

musical talents of the Negro in his *Notes on Virginia* (1784); Aird's *Selection of Scotch, Irish, and Foreign Airs* (Glasgow, 1782) contained a "Negro Jig"; J. Carr of Baltimore published in 1801 a "Negro Song," composed or arranged by Benjamin Carr, an English musician who moved to America in 1793; and Gottlieb Graupner became one of the forerunners of the minstrel show by singing in costume "A Gay Negro Boy" between the acts of a play in Boston in 1799. Thus, white men's descriptions and imitations of Negro singing came into vogue long before Negro music was collected and preserved. The minstrel shows received their impetus directly from the Negro, however. According to tradition, which is partially confirmed by known fact, this type of entertainment was popularized by Thomas Rice, who dressed in clothes borrowed from a Negro and imitated the Negro's manner of singing a song called "Jim Crow." This occurred about 1830, and from that time on the movement spread and dozens of minstrel troupes came into prominence. Most of the songs written for the minstrels were composed by white composers, among them Stephen Foster, and for decades these Negro-dialect songs constituted the chief source of information that many Americans, particularly Northerners, possessed regarding the musical talents of the Negro.

It was not until after the Civil War that native Negro singing and songs became known to the country at large, mainly through a traveling group of Negro singers from Fisk University led by George L. White. As other Negro institutes were founded, notably Hampton and Tuskegee, their student singing groups toured the country and acquainted the nation, particularly the North, with the Negro's own songs. In their programs, the emphasis was principally on the so-called "spirituals," or religious songs, of the Negro.

II. The origin of the Negro's melodies is a controversial subject, particularly as to whether any appreciable number of them have an African background. Comparison is made between the music of African peoples and that of the American Negro. The pentatonic scale is common to both, and each has a decided tendency toward syncopation. Also, the Negro has a love for complex and involved rhythmic combinations, which some students claim derives from an African background. Other authorities, notably George Pullen Jackson in his *White Spirituals in the Southern Uplands* (1933), claim a white origin

for many of the Negro songs and point to many convincing examples [see Jig]. It is true, also, that white evangelists and "revivalists" traveled among the southern Negroes and sang to them many of the gospel songs from their own hymn-books. The most tenable theory, perhaps, is that the Negroes brought with them from Africa their own musical traditions and that association with white men and exposure to their customs and music tempered and molded the African idioms into something that represented a combination of the two.

III. The emphasis on Negro religious songs delayed for many years recognition and general knowledge of the secular songs, which cover a wide range, both in type and in mood. These have been collected and distributed only since about 1930, as interest in folklore and balladry became something of a science among American scholars. There are work songs—for cotton-picking, corn-shucking, stevedoring; railroad songs of the section gang; steamboat songs; and prison songs of the chain gang and the rock pile. The Negro's love of balladry is responsible for many songs of the narrative type—"Frankie and Johnnie," Negro versions of "Casey Jones," the story of "John Henry," and many other legends. In addition there are bad men's songs, unprintable "devil's" songs, and numerous tunes for Negro dances. Of particular importance is the \*blues, a type of sorrow-song that has become extremely popular and became one of the main ingredients of jazz.

The 20th century has brought striking innovations in Negro folk singing, notably the religious dance, the rhythmic gospel song, and the choral organizations in the folk church. These innovations stem largely from the introduction of instrumental accompaniment into the church service. The accompaniment, provided principally by piano (and tambourine in the Holiness Church service), is not the conventional four-voice hymn accompaniment but highly rhythmic and prominent. Pieces featuring these innovations are known as "gospels." An important feature of their appeal is the improvisory style of the singers, who rely little on the printed page. Pioneers in gospel song—the new spiritual—include Thomas A. Dorsey and Roberta Martin of Chicago, and Lucy Campbell of Memphis.

The effect of Negro folk music on the art music of America, as well as the work of serious Negro composers, is discussed under United States II, IV. See also Jazz.

**Neighbor tone.** Same as auxiliary tone; see Non-harmonic tones I.

**Nelson Mass.** Mass by Haydn in D minor, written in 1798 while Lord Nelson was engaged in the Battle of the Nile, an event that intrigued Haydn immensely. The Mass is sometimes called "The Imperial."

**Neoclassicism.** A movement of 20th-century music that is characterized by the inclusion into contemporary style of features derived from the music of the 17th and 18th centuries. It represents the expression of a general reaction against the unrestrained emotionalism of late romanticism. Particularly distinct is the influence of Bach, which makes itself felt in the emphasis on contrapuntal texture; in the revival of early forms such as the suite (not the ballet-suite of the late 19th century), toccata, passacaglia, ricercar, concerto grosso, and ground; in the reduction of orchestral resources and colors; in the abandoning of program music; and in a general tendency toward an objective and detached style. The music of Scarlatti, Pergolesi, Monteverdi, F. Couperin, and Lully has also left imprints on contemporary works, particularly by

French and Italian composers who supplemented the "back to Bach" movement with the motto "clarté latine."

Considered a typically neoclassical work is Prokofiev's Classical Symphony (1918), a clever parody of Mozart's style. However, neoclassicism as a general movement did not start until the early 1920's, when Igor Stravinsky startled the musical world with his *Pulcinella*, his opera *Mavra*, and other works written in what was then interpreted as an "18th-century manner" but that proved to be the beginning of a new style in contemporary music. The same idiom prevails in his Sonata (1924), Piano Concerto (1924), Serenade (1925) for piano, his opera-oratorio *Oedipus Rex* (1927), and the ballet *Apollon Musagète* (1928). Although the term neoclassicism seems to have been adopted by musicologists to refer to a stylistic category, most of the composers to whom it could be applied totally refuse to accept it, notably Stravinsky.

Still closer in spirit to Bach than Stravinsky is Paul Hindemith, who, from c. 1925 on (Three Concertos, op. 36; Piano Studies, op. 37), has systematically developed a new contrapuntal style, deliberately impersonal and sometimes mechanical, that may well be described as a 20th-century version of Bach. Certain features point to a still more distinct relationship, namely, the dissonant linearity of 14th-century composers such as Machaut [see under *Ars nova* II]. Hindemith is only one of a number of composers who, c. 1925, arrived at neoclassicism as their "third period," after earlier periods of first impressionism and then a rather anarchic mixture of primitivism and jazz. In this group are A. Casella, G. F. Malipiero, W. Piston, W. Fortner, and others.

The neoclassical movement has led to the revival of numerous forms and idioms that developed from the 16th to 18th centuries, e.g., the madrigal, *ricercar*, concerto grosso, number opera, *passacaglia*, *ostinato*, counterpoint, polyrhythmic and polymetric devices, etc.

Browne, "Paul Hindemith and the Neo-classic Music" (*ML* xiii, 42).

**Neomodal.** Pertaining to the use of modal idioms in present-day music. See *Modality*.

**Netherlands.** The music history of the Netherlands cannot be described without taking into account the political changes that took place in northwest Europe during the last five centuries. This area was successively a part of France, Burgundy, The Holy Roman Empire, and Spain, until it became an independent state in 1581 (William of Orange), which, from 1815 to 1830, also included present-day Belgium. Such 19th-century historiographers as Kiesewetter, Fétis, Ambros, and Van der Straeten included Belgium in their studies of Netherlands music and even extended their scope to some bordering provinces of northern France (Cambrai), which in the 15th and 16th centuries were politically or culturally related to the Netherlands. Modern scholars distinguish between the northern (now Protestant) and the southern (Roman Catholic) parts of the Low Countries, the former being considered Netherlands or Dutch countries, the latter Belgium or, in earlier times, Flemish countries. Through this distinction, the early history of Netherlands music loses much of the glory with which it has been surrounded by the above-mentioned writers [see *Netherlands schools*].

The so-called Gruythuyser MS (ed. K. H. Heeroma and C. W. H. Lindenburg, 1966) from the second half of the 14th century contains 147 monophonic songs in the Dutch language [see J. Wolf, in *CP* 1924], while the contemporary MS Prague XI E 9 includes polyphonic compositions with Dutch titles, such as "Vaer rouwe in dander huys," "Het dunct mi wesen verre," etc. [see F. Kammerer, *Die Musikstücke des Prager Kodex XI E 9* (1931)]. In both sources French influence is apparent. In the 15th century, Jacob Obrecht (1452-1505), the only real Dutchman among the "Netherlands composers" (he was born at Bergen op Zoom in Brabant), wrote not only Masses, motets, and French chansons, but also a number of Dutch songs [see A. Smijers, *Van Ockeghem tot Sweelinck*, vol. iii]. A collection of three-part compositions with full texts, dating from about 1500, has been published by J. Wolf in \*Editions LII, 30. An important source of Dutch-Flemish music of the 16th century are the seven *Musyckboexkens* (music booklets) published by Tielman Susato of Antwerp (1551-57). Books 1-2 contain "amoreuse liedekens" (amorous chansons), Book 3 is a collection of dances, and Books 4-7 contain religious songs, the \**Souterliedekens* (Psalter songs).

The next important Dutch composer after

Obrecht is Jan Pieterszoon Sweelinck (1562–1621). His main vocal work, the four- to eight-part polyphonic setting of the complete Psalter, appeared in four books, three of them during his lifetime (Amsterdam, 1604–21). Among his instrumental works, nearly all for keyboard instruments, the *Fantasia Chromatica*, with its use of a chromatic style, is a striking exception to Sweelinck's more usual diatonic style. He became famous throughout Europe for his organ playing at the Oude Kerk in Amsterdam, and his pupils included nearly all the leading German organists and organ composers of the early baroque (S. Scheidt, H. Scheidemann, M. Schildt, P. Siefert, J. Praetorius), a fact that won him the name "Der deutsche Organistenmacher" (the maker of German organists). A successor of Sweelinck was A. van Noordt, who published a *Tabulatuur-Boeck van Psalmen en Fantasyen* (1659) containing six keyboard fantasias that represent a significant step in the development from earlier imitative forms to the fugue. Noordt's book is reissued in \*Editions LII, 19, which also includes other examples of the development of Netherlands music during the 17th and 18th centuries.

Little can be said about the development of indigenous Netherlands music during the 17th and 18th centuries, when it was influenced first by Italian and later by French music of the time. During the 19th century the influence of German composers such as Mendelssohn and Schumann became prominent, appearing in the works of Johannes Verhulst (1816–91), Richard Hol (1825–1904), and others. Toward the end of the century a period of new creative musical activity was initiated by Alfons Diepenbrock (1862–1921), the most important Dutch composer. A self-taught musician, Diepenbrock was first attracted to both the chromatic harmonics of Wagner and the polymelodic, vocal style of Palestrina, which he combined most successfully in one of his main works, the *Te Deum* for 4 solo voices, double chorus, and orchestra (1897–1908). In later years he came to admire Debussy, as is seen in his numerous songs, written mostly to French texts, and his stage music for *Marsyas* (a Dutch comedy by Balthasar Verhagen; 1910) and Sophocles' *Electra* (1920). In striking contrast to the subjective mysticism of his music is that of his contemporary Johan Wagenaar (1862–1941), who was rooted in the German tradition of Liszt and R. Strauss.

The later Dutch composers were more inclined toward internationalism of German or,

more frequently, French derivation. Representatives of the latter group include Hendrik Andriessen (b. 1892) and Alexander Voormolen (b. 1895). More advanced, although unmistakably French-oriented, is the work of Daniel Ruyneman (1886–1963) and Willem Pijper (1894–1947), the latter the most original Dutch composer since Diepenbrock. Pijper created a musical language based on the use of polytonality, polymetric and polyrhythmic figures, and the "germ cell," which is often no more than a chord or a single motif, from which is developed organically not only all the motivic and thematic material of a composition but even its form and the duration of its movements. Thus Pijper's music exhibits a highly intellectual structure yet, at the same time, concentrated expressiveness, as in his Piano Sonatinas nos. 2 and 3 (1925) and the Third Symphony (1926). The teacher of most of the leading present-day Dutch composers, he has had a profound influence on Dutch music. Among his pupils are Guillaume Landré (b. 1905), known for his orchestral works and chamber music; Kees van Baaren (b. 1906), who adopted the twelve-tone technique of Schoenberg and the Viennese school in such works as *Variations per Orchestra* (1959); Henk Badings (b. 1907), the most prolific contemporary Dutch composer, who clings more to the German tradition of Reger and Hindemith; Rudolf Escher (b. 1912); and Hans Henkemanns (b. 1913). The most recent generation is represented by Ton de Leeuw (b. 1926), a pupil of Messiaen, who in his opera *The Dream* (1964) shows a great attachment to Asian idioms, and Peter Schat (b. 1935), disciple of Boulez and Cage, whose most advanced project, *Labyrinth* (1966), is an important attempt at creating a new kind of musical theater.

rev. E.R.

**Netherlands schools.** A designation introduced by R. G. Kiesewetter, in his *Die Verdienste der Niederländer um die Tonkunst* (1826), for the long series of 15th- and 16th-century musicians of the Low Countries. He distinguished a first, second, and third Netherlands school, which were headed respectively by Dufay (c. 1400–74), Ockeghem (1430–95) and Obrecht (1452–1510), and Josquin (c. 1450–1521). Today, these terms have been largely discarded, chiefly because only one of the so-called “Netherlands” masters, Obrecht, came from the Netherlands proper, all the others coming from either the southern Lowlands (Belgium), northern France (Cambrai), or Burgundy (Dijon). A more appropriate name for the first Netherlands school is \*Burgundian school, while the musicians from Ockeghem to Lasso can be grouped best in various generations of the \*Flemish school. See H. C. Wolff, *Die Musik der alten Niederländer* (1956); P. H. Lang, in *MQ* xxv, 48.

**Neue Musik** [G.]. German term for \*twentieth-century music. Also see under New music.

**Neue Sachlichkeit** [G.]. A term coined in the 1920's for antiromantic tendencies toward an objective [G. *sachlich*] and even nonexpressive type of music.

**Neuma.** (1) See under Neumes. (2) Medieval term for extended melismatic passages of plain-song, sung to one syllable or simply a vowel [see Vocalization]. In the early Middle Ages, when the Christian service had the character of boundless exultation rather than restrained devotion, the *neuma* had a symbolic significance as expressing a mystic feeling that could not be put into words. In Gregorian chant the term applies mainly to long melismas representing a later insertion, i.e., a nontextual \*trope. They occur especially in responsories, the most famous example being the *neuma triplex* of “Descendit de caelis” [see *ApGC*, p. 343]. (3) In the later Middle Ages the name *neuma* was given to instructive melodies devised to show the special characteristics of each mode [see *Noeane*]. Through misuse, however, these melodies were introduced into the Office and sung before or after the antiphons (in Paris as late as 1873). They also served, under the name *Neuma*, as tenors for 13th-century motets [see P. Aubry and A. Gastoué, *Recherches sur les “Tenors” latins* (1907), p. 13].

**Neumatic style.** See under Gregorian chant III.

**Neumes.** The notational signs of the Middle Ages (8th–14th centuries), which were used for writing down plain-song. The term means chiefly the signs used for the music of the Roman Catholic Church (Gregorian chant) but is also used for other systems of a similar character, such as the \*Byzantine, Mozarabic, or Armenian neumes. This article describes only the first type.

I. Neumatic notation consists of a large number of signs for single tones as well as for groups of two, three, or more tones. The accompanying table shows the most important neumes as they occur in the MSS of St. Gall (9th–10th centuries), together with the modern forms used in present-day liturgical books (Solesmes edition, Vatican edition) and a rendition in ordinary notation.

The neumes may be divided into two main groups, the “basic” neumes (A) and the “special” neumes (B). The former indicate melodic motion only, while the latter also indicate special manners of performance. Category A.1 of the table includes the so-called “simple” neumes, i.e., those having up to three notes. For these, individual names are used, while the neumes with more than three notes (A.2, “compound” neumes) have compound names. The signs under B.1 are the “liquescent” neumes (*semivocales*). They always occur on a diphthong (*au*, *eu*) or where there are two consonants in succession, such as *ng* (*angelus*), *lm*, *rn*, etc. According to one theory, they are thought to have called for a particularly smooth transition by means of an interpolated *e*, as, for instance, *in(e)fer(e)ni* instead

of *inferni*. The *epiphonus* is the liquescent variety of the *podatus*, the *cephalicus* that of the *clivis*, the *ancus* that of the *climacus*. See the accompanying example, from the Introit “Circumdederunt.” The signs under B.2 belong to the class of “ornamenting” neumes. Each of them involved a special manner of performance, whose exact nature is not always clear. The *strophicus* (*apostropha*) occurs usually as a group of two or three signs (*bistropha*, *tristropha*) of identical pitch and indicates a quick reiteration (repercussion), i.e., a true vocal \*tremolo [see *ApGC*, p. 107f]. In present-day practice it is usually rendered as a sustained note of double or triple duration. The original significance of the *oriscus*, *quilisma*, *salicus*, and *pressus* is very

obscure, and the explanations in *LU*, pp. xxivff, have little historical validity [see *ApGC*, pp. 110ff]. Another specialized neume frequently found in the earliest MSS of St. Gall is the *trigon*, consisting of three dots forming a triangle. It probably indicated staccato performance of *torculus* formations involving a semitone at the beginning, such as e-f-d or b-c'-a. Possibly, the initial interval was a quarter tone, since later MSS usually represent the *trigon* as a repercussive formation, f-f-d or c'-c'-a. Early writers cite quite a number of other "ornamenting" neumes under names such as *notae vinnulae* ("charming" notes) or *tremulae*, which, we are told, the Franks were unable to sing [see C. Vivell, "Les 'Sons Répercutés' dans le chant Grégorien," in *TG* xviii; also see *Vox* (1)].

II. There are various theories about the origin of the neumes. The one most generally accepted considers the neumes an outgrowth of accents in the Greek language, signs that indicated not so much accentuation in the modern sense but an inflection of the voice, the *acutus* (a), a raising, and the *gravis* (b), a lowering of the pitch. The former became the *virga* (which, as a rule, is used for a higher note), and the latter the

*punctum* (which usually indicates a lower tone). Combinations of these accents (c, d, e) led to neumes of two or more notes, the *podatus*, *clivis*, *porrectus*, etc. Therefore, all these neumes (group A of the complete table) are called "accent neumes" [G. *Akzentneumen*]. Most of the neumes shown in group B belong to the category called "hook neumes" [G. *Hakenneumen*] because they are drawn with a rounded hook that may have come from the Greek aspirate sign: ρ.

In the earliest sources (9th–10th centuries) the neumes are written so as to give only the general outline of the melodic motion and not the actual intervals. Thus, the *podatus* may mean an ascending second, third, fifth, etc. Evidently these signs served only as a mnemonic aid for the singer, who knew the melodies by heart, or for the choir leader, who may have interpreted them to his choir by appropriate movements of the hand. These neumes are called \*chironomic, staffless, oratorical, or *in campo aperto* ("in the open," i.e., without clear orientation). About A.D. 1000 we find the earliest traces of a more

careful arrangement of the neumatic signs so as to give some tentative indication of pitch. Particularly the 11th-century MSS of Italy, written in the so-called Longobardian or Beneventan character, are remarkable for their early use of "heighted" (intervallic, diastematic) neumes, i.e., neumes that are written on a staff, either imagined or actually indicated by one, two, or finally four lines. Slightly later than the Beneventan neumes are the Aquitanian neumes, whose shapes approximated, and finally led to,

the square-shaped characters of the 13th century. These were quickly adopted everywhere except in Germany, where a peculiar variety, the Gothic neumes, remained in use as late as the 16th century. The square-shaped neumes are still used today in the liturgical books of the Roman Catholic Church. The accompanying illustration shows the eight "simple" neumes in five different styles: I. Messine neumes (Monastery of Metz, 9th–10th cent.; G. Metzger *Neumen*); II. Beneventan neumes (Monastery of Beneventan in southern Italy, 11th–12th cent.); III. Aquitanian neumes (southern France, 12th–13th cent.); IV. Square neumes from Salisbury, England (Sarum use; 13th cent.); V. Gothic neumes, also called \**Nagelschrift* (German MSS, 14th–15th cent.). These may be compared with the St. Gall neumes shown above.

The chironomic neumes as such cannot be deciphered [for a futile attempt, see O. Fleischer, *Die germanischen Neumen* (1923)]; they can only be compared with those of the later sources, which have preserved the old melodies in a clearer system of notation, with the neumes written on an imaginary or real staff of one to four lines. For material showing the development of the neumes see Editions XLII, A, 2 and 3.

III. The question of the rhythmic meaning of neumatic notation is infinitely more difficult than that of pitch. It has been the subject of painstaking research and of sharp controversies that still continue. See Gregorian chant VI.

The neumatic signs in their final shape (square shapes of the 13th century) were also adopted for the notation of two other bodies of early music, secular monophonic melodies (troubadours, trouvères) and polyphonic music (organa, clausulae of the school of Notre Dame). In both cases they present problems of rhythmic interpretation that are entirely different from those of the neumes in Gregorian chant. See Monophonic notation and Square notation; also Notation.

Lit.: G. Suñol, *Introduction à la paléographie musicale grégorienne* (1935); P. Wagner, *Einführung in die gregorianischen Melodien ii: Neumenkunde* (1905; rev. ed., 1912); H. M. Bannister, *Monumenti Vaticani* (1913; extensive tables of neumes); E. Jammers, *Tafeln zur Neumenschrift* (1965); \*Editions XLII, A 2 and 3 (*Justus ut palma* from more than 200 MSS); M. Huglo, "Les Noms des neumes et leur origine" (*Études grégoriennes* i); J. Handschin, "Eine alte Neumenschrift" (*AM* xxii); see also under Gregorian chant and in *ReMMA*, pp. 440–42; also s.v. "Notation" A. II. and B. I., in *MGG* ix.

**Neutöner** [G.]. A derogatory term applied, c. 1890, to Wagner, Richard Strauss, and other "radicals" of the time.

**Nevel.** See Nabla.

**New music.** A term adapted from G. *neue Musik* as a designation for various novel and radical trends in 20th-century music, such as \*atonality, \*serial techniques, etc. The term, which was introduced c. 1925, is interesting historically, since similar names were used for similar reasons both 300 and 600 years ago, i.e., the \**nuove musiche* of 1600 and the \**ars nova* of 1300 [see also History of music].

**New World Symphony.** Dvořák's Ninth Symphony (usually called no. 5) in E minor, op. 95 (1893). It was written while Dvořák resided in the United States and incorporates themes modeled after the songs of American Negroes and Indians. Some of this material, however, sounds more Bohemian (Czech) than American.

**New Zealand.** See under Australia.

**Nibelungenring.** See *Ring des Nibelungen*, *Der*.

**Nicaragua.** Information about native songs and dances in Nicaragua at the time of the Spanish conquest is found in the writings of Columbus' historiographer, Gonzalo Fernandez Oviedo. He described dance festivals involving large numbers of Indians. One of them would act as a leader and answer in antiphonal manner to the singing of the group, supported by the beats of native drums and calabash shakers. These and other native instruments are still in use. The amalgam of Indian rituals and Roman Catholic rites is shown in such examples as the festival plays known as *Güegüence*, which date from colonial times and in which Spanish and Nahuatl dialects are mixed.

Many of the Creole forms of songs and dances that are at present popular in Nicaragua are basically the same as those found in the rest of Central America.

Art music in Nicaragua developed relatively late. Data on some composers born during the last decades of the 19th century has been recently made available. Alejandro Vega Matus (1875-1935) and José de la Cruz Mena (1874-1907), a composer of sacred music, belong to this group. The foremost figure in Nicaraguan music is Luis A. Delgadillo (1887-1964), a prolific composer of more than four hundred works who served as director of the Escuela Nacional de Música, founded in 1950, and conductor of the symphony orchestra of Managua. His works all are in the romantic tradition, and most of them are inspired by native music. Other contemporary composers from Nicaragua are Manuel Ibarra, J. Francisco Rosales, Antonio Zapata, Arturo Picado, Carlos Ramirez Velasquez, and Justo Santos.

Lit.: G. Vega Miranda, "De la Música nicaragüense" (*Elite* vii, 75); L. A. Delgadillo, "La Música indígena y colonial en Nicaragua" (*Rev. estud. mus.* i, 3). Also see under Latin America.

J.O-S.

**Nightingale, The** [Rus. *Salavei*]. Opera in three acts by Stravinsky (libretto by the composer and S. Mitusov after H. C. Andersen's fairy tale), produced in Paris (in French, as *Le Rossignol*), 1914. Setting: fairy tale (China).

**Night on the Bald Mountain.** Symphonic poem in variation form by Mussorgsky, inspired by the witches' Sabbath in Gogol's story, "St. John's Eve." Composed in 1867, it was repeatedly revised and eventually incorporated into his un-

finished opera, *Fair at Sorochinsk*. Today it is performed in an orchestral arrangement by Rimsky-Korsakov.

**Nights in the Gardens of Spain.** See *Noches en los jardines de España*.

**Ninth chord.** A chord that consists of the third, fifth, seventh, and ninth above the root. It usually occurs as the dominant of the key (dominant ninth chord), e.g., in C major: g-b-d'-f'-a'. Frequently the root (g) is omitted, in which case the chord can also be interpreted as the seventh chord of the seventh degree (b). The principle of superimposed thirds that leads from the triad to the seventh chord and to the ninth chord can be carried on still further, resulting in the eleventh chord (g-b-d'-f'-a'-c'') and thirteenth chord (g-b-d'-f'-a'-c''-e''). This building-up principle is used to produce a very impressive climax in the first movement of Bruckner's Symphony no. 7 [see Ex.]. Usually, the chords mentioned

occur in a reduced form and in exchanged position of the higher notes. In such cases they can usually be interpreted as appoggiaturas of simpler chords, e.g., g-f'-b'-e'' as an appoggiatura of g-f'-b'-d''.

**Ninth Symphony.** Although many composers (e.g., Bruckner, Dvořák, Haydn, Mozart, Mahler) have written nine or more symphonies, the most celebrated ninth is Beethoven's last symphony, also known as the \*Choral Symphony.

**Nobilissima Visione.** Ballet by Hindemith (composed 1938), based on the life of St. Francis of Assisi. Some of the numbers were arranged into an orchestral suite for concert performance.

**Noces, Les** [F., *The Wedding*]. Ballet by Stravinsky (choreography by B. Nizhinska), produced in Paris, 1923. It is scored for chorus, soloists, four pianos, and seventeen percussion instruments (including four tympani) and consists of four scenes.

**Noches en los jardines de España** [Sp., *Nights in the Gardens of Spain*]. Suite for piano and

orchestra by Manuel de Falla, finished in 1915. The three movements are (translated titles): (1) In the Generalife; (2) Distant Dance; (3) In the Gardens of the Sierra de Cordoba.

**Nocturn** [L. *horae nocturnae*]. One of the three parts into which the Office of Matins is divided. See Office.

**Nocturne**. A romantic \*character piece for piano, written in a somewhat melancholy or languid style, with an expressive melody over a broken-chord accompaniment. The first nocturnes were written by the Irishman John Field (1782–1837), from whom F. Chopin adopted the idea and the name. See *Notturmo*; *Nachtstück*.

**Nocturnes**. Three symphonic poems by Debussy, composed 1893–99: 1. *Nuages* (Clouds); 2. *Fêtes* (Festivals); 3. *Sirènes* (Sirens), with women's voices.

**Node**. In a vibrating string, the points of rest or of minimum amplitude. Such points occur not only at the two fixed ends of a string, e.g., bridge and fingerboard of a violin, but also at regular points in between, owing to the fact that the string vibrates not only as a whole but also in segments— $\frac{1}{2}$ ,  $\frac{1}{3}$ ,  $\frac{1}{4}$ ,  $\frac{1}{5}$ , etc.—of its length. Harmonics on a violin are produced by touching the string at one of these points. Similarly, in a vibrating air column (pipe), nodes are the points of highest density, where the air particles do not move. The intermediate points of maximum amplitude (string) or movement (pipe) are called loops or antinodes. See Acoustics V.

**No drama**. See *Noh*.

**Noeane, noeagis**, etc. Word formations of unknown meaning that appear in various treatises of the 9th and 10th centuries in connection with short melodies called *neuma* and are designed to give the characteristics of the various modes. The "Commemoratio brevis" of c. 900 gives a set of eight such neumata, e.g., for the first tone [see GS i, 214]:

a g f e g f e d c fga gagf eaf efe d  
No- a- no- e- a- ne

The syllables *no-e-a-no-e-a-ne* were commonly used for modes 1 and 3, *no-e-a-ne* for 5 and 7, and *no-e-a-(g)is* for all the plagal modes. They are mentioned c. 850 by Aurelianus Reomenois ("Musica disciplina"; see GS i, 41f), who tried to learn their meaning from a Greek and was told that they were merely expressions of joy. They are related to the Byzantine *enechemata* [see

*Echos*]. See also *Anenaiki*; Solmization. See *ReMMA*, p. 173; *RiHM* i.2, 57; H. Riemann, in *ZIM* xiv; E. Werner, in *MQ* xxviii, L. Kunz, in *KJ* xxx.

**Noel** [F.]. A popular Christmas song, particularly of French origin [see Carol]. In 1553 Nicolas Denisot published two books called *Cantiques et Noëls*, the second of which includes thirteen melodies. Another important early publication is F. Colletet, *Noëls nouveaux et cantiques spirituels* (1660). Eustache de Caurroy's *Meslanges* (1610) contains polyphonic settings of noels. From the 17th to 19th centuries innumerable noels were published (frequently as sheet music), in which a semireligious text was set to secular melodies, dancing songs, drinking songs, *vaudevilles*, etc. In the 17th century the name was applied to organ pieces designed to be played during the Christmas service. Most of these are simple variations on popular Christmas melodies. Collections of noels were published by Nicolas-Antoine Le Bègue [see *HAM*, no. 231], Nicolas Gigault, Jean F. Dandrieu, Louis-Claude Daquin, A. P. F. Boely, Claude Balbastre, and others.

The earliest known use of the word *noël* [from L. *natalis*, birthday] in musical compositions is in a Christmas motet, "Nova vobis gaudia," by Grenon (c. 1420), which includes four (isorhythmic) refrains sung to the word "noël" [see J. Marix, *Les Musiciens de la cour de Bourgogne* (1938), p. 233]. To the same class belong a motet by Busnois sung entirely to this word and Mouton's motet "Noe, noe psallite noe." A number of the 15th-century English carols begin with the word "Nowell" [see Editions XXXIV, 4].

Lit.: F. Hellouin, *Le Noël musical français* (1906); H. Bachelin, *Les Noëls français* (1927); J. R. H. de Smits, *Les Noëls et la tradition populaire* (1932); H. Poulaille, *La Grande et Belle Bible des noëls anciens* [1948].

**Noh** [Jap.]. A genre of Japanese theater performed by a group of soloists, a chorus, and three or four instrumentalists. It was founded by Kan'ami Kiyotsugu (1333–84?), an author and actor of *sarugaku* [see Japan IV], and his son Zeami Motokiyo (1363–1443?) under the patronage of the shogun Ashikaga Yoshimitsu. A *noh* play is normally in one or two acts and is classified according to subject as god play, battle play, woman's play, secular play, or demon's play. Usually a *kyōgen*, a comic intermezzo, is performed between acts and/or between two *noh* plays. The entire text of *noh* is either sung or re-

cited while that of *kyōgen* is spoken. A passage from a *noh* that is performed as a vocal piece without costume or instrumental accompaniment is called *utai* or *yōkyoku*.

*Noh* is performed by *shite*, the leading character, who usually wears a mask, and by *waki*, the principal supporting character, who does not. Other minor roles are called *tsure* and *wakizure*; sometimes there is a *kokata*, a role assigned to a young boy. The chorus, consisting of about eight persons, explains the plot or comments on the *shite*'s psychological situation. The soloists may recite or sing, while the chorus always sings; the manner of singing is much influenced by *shōmyō* [see Japan III, IV].

The instrumental ensemble in *noh* consists of a bamboo flute (*noh-kan* or *fue*), two drums shaped like an hourglass (the larger, *ōtsuzumi*, rests on the player's left knee, while the smaller, *kotsuzumi*, is held on the right shoulder; both are played with the right hand), and a barrel-shaped drum (*taiko*), played with two wooden sticks. An instrumental passage often occurs at the entrance of the *shite*, at the climactic dances, or at the end of the play, joining in with the vocal parts. Such an instrumental piece, when played independently, is called *hayashi*. In addition to playing the instruments, the drummers often utter vocal exclamations, such as "Yah," "Hah," etc., which in fact are a part of the music.

The scale system used in singing a *noh* centers around three important notes, *jō* (high), *chū* (middle), and *ge* (low), with several less important notes around them. The intervals between these three important notes depend on the manner of singing. In *yowagin* (the "soft" style) each note is a perfect fourth apart, while in *tsuyogin* (the "strong" style) *jō* and *chū* fall on the same note and *ge* is a minor third below.

The descendants of Zeami took the family name Kanze, which also became the name of the school. In addition, there originally were three other schools: Komparu, Hōshō, and Kongō. Later, in the early 17th century, a fifth school, Kita, was founded by Kita Shichidayū. See T. Minagawa, in *JAMS* x, 181–200. M.K.

**Noire** [F.]. See under Notes.

**Nola** [L.]. See under Cymbalum.

**Nomos** [Gr.]. In early Greek culture, particularly in the Homeric epoch, the traditional melodies used by the singer (*aidos*) for the recitation of the epics, to the accompaniment of the phorminx. See Greece I; Melody type.

**None.** (1) German term for the interval of the ninth; *Nonenakkord*, ninth chord. (2) The sixth of the canonical hours. See Office.

**Nonet** [G. *Nonett*; It. *nonetto*; Sp. *noneto*]. Chamber music for nine instruments, e.g., string quartet and five winds. Nonets have been written by Spohr (op. 31), Rheinberger (op. 139), Stanford (op. 95, for strings and winds), Ravel (*Trois Poèmes de Stéphane Mallarmé*, for voice and nine instruments), Webern (*Concerto* op. 24), and others.

**Nonharmonic tones.** In \*harmonic analysis, generic term for tones that are foreign to the harmony of the moment and occur as melodic "ornamentations" in one of the parts. There are two main categories:

I. Rhythmically weak notes occurring between two "harmonic" notes (i.e., notes that are part of the harmony). There are five such types, four of which are found between harmonic notes of different pitch [in Ex. 1–4, at the interval of a second], and one between harmonic notes of the same pitch [Ex. 5]. These are called: (1) *passing tone*; (2) *anticipation*; (3) *échappée*; (4) *cambiata*; (5) *auxiliary tone* (upper or lower auxiliary; also called embellishment, neighbor tone, returning note, alternating note).

The first four of these may, of course, occur between two harmonic notes forming any ascending or descending interval. The difference between *échappée* and *cambiata* is that in the

The image contains 14 numbered musical examples, each on a single staff. Examples 1 through 5 are in treble clef and show intervals of a second. Examples 6 through 14 are in various clefs (treble and bass) and show different nonharmonic tones. Examples 1-4 show intervals of a second, and example 5 shows the same pitch. Examples 6-14 show various nonharmonic tones in different contexts.

former the motion to the ornamenting tone is contrary to the motion between the harmonic tones, while in the latter these two motions are similar [see Motion]. Thus, with an ascending progression of harmony notes, e.g., e–g, the nonharmonic note d would be an *échappée* (e–d–g), the nonharmonic note A a *cambiata* (e–a–g).

II. Rhythmically strong notes occurring in place of harmonic notes. These are called *appoggiatura* [from It. *appoggiare*, to lean; also neighbor-tone]. An *appoggiatura* is the tone a second above or below the harmonic tone, played on the beat and resolved to the harmonic tone. The plain triad offers many possibilities for *appoggiatura* formations [Ex. 6] that are important as sources for dissonant chordal combinations. If the “wrong” note appears in the preceding chord, one speaks of a *prepared appoggiatura* [Ex. 7]; otherwise the *appoggiatura* is *unprepared*. The former type is the more orthodox, because the previous appearance of the “wrong” note somewhat weakens its dissonant character. This character is still more weakened—in fact, almost eliminated—if the preparing tone is tied to the *appoggiatura*. This formation is called *suspension* (sometimes retardation; Ex. 8). If two or more *appoggiaturas* occur simultaneously, one speaks of an *appoggiatura* chord [Ex. 9, Tchaikovsky, Symphony no. 4, last movt.]. A characteristic idiom of modern music is the extended use of “unresolved *appoggiaturas*” [Ex. 10, Debussy, *Pelléas et Mélisande*, end of Act I].

III. The classification and terminology above (based on W. Piston’s *Harmony*, 1941) differs in various particulars from that used by other authors. This is especially true with respect to the term “*appoggiatura*,” which is frequently restricted to those cases in which the “wrong” note is approached by leap [Ex. 11], the cases of stepwise approach being called *accented passing tone* [Ex. 12]. The advantage of this terminology appears to lie chiefly in its application to historical studies, since accented passing tones occur in practically all periods of music history while the “free” *appoggiatura* was not much used before c. 1750 (it is a characteristic feature of the *\*Empfindsamer Stil* of K. P. E. Bach; see *SchGMB*, p. 458). Other terms frequently used are *free passing tone* for a passing tone approached by leap [Ex. 13] and *changing notes* for the upper and lower auxiliary in succession [Ex. 14]. See E. Walker, “The *Appoggiatura*” (*ML* v, 121). See also *Cambiata*.

**Nonnengeige** [G.]. Name for \*tromba marina.

**Non nobis Domine.** A celebrated canon that is usually, but without demonstrable evidence, attributed to William Byrd. It is frequently sung as a grace at English banquets. It is remarkable for the great number of solutions it admits, solutions that differ according to the number of parts and to the intervals and distance of the imitating voices. See the article in *GDB*.

**Norddeutsche Schule.** See Berlin school.

**Norma.** Opera in four acts by Bellini (libretto by F. Romani), produced in Milan, 1831. Setting: Gaul during the Roman occupation, c. 50 B.C.

**Norway.** Some 12th-century chants in honor of St. Olaf (c. 995–1030), patron saint of Norway, are probably the oldest music composed in that country. Giraldus Cambrensis (c. 1147–1223), in his well-known description of early part-singing [see *ReMMA*, p. 387], says that this practice may have originated among the Danes and Norwegians. From the Orkney Islands, a Norwegian possession from the 9th century, comes a two-part hymn, “*Nobilis, humilis*,” in praise of their patron saint, St. Magnus (d. 1115), which may well be an example of early Norwegian polyphony. At the time of the Reformation (1537 in Norway), much of the earlier music was forbidden and, as a result, was lost. The songbooks of the Lutheran Church represent a new beginning. Among them were H. Thomissøn’s *Salmebog* (1569), T. Kingo’s *Graduale* (1699), and later Pontopiddan’s *Salmebog* (1742). The first composers of note were Johan Daniel Berlin (1714–87), town musician of Trondheim, and, especially, his son, Johan Henrich Berlin (1741–1807), who composed cantatas, symphonies, concertos, and string quartets in the style of the time. The rise of national art music went hand in hand with political independence, which began in 1814 with the separation from Denmark. Waldemar Thrane’s *Singspiel Fjeld-eventyret* (1825; first perf. 1850) may be said to mark the beginning of indigenous Norwegian music. Halfdan Kjerulf (1815–68) wrote songs and piano pieces in the style of Mendelssohn and Schumann, though not without a certain Norwegian lyricism. Martin Andreas Udbye (1820–89) composed string quartets and operas. Under the influence of Rikard Nordraak (1842–66), who composed the present Norwegian national anthem, Edvard Hagerup Grieg (1843–1907) created a national style that won universal recognition and fame. Grieg often used melodic

and rhythmic patterns derived from folksongs and from the *\*hardingfele* music. Johan Svendsen (1840–1911) and Christian Sinding (1856–1941), contemporaries of Grieg, were exponents of international romanticism rather than national Norwegian music, although traits of the latter are by no means absent. Both cultivated larger symphonic forms as well as the more intimate ones, including songs, piano works, piano-violin pieces, and string quartets. Post-romantic tendencies of German derivation are evident in the works of Hjalmar Borgström (1864–1925), Johan Halvorsen (1864–1935), and Halfdan Cleve (1879–1952). French impressionist influences appeared after 1920 in the works of Alf Hørum (b. 1882), Arvid Kleven (1899–1929), and Pauline Hall (b. 1890). Harald Sæverud (b. 1897), Klaus Egge (b. 1906), and Eivind Groven (b. 1901) combine folk rhythms and melodies with free tonal concepts derived from the melodies themselves. Both Fartein Valen (1887–1952) and Klaus Egge (after World War II) composed in a linear style with free use of serial techniques. Younger composers, among them F. O. Arnestad (b. 1917) and others, followed similar paths, with G. Sønstevald (b. 1912) and K. Wiggen (b. 1927) experimenting with electronic music. Arne Nordheim (b. 1931), Finn Mortensen (b. 1922), and Egil Hovland (b. 1924) employed serial or nonserial techniques emphasizing vertical and coloristic means of expression.

H.-J.H.

**Nota cambiata.** See Cambiata.

**Notation.** The method or methods used for writing down music.

I. A fully developed system of notation must be designed so as to indicate the two main properties of a musical sound: its pitch and its duration. The most satisfactory of the numerous symbols that have been devised for this purpose is the note, a pointlike sign that indicates pitch by its position on a \*staff provided with a \*clef, and duration by a variety of shapes, such as hollow or black heads with or without stems, flags, etc. [see Notes]. Additional symbols of modern notation are \*accidentals, \*key signature, \*time signature, \*dynamic marks, \*tempo marks, \*expression marks, the \*tie, the \*slur, etc. The modern system of notation dates from the early 17th century. Previously, systems of notation had been used that differ more or less radically from the present one regarding either the indication of rhythm (as in mensural notation) or that of pitch (as in the tablatures). Below is a brief survey of the evolution of notation (in Europe).

II. Greek music was notated by means of letters. Two systems were in use: an older one (used chiefly for instrumental music and evidently devised for the kithara), which included certain ancient symbols (Phoenician letters?) and used these symbols in different positions, upright, reversed, etc. [see under Pyknon]; and a more recent one (used chiefly for vocal music), which employed the Ionic alphabet together with a few additional signs [see *ReMMA* pp. 26, 27; C. Sachs, in *ZMW* vi, vii]. This method left no immediate traces in the musical notation of the Christian era [for a 9th-century revival, see Daseian notation]. The ensuing development and, for that matter, our modern system of notation are rooted not in the notational signs of Greek music but in the much vaguer symbols of Greek and Oriental (Jewish) speech recitation, the grammatical accents [see Accent (3)] of the 2nd century B.C., and similar signs known generically as ecphonetic notation. These developed (c. 800?) into a more elaborate system of stenographic symbols vaguely indicating the outlines of the melodic movement, the \*neumes. Far from being "primitive" (as they are frequently described), the neumes are a very sensitive and supple means of recording the innumerable finesses of ancient singing, involving special techniques that today survive only in Oriental music. On the other hand, owing to their failure to clearly indicate pitch as well as rhythm, they are not a fully developed notation but only a mnemonic aid for the oral transmission of the chant. As early as the 9th century

various methods were designed to remedy the indefiniteness of the neumes, chiefly by the addition of letters [see Letter notation; Romanus letters]. More important were the modifications that took place during the 11th century, leading from the vague chironomic symbols to shapes that corresponded more accurately to the rise and fall of the melody, the diastematic neumes. This evolution was stabilized by the adoption of staff lines, first one, then two, and finally four. About 1200, the neumes acquired the square shapes that are still used in the liturgical books of the Roman Catholic Church. See Neumes.

III. The square shapes [see Ex. 1] were soon adopted for the notation of monophonic secular melodies [see Monophonic notation] as well as for polyphonic music, where they are known as

\*ligatures. The introduction of the square shapes was accompanied, shortly before 1200, by the establishment of definite rhythmic values on the basis of the rhythmic \*modes. The resulting system is known as \*square or \*modal notation [Ex. 2]. There followed, during the 13th and 14th

Organum triplum "Descendit," Wolfenbüttel 1206 (olim Helmstedt 1099).

centuries, an extremely rapid development, involving frequent changes and innovations: the introduction of two different note values, called *longa* and *brevis* (c. 1225), which became necessary for the notation of the texted parts of

the motet [Ex. 3]; about 1250, the introduction of a smaller note value, called *semibrevis*, two or three of which could be used in place of a *brevis*; about 1260, the unequivocal rhythmic interpretation of the ligatures, independent of the modes (Franco of Cologne; usually considered the beginning of \*mensural notation); about 1280, the introduction of more than three semibreves (up to seven) in place of a *brevis* (Petrus de Cruce). Shortly after 1300, the restriction to modal rhythm, i.e., to ternary meter, that prevailed throughout the 13th century [see *Ars antiqua*] was abandoned, and the basic principles of rhythm and notation were radically revised by Philippe de Vitry. The new system, expounded in his treatise "Ars nova" (c. 1320), recognized duple and triple rhythm as equally important and applied this dichotomy to all the note values in the different mensurations: *modus* (*longa-brevis*), *tempus* (*brevis-semibrevis*), and *prolatio*

Motet "Ave beatissima," Montpellier, Fac. de Méd. H. 196.

(*semibrevis-minima*). The notational principles of this period remained virtually unchanged until the end of the 16th century, the only modification being the change, c. 1450, from black notes (black mensural notation) to white notes (white mensural notation). The explanations of the latter system, found under Mensural notation, therefore cover also the principles (though not the details) of black mensural notation.

Simultaneously with Vitry's system, however, there developed a different system in Italy (Italian notation) that retained to a greater extent the principles of the late 13th century (particularly the Petronian groups of semibreves, i.e., those of Petrus de Cruce). After 1350 this system incorporated features of the contemporary and more progressive French system, thus leading to a system (Mixed notation) that was used by Francesco Landini and other composers of the second half of the 14th century [Ex. 4].

4

Et sun poga speranza. Nella suo goui ne ça. Et se la se.

Et sun poga speranza. Nella suo goui ne ça. Et se la se.

Et sun poga speranza. Nella suo goui ne ça. Et se la se.

F. Landini, *Nessun ponga speranza*, Florence, Bibl. Laur. Pal. 87, *Squarcialupi Codex*.

Toward the end of this century, notation became so complicated that the pieces of this period now represent the most interesting problems in the study of notation (mannered notation).

IV. In the first half of the 15th century (Dufay) these complications were largely abandoned. There resulted what might be called the "classical" system of mensural notation (c. 1450–1600), characterized by the use of white instead of black notes (white mensural notation; Ex. 5). Its principles are the same as those of the French notation of the Machaut period, except for the addition of the \*proportions as a notational device and the occasional use of riddle canons [see Canon III]. This is the notation used

Pierre de la Rue, *Missa L'Homme armé, "Patrem"* (*Misse Petri de la Rue, Petrucci, 1503*).

by the Flemish masters Ockeghem, Obrecht, and their numerous successors. In the latter part of the 16th century triple mensuration (*tempus perfectum, prolatio perfecta*) as well as the ligatures were largely discarded, together with other special methods of mensural notation (proportions). Thus, the system of notation became virtually that of the present day, particularly after the general acceptance of \*bar lines and score arrangement [see Score; Partbooks]. Throughout the 17th century, however, remnants of the older system lingered on, particularly the use of blackened notes (coloration) and proportional signs [see Time signatures]. Of these the \**alla breve* sign is the only one that has survived. The accompanying example illustrates the development of the main notational signs in six periods.

I. Greek accents: 1. *Accentus acutus*; 2. *Acc. gravis*; 3. *Acc. circumflexus*; 4. *Hypothetical*. II. Neumes: 5. *Virga*; 6. *Punctum*; 7. *Podatus*; 8. *Clivis*. III. Black mensural notation (1250): 9. *Longa*; 10. *Brevis*; 11. *Semibrevis*; 12. *Descending ligature*; 13. *Ascending ligature*. IV. Additional signs of the 14th century: 14. *Minima*; 15. *Semiminima*. V. White mensural notation (1450): 16. = 9; 17. = 10; 18. = 11; 19. = 14; 20. = 15; 21. *Fusa*; 22. = 12; 23. = 13. VI. Modern notation (after 1600): 24. *Breve or double-whole note*; 25. *Whole note*; 26. *Half note*; 27. *Quarter note*; 28. *Eighth note*.

V. Side by side with the system of mensural notation there existed, particularly in the period 1450–1600, special notational methods known as \**tablatures*. These were used for writing down keyboard and lute music (generally solo music, while mensural notation was used for ensemble music; see *Ensemble*). Some of these systems use the ordinary mensural notes, differing from mensural notation only in that the parts are written in score, as in the modern piano score or the modern partitura. These may be designated as keyboard scores or keyboard partituras, as opposed to the tablatures proper, which use letters, figures, or other symbols instead of notes.

Surveys of modern attempts at reform are given in *WoHN* ii, 335ff, and A. Eaglefield-Hull, *A Dictionary of Modern Music* (1924). Entirely novel methods of notation have been devised for \**electronic music* and \**musique concrète*.

VI. In the Far East various notational systems were developed, especially in China, Korea, Japan, and India. All these employ pitch symbols derived from literary script, some of them with additional symbols for duration and for special effects (e.g., loud, soft, different manners of plucking stringed instruments or beating drums, etc.). The Tibetan notation of Buddhist chant employs oddly curved symbols that are vaguely reminiscent of the neumatic symbols of Western chant.

**Note-against-note style.** See *Homorhythmic*.

**Note nere** [It.]. See under *Chromatic* (4).

**Notes.** The signs with which music is written on a staff. In British usage the term also means the sound indicated by a note, as well as the key of the piano on which the sound is produced [see under *Tone* (2)].

The illustration shows the note values with their American names. British, French, German, Italian, and Spanish terms are given below. The

Whole note: Brit. *semibreve*; F. *ronde*; G. *Ganze* (Note); It. *semibreve*; Sp. *redonda*. Half note: Brit. *minim*; F. *blanche*; G. *Halbe* (Note); It. *bianca*; Sp. *blanca*. Quarter note: Brit. *crotchet*; F. *noire* [*soupir*]; G. *Viertel*; It. *nera*; Sp. *negra*. Eighth note: Brit. *quaver*; F. *croche*; G. *Achtel*; It. *croma*; Sp. *corchea*. Sixteenth note: Brit. *semiquaver*; F. *double-croche*; G. *Sechzehntel*; It. *semicroma*; Sp. *semicorchea*. Thirty-second note: Brit. *demisemiquaver*; F. *triple-croche*; G. *Zweiunddreissigstel*; It. *biscroma*; Sp. *fusa*. Sixty-fourth note: Brit. *hemi-demisemiquaver*; F. *quadruple-croche*; G. *Vierundsechzigstel*; It. *semibiscroma*; Sp. *semifusa*.

German names for the rests are: *ganze* (*halbe*, *viertel*, etc.) *Pause*; Italian: *pausa di semibreve* (*bianca*, etc.); French: *pause*, *demi-pause*, *soupir*, *demi-soupir*, *quart de soupir*, *huitième de soupir*, *seizième de soupir*; Spanish: *silencio de redonda* (*blanca*, *negra*, *corchea*, *semicorchea*, *fusa*, *semifusa*).

**Note sensible** [F.]. \*Leading tone.

**Notes inégales** [F.]. See *Inégales*.

**Nothus** [L.]. A term used by Regino of Prüm (d. 915) for certain antiphons (*antiphonae nothae*) of irregular tonal behavior, "beginning in one mode, belonging to another in the middle, and finishing in a third" [GS i, 231]. The examples he cites belong to a type [Gevaert's *thème* 29, in *La Mélodie antique dans le chant de l'église latine* (1895), p. 322] that is represented by more than eighty antiphons. See *Parapter*.

**Notre Dame, school of.** Designation for a school of French polyphonic music of c. 1200, whose leading composers—the only ones known by

name—were Leoninus (second half of the 12th cent.) and Perotinus (c. 1160–1220). The name is based on the surmise (a very likely one) that both masters were connected with the famous cathedral of Paris, whose cornerstone was laid in 1163. The repertory of the school of Notre Dame, preserved mainly in the MSS *F*, *W*<sub>1</sub> and *W*<sub>2</sub> [see Sources, no. 3], consists of a collection of two-part organa known as the \**"Magnus liber organi,"* additional organa in two, three, and four parts, and numerous \**clausulae*, \**conductus*, and early \**motets*. See *Ars antiqua*.

Lit.: See under *Ars antiqua*; *Conductus*; *Organum*. See also J. Handschin, "Zur Geschichte von Notre Dame" (*AM* iv); *id.*, "Was brachte die Notre Dame-Schule Neues?" (*ZMW* vi); *id.*, "Zur Notre Dame-Rhythmik" (*ZMW* vii).

**Notturmo** [It.]. (1) \*Nocturne. (2) An 18th-century name for compositions similar to the \*serenade, designed to be played as an evening entertainment. Notable examples are Haydn's *Notturmi* of 1790, for 2 *lire organizzate* (\**hurdy-gurdies*), 2 clarinets, 2 horns, 2 violas, and bass; six of them have three movements, one four, and one two. Mozart wrote a *Notturmo* for strings and 2 horns (K. 269a).

**Nourri, bien** [F.]. With a rich sound.

**Novachord.** See under Electronic instruments II.

**Nowell.** \*Noel.

**Nozze di Figaro, Le** [It., The Marriage of Figaro]. Opera in four acts by Mozart (libretto by L. da Ponte, after Beaumarchais' play *La Folle Journée ou Le Mariage de Figaro*, sequel to his *Le Barbier de Seville*, the source of Rossini's \**Barbiere di Siviglia*), produced in Vienna, 1786. Setting: castle near Seville, 18th century. *Figaro* and \**Don Giovanni* generally are considered Mozart's finest operas.

**Nuances** [F.]. Subtle modifications of intensity, tempo, touch, phrasing, etc. The term is also used as a translation of the Greek \**chroai*, and for other microtonic intervals.

**Number opera** [G. *Nummernoper*]. An opera written in single "numbers," i.e., separate pieces such as arias, duets, ensembles, and ballets, interspersed with recitative or spoken dialogue. This type of opera prevailed until the early 19th century. It was vehemently opposed by Wagner, who supplanted it with continuous music that follows the action without interruption. His

procedure has been adopted by practically all subsequent operatic composers. It must be noted, however, that replacement of the "number style" with continuous writing began as early as the operas of Jommelli, Traetta, Gluck, and particularly Mozart, whose late operas (*Le Nozze di Figaro*, *Don Giovanni*) contain several long sections in which various numbers are linked together by transitional passages to make a complete, well-rounded musical whole. This tendency is still more pronounced in the operas of Beethoven, Weber, and Meyerbeer, while French and Italian composers such as Auber, Rossini, Bellini, and Donizetti generally adhered to the number opera. Some composers of the 20th century have deliberately revived the form of the number opera, examples being Hindemith's *Cardillac* (1926; rev. 1952), and Stravinsky's *The Rake's Progress* (1951). See Opera VIII, XI.

**Number symbolism.** Secret numerical relationships supposed to exist in the works of great masters, especially Bach. Attempts to find such relationships are based on one or another system of assigning numbers, e.g., A = 1, B = 2, etc. According to this system the letters BACH total 14, while J. S. BACH totals 41; in his last work, the organ chorale *Vor deinen Thron*, the first line of the melody has 14 notes, the entire melody 41. See M. Jansen, "Bachs Zahlensymbolik" (*BJ* 1937).

**Nunc dimittis.** See under Canticle.

**Nuove musiche** [It.]. (1) Title of a publication of 1601 by Giulio Caccini (c. 1546–1618), containing arias and madrigals in the then new style of monodic recitative with thoroughbass accompaniment. For the difference between aria and madrigal in this work, see Aria II.

(2) Today, the term is used for music of the whole period around 1600, which is one of the most important landmarks in music history since it marks the origin of the opera, oratorio, cantata, and the baroque period in general [see History of music]. The leading idea of the new movement was to abolish the Flemish tradition of the 16th century, with its emphasis on counterpoint and artful elaboration. Particularly objectionable was the obscuring of the text that resulted from polyphonic treatment and from the motet style, with its characteristic points of imitation. The reaction against this style led, in the course of a few decades, to a complete reversal of the relationship between music and

text, as was clearly expressed by Monteverdi (*Scherzi musicali*, 1607): "L'orazione sia padrona dell' armonia e non serva" (The text should be the master, not the servant, of the music). As a result, the polyphonic *a cappella* style was replaced by accompanied solo song (\*aria, \*monody, \*recitative).

These tendencies found strong theoretical support in classical studies of Greek theory, which, about 1580, were pursued by Vincenzo Galilei (1520–91) and others known as the \*Camerata. Although they could not decipher the remnants of Greek music then available and so relied on ancient writings, these men formed a picture of the role that music had played in the ancient Greek drama, and made the perfect union of words and music (in Greek music always a monophonic rendition of the text) their own goal. Although accompanied solo songs in rather plain homophonic style had been written in Spain as early as 1530 (vihuela songs by Milán, E. de Valderrábano), it was not until the last years of the century that the open break with the tradition occurred, in the earliest operas of Peri and Caccini [see Opera III], which were based exclusively on the principle of monody. Caccini in his *Nuove musiche* applied the new style to short lyrics, giving it a subtler, more expressive design. Cavalieri, another pioneer of the new style, used it in his *La \*Rappresentazione di anima e di corpo* of 1600 [see Oratorio II], a work that, owing to its inclusion of choral passages [see *SchGMB*, no. 169], is less radical but actually more progressive than those of Peri and Caccini. In fact, the limitations of the *stile rappresentativo* soon became patent. Music could not, for any length of time, be completely subjugated to the role of a mere servant, and musicians began to resume some of the trends that had too abruptly been halted. As early as 1607 Monteverdi's *Orfeo* showed that mixture of old and new ideas upon which the imposing structure of the baroque was to be built. See R. Paoli, "Difesa del primo melodramma" (*LRM* 1950, xx, 93); M. Mila, in *LRM* 1933, vi, 219 (Peri); M. Feller, in *CP* 1958 (Caccini); C. Palisca, in *MQ* xlvii (Galilei). (See also under Baroque music; Camerata.)

**Nut.** See under Frog.

**Nutcracker Suite.** Orchestral suite in six movements by Tchaikovsky, op. 71a (1891), arranged from his ballet *The Nutcracker* [F. Casse-noisette], based on E. T. A. Hoffmann's fairy tale, *The Nutcracker and the Mouse King*.

**O.** This or similar signs (circle; zero) are used as follows: (1) In music for violins, etc., to indicate the open string. (2) In English \*fingering for keyboard, as a sign for the thumb. (3) In thorough-bass parts, as a sign for *tasto solo*; see Thorough-bass 6. (4) In \*mensural notation, as a sign for *tempus perfectum* (circle). (5) In medieval tonaries, as a sign for the seventh church mode, e.g. in the Codex Hartker.

**O antiphons.** Antiphons used for the Magnificat during the week preceding the Nativity, so called because they all begin with the exclamation "O": *O sapientia*, *O Adonai*, *O Radix Jesse*, etc. [see *LU*, pp. 340ff]. Also known as Great Antiphons, they all are sung to a standard melody of the second mode. The late 14th-century Codex Torino Bibl. Naz. *J II 9* [see Sources, no. 18] contains polyphonic settings of these chants. See A. Cabaniss, "A Note on the Date of the Great Advent Antiphons" (*Speculum* xxii).

**Obligato** [It.]. Obligatory, usually with reference to an instrument (*violino obbligato*) or part that must not be omitted; the opposite is \**ad libitum*. Unfortunately, through misunderstanding or carelessness, the term has come to mean a mere accompanying part that may be omitted if necessary. As a result, one must decide in each individual case whether obbligato means "obligato" or "ad libitum"; usually it means the former in early music and the latter in more recent pieces. For *accompanimento obbligato*, see under Accompaniment.

**Obbligo, obligo** [It.]. In 17th- and 18th-century counterpoint, *con obbligo* means a manner of writing that involves certain "obligations," such as canon, double counterpoint, inversion, etc. Early examples are Frescobaldi's "Capriccio di obligo di cantare la quinta parte" (calling for the addition of a short melody at suitable places) and his "Recercar ottavo, obligo di non uscir mai di grado" (obligation to avoid conjunct motion), both in *Il primo libro di capricci* (1626).

**Oberdominante** [G.]. Dominant, as opposed to *Unterdominante*, subdominant.

**Oberstimme** [G.]. Upper part.

**Obertas** [Pol.]. A Polish round dance in quick triple meter and performed very vigorously,

like a wild waltz. Examples are in Wieniawski's *Mazurka Caractéristique* no. 1 (for violin) and in the first act of Boito's *Mefistofele*. Chopin's Mazurka op. 56, no. 2 is in the character of an *obertas*. A modern example is in A. Tansman's *Quatre Danses Polonaises* [1932] for orchestra. Another name, more commonly used today, is *oberek*.

**Obertaste** [G.]. See *Taste*.

**Oberton, Obertöne** [G.]. Upper harmonic(s).

**Oberwerk** [G.]. Swell organ.

**Obligat** [G.]. \*Obbligato.

**Oblique motion.** See *Motion*.

**Oboe family.** A large group of \*wind instruments having a double reed [see *Reed*; *Mouthpiece*], in contrast to the \*clarinet family, comprising the wind instruments with a single reed. Strictly speaking, the oboe, English horn, bassoon, etc., constitute families of their own, since each of these instruments existed in various sizes [see N. Bessaraboff, *Ancient European Musical Instruments* (1941), p. 111]. In the present article these distinctions will be disregarded. The instruments of the present-day orchestra are discussed below under I, and those that are rarely used or obsolete under II, while a historical survey is given under III. All these instruments (with the exception of some old types) have a conical bore, in contrast to the cylindrical bore of the clarinets.

I. *Present-day forms.* A. Oboe [F. *hautbois*]. The oboe consists of a conical pipe made of wood (usually in three sections: top joint, lower joint, and bell) with a double reed fixed to the upper end. The scale produced when the six finger holes are opened in succession is D (as is that of the flute); nevertheless, the oboe is not treated as a transposing instrument and hence is considered to be in the key of C. Owing to its conical bore, the oboe overblows at the octave, as do all the other members of the family. For the difference in timbre between the oboe and the clarinet, see *Clarinet family I*.

The oboe seems to have originated in the mid-17th century. Cambert's *Pomone* (1671) has a part for "Hautbois." The repertory for oboe includes concertos by Handel and K. P. E. Bach, Schumann's *Drei Romanzen* op. 94, Piston's *Suite* (1934), Hindemith's *Sonata* (1939), and

Nielsen's *Fantasiestücke* op. 2. For bibl. see end of section III.

B. The English horn [F. *cor anglais*; G. *englisches Horn*; It. *corno inglese*; Sp. *corno inglés*]. An alto oboe, pitched a fifth below the oboe. To facilitate the handling of this rather long instrument, the double reed may be carried on a small metal tube attached to the upper end and bent back toward the player's mouth. Its bell is pear-shaped, with a rather small opening [see II, A], which accounts for its soft, somewhat melancholy timbre. It is treated as a transposing instrument, the parts sounding a fifth lower than written. Early instruments of this size were curved like an animal's horn, a fact that explains half of its name; it is not known why it is called "English" [see II, B]. In the early part of the 19th century, the English horn is thought to have gradually replaced the older *oboe da caccia*. Early uses of the English horn are in Jommelli's *Ezio* (1741), J. A. Hasse's *Il Trionfo di Clelia* (1762), and Haydn's Symphony no. 22. By about 1830 the instrument was generally accepted into the orchestra; Rossini used it in *Guillaume Tell* (1829) and Meyerbeer in *Robert le diable* (1831).

C. Bassoon [F. *basson*; G. *Fagott*; It. *fagotto*; Sp. *fagote*]. The bass of the oboe family. Owing to the great length of the tube, it is bent back on itself, first descending and then ascending. The instrument consists of five sections: the *crook*

Normal ranges: a. Oboe. b. English horn. c. Bassoon. d. Contrabassoon.

(bocal), a narrow, curved metal tube to which the reed is attached; the *wing* or *tenor joint*, which forms the descending section of the pipe; the *butt* or *double joint*, the bottom section, in the shape of a U; the *bass* or *long joint*, which forms the ascending pipe; and the *bell*. The instrument is remarkably even in tone color, although the lowest fifth of its range tends to be rather thick and reedy and the highest fifth is somewhat "pinched" and terse. It has a wide dynamic range, and all kinds of legato and staccato figures can easily be performed on it. It blends well with the French horns, with which it is often used, but is equally valuable as a solo instrument or as a bass to the woodwind section. The bassoon is specified in several compositions by Schütz (e.g.,

*Symphoniae sacrae*, 1629). In 1645, A. Bertali published nine "Sonatas" for bassoon solo (*Compositioni musicali fatte per sonare col fagotto solo*). Vivaldi wrote a great many concertos for bassoon alone or with other solo instruments. Bassoon concertos were written by Mozart (K. 191) and Weber (op. 75), and a sonata by Hindemith (1938). See L. G. Langwill, *The Bassoon and Contrabassoon* [1965]; W. Heckel, *Der Fagott*, rev. ed. (1931); W. Spencer, *The Art of Bassoon Playing* (1958); E. Halfpenny, "The Evolution of the Bassoon in England, 1750–1800" (GSJ x).

D. Contrabassoon or double bassoon [F. *contrebasson*; G. *Kontrafagott*; It. *contrafagotto*; Sp. *contrafagot*]. This instrument is pitched an octave below the bassoon. Its modern form, which was developed by Heckel (c. 1880), has a tube more than sixteen feet long that is doubled on itself four times. The bell points down instead of up, as in the bassoon. It is notated an octave above the actual sound (in Wagner's *Parsifal* it is written at its true pitch). Both the lowest and highest tones of its range are rather unsatisfactory and therefore are less frequently used. An older form of double bassoon was used by Handel in the *Coronation Anthem* (1727) and in *L'Allegro* (1740). Haydn scored for it in *The Creation*, and Beethoven used it in his Fifth and Ninth Symphonies. In 1739 a giant instrument, three times the size of the normal one, was built [see E. Halfpenny, in *ML* xxxiv, 41ff]. See L. G. Langwill, "The Double-Bassoon" (*PMA* lxix, 1ff).

II. *Rare and obsolete forms.* The oboes of the 18th and early 19th centuries were much more strident and piercing in sound than the modern instruments, a statement even more true of still earlier instruments [see under *Aulos*].

A. Oboe d'amore. A mezzo-soprano instrument pitched a minor third below the ordinary oboe and having the characteristic pear-shaped bell [G. *Liebesfuss*] of today's English horn. The name probably refers to its sound, which was "sweeter" than that of the other oboes of the day. It was invented c. 1720, one of its earliest uses being in Bach's cantata no. 37, "Wer da glaubet" (c. 1727). A reconstructed form is called for in R. Strauss's *Sinfonia Domestica* to characterize the "dreaming child."

B. Oboe da caccia. Probably an alto oboe in F, with an expanding bell or, more frequently, a pear-shaped bell that rendered the sound less strident. The instrument was built in the shape of a curved hunting horn and may have been the

# OBOE FAMILY

1. Double bassoon or contrabassoon. 2. Bassoon. 3. English horn. 4. Oboe. 5. Heckelphone. 6. Sarrusophone.

7. Shawm (bass). 8. Oboe da caccia. 9. Aulos. 10. Racket. 11. Curtal, double. 12. Crumhorn (tenor). 13. Shawm (tenor).

model for the old, curved form of the English horn.

C. Tenoroon. A small bassoon pitched a fifth above the ordinary bassoon. Invented and used in the first half of the 19th century, it is now obsolete.

D. Quartfagott, Quintfagott. According to M. Praetorius (*De Organographia*, 1619), instruments pitched respectively a fourth and a fifth below the ordinary bassoon. In the 18th and 19th centuries the names were used for small bassoons pitched a fourth or a fifth above the ordinary bassoon, like the tenoroon [see above].

E. Heckelphone. A baritone oboe invented by Heckel in 1904 and pitched an octave below the oboe. Built in a straight shape with a bulb-shaped bell, it has a bore much wider than the oboe's. In spite of its full, rich sound it has been little used (R. Strauss, *Salome*; Delius).

F. Sarrusophone. A whole family of double-reed brass instruments, invented by the French bandmaster Sarrus (patented 1856) and made in eight sizes, from sopranino to subcontrabass. The only sarrusophone used in the orchestra is a contrabass size in C that has the same compass as the contrabassoon and has been preferred by numerous French composers to the contrabassoon. The smaller sizes are obsolete, but the larger ones continue to be used in some wind and rhythm bands, especially in Italy.

III. *History*. Double-reed instruments are very ancient and widespread, much more so than single-reed instruments (clarinets). They usually occur in pairs (double oboe), the longer pipe probably being used to provide a drone or, perhaps, some tones missing in the shorter one. Sumerian double oboes are documented as far back as 2800 B.C., and similar instruments were common in Egypt, Israel (*halil*; see Jewish music I), Greece (*\*aulos*), and Rome (*tibia*). They are found in practically all the countries of Asia, where they are usually provided with a metal disk against which the player's lips are stretched (he takes the reed entirely into his mouth—not, as in European practice, between his lips). Because Egyptian oboe players blow continuously, they must breathe exclusively through the nose [see *Launeddas*]. The indigenous oboe of China (*kuan*) and Japan (*hichiriki*) is cylindrical. A conical type is an importation from India, where oboe music "is in great demand at weddings, ceremonials, processions and festivals. Expert performers are paid fabulous sums" [see *SaHMI*, p. 230].

The early European ancestor of the oboe is

the *shawm*, which was used until the 17th century. In France it was called *bombarde*, *chalemie*; in Germany, *Pommern* (*Bomhart*, *Pumhart*), except for the highest member of the group, which was known as *Schalmei*; in Italy, *piffaro*; in Spain, *chirimia*. The earliest reference to such an instrument is in French literary sources of the 13th century. Probably introduced from the Near East in the 12th century, it consisted of a single piece of wood curving in a bell. By the 16th century shawms existed in all sizes, ranging from sopranino (Praetorius' *Klein-Schalmei*) to double bass (*Gross-Bass-Pommer*), the name "shawm" being reserved for the soprano instrument while the lower-pitched instruments were called *bombard*. The bombards (all straight tubes) were soon abandoned in favor of shortened shapes called *curtals* [F. *courtaut*; G. *\*Kortholt*, "short wood," referring to the instrument's shortened form, i.e., with folded tube]. These instruments [F. *basson*, *fagot*; G. *Dulzian*, *Fagott*; It. *fagotto*; Sp. *bajón*] were forerunners of the modern bassoon but were made from a single block of wood with two parallel bores, one descending and one ascending.

Numerous other types of double-reed instrument are described by Praetorius under names such as *Sordune*, *Schryari*, and *Bassanelli*. The *Sordune* [F. *sourdines*] had a channel running down and up two or three times within the same piece of wood, ending in a lateral hole [see *SaHMI*, p. 317f]. More important are the *crumhorns* [F. *cromorne*, *tournebout*; G. *Krummhorn*; It. *storto*; Sp. *orlo*], which are depicted in paintings of the 15th and 16th centuries as held by angels. Their tube was nearly cylindrical, curved upward like a J, and a pierced cap (wind cap) covered the reed so that the player could not touch it [see ill. in *SaHMI*, p. 320]. The cap served as a wind chamber, so that the reed was set in vibration much as in the reed pipes of the organ. Thus the sound was as unchangeable as that of an organ pipe, i.e., overblowing was impossible. The instrument was used until about the mid-17th century. One of the strangest instruments is the *racket* [G. *Rackett*, *Rankett*], a short, thick cylinder of solid wood pierced lengthwise by ten cylindrical channels connected so as to form a continuous tube. Praetorius described four sizes of racket. Toward the end of the 17th century a new version was devised with a conical tube and bore and a bassoon-like bell. It came to be known as racket bassoon or sausage bassoon [G. *Wurstfagott*]. See H. Seidl, "Das Rackett" (diss. Leipzig, 1959).

Lit. (for Oboe): P. Bate, *The Oboe* [1956]; R. Sprenkle and D. Ledet, *The Art of Oboe Playing* [1961]; E. Halfpenny, "The English 2- and 3-keyed Hautboy" (*GSJ* ii); *id.*, "The 'Tenner Hoboy'" (*GSJ* v); *id.*, "The French Hautboy: A Technical Survey" (*GSJ* vi and viii); J. Marx, "The Tone of the Baroque Oboe" (*GSJ* iv). I by W.D.D.

**Obra** [Sp.]. General designation for work, as in the *Obras de música* (1578) by Antonio de Cabezón. Specifically, a *\*tiento*, e.g., *Obra de 8° tono* (Jiménez).

**Ocarina**. A popular instrument in the shape of an egg, a bird, or a sweet potato (the last name commonly used in the U.S.), with a mouth-hole and a number of finger holes. It is classified as a globular flute, a type with an interesting ancestry in China and Africa [see *SaHMI*, p. 166f].

**Occursus** [L.]. In the 9th- and 10th-century organum of the fourth, the unison-confluence of the two parts employed at the beginning and end of phrases (converging organum; see Organum I). The term is used (for the first time?) in Guido's "Micrologus," ch. xviii: "De Diaphonia."

**Octave**. (1) The eighth tone of the diatonic scale [see Interval]. Acoustically, the tone with twice the frequency of the home tone (ratio 1:2; e.g.,  $a' = 440$ ;  $a'' = 880$ ). The octave is the most perfect consonance, so perfect that it gives the impression of duplicating the original tone, a phenomenon for which no convincing explanation has ever been found. Its singularity becomes apparent if the acoustical frequencies are compared with the series of color frequencies (spectrum), which does not show any such duplication [see Color and music]. The fundamental importance of the octave appears also from the fact that it is the only interval common to practically all the scales ever evolved, regardless of the number or pitch of the intermediate steps. For the designation of the various octaves, see Pitch names.

(2) In ecclesiastical terminology, the eighth day or the entire week after a feast.

**Octave species** [G. *Oktavgattungen*]. See under Greece II.

**Octavier** [F.]. See under Wind instruments III.

**Octet**. Chamber music for eight instruments, either all strings (Mendelssohn, Gade, Enesco), all winds (Beethoven, op. 103; Stravinsky), or mixed (Schubert, Spohr).

**Octobasse**. See under Violin family (j).

**Octoechos**. See *Echos*.

**Oda** [It.]. A 14th- and 15th-century type of Italian poetry consisting of a number of four-line stanzas with the rhyme scheme *a a b b* (repeated) or *a b b c c d d e e f f g . . .*. Petrucci's collections of *\*frottole* include several *ode*, composed as strophic songs. See A. Einstein, *The Italian Madrigal*, 3 vols. (1949), i, 91f; E. B. Helm, in *MQ* xxvii, 308.

**Oddonic letters**. See Letter notation.

**Ode**. (1) In poetry (ancient Greek and Latin as well as modern), a poem in free meter and verse structure, frequently addressed to a deity. Odes are usually composed in a free form similar to that of the cantata, including several movements or sections for chorus, soloist, and orchestra. Dryden's "Ode on St. Cecilia's Day" (set by Handel) and Schiller's "Ode to Joy" (set by Beethoven, Ninth Symphony) are well-known examples.

In the 16th century the Horatian odes were frequently set to music in strict chordal style and in a rhythm dictated by the poetic meter, e.g.:

This practice was inaugurated by Konrad Celtis, professor of poetry at the University of Ingolstadt (1492-97). Among the earliest publications of such odes are: Petronius Tritonius, *Melopoiae sive harmoniae tetracenticae super xxii genera carminum heroicorum* (1507); Paulus Hofhaimer, *Harmoniae poeticae* (1539), Ludwig Senfl, *Varia carminum genera* (1534), and Claude Goudimel, *Q. Horatii Flacci poetae lyriici odae . . . ad rhythmos musicos redactae* (1555). Examples for the lute occur in Judenkünig's *Ain schone kunstliche Underweisung* of 1523 [see *DTO* 56; *ApMZ* i]. In France this poetic modification of musical rhythm [see Rhythm II (b)] led to the *\*vers mesuré*. See Humanism.

(2) In Byzantine chant, *ode* is one of the nine sections of the *kanon*, each written in imitation of a scriptural canticle. See Byzantine chant II.

Lit.: R. von Liliencron, in *VMW* iii; P. Masson, in *RMC* vi; H. J. Moser, *Paul Hofhaimer* (1929), Appendix, pp. 112ff; *id.*, *Geschichte der deutschen Musik* i (1920), 406ff.

**Ode to Napoleon Buonaparte.** Composition by A. Schoenberg, op. 41b (1942), based on Byron's poem, scored for string orchestra, piano, and a reciting voice. The text is a bitter comment on the downfall of dictators. The work is organized as an opera without action, with an overture, arias, and recitatives, and, for its significance at the time of composition, a quotation of the opening "Victory" theme from Beethoven's Fifth Symphony.

**Odhecaton.** Title (complete form: *Harmonice musices Odhecaton A*) of a printed collection of "100 songs" (actually only 96) published by Petrucci in 1501. The book is the earliest printed publication of polyphonic music [see Printing of music] and of great importance as a collection of secular polyphonic music of the period c. 1470–1500. Similar collections, *Canti B* and *Canti C*, appeared in 1502 and 1504. The composers represented include Hayne van Ghizeghem [see Burgundian school], Ockeghem (1430–95), Obrecht (1452–1505), Isaac (c. 1450–1517), Alexander Agricola (c. 1446–1506), Josquin (c. 1450–1521), and many others. The fact that only nine pieces have a text does not necessarily prove that the contents of these books was exclusively instrumental music; indeed, a considerable number of the compositions are preserved in other sources (manuscripts) with a text, at least in the discant. On the other hand the omission of the texts, although perhaps conditioned by practical considerations (typographic problems), illustrates the latitude of 16th-century musical practice, which readily admitted instrumental performance of vocal pieces. It is, of course, impossible to assume that all the readers of these books were familiar with the texts of more than 300 compositions.

Lit.: ‡*Harmonice musices Odhecaton* (fac. ed. pub. by *Bollettino bibliografico musicale*, 1932); H. Hewitt, ed., ‡*Harmonice musices Odhecaton A* (1942); C. L. W. Boer, *Chansonvormen op het Einde van de XVde Eeuw* (1938); G. Reese, in *MQ* xx; M. Cauchie, "L'Odhecaton, recueil de musique instrumentale" (*RdM* 1925, p. 148); J. Marix, in *RdM* 1935, p. 236; B. Disertori, in *RMI* li.

**Odoistic notation.** Same as Oddonic notation; see Letter notation.

**Oedipus Rex** [L., King Oedipus]. Opera-oratorio in two acts by Stravinsky (libretto in Latin by J. Cocteau and J. Daniélou, based on Sophocles' tragedy), produced in Paris, 1927. Setting: ancient Thebes. The extensive use of the chorus

for commentary, the use of a narrator, the reduction of the action to entrances and exists, and the minimal scenery all are reminiscent of ancient Greek tragedy and prevent the work from being called an opera in the usual sense. The underlying principles are similar to those of Cavalieri's *La \*Rappresentazione di anima e di corpo* (1600).

**Oeuvre** [F.]. \*Opus.

**Offertory** [L. *offertorium*]. In the Roman Catholic liturgy, the fourth item of the Proper of the Mass, accompanying the placing on the altar of the elements (bread and wine). Originally it was a psalm with antiphon (*antiphona ad offerendum*); today only the antiphon remains. However, the verses (published in C. Ott, *Offertoriale sive versus offertoriorum*, 1935) are of great stylistic interest [see *ApGC*, pp. 363ff; also R. Steiner, in *JAMS* xix]. Unlike the other antiphonal chants of the Mass (Introit, Communion), the Offertory acquired a highly developed melismatic style, thus becoming a responsorial chant.

Polyphonic settings of Offertories, based on the plainsong melodies, are found sporadically in 15th-century sources (Trent Codices). In England, the Offertory "Felix namque" for Lady-Masses was set for organ as early as c. 1400 and frequently during the 16th century. Toward the end of the 16th century, Lassus (in *Sacrae cantiones*, 1582, '85) and Palestrina (in *Offertoria per totum annum*, 1593) published complete cycles of Offertories written as free motets, without use of the plainsong melodies. In the 17th century, the ceremony of offering became the most suitable occasion for organ playing. Frescobaldi wrote several pieces "per l'Elevazione" [see Elevation], and numerous *Offertoires* for organ with or without other instruments were composed by Lebègue, Grigny, F. Couperin, and others.

**Office, Divine** [L. *officium*]. In the Roman Catholic liturgy, the service of the canonical or daily hours (as distinct from that of the Mass), including \*psalms, \*canticles, \*antiphons, \*responsories, \*hymns, \*versicles, lessons (lections, readings), and prayers. The Offices are celebrated eight times a day: (1) *Matins* [L. *matutinum*], held during the night, usually between midnight and dawn; (2) *Lauds* [*laudes*], immediately following Matins, originally at sunrise; (3) *Prime* [*ad primam*], c. 6 a.m.; (4) *Terce* [*ad tertiam*], c. 9 a.m.; (5) *Sext* [*ad sextam*], c. noon; (6) *None* [*ad nonam*], c. 3 p.m.; (7) *Vespers* [*vesperae*], sunset; (8) *Compline* [*completorium*],

immediately after Vespers or before retiring. The Mass follows Terce except on ordinary weekdays, when it follows Sext, or on fast days, when it follows None.

From the musical point of view the most important Offices are Matins, Vespers, Lauds, and Compline. The service of Matins consists of the \*invitatory and three divisions called *nocturns*, each of which includes three psalms with antiphons and three lessons, each followed by a responsory. The last responsory is usually replaced by the \*Te Deum. Matins is now held regularly only in monastic churches and is therefore not included in the *Antiphonale Romanum* [see Liturgical books II]. The *Liber usualis* includes Matins of Nativity [LU, pp. 368ff], Maundy Thursday [pp. 626ff], Good Friday [pp. 688ff], Holy Saturday [pp. 752ff], Pentecost [pp. 863ff], Corpus Christi [pp. 917ff], and the Office of the Dead [pp. 1779ff].

Vespers includes five psalms, each with an antiphon, a hymn, and the \*Magnificat. It is the only Office for which music other than Gregorian chant is admitted. Beginning in the 16th century the evening psalms were frequently treated in four-voice harmony (so-called \*fauxbourdon), and the Magnificat in particular has been given very elaborate settings by numerous great composers. Motets also find their place chiefly at Vespers. Mozart wrote two Vespers (K. 321 and 339) for voices, orchestra, and organ, each comprising five psalms and the Magnificat.

Lauds has the same structure as Vespers, but with the Canticle of Zachary ("Benedictus Dominus Deus Israel") instead of the Magnificat (Canticle of the Virgin), and with the fourth psalm replaced by one of the lesser \*canticles, two of them being assigned to each day of the week—one for normal use, the other during Lent. The *Liber Usualis* includes the general order of Lauds of feasts (LU, pp. 221–23), as well as the special Lauds for the feasts named under Matins. The full service of Lauds is given in the *Antiphonale Romanum*.

Compline includes three psalms enframed by a single antiphon, a hymn, the Canticle of Simeon ("Nunc dimittis"), and the four Marian antiphons [see Antiphon (2)], one for each season of the year. The other hours—Prime to None—each include a hymn and three psalms enframed by a single antiphon.

The service for the hours on an ordinary Sunday is given in LU, pp. 224ff (without Matins and Lauds). See also *ApGC*, pp. 19ff; P. Batiffol, *Histoire du Bréviaire Romain* (1911); J. Pascher,

*Das Stundengebet der röm. Kirche* (1954); J. A. Jungmann, *Der Gottesdienst der Kirche* (1955), pp. 167–98; *id.*, *Brevierstudien* (1958).

**O I O U E A E.** In the Anglican liturgical books, the usual abbreviation for "world without end, Amen" (i.e., the vowels from this phrase analogous to the Roman \*E u o u a e).

**Oiseau de feu, L'** [F., The Firebird]. Ballet by Stravinsky, produced by the Ballets Russes (Diaghilev and Fokine) in Paris in 1910. The story, taken from Russian legend, concerns Prince Ivan who captures the fabulous Firebird. *L'Oiseau de feu* is an outstanding product of Stravinsky's early period, when the composer was following the nationalist tradition of his teacher, Rimsky-Korsakov. Three versions of a suite taken from the ballet have been made by the composer, the last (1945) identical with the first (1911), but for a smaller orchestra.

**Oketus.** See Hocket.

**Oktave** [G.]. Octave. Applied to instruments, it means sizes an octave above the normal size (e.g., *Oktavflöte*, piccolo flute), or below it (e.g., *Oktavfagott*, contrabassoon). *Oktavgattung*, Octave species.

**Oktavieren** [G.]. See under Wind instruments III.

**Oktoechos.** See *Echos*.

**Old English Edition, The.** See Editions XL.

**Old Hall MS.** See Sources, no. 25.

**Old Hundredth.** An old hymn tune that was used in Bêza's *Genevan Psalter* (1554) for the 134th Psalm, in Knox's *Anglo-Genevan Psalter* (1556) for the 3rd Psalm, and in Sternhold and Hopkins' *Psalter* (1562) for the 100th Psalm (hence the name). See W. H. Havergal, *A History of the Old Hundredth Psalm Tune* (1854); GDB vi, 184f.

**Old Maid and the Thief, The.** Opera in one act by Menotti (to his own libretto), produced by N.B.C. radio in New York, 1939, stage premiere, Philadelphia, 1941. Setting: a small American town in the present.

**Old Roman chant.** A repertory of chant discovered c. 1890 and preserved in five MSS (the earliest dated 1071), all of which were written in Rome. Liturgically, it is very similar to Gregorian chant in both the structure of Mass and Office and the texts prescribed for the various services. However, the melodies are essentially

different, although occasionally their outlines agree with those of the corresponding Gregorian melodies. Dom Mocquereau, who was the first to call attention to this special group of manuscripts (\*Editions XLII, A, 2, pp. 4ff), considered the melodies variants from a decadent epoch. Dom Andoyer, on the contrary, maintained that they were older than the Gregorian melodies and designated them "pre-Gregorian," whereas B. Stäblein considered them "Gregorian," assigning the so-called Gregorian repertory to the second half of the 7th century. According to the most recent theory, the two repertories represent different locales rather than different periods, the Old Roman being connected with Rome and the Gregorian with the Frankish kingdom and empire of Pepin and Charlemagne. See *ApGC*, pp. 77ff, 484ff.

**Olé.** See under Polo.

**Oliphant.** A medieval instrument for signaling, made from an elephant's tusk, often beautifully carved.

**Ombra scene** [It.]. In early operas, designation for a scene that takes place in Hades or in which ghosts are conjured up. Every opera dealing with the subject of \*Orpheus has an *ombra* scene.

**Ondeggiando, ondulé** [It., F.]. In violin playing, an undulating movement of the bow [see Bowing (n)]. It is used for arpeggio-like figures but also on one note in order to produce a slight fluctuation of intensity. In earlier music (c. 1650–1750; Purcell, Stamitz) the latter effect, which is actually a \*tremolo, was rather common, being indicated by a wavy line [see ill. accompanying Ornamentation].

**Ondes Martenot** [F.]. See Electronic instruments II.

**One-step.** American dance of the period c. 1910–20, in quick duple meter, similar to the \*fox trot. It was superseded, c. 1920, by the slower two-step (slow-fox).

**Ongarese, all'** [It.]. In Hungarian style.

**Onion flute.** Same as eunuch flute. See Mirliton.

**Onzième** [F.]. The interval of the eleventh.

**Op.** Abbr. for \*opus.

**Open fifth, open triad.** A fifth or triad without the third, e.g., c–g–c'.

**Open graces.** See under Grace.

**Open harmony.** See under Spacing.

**Open notes.** (1) On wind instruments, same as natural notes. (2) On stringed instruments, the tones produced on the \*open strings.

**Open pipe.** See under Wind instruments III.

**Open strings.** The unstopped strings of violins, lutes, etc. Their use is sometimes prescribed by the sign O.

**Opera** [It.; F. *opéra*; G. *Oper*; Sp. *ópera*]. "A drama in which music is the essential factor comprising songs with orchestral accompaniment (as *recitative*, *aria*, *chorus*) and orchestral preludes and interludes" (*Webster's Third New International Dictionary*).

I. *General.* Opera is the most important of the forms that combine music and theatrical representation. It is highly complex, involving many different arts—music (both instrumental and vocal), drama, poetry, acting, dance, stage design, costuming, etc.—and this fact accounts in part both for its widespread appeal and for the equally widespread objection that it is artistically impure. The classic statement of this critical attitude is Saint Evremond's definition of opera as "a bizarre affair made up of poetry and music, in which the poet and the musician, each equally obstructed by the other, give themselves no end of trouble to produce a wretched result" [*Oeuvres* (1740 ed. of Des Maizeau) iii, 248]. Because opera is, of all musical or dramatic forms, the most difficult and expensive to produce, it has been associated with the upper social strata, thus making it a "status symbol" for the public as well as an object of particular attraction for many ambitious composers and singers. Most operas have been composed by specialists in the form, the composers who have distinguished themselves equally in opera and other branches of music being exceedingly few—Monteverdi, Handel, Mozart, R. Strauss, Berlioz, Prokofiev, Britten, and Stravinsky being outstanding in this respect. On the other hand, composers such as Bach, Schubert, Schumann, Mendelssohn, Brahms, and Bruckner either did not attempt opera at all or did so without conspicuous success, while the achievements of Beethoven and Debussy are limited to one work each, albeit a masterpiece in both cases.

Like all art forms, opera is founded on certain conventions, the most important of which is that the characters express their thoughts and feelings in song rather than speech. Since it usually takes longer to develop ideas in music than in words,

either or both of the following devices are often used: (1) a noticeable stretching out and consequent slow pace of the action (as in Wagner's music dramas); (2) alternating periods of action and repose, the action being carried on in \*recitative (with a minimum of music) and being periodically interrupted by musical "numbers" (arias, ensembles, ballets, etc.; see Number opera), all of which are, from the dramatic standpoint, likely to be merely episodic or at best unnecessarily long elaborations of certain moments of the action. Such a slow tempo of the action or such frequent interruptions, which would be regarded as serious defects in a spoken play, are hardly avoidable in opera. From these basic necessities arise many of the features of opera that persons unaccustomed to the form may find difficult to accept, such as frequent text repetitions, prolonged emotional scenes, dying speeches, and so on. While it is true that many operas are cheaply sentimental, silly, or melodramatic, the same charge may be made against many plays. These faults are not inherent in the form, though the skillful use of music may cause the ordinary listener to forgive their presence in opera more readily than in a play.

II. *Prehistory*. Although the first work now known as an opera dates from 1597, the combining of music and drama is undoubtedly of very early origin. Ancient Greek drama incorporated the choral songs and dances of the earlier \*dithyrambs, in a tradition that may go back to the still older rites of the Bacchic cults. The tragedies of Aeschylus, Sophocles, and Euripides all give a large place to the chorus, and it is known from theoretical treatises (e.g., Aristotle's *Poetics*) that music was an essential element of the form, though unfortunately only a single mutilated specimen of Greek dramatic music has survived (fragment of a chorus from Euripides' *Orestes*).

In the Middle Ages the Church fostered dramatic music in the \*liturgical dramas (11th–13th centuries) and mystery plays (14th–16th centuries). While medieval religious drama had no direct historical connection with the earliest operas, its tradition may still be traced in some of the operas on religious subjects at Rome and in Germany during the 17th century.

The immediate predecessors of opera are various types of secular dramatic entertainment with music that appeared during the 16th century. These are of two basic categories: (1) works in which music was an adjunct to scenery and dancing, the definitive form in this

class being the \*ballet, brought from Italy to France, where it later exercised a determining influence on the French opera [see below]; (2) works in which music served as a diversion from spoken drama, the musical portions usually appearing as \*intermezzi between the acts of a play. However, the creation of opera itself had to await the discovery of a kind of drama that would lend itself to the continuous use of music and of a kind of music that would be suitable for dramatic expression. The necessary poetic form was found in the pastorella, which toward the end of the 16th century displaced practically all earlier dramatic types in Italy and culminated in T. Tasso's *Aminta* (1573) and B. Guarini's *Il Pastor fido* (1581–90). The earliest opera-poems are pastorellas modeled on these two works [see also Eclogue]. A musical style suitable for opera was developed by the Florentine \*Camerata [see also *Nuove musiche* (2); Monody]. The \*madrigal comedies of O. Vecchi, which are frequently mentioned as preoperatic types, have only a subsidiary place in the history of the opera.

The history of opera may be divided into five periods:

1590–1680. Development of dramatic style in music and of appropriate dramatic and musical forms [sections III–VII below].

1680–1760. Utilization of established style and forms in serious operas of a standard type; rise of comic opera as an independent genre [VII–VIII].

1760–1850. Introduction of new subject matter and loosening of traditional forms in the interest of a more direct connection between dramatic content and musical expression [IX]; rise of national types of opera.

1850–1920. Rejection of set forms and formal divisions in favor of continuous music, with recurrence of characteristic motifs; the music drama [X].

1920—. Reaction against romantic subject matter and musical amorphousness of the music drama; fusion of opera with oratorio and other dramatic forms; revival of the 18th-century "number" opera in 20th-century musical idioms [XI].

III. *Early Italian opera*. The earliest operas, all performed at Florence, were: *Dafne*, poem by Rinuccini, music by J. Peri (1597; music lost); *Euridice*, poem by Rinuccini, music by G. Caccini (perf. 1602; in \*Editions XLVII, 10); *Euridice*, poem by Rinuccini, music by Peri and

Caccini (1600; in \*Editions III, 6, and IX, 24). The music of the Florentine operas consists mostly of recitative over a thoroughbass whose somewhat colorless harmonies were realized by a small instrumental ensemble. Conforming to the ideal of imitation of Greek drama, the vocal line aims at close adherence to the natural rhythm and accent of the spoken word; therefore, although flawless in declamation and occasionally expressive in detail, it is lacking in any distinct melodic character or any clear principle of musical organization. Exceptions to this style occur in the occasional metrical songs and choruses, usually with dancing, which are placed at the end of the principal scenes. However, the almost total exclusion of counterpoint and the neglect of instrumental music led, as soon as the novelty of the new *stile recitativo* had worn off, to an unbearable monotony of effect. It was Monteverdi who introduced into opera the full resources of the art of music. His *La Favola d'Orfeo* (Mantua, 1607; poem by Alessandro Striggio) is on the same subject and in the same general style as the earlier Florentine *Euridice* operas, but it shows notable advances in both dramatic characterization and musical form. Monteverdi's harmony is incomparably richer and more varied than that of Peri or Caccini. The recitative is more expressive and is frequently organized by means of repetitions, sequential passages, etc., into distinct musical patterns. The remarkable aria "Possente spirito" in Act III consists of six strophes of elaborately ornamented vocal solo, each with a different orchestral accompaniment. The large orchestra is another feature of this work, as well as the number of instrumental pieces (26 in all), including the introductory "toccata" (the earliest operatic \*overture) and the frequent ritornellos, which, by their recurrence, give musical unity to long sections of the opera.

In the third decade of the 17th century the center of operatic interest shifted to Rome (S. Landi, D. Mazzocchi, M. A. Rossi, L. Vittori, L. Rossi). Mazzocchi's *La Catena d'Adone* (1626) and Landi's *Il Sant' Alessio* (1632; \*Editions III, 5) show the gradual differentiation between recitative and aria styles, with the use of tuneful melodies in the latter, as well as continued progress toward formal clarity. In Landi's work the "canzona" type of overture appears, while the "sinfonia" before the second act is an early example of the three-movement arrangement (fast-slow-fast) of the later Italian overture. The Roman operas are distinguished by

extensive use of vocal ensembles. This school was also the first to produce \*comic operas.

IV. *Later 17th-century Italian opera.* An important historical event was the opening at Venice in 1637 of the first public opera house (Teatro San Cassiano). The transformation of opera from a courtly entertainment for invited guests to a public spectacle for a general audience had important consequences for both music and libretto. The earliest composers at Venice were Monteverdi with *Il Ritorno d'Ulisse in Patria*, 1641 (DTO 57), and *L'Incoronazione di Poppea*, 1642; and P. F. Cavalli with *Giasone*, 1649 (\*Editions XLVII, 12), and *Xerse*, 1654. The recitatives in Monteverdi's *Incoronazione* are the apotheosis of the Florentine monodic style. Combined with more regular aria forms, they make for one of the most beautiful operatic scores of the entire 17th century. The works of Cavalli and M. A. Cesti show the influence of public taste on operatic form in their greater size, more lavish staging [see especially Burnacini's stage designs for *Il Pomo d'oro* in DTO 6 and 9], greater number of characters, plot complications, and use of burlesque comic episodes. Musical effects become less subtle than in earlier works. The virtuoso soloist begins to be featured. Recitative and aria become completely distinct and the latter crystallizes into standard forms (strophic, ostinato-bass, *da capo*). There are many arias in light, popular, melodic style, as well as more serious types. The use of an orchestral introduction to the aria, repeated at the close ("ritornello" principle), as well as short orchestral interludes between the sections, becomes established. There are important orchestral overtures and sinfonias, but vocal ensembles (except duets) are much less prominent than in operas from the first half of the century.

The course of Italian opera in the later 17th century is difficult to follow because few scores are available in modern editions. Venice remained the principal but by no means the only center of production, the leading composers there being Antonio Sartorio (*L'Adelaide*, 1672) and Giovanni Legrenzi (*Totila*, 1677). Other notable figures in Italy were M. A. Cesti, active in various cities, who produced *La Dori* at Florence in 1661 (\*Editions XLVII, 12) and *Il Pomo d'oro* (DTO 6 and 9) at Vienna in 1661, A. Stradella (*La Forza dell'Amor paterno*, 1678), and F. Provenzale, one of the first composers of opera at Naples. Among Italians resident at South German centers were C. Pallavicino (*La Gerusalemme liberata*, 1687; see DdT 55) and

especially Agostino Steffani (*Alarico il Balta*, 1687; *Henrico Leone*, 1689; see DTB 21, 23), whose works achieved a perfect reconciliation of the monodic and contrapuntal principles and laid the foundation for the operatic style of Handel.

By the end of the 17th century Italian opera was firmly established in its native land as a leading musical institution. Moreover, the forms of music and drama that had developed by then remained basic to the further evolution of Italian opera over the next two centuries and had a far-reaching influence on opera in other countries as well.

V. *French opera, 1670–1750.* French national opera was founded by Robert Cambert (*Pomone*, 1671) and Jean-Baptiste Lully (*Cadmus et Hermione*, 1673; *Atys*, 1676; *Amadis*, 1684; *Armide*, 1686). Although there had been performances of Italian opera in Paris between 1645 and 1662 (notably Luigi Rossi's *L'Orfeo* in 1647; first perf.), the French were slow to adopt the form, partly because in their own classical tragedy (Corneille, Racine) and in the \*ballet they had already perfected two types of stage production with which they were satisfied and which they did not believe could be successfully merged. It is a tribute to Lully's skill that he was able to take certain features of each of these established forms, along with some elements of the pastorate, and combine them in a form of opera he called *tragédie lyrique*. Compared to contemporary Italian works, the French opera was distinguished by (1) the relatively greater importance of the drama; (2) the exceptionally large place given to ballets, choruses, and spectacular scenes in general; (3) the greater use of instrumental music; (4) the use of short and simple songs, mostly of a dancelike character (\*airs) rather than elaborate arias; (5) a special type of \*recitative; and (6) a special type of \*overture known as "French overture." This type of opera remained essentially unchanged in the hands of Lully's successors, including Rameau (*Hippolyte et Aricie*, 1733; *Castor et Pollux*, 1737), whose operas represent the high point of this form in France before Gluck. [For reprints of French operas, see Editions VII.]

VI. *English opera.* As French opera grew out of the ballet, so English opera developed from the \*masque, though not without difficulty owing to the prejudice against stage entertainments during the Commonwealth (1649–60). John Blow's *Venus and Adonis* (c. 1684?), although entitled "a masque," is the first genuine

opera to be produced in England in this period. The only great figure of English opera is Henry Purcell, whose *Dido and Aeneas* (c. 1689) is a masterpiece in miniature. Though not free from French influence (form of overture, care for clear text declamation, certain rhythmic mannerisms, prominence of dancing, instrumental pieces, and choruses), it nevertheless combines these features with highly original and characteristically English melodies, rhythms, and harmonies, together with a degree of tragic expressiveness (Dido's lament, "When I am laid in earth") that has hardly been surpassed in opera. The same qualities may be found in much of Purcell's other theater music, which is in the form of incidental music to plays (*Dioclesian*, 1690; *King Arthur*, 1691). With Purcell's early death, the writing of serious operas by English composers of the first rank practically ceased until the 20th century.

VII. *German opera.* With the exception of Heinrich Schütz's *Dafne* (1627 at Torgau; music lost), the early history of opera in Germany is predominantly the history of Italian composers at German courts: Pallavicini at Dresden, A. Draghi at Vienna, A. Steffani at Munich and Hanover, and a host of others. Their influence was such that for the next hundred years even native German masters were content to write in the Italian style and to Italian texts (J. J. Fux, J. A. Hasse, Gluck, Mozart). The only important native German school was at Hamburg, where the titles of the first Singspiele (e.g., J. Theile's *Der erschaffene, gefallene und aufgerichtete Mensch* 1678) show the connection with the tradition of "school dramas" (plays with music, usually about Biblical subjects, intended for the edification and instruction of pupils in schools. An earlier example is S. T. Staden's "spiritual pastorate" *Seelewig*, Nuremberg, 1644; see *MfM* xiii; SchGMB, no. 195). German operas on secular subjects, both serious and comic, soon made their appearance. The chief composer of the Hamburg school was Reinhard Keiser, of whose reputed 120 operas only 18 have been preserved (*Croesus*, 1711, rev. 1730, in *DdT* 37/38; *Octavia*, 1705, in vol. vi of sup. to Händelgesellschaft ed. of Handel's works; *Der laecherliche Printz Jodelet*, 1726, in \*Editions XLVII, 18). Keiser not only was the best composer of early German opera but had a direct influence on Handel, whose first four operatic works were produced at Hamburg (1705–06). Keiser's operatic style is essentially like that of Steffani, its outstanding features being the skill

of his orchestral writing and the variety of instrumental combinations he employed for accompanying solo arias. After Keiser, German opera degenerated and by the middle of the 18th century had entirely disappeared.

VIII. *Italian 18th-century opera*. The prevailing type of 18th-century Italian *opera seria* was cultivated in all countries (except France) by native and Italian composers alike. Because many of its early composers worked chiefly at Naples, this type of opera has sometimes been called "Neapolitan" [see Neapolitan school], although in fact Naples was but one center among many. Much of the usual criticism of *opera seria* rises from not understanding the principles of the form or from concentrating on its abuses while ignoring its virtues. *Opera seria* was based on a rationalist ideal of drama, realized through the reforms of A. Zeno and his more famous successor, P. Metastasio, who purged the chaotic 17th-century opera libretto of irrelevant elements (e.g., comic and fantastic episodes) and created a unified, close-knit three-act dramatic structure, with characters and subjects drawn principally from ancient history or legend (seldom from mythology). Formally, each scene consists of two distinct parts, the first comprising the action and the second devoted to the expression of the reflections, feelings, or resolves of the principal character, which are a consequence of the action just preceding. Thus the libretto presents a constant alternation of active and reflective portions, the former being interpreted musically as recitative (mostly *recitativo secco*) and the latter as aria. Choruses are practically nonexistent. As for the orchestra, its function, except for the overture [see Overture I] and an occasional march or other incidental piece, is decidedly subordinate, though in the hands of an able composer the ritornellos and accompaniments to the arias may be of considerable interest and importance. But the center of attention and the basic structural unit of these operas was the aria, of which there were many different types (*aria cantabile*, *aria parlante*, *aria di bravura*, etc.), practically all of them in the *da capo* form. There were fairly rigid conventions as to the number and order of the different types of aria and their distribution among the members of the cast, and the popularity of Metastasio (his 27 librettos were set to music more than 1,000 times in the 18th century) is in large part attributable to his ability to meet the peculiar requirements of the form without undue sacrifice of dramatic force

and continuity. Corollary to the concept of the aria as the essential structural unit were two phenomena characteristic of 18th-century opera: (1) the high development of vocal technique [see *Bel canto*], particularly by the *\*castrati*; (2) the prevalent custom of borrowing arias from one opera for use in another, whether or not by the same composer (*\*pasticcio*). Since there were no printed scores and no copyright restrictions, an opera was seldom performed the same way in any two places or at any two times, and the changes were sometimes so extensive that it is no longer possible to reconstruct the original version.

Alessandro Scarlatti, who has sometimes been called the founder of the 18th-century *opera seria*, is probably better regarded as a composer in the late baroque tradition. The lighter, more vivacious, more purely melodic preclassical style characteristic of the *opera seria* began to predominate from about 1720, the principal early composers being N. A. Porpora, L. Vinci, L. Leo, and J. A. Hasse. Unquestionably the greatest composer of Italian opera in this period was G. F. Handel, who from 1711 to 1740 produced at London some works that have never been surpassed in nobility of style or profundity of dramatic insight (*Giulio Cesare in Egitto*, 1724; *Tamerlano*, 1724; *Rodelinda*, 1725). Later composers of *opera seria* include G. Latilla, N. Piccinni, G. Sarti, A. Sacchini, A. Salieri, Gluck (early works), J. C. Bach, and Mozart (*Idomeneo*, 1781). Growing objections to the rigidity of the form and the abuses resulting from the overbearing vanity of singers [see B. Marcello's satire *Il Teatro alla moda*, 1720] led to efforts at reform, in which N. Jommelli (*Fetonte*, 1768; in *DdT* 32/33) and T. Traetta (in *DTB* 25, 29) were prominent. Credit for the final reform of Italian 18th-century opera is generally given to Gluck, in spite of the fact that of his "reform" operas only two (*Orfeo ed Euridice*, 1762; *Alceste*, 1767, pub. 1769) were composed originally to Italian librettos, and these were later revised and adapted to French texts at Paris. His other late operas (*Iphigénie en Aulide*, 1774; *Armide*, 1777; *Iphigénie en Tauride*, 1779) on French poems were designed for and performed at Paris, and moreover they embodied many of the features that had been characteristic of French opera from the time of Rameau and Lully: comparative subordination of music to drama, avoidance of mere vocal display, flexibility of musical forms, closer approximation of style between

recitative and aria, and general simplicity both of subject and treatment. (These are the points stressed in the famous dedicatory preface to *Alceste*.) To these features may be added another detail common to Rameau and Gluck but not common in Italian operas before the late 18th century: the use of large choral and ballet scenes connected with the action. In short, the direct reform of Gluck lay in his injection of renewed dramatic vigor into French opera, though indirectly his success at Paris and the subsequent steadily growing influence of the French capital in operatic affairs made later Italian composers more ready to adopt practices calculated to win Parisian approval, thus leading to a closer *rapprochement* of the two national styles. Other influences working toward a reform of *opera seria* in the late 18th century were the cult of naturalness set forth in the writings of Rousseau and the increasing importance of popular comic operas, which by the end of the century had in all countries attained artistic equality with serious opera. See Comic opera: Number opera.

IX. *From Mozart to Wagner.* The climax of later 18th-century Italian opera is reached in the works of Mozart (*Le Nozze di Figaro*, 1786; *Don Giovanni*, 1787; *Così fan tutte*, 1790), and it is significant that his three Italian masterpieces were of the comic or semicomical variety (his *opera seria*, *La Clemenza di Tito*, 1791, is of less importance). Mozart's operas are outstanding in sharpness and subtlety of characterization, integration of vocal and instrumental factors, and the adaptation of the classical symphonic style in their ensemble finales. His *Die Entführung aus dem Serail* (1782) is one of the finest examples of the \*Singspiel, and *Die Zauberflöte* (1791) is an important forerunner of 19th-century German romantic opera.

The influence of Gluck was evident in a school of large-scale "heroic" opera centering at Paris, represented by such works as A. Sacchini's *Dardanus* (1784) and *Oedipe à Colone* (1786), A. Salieri's *Les Danaïdes* (1784), Cherubini's *Médée* (1797), G. Spontini's *La Vestale* (1807), and E.-N. Méhul's *Joseph* (1807). The continuation of this school was the 19th-century "grand opera," of which the most famous examples are G. Rossini's *Guillaume Tell* (1829), J. Halévy's *La Juive* (1835), G. Meyerbeer's *Les Huguenots* (1836) and *Le Prophète* (1849), R. Wagner's *Rienzi* (1842), and H. Berlioz' *Les Troyens à Carthage* (2nd pt. 1863; whole work, 1890). In contrast to this style was opera with more realistic, often melodramatic subjects, a charac-

teristic form being the "rescue opera" (Cherubini's *Les Deux Journées*, 1800; Beethoven's *Fidelio*, 1805, '06, '14). The works mentioned so far constitute what may be called the international opera of the early 19th century. Less pretentious at first in scope and subject matter but of greater eventual importance historically were the various national schools.

In Italy the leading composers were Rossini (best known for his comic opera *Almaviva*, better known as *Il Barbiere di Siviglia*, 1816), Bellini (*Norma*, 1831), Donizetti (*Lucrezia Borgia*, 1833; *Lucia di Lammermoor*, 1835), and Verdi (*Rigoletto*, 1851; *Il Trovatore*, *La Traviata*, 1853; *La Forza del Destino*, 1862; *Aida*, 1871; *Otello*, 1887; *Falstaff*, 1893). The crowning point of typical Italian opera, characterized by melodramatic plots, popular-type melodies, and concentration on "effective" vocal numbers [see Number opera], is reached in Verdi's works of the 1850's. *Aida*, a work in the "grand opera" tradition, shows unmistakable signs of the changes in style that were fully realized in *Otello* and *Falstaff*: better libretto, continuity of presentation, a more flexible rhythm, more varied harmony, and closer approach to equality between vocal and instrumental elements—though still retaining the classical Italian qualities of clarity, dramatic simplicity, and profound comprehension of the expressive possibilities of the solo voice.

In France, besides "grand opera" the early 19th century was taken up with the *opéra comique*, a form and style inherited from the preceding period that gradually developed into the lyric opera of Gounod (*Faust*, 1859) and A. Thomas (*Mignon*, 1866), both showing Italian influence. Later 19th-century French opera is represented by Bizet (*Carmen*, 1875), Delibes (*Lakmé*, 1883), Chabrier (*Gwendoline*, 1886, obviously indebted to Wagner's *Tristan und Isolde*, 1865), Massenet (*Manon*, 1884), D'Indy (*Fervaal*, 1897), and other composers (see below).

In Russia a national school of opera was definitively launched with the performance of Glinka's *A Life for the Czar* in 1836. Its chief representative was Mussorgsky, who in *Boris Godunov* (1874) created a work that combined nationalist subject matter and musical material with originality and great dramatic power. Other composers of Russian opera who should be mentioned are Borodin (*Prince Igor*, 1890) and Rimsky-Korsakov (*The Snow Maiden*, 1882; *Sadko*, 1898). Tchaikovsky's works in operatic

form (*Yevgeny Onyegin*, or *Eugen Onegin*, 1879; *The Queen of Spades*, 1890) are in the romantic style but are not nationalist.

The background of romantic opera in Germany is found in the *Singspiel* of the late 18th and early 19th centuries. An important early composer is L. Spohr (*Faust*, 1816; *Jessonda*, 1823), Weber's *Der Freischütz* (1821) and *Euryanthe* (1823) established the fundamental characteristics of the school: (1) romantic treatment of subjects derived from national legend and folklore; (2) a deep feeling for nature and the use of natural phenomena as an essential element in the drama; (3) the acceptance of supernatural agencies as a means of dramatic development; and (4) nationalism. Musically, *Der Freischütz* marks an important stage in the discovery of romantic expressive effects (introduction to the Overture, the Wolf's Glen scene), as well as in the use of folksong-like melodies side by side with more conventional operatic arias. The operas of Marschner (*Der Vampyr*, 1828; *Hans Heiling*, 1833) continue the general type established by Weber, and the latter's influence is strongly evident in Wagner's *Der fliegende Holländer* (1843) and even *Lohengrin* (1850).

X. *The music drama*. Wagner's next two operas after *Der fliegende Holländer* are steps in the evolution toward the music drama. *Tannhäuser* (1845) still retains the old-fashioned division into "numbers" and has some unessential display scenes, but in *Lohengrin* (composed 1846-48) these irrelevancies are dismissed. Music and drama are more closely unified, greater continuity is achieved, and the symbolic meaning of the drama is made clearly evident. The vocal line begins to be emancipated from the older periodic rhythm, approaching the free melodic style of the late works. Wagner employed the early years of his exile (1849-64) in completing the libretto and part of the music of *Der Ring des Nibelungen* and in writing various essays, of which the most important is *Oper und Drama* (1851). In this work he developed the theoretical basis for the music drama, whose practical application appears in the four dramas of the *Ring* (first complete perf. at Bayreuth, 1876), *Tristan und Isolde* (composed 1857-59, perf. 1865), *Die Meistersinger von Nürnberg* (comp. 1862-67, perf. 1868), and *Parsifal* (comp. 1877-82; perf. 1882).

These works all are based on a concept of the music drama as a universal art form (*Gesamtkunstwerk*) in which all the constituent arts are transfigured, sacrificing their individual identity

and some of their special characteristics for the larger possibilities of development opened up by the new association. The myth is held to be the ideal subject, not merely because it is entertaining but also because it is significant; its meaning is expressed in poetry (speech), but it is inevitably impelled to song, since only music is capable of conveying the intensity of feeling to which the ideas of the poem give rise. This song is flexible (nonperiodic rhythm) and free (no formal divisions into recitative, aria, etc.); it implies a polyphonic substructure that is realized by the orchestra and that embodies the "inner action" of the drama (i.e., the feelings) as the words embody its "outer action" (i.e., the precise ideas with which the feelings are associated). The orchestral music is continuous throughout an act, the technical concomitant of this being the avoidance of double bars and perfect cadences and the continual shifting of the tonal center; it is unified by the use of *\*leit-motivs*, short musical themes, each connected with a particular person, thing, or idea (or all three, as in the case of Siegfried's horn call), and recurring, varying, or developing musically in accord with the recurrence, variation, or development of the corresponding object in the drama. Wagner's music is the incarnation of the full, rich sound ideal of the late romantic period, deriving a peculiar intensity of expression from skillful orchestration, freedom and variety of the harmonic progressions, and effective use of suspensions and appoggiaturas. The continuing popularity of his works is undoubtedly due more to their musical qualities and their sheer dramatic effectiveness than to any general acceptance of the theory of the *Gesamtkunstwerk*, with its manifold implications.

XI. *The 20th century*. Wagner's musical style and his ideal of continuous melody influenced the composers of opera in the late 19th and early 20th centuries, particularly Richard Strauss (*Salome*, 1905; *Der Rosenkavalier*, 1911). At the same time, the music drama provoked a reaction in favor of so-called "realism" in subject matter and compression and simplicity of musical treatment. This reaction took such forms as the "realism" of the French Bizet (*Carmen*, 1875), the *\*verismo* of the Italians Mascagni, Leoncavallo, and Puccini (*La Bohème*, 1896; *Tosca*, 1900), and the "naturalism" of the French Bruneau (*Messidor*, 1897) and Charpentier (*Louise*, 1900). Another reaction to 19th-century styles was impressionism. Debussy's *Pelléas et Mélisande* (1902) is a unique application of the

\*impressionist technique to opera and comes closer than any other modern work to realizing the Florentine ideal of music as an almost imperceptible support and setting for the poetry. Dukas' *Ariane et Barbe-Bleue* (1907) and Bartók's *Duke Bluebeard's Castle* (comp. 1911, perf. 1918), both based on a Maeterlinck drama, were strongly influenced by Debussy. Maurice Ravel's *L'Heure espagnole* (1911) and Fauré's *Pénélope* (1913) are lesser-known operas in the French impressionist style. In Italian opera immediately before World War I, both French and German influences began to replace the *verismo* style (I. Montemezzi, *L'Amore dei tre re*, 1913).

In the period following World War I, the established opera houses still leaned heavily on the standard repertory from Mozart to Puccini. Despite such experiments as Alban Berg's atonal *Wozzeck* (1925) and Schoenberg's uncompleted masterpiece *Moses und Aron* (acts I and II completed 1932, radio perf. 1954), many composers retained traditional subjects, forms, and musical styles (R. Strauss, *Die Frau ohne Schatten*, 1919). Among the most significant operas of the 1920's are Janáček's *Káta Kabanová* (1921) and *The Cunning Vixen* (1924), and Prokofiev's *The Love for Three Oranges* (1921). Jazz influenced Krenek's *Jonny spielt auf* (1927). The only serial opera that has found public acceptance is Berg's *Lulu* (1937). Schoenberg's *Moses und Aron* (less successful because of enormous staging difficulties) exemplifies an important tendency in this period to combine the characteristics of opera and oratorio in works of serious ethical purpose with huge musical and stage resources. Other examples of this tendency are Arthur Honegger's *Jeanne d'Arc au bûcher* (1938), Paul Hindemith's *Mathis der Maler* (1938), and Darius Milhaud's *Christophe Colomb* (1930). Other operas of the 1930's are Virgil Thomson's *Four Saints in Three Acts* (1934), an opera in a simple musical style set to a text by Gertrude Stein, and Shostakovitch's *\*Lady Macbeth of Mtsensk* (1934).

Since World War II there have been a large number of new, successful operas. Numerous works in traditional styles achieved some public success: G. C. Menotti's *The Medium* (1946), *The Consul* (1950), *Amahl and the Night Visitors* (1951) and *Le dernier Sauvage* (1963); S. Barber's *Vanessa* (1958); W. Walton's *Troilus and Cressida* (1954); and A. Copland's *The Tender Land* (1954). In a somewhat more venturesome vein were Britten's *Peter Grimes* (1945), *The Turn of*

*the Screw* (1954), *A Midsummer Night's Dream* (1960), and *Curlew River* (1964). Operas on a very large scale are Prokofiev's *War and Peace* (1955), Hindemith's *Die Harmonie der Welt* (1957), Milhaud's *David* (1954), and Ginastera's *Don Rodrigo* (1964). Interesting formal experiments, on a more modest scale and with elements adapted from folklore, are the early musico-dramatic works of Carl Orff, including *Die Kluge* (1943). His *Antigonae* (1949) and *Oedipus der Tyrann* (1959) combine stylized speech and chant with melismatic phrases against a percussive orchestral background. Along with the tendency toward the fusion of opera and oratorio came an opposite trend toward opera as straightforward dramatic entertainment, serious or comic, in a neoclassical revival of the 18th-century principle of the \*number opera; the outstanding example is Stravinsky's *The Rake's Progress* (1951). Another important work of this type is Poulenc's *Les Dialogues des Carmélites* (1957). Serial techniques were used by Luigi Nono for *Intolleranza 1960* (1961).

In the United States *The Ballad of Baby Doe* (1956) by Douglas Moore and *Susannah* (1955) by Carlisle Floyd are examples of folk operas that have been fairly successful. Other American operas are *Montezuma* (first perf. in Berlin, 1964) by Roger Sessions, *The Crucible* (1961) by Robert Ward, *The Mother of Us All* (1947) by Virgil Thomson, and *The Wings of the Dove* (1961) by Douglas Moore. A hopeful sign for the future of opera in the United States is the growing number of new works produced under the patronage of civic and community groups, colleges, and music schools.

**Opéra bouffe** [F.]. See Comic opera.

**Opera buffa** [It.]. See Comic opera.

**Opéra comique** [F.]. See Comic opera.

**Opera houses.** The first public opera house was the Teatro San Cassiano in Venice, opened in 1637; previously, opera performances had been given in private homes and for invited guests only. There followed the establishment of opera houses in London (1656), Paris (1669), Rome (1671), and Hamburg (1678). After 1700, opera houses became common in all the musical centers of Europe. The most important opera houses of today are listed below.

I. United States. New York: *Metropolitan Opera* (Lincoln Center). Chicago: *Civic Opera House* (Lyric Opera). San Francisco: *War Memorial Opera House* (San Francisco Opera).

II. South America. Buenos Aires: *Teatro Colón*. Rio de Janeiro: *Teatro Municipal*.

III. Austria. Vienna: *Staatsoper*; *Volksoper*.

IV. England. London: *Royal Opera House* (Covent Garden).

V. Germany. Berlin: *Deutsche Staatsoper* (E. Berlin); *Städtische Oper* (W. Berlin). Dresden: *Staatstheater*. Hamburg: *Staatsoper*. Munich: *Prinzregententheater*; *Bayerische Staatsoper*. Bayreuth: *Bühnenfestspielhaus* (Wagner operas). There are about 30 more opera houses in smaller German cities; see *Opera Annual*, ed. H. Rosenthal [1960].

VI. France. Paris: *Théâtre national de l'Opéra*; *Théâtre national de l'Opéra-Comique*.

VII. Italy. Rome: *Teatro dell'Opera*; Milan: *Teatro alla Scala*. Venice: *Teatro la Fenice*. Turin: *Teatro nuovo*. Naples: *Teatro San Carlo*.

For more detailed information see Pierre

Key's *Music Year Book* (1927–28). See also S. Hughes, *Great Opera Houses* [1956]; E. Krause, *Die grossen Opernbühnen Europas* (1966).

**Opera seria, semiseria** [It.]. *Opera seria* refers to 18th-century Italian operas based on a "serious" plot and divided into three acts, as opposed to the *opera buffa*, the comic opera consisting of two acts. Mozart's *Idomeneo* is an example of *opera seria*. *Opera semiseria* is a serious opera including comic elements, e.g., Mozart's *Le Nozze di Figaro*. Also see Opera VIII.

**Operetta.** In the 18th century, a short opera; in the 19th and 20th centuries, a theatrical piece of light and sentimental character in simple and popular style, containing spoken dialogue, music, dancing, etc. The modern operetta originated in Vienna with Franz von Suppé (1819–95; c. 30 operettas from 1860 to his death) and in Paris with Jacques Offenbach (1819–80; c. 90 operettas from 1855 to his death). The latter's *Orphée aux enfers* (1858), and *La Belle Hélène* (1864) are famous for their satirical treatment of Greek mythology. Johann Strauss the Younger (1825–99) raised the Viennese operetta to international fame with about 16 operettas written between 1871 and 1897, among which *Die Fledermaus* (1874) has remained in the repertory to the present day. The Viennese tradition was continued by Franz Lehár (1870–1948) with *Die lustige Witwe* (1905). In England Sir Arthur Sullivan wrote operettas (mostly to librettos by W. S. Gilbert) that represent the first high point in English dramatic music since Purcell.

In the United States operettas were written mainly by Victor Herbert (1859–1924), composer of *Mlle. Modiste* (1905), *Naughty Marietta* (1910), and many other operettas, and by H. L. Reginald de Koven (1859–1920), remembered chiefly for his *Robin Hood* (1890). Other works that might be mentioned are *The Doctor of Alcantara* (pub. libretto 1862) by J. Eichberg, *The Firefly* (1912) by Rudolf Friml, *The Student Prince* (1924) by Sigmund Romberg, and G. W. Chadwick's *Tabasco* (1894). During the late 1920's the sentimental operetta began to change (e.g., Jerome Kern's *Showboat*, 1927) into what is now called a "musical comedy," "musical play," or simply "musical." Political and social satire appeared in *Of Thee I Sing* by George Gershwin (1931; first musical to win a Pulitzer Prize), K. Weill's *Die Dreigroschenoper* (text by B. Brecht, 1928; as *The Threepenny Opera*, 1933), and Richard Rodgers'

*Pal Joey* (text by L. Hart, 1940). Although Irving Berlin's musicals continued the more traditional vein (*Annie Get Your Gun*, 1946), a more unified format developed in the 1940's, exemplified by Richard Rodgers' *Oklahoma!* (1943; Pulitzer Prize 1944) and *South Pacific* (1949), and Cole Porter's *Kiss Me Kate* (1948). Leonard Bernstein's *Candide* (1956) is noteworthy for its musical content, and his *West Side Story* (1957) for the emphasis on choreography, while *My Fair Lady* (1956) by Frederick Loewe (lyrics by Alan Jay Lerner) will probably remain a model of the genre. Also see Comic opera.

**Ophicleide.** See under Brass instruments V (c).

**Opus** [L.; F. *oeuvre*]. Term, abbr. op., used to indicate the chronological position of a composition within a composer's entire output (e.g., op. 1, op. 2). Opus numbers are not always reliable because they are usually applied in the order of publication rather than composition. Perhaps the first composer to use opus numbers was Adriano Banchieri (1567–1634), whose *L'Organo suonarino* of 1605 was designated op. 13. Another early composer using opus numbers was Biagio Marini (*Affetti musicali*, op. 1, 1617). Bach never numbered his compositions, and with both Haydn and Mozart the opus numbers are applied so inconsistently and haphazardly (frequently by the publisher rather than the composer) that they are practically useless. Beethoven was the first to use opus numbers with some consistency, at least for his more important works.

**Oratio** [L.]. The prayer of the Roman Catholic Mass, also called \*Collect.

**Oratoric(al) neumes.** Same as staffless neumes; see Neumes II.

**Oratoric rhythm.** Term used for Dom Pothier's rhythmic interpretation of Gregorian chant, according to which the accentual structure of the Latin text is a basic factor in the rendition of the melodies. Another name for this type of inter-

pretation is "accentualist" [see Gregorian chant VI].

**Oratorio.** I. *Definition.* A composition with a long libretto of religious or contemplative character that is performed in a concert hall or church without scenery, costumes, or action, by solo voices, chorus, and orchestra. This definition applies to most but not all oratorios. For example, the earliest oratorios were usually performed with scenery and costumes, the chief distinguishing characteristic from opera being a more contemplative, less dramatic libretto. Other features distinguishing the oratorio from opera are greater emphasis on the chorus, absence of quick dialogue (question and answer in rapid succession), and, frequently, use of a narrator [It. *testo*] who introduces the characters and connects their parts. Compositions of a similar nature but based on a scriptural or liturgical text (Mass, Requiem, Passion) are usually not considered oratorios. There are, however, Passion oratorios, in which the story of the Passion is freely told. The oratorio is distinguished from the sacred cantata (Bach) by greater length and a more narrative libretto.

II. *History to 1650.* Forerunners of the oratorio include such early types of dramatic music as the \*liturgical dramas of the later Middle Ages and the mystery plays of the 14th and 15th centuries. More properly, the history of the oratorio begins in the mid-16th century when Filippo Neri inaugurated, in Rome, a special order called *oratoriani* and established a building called *oratorio* in which regular services of a popular character were held. These included reading from the Scriptures, a sermon, and the singing of \**laude*. A special type of *laude* were the "dialogue-*laude*," religious poems in the form of a dialogue between God and the Soul, Heaven and Hell, etc. Being written in three or four parts, they were performed by different groups of singers who may have dressed up as the characters they represented. It is from these presentations (called *rappresentazione*, *storia*, *esempio*, *misterio*) that the oratorio proper developed, supported, no doubt, by the popularizing tendencies of the Counter-Reformation. Palestrina as well as other famous 16th-century composers is supposed to have written music for such occasions, but nothing has been preserved prior to Emilio del Cavalieri's (c. 1550–1602) \**Rappresentazione di anima e di corpo* (1600; \*Editions IX, 10; also *SchGMB*, 169, 170; *HAM*, no. 183), a work that in terms of both date and style is

close to the earliest operas (Peri, Caccini). In fact, some modern writers (Alaleone, see Lit.) have denied it a place in the history of the oratorio and, mainly on account of its elaborate stage production (including the simultaneous [*sic*] representation of Heaven, Earth, and Hell, splendid costumes and ballets; see *GD* iii, 70; *GDB* vi, 247ff), have called it a "spiritual opera," a later example of which is S. Landi's *Il Sant' Alessio* (1632). At any rate, this work appears to have been an isolated attempt that failed to establish a tradition. More successful was the *Teatro Armonico Spirituale* (1619) of Giovanni Francesco Anerio (c. 1567–1630), in which a refined madrigal style is used for the choral portions, alternating with monody for the solo parts, which included a narrator. Another important work, greatly celebrated in its day, was Domenico Mazzocchi's (1592–1665) *Querimonia di S. Maria Maddalena* (c. 1640?). It is an example of the *oratorio volgare*, i.e., written in the vernacular.

III. 1650–1800. About the middle of the 17th century the oratorio entered a new phase with G. Carissimi (1605–74), who in such works as *Jephtha*, *Judicium Salomonis*, *Jonas*, and *Extremum Judicium* [\*Editions IX, 5] created the first oratorios fully deserving of the name [ex. in *HAM*, no. 207]. Most of his oratorios have a Latin text (*oratorio latino*) and were directed at a more educated audience. Carissimi's successors included A. Draghi (1635–1700; c. 40 oratorios); A. Stradella (1642–82), with his oratorios *S. Giovanni Battista* and *Susanna* [see *SchGMB*, no. 230]; and A. Scarlatti (1660–1725), who wrote a large number of oratorios (eighteen are preserved with the music) that approximate rather closely the style of his operas but are, on the whole, much less successful. The oratorios of A. Lotti (c. 1667–1740) and A. Caldara (1670–1736), both representatives of the Roman-Venetian tradition, are more reserved in style, combining dignity with slightly sentimental pathos, while L. Leo (1694–1744), J. A. Hasse (1699–1783; *La Conversione di Sant' Agostino*, *DdT* 20; *HAM*, no. 281), and N. Jommelli (1714–74; *La Passione*; see Editions IX, 15) continued the Neapolitan emphasis on virtuosity and vocal display, thus removing the oratorio even further from its ideal.

The first German oratorio composer was Heinrich Schütz, with his *Historia der Auferstehung* (1623) and his Christmas Oratorio (*Historia von der . . . Geburt Christi*, 1664), a work of no less artistic significance than Bach's Christ-

mas Oratorio written a century later. Oratorios by Selle (1642), Theile (1672), and Sebastiani (1672) belong to the special category of the Passion [see Passion music], and later composers such as Weckmann, Buxtehude, and Rosenmüller preferred the smaller form of the cantata. J. S. Bach was the first to resume the tradition of Schütz in his great Christmas Oratorio (1733–34) and in the less important Easter Oratorio (1736?). There followed J. E. Eberlin with *Der blutschwitzende Jesus* (*DTO* 55), G. P. Telemann (1681–1767) with his highly dramatic *Der Tag des Gerichts* of 1761 (*DdT* 28; *HAM*, no. 272), and Johann Christoph Friedrich Bach (1732–95) with *Die Kindheit Jesu* and *Die Auferweckung des Lazarus* (*DdT* 56). This development came to a fitting close with the truly remarkable oratorios of K. P. E. Bach (*Die Israeliten in der Wüste*, 1775; *Die Auferstehung und Himmelfahrt Jesu*, 1787), which, in their mixtures of styles, reflect the influence of his father but also foreshadow Haydn [see the study by W. H. Hadow, in *OH* v].

The English oratorio is represented by Handel who, after a few early works (*La Resurrezione*, 1708), turned mainly to oratorio writing after becoming dissatisfied with opera, and whose *Israel in Egypt* (1737), *Messiah* (1742), *Judas Maccabeus* (1746), and *Jephtha* (1751) are lasting monuments to his greatness. In contrast to Bach's devotional attitude, Handel approached the oratorio more subjectively, using it to express his own dynamic personality and incorporating the elements of his dramatic opera style. It is interesting that his oratorios were intended to be performed during Lent, when theatrical performances were forbidden by law. The practice of composing Lenten oratorios was continued by J. C. Smith (1712–95), J. Stanley (1713–86), and others. T. Arne (1710–78), in his *Abel* (1744) and *Judith* (1764), succeeded in not succumbing totally to Handelian influence, but after Arne's death the English oratorio entered "on a century of artistic darkness, over which brooded from first to last the elephantine shadow of Handel, to which was added in the final thirty years the almost equally universal though less ostentatiously ponderous shadow of Mendelssohn. The composers of these tons of oratorios were 'all honourable men': . . . but . . . their music is nothing worse than intolerably dull" (*GD* lii, 721f, *GDB* vi, 260f).

An important though little-known development took place in France with Carissimi's pupil M.-A. Charpentier (1634–1704) whose works, so-called *histoires sacrées* (*Judicium Salomonis*,

*Filius prodigus*, *Le Reniement de St. Pierre*, etc.), all with Latin texts, combine masterly technique with depth of feeling and dramatic expression [see *HAM*, no. 226]. Unfortunately he had no successors in his country.

IV. 1800–Present. Haydn (1732–1809), after his *Il Ritorno di Tobia* (1775; said to be “the finest example of 18th-century Italian oratorio that exists” [*GD* iii, 718; *GDB* vi, 257]) and his highly expressive \**Seven Last Words on the Cross* (1797), wrote two works that inaugurated a new era in oratorio writing, *Die Schöpfung* (*The Creation*, 1797) and *Die Jahreszeiten* (*The Seasons*, 1801). The latter, though justly called an oratorio, is more secular than religious. Compared to these works, which stand at the summit of a long life of creative activity, Beethoven’s early *Christus am Ölberge* (op. 85, comp. 1800, pub. 1811) is insignificant. In the first half of the 19th century Germany underwent a period of oratorio worship similar to that of England, and the works of L. Spohr (1784–1859; *Das jüngste Gericht*), F. Schneider (1786–1853), and Karl Loewe (1796–1869; *Hiob*, 1848) enjoyed a popularity that is hardly justified by their artistic merits but continued until Mendelssohn (1809–47) appeared with his *St. Paul* (1836) and *Elijah* (1846). These two oratorios, with their romantically colored Bach-Handel style, have retained a lasting place of honor, particularly in England. Schumann wrote two secular oratorios, *Das Paradies und die Peri* (1843) and *Der Rose Pilgerfahrt* (1851).

In the second half of the 19th century quite a number of composers produced oratorios (Wagner, *Das Liebesmahl der Apostel*, 1844; Liszt, *Die Legende von der heiligen Elisabeth*, 1862, and *Christus*, 1866; Dvořák, *St. Ludmila*, 1886; Berlioz, *L’Enfance du Christ*, 1854; Franck, *Les Béatitudes*, 1879, *Rebecca*, 1881, etc.; D’Indy, *La Légende de Saint-Christophe*, properly a stage work), but on the whole with conspicuous lack of success. The only great contribution of this period was Brahms’ *Ein Deutsches Requiem* (op. 45, 1857–68), a work that, although not an oratorio in the strict sense of the word (it is based on scriptural passages rather than a free text), cannot be omitted in a description of this form. England saw, after more than a century of mediocrity, a notable revival in oratorios such as H. Parry’s *Judith* (1888), *Job* (1892), and *King Saul* (1894); Elgar’s *The Dream of Gerontius* (1900), *The Apostles* (1903), and *The Kingdom* (1906); W. Davies’ *Everyman* (1904); and W. Walton’s *Belshazzar’s Feast* (1931)—nearly

all compositions written for and performed at one of the British Festivals. Of American oratorios, H. Parker’s *The Legend of St. Christopher* and *Hora novissima* as well as Paine’s *St. Peter* must be mentioned.

In the 20th century, A. Honegger opened new possibilities for the oratorio in his *Le Roi David* (1923) by abandoning the emotionalism of the romantic oratorio and incorporating archaic idioms that give the work an impressive touch of “biblical greatness.” Other composers have cultivated the secular oratorio, e.g., Stravinsky in *Oedipus Rex* (1927, with stage action), Hindemith in *Das Unaufhörliche* (1931), and Hermann Reutter in *Der grosse Kalender* (1933). Recent examples of the religious oratorio are Malipiero’s *La Passione* (1935), Driessler’s *Dein Reich komme* (1948/9; first perf. 1950), Dallapiccola’s *Job* (1950), Stravinsky’s *Threni* (1958), and Orff’s *Comædia de Christi resurrectione* (1956).

**Orchésographie.** Title of T. Arbeau’s important treatise (1589) on the dance. See under Dance music II.

**Orchestra.** I. *General.* In its common meaning, a large ensemble of instruments, as distinct from small ensembles (one player to the part) used for chamber music or from ensembles consisting of special instruments, called \*band. The modern symphony orchestra consists of about 100 instruments divided into four main sections: strings, woodwinds, brass, and percussion:

*Strings:* violin I (18); violin II (16); viola (12); cello (10); double bass (8); harp (2). *Woodwinds:* flute (3); piccolo (1); oboe (3); English horn (1); clarinet (3); bass clarinet (1); bassoon (3); double bassoon (1). *Brass:* horn (6); trumpet (4); trombone (4); tuba (1). *Percussion:* kettledrums (4);

glockenspiel, tenor drum, bass drum, chimes, xylophones, celesta, cymbals, etc., according to requirements. To these may be added organ, piano, saxophones, mandolins, and other special instruments.

The orchestra just described is that generally called for in compositions of the late 19th century (Wagner, Brahms, Bruckner, Tchaikovsky, R. Strauss). In the early decades of the 20th century composers often wrote for considerably larger groups. For instance, Mahler in his Eighth Symphony ("Symphony of a Thousand," 1910) calls for the following: 2 piccolos, 4 flutes, 4 oboes, English horn, 2 E-flat clarinets, 3 B-flat clarinets, bass clarinet, 4 bassoons, contra-bassoon; 8 horns, 4 trumpets, 4 trombones, tuba; timpani, bass drum, 3 pairs of cymbals, tam-tam, triangle, chimes, glockenspiel, celesta; piano, harmonium, organ, 2 harps, mandolin; 4 trumpets and 3 trombones as a supplementary fanfare group; first violins, second violins, violas, cellos, double basses; first and second soprano, first and second alto, tenor, baritone, and bass soloists, two mixed choruses, and boys' choir. The musical revolution that got underway after World War I naturally brought with it fundamental changes in orchestral technique and resources. The giant orchestra of the Mahler period was replaced by small groups, frequently approaching the size of a chamber orchestra but in highly individual combinations that differ greatly from one work to another. The change may be illustrated by comparing two works of Stravinsky's: the one, his *Le Sacre du printemps* (1911-13), utilizes an instrumental group even larger than the list above (though without vocalists), while his *Histoire du soldat* (1918) is scored for violin, double bass, clarinet, bassoon, cornet, trombone, and 8 percussion instruments handled by one player.

II. *History*. The music of the Middle Ages and early Renaissance that can be identified as "instrumental" [see Instrumental music; Instruments, *History*] was chamber rather than orchestral music. Larger ensembles did exist, but they were used mainly for ceremonial and festive occasions, such as welcoming royalty, weddings, and banquets. During the 16th century orchestral groups of fairly large sizes were used in the \*intermezzi. The presentation, in 1565, of a comedy, *La Cofanaria*, with music by Corteccia and Striggio, involved, among others, 4 harpsichords, 4 viols, 2 trombones, 2 tenor recorders (*tenori di flauti*), 2 \*cornetts (*cornetti*), 4 flutes (*traverse*), 2 lutes, 1 bass viol (*sotto basso*

*di viola*), 5 \*storte, and also *dozaina*, *lirone*, and *tamburi* [see Sonneck, in *MA* iii; A. della Corte, *Storia della musica*, i, 271ff]. During the latter part of the 16th century many-voiced motets were occasionally performed by orchestral groups of considerable size. Thus, Massimo Troiano (*Dialoghi*, 1569) reports that Striggio's motet "Ecce beatam lucem," written in forty parts for four choirs, was performed at a marriage ceremony of the Bavarian court by 8 *tromboni*, 8 *virole da arco*, 8 *flauti grossi*, 1 *instrumento da penna* (harpsichord), and 1 *liuto grosso* (large lute). Giovanni Gabrieli's *Sacrae symphoniae* of 1597 are the first compositions to indicate a specific instrument for each part, namely, *cornetti*, trombones, and violins [see Editions XXIII, 2, nos. 6, 11, 12, 16]. One of these compositions, the famous *Sonata pian' e forte*, employs two instrumental groups, one consisting of *cornetto* and 3 trombones, the other of violin and 3 trombones. The apotheosis of the Renaissance orchestra is represented by the instrumentation for Monteverdi's *Orfeo* of 1607. It consisted of: 2 harpsichords (*gravicembali*), 2 double-bass viols (*contrabassi de viola*), 10 viols (*virole da braccio*), 1 harp (*arpa doppia*), 2 violins (*violini piccoli alla francese*), 2 bass lutes (*chitaroni*), 2 organs with wooden pipes (*organi di legno*), 3 bass viols (*bassi da gamba*), 4 trombones, 1 \*regal, 2 cornetts, 1 small recorder (*flauto alla vigesima seconda*), 1 high trumpet (*clarino*), and 3 "soft" trumpets (*trombe sordine*), the trumpets having the usual (though unspecified) kettle-drum support, at least in the overture. Praetorius carefully designated kettledrums in his *Polyhymnia caduceatrix* (1619).

In the 17th century, instrumental groups were usually small and variable. Music of the *basso continuo* type was performed by violins (for the upper parts) and a group of foundation instruments, such as harpsichord (or organ), bass viol, harp, lute, and theorbo, for the continuo [see the Sinfonia of Landi's *Il Sant' Alessio*, c. 1632; repr. in *HAM*, no. 208]. Contrapuntal music, such as instrumental canzonas, was played by what instruments were available. Occasionally, instruments are specified, as, e.g., in Legrenzi's "sonata" *La Buscha* (1655), scored for two *cornetti*, *fagotto*, 2 *violini*, and *viola da braccio* [see *HAM*, no. 220]. The most famous orchestra of the 17th century was that established by Lully under the name "Les vingt-quatre violons du Roi," which, as the name implies, consisted mainly of strings. About 1700, this included a well-defined group of wind instruments, flutes,

oboes, and horns, in addition to the violins, which by this time had replaced the earlier viols.

In the 18th century, trumpets and kettledrums were occasionally required. Bach's cantata, "Preise, Jerusalem, den Herrn" (1723), composed for the election of the city council of Leipzig (*Ratswahlkantate*), utilizes the following: 4 voice-parts, 4 trumpets, 2 timpani, 2 flutes, 3 oboes, 2 *oboi da caccia*, first and second violins, violas, and continuo, the last to be played by cellos and an organ. Under Johann Stamitz (1717–57), the main representative of the Mannheim school, the orchestra became more standardized: string section and doubled wind instruments, flutes, oboes, horns, and bassoons [see *HAM*, no. 294]. By the end of the 18th century this was amplified into the standard orchestra of the Viennese classics, consisting of 2 flutes, 2 oboes, 2 clarinets, 2 bassoons, 2 horns, 2 trumpets, 2 timpani, and the string group (first and second violins, violas, cellos, and double basses). In the 19th century, Weber, Berlioz, Meyerbeer, and Wagner contributed most to the development of orchestral resources. Berlioz in his *Grand Traité d'instrumentation et d'orchestration* (1843) discusses, in addition to the above-mentioned instruments, the harp, guitar, mandolin, piano, English horn, contrabassoon, bass clarinet, piccolo, organ, various sizes of trombone, bass tuba, glockenspiel, bass drum, tamtam, cymbals, side drum, triangle, castanets, saxophones, saxhorns, and various instruments that have dropped out of use. He describes the make-up of what he considers an ideal concert orchestra, containing 121 players, and, for giant festivals, a 465-member orchestra. Wagner designed and introduced the tubas (actually horns) named after him, which were later employed by Bruckner and R. Strauss. Shortly before 1900 the xylophone (Saint-Saëns' *Danse macabre*) and celesta (Tchaikovsky's *Nutcracker*) were added to the percussion section and soon were accorded full symphony status, along with other instruments, by Mahler. See *Orchestration*.

**Orchestras.** Following is a selected list of important orchestras (with date of establishment).

I. *United States:* Baltimore Symphony O. (1916); Boston Symphony O. (1881); Chicago Symphony O. (1891); Cincinnati Symphony O. (1895); Cleveland O. (1918); Detroit Symphony O. (1914); Indianapolis Symphony O. (1930); Los Angeles Philharmonic O. (1919); Minneapolis Symphony O. (1903); New York, Philharmonic Symphony O. (1842); Philadelphia O. (1900); Pittsburgh Symphony O. (1926); Rochester Philharmonic O. (1922); St. Louis Symphony O. (1907); San Francisco Symphony O. (1911); Washington, National Symphony O. (1931).

II. *Latin America:* Bogotá (Colombia), Orquesta Sinfónica de Colombia (1936); Buenos Aires (Argentina), Orquesta del Teatro Colón (1908); Caracas (Venezuela), Orquesta Sinfónica Venezuela (1935); Guatemala, Orquesta Sinfónica Nacional (1944); Havana (Cuba), Orquesta Filarmónica (1924); Lima (Peru), Orquesta Sinfónica Nacional (1938); Mexico, Orquesta Sinfónica Nacional (1928); Montevideo (Uruguay), Orquesta Sinfónica del Servicio Oficial de Difusión Radio Eléctrica, abbr. Ossodre (1931); Rio de Janeiro (Brazil), Orquesta Sinfónica Municipal, Orquesta Sinfónica Brasileira (1940); Santiago (Chile), Orquesta Sinfónica de Chile (1922).

III *Europe:* Amsterdam, Concertgebouw Orchestra (1883); Berlin, Philharmonisches Orchester (1882); Brussels, Orchestre National Belge (1895); Geneva, Orchestre de la Suisse Romande (1918); Leipzig, Gewandhaus Konzerte (1781); London, London Philharmonic Orchestra (1932), London Symphony Orchestra (1904); Munich, Bayrisches Staatsorchester (1911), Konzertverein or Philharmoniker; Paris, Concerts du Conservatoire (1792), Concerts Colonne (1873), Concerts Padeloup (1920);

Rome, Concerti del Augusteo (1908); Vienna, Wiener Philharmonische Konzerte (1842).

IV. In the 1930's radio broadcasting orchestras were founded all over the world, not only in the great centers of music but also in numerous other places (Australia, Canada, New Zealand, etc.). The most outstanding were those of the National Broadcasting Company (NBC) and the British Broadcasting Company (BBC).

Lit.: M. Grant and H. S. Hettinger, *American Symphony Orchestras* (1940); J. H. Mueller, *The American Symphony Orchestra* (1951); *Pierre Key's Music Year Book* (1927–28); A. Eaglefield-Hull, *A Dictionary of Modern Music* (1924), s.v. "Orchestras"; A. Einstein, *Das Neue Musiklexikon* (1926), s.v. "Orchester"; R. Nettel, *The Orchestra in England*, rev. ed. [1956]; E. Chateau, *Histoire . . . des orchestres symphoniques aux États-Unis* (1933).

**Orchestration.** The art of employing, in an instrumental composition, the various instruments in accordance with (a) their individual properties and (b) the composer's concept of the sonorous effect of his work. It involves a detailed knowledge of the playing mechanism of each instrument, its range, tone quality, loudness, limitations, etc.

I. *Standard practice.* In traditional music, the *strings* are the backbone of the orchestra and, in general, are given the most important melodic parts of the score. Highly expressive, adaptable, and not too "individual," they are used throughout the composition with only short interruptions. Next in importance as melody instruments are *woodwinds*, each of which has a very characteristic timbre. The woodwinds are generally used sparingly as color effects imposed on the basic drawing of the violins. In the *brass* group, the horns (French horn) are rather similar in character and use to the woodwinds. Particularly in early symphonies (Haydn, Mozart) they are usually combined with the oboes. The trumpets and trombones, the "heavy artillery" of the orchestra, serve chiefly as a reinforcement for the climaxes of massed sound. They are also valuable for soft effects and as solo instruments, the trombones to express solemn grandeur, the trumpets for brilliant passages of a military or other character. The *percussion* group contributes rhythmic life and also special effects (triangle, cymbals, celesta).

II. *To 1700.* Until the end of the 16th century instrumental music was hardly ever written for or performed by specific instruments. Among

the rare exceptions are Dufay's "Gloria ad modum tubae," a vocal canon accompanied by two *tubae* (trumpets) sounding a fanfare ostinato, and A. Busnois' motet "Anthoni usque limina," which calls for the sounding of a bell (*campana*) in every second measure. G. Gabrieli was the first to prescribe specific instruments in his *Sacrae symphoniae* of 1597 [see Orchestra II], but little distinction is made between the capabilities of the various instruments. Monteverdi was perhaps the first to realize what color effects could be obtained by the judicious employment of one instrument or another. On the title page of his *Orfeo* (1607) the large orchestra employed for the first performance is indicated [see Orchestra II]. Although, in conformity with the then novel practice of \*thoroughbass, the score consists largely of the vocal parts and the bass part, the accompanying written directions giving an idea of the desired orchestral effects. For instance, in Act III Caronte (Charon) is always accompanied by the regal and Orfeo by the *organo di legno* [see HAM, no. 187]. Also noteworthy is the use of the violin pizzicato and measured tremolo in Monteverdi's *Combattimento di Tancredi e Clorinda* [see HAM, no. 189].

The 17th-century emphasis on bowed instruments and the prevailing practice of thoroughbass scoring (melody and bass only) were not conducive to progress in the use of orchestral resources. The main place for a variety of instruments was the continuo part, which, in addition to harpsichord and double bass, could be performed by harps, lutes, theorbos, and other "foundation" instruments. This, however, was largely an early baroque practice that disappeared after 1650.

III. *18th century.* By the time of Bach (1685–1750), instruments and techniques of instrumental performance had been improved and various effective combinations worked out. Bach's basic method of orchestration consisted of an impartial distribution of interchangeable parts among string and wind instruments; each of the four fundamental parts—as opposed to the three or five of the 17th century—is independent, melodic, essential, and conceived in general rather than individual instrumental terms. Thus a part, whether for voice, flute, oboe, violins, or even brass, can scarcely be identified save by range. Wholesale duplication of the fundamental parts is common. In arias, where smaller groups of instruments are used, these, as well as special effects such as pizzicato and

*con sordino*, are carried through the entire number, the contrast being from number to number rather than within a piece.

Handel, who had a keener sense of orchestral effect, treated his instrumental forces in a more broadly contrasting style than Bach yet without departing from "contrapuntal orchestration." His occasional use of the small recorder, contrabassoon, trombone, and harp in operas and cantatas is exceptional for the period, while his purely instrumental compositions are often for groups much more conventional than those of Bach. That the makeup of the orchestra was not yet standardized is obvious from an examination of Bach's \*Brandenburg Concertos and four Orchestral Suites.

Although the orchestra as such remained largely unchanged throughout the 18th century, important progress was made in its treatment. Perhaps the first composer to give each instrument a distinct part of its own was J.-P. Rameau (1683-1764). He introduced interesting and unexpected passages on the flutes, oboes, and bassoons, opening the path to the coloristic treatment of the modern orchestra, and he, along with Arne, J. C. Bach, and Gluck, helped the clarinets achieve permanent status. Johann Stamitz (1717-57), leader of the Mannheim orchestra [see Mannheim school], developed the dramatic resources of the orchestra, chiefly the string section, by the use of dynamic variations such as sudden *ff* and *pp*, sustained crescendos, etc. The four symphonies written by K. P. E. Bach c. 1776 may be said to represent the final phase of orchestration prior to the masterworks of Haydn and Mozart. They are scored for two flutes, two oboes, one or two bassoons, two horns, and the usual group of strings. The interchangeable instrumental part of the past gives way to a part characteristic for the instrument for which it is written, though features of the older style remain in the frequent unison of the first and second violins and the near identity of viola, cello, and bass parts, including the harpsichord.

IV. *From Haydn to the present.* During the time of Haydn and Mozart the stringed instruments became entrenched as the foundation of the orchestra, and their numbers grew larger in proportion to the number of performers in the entire group. Each wind instrument was regarded as fully capable of assuming the main melodic line if the occasion demanded, as well as aiding in supplying the harmonic background, since the keyboard instrument was no longer

used for that purpose. Ordinarily, instruments were no longer omitted from entire movements of a work, except in the trio of the minuet, and the orchestral color changed on a moment-to-moment basis, emphasizing the changes of subjects and the alternation of motifs. Beethoven, in his middle and late symphonies, occasionally augmented the orchestra with a piccolo, contrabassoon, third and fourth horn, and trombones; the last three symphonies also require the timpani to be tuned to notes other than tonic and dominant, and the Ninth has one section that uses triangle, cymbals, and bass drum.

The 19th century benefited enormously from improvements in instrument-making, most notably the key mechanisms for woodwinds and the valve systems for horns and trumpets. It also owed much to Berlioz regarding the use of instruments for their particular tone quality, and his ambitious and imaginative compositions greatly influenced such later composers as Liszt, Wagner, and R. Strauss. Berlioz seems to have risen suddenly as an innovator during the 1830's, but if one considers earlier composers, largely of the French school, it is evident that his work is partly founded on the coloristic efforts of Gluck, Cherubini, Méhul, Spontini, Boieldieu, and Weber.

In the second half of the 19th century there developed certain standard practices well known through the works of Wagner, Brahms, Tchaikovsky, Dvořák, and others [see I above]. A notable exception was Bruckner, who employed methods that have been somewhat contemptuously termed "organ orchestration" but that are well suited to the style of his symphonies. The complex scoring of R. Strauss outdid that of all previous composers in technical difficulty. Mahler, too, demanded a virtuoso orchestra and wrote with consummate skill for both small and mammoth forces. In strong contrast, Debussy introduced new methods of utter refinement and a highly developed coloristic technique for which the characteristic name "orchestral palette" has been widely adopted [see Impressionism].

The musical revolution of the 20th century has naturally brought with it many changes in orchestration techniques. One reaction against the 19th-century principles of orchestration was the shift from the huge forces of Strauss and Mahler to smaller groups (chamber orchestra), a change observable in the successive works of Stravinsky and Schoenberg. The breakdown of the standard orchestra was also spurred by the

search for new timbres and combinations. One method was "perverted orchestration," e.g., giving the melody to the brass and using the strings for percussive effects; often used by Stravinsky, it has been widely employed for many purposes, including parody. Other approaches included the eliciting of new sounds from standard instruments, especially percussion and harp (Carlos Salzedo); the scoring largely or exclusively for percussion (Stravinsky's *Les Noces*; Varèse's *Hyperprism* and *Ionisation*); the adoption of Latin American or other exotic instruments (such as the Hungarian cimbalom, used not only by Bartók and Kodály but also in Stravinsky's *Renard* and *Ragtime*); the employment of unusual sound-effect instruments (big iron chains in Schoenberg's *Gurrelieder*; sirens, roulette wheel, typewriter, rattle, pistol shots, water splashes, etc. in Satie's *Parade*); and the use of newly invented instruments (Vibraphone in Berg's *Lulu*, the Ondes Martenot in many French works). Anton Webern introduced a new technique known as \**Klangfarbenmelodie*, which became the point of departure for the avant-garde orchestration employed in \**musique concrète* and \**electronic music*, an "orchestration without orchestra."

**Orchestrion.** See under Mechanical instruments III.

**Ordinary and Proper** [L. *ordinarium, proprium*]. In the Roman Catholic rites, the Ordinary is the portion of the service that remains the same no matter what day it is performed, while the Proper includes all the variable texts and chants. The distinction is particularly important with the Mass [see Mass A]. Other services, however, also contain invariable and variable portions, e.g.,

the \**Magnificat* is a part of the Ordinary of Vespers.

**Ordo** [L., pl. *ordines*]. See under Modes, rhythmic.

**Ordo Romanus** [L.]. Designation for early liturgical books (7th–9th centuries) containing descriptions of the liturgy as celebrated by the Pope. Their contents include important information concerning the early form of Mass chants, e.g., the Introit with numerous verses [see *ApGC*, pp. 52f, 190]. They are edited in M. Andrieu, *Les Ordines romani du haut moyen âge*, 3 vols. (1931–35).

**Ordre** [F.]. In F. Couperin's *Pièces de Clavecin* (1713–30), name for his suitelike collections of pieces in the same key. An *ordre* usually begins with a few pieces in the style of an *allemande*, *courante*, and *sarabande*, but also includes a great many other pieces with fanciful or descriptive titles. See Suite III.

**Orfeo.** See *Favola d'Orfeo, La* (Monteverdi); *Orphée aux Enfers*; Orpheus and Eurydice.

**Orfeo ed Euridice.** Opera in three acts by Gluck (libretto by R. di Calzabigi), produced in Vienna, 1762 (produced in Paris, as *Orphée*, 1774, with French text). Setting: Greece, legendary times. The story is essentially the same as that of Monteverdi's *La Favola d'Orfeo*, the main difference being that the tragic and heroic close of Monteverdi's work is replaced by a happy ending (Amor, the god of Love, appears and restores Euridice to life). *Orfeo* is the first of Gluck's reform operas.

**Organ** [F. *orgue*; G. *Orgel*; It. *organo*; L. *organum*; Sp. *órgano*]. I. *General description.* The organ is a keyboard instrument, operated by the player's hands and feet, that consists of a series of pipes standing on a wind chest. The wind chest is fitted with valves connected to the keys, either by a direct mechanical linkage or by electrical and/or pneumatic intermediaries. Means also are provided for delivering a constant supply of air under pressure to the chest. Traditionally the wind was supplied by \**feeders* or bellows; since about 1915 the source of supply has been an electric rotary blower, in which case the bellows serve merely as a reservoir whose top is weighted or sprung to ensure a steady pressure. The simplest organ consists of one set of pipes, each pipe corresponding to one key of the keyboard. However, to make available a variety of tone colors for the performer, organs usually

have several sets (\*ranks) of pipes, known as \*stops or \*registers, which can be brought into play or retired—i.e., “stopped”—at will.

II. *Mechanism.* In all organs, ancient or modern, the sounding of a desired pipe is effected by a combination of two mechanisms that operate crosswise in the manner of Cartesian coordinates. One of these, the “abscissa” ( $x$ ), is actuated by depressing a key, while the other, the “ordinate” ( $y$ ), is actuated by drawing a stop. In geometry an ordered pair of numbers ( $x, y$ ) is required to determine a point; in organ playing a key must be depressed and a stop be drawn if a particular pipe is to speak. The means for effecting these two types of control vary. Prior to the mid-19th century the mechanism was a mechanical linkage, a system of levers known as \*tracker action. Thereafter pneumatic and/or electric mechanisms became increasingly common until the second quarter of the 20th century, when tracker key action began to reappear.

(a) Tracker organ. In a hypothetical miniature organ with three ranks and seven keys, there will be 21 pipes and 21 holes arranged in three lines of 7 each in the upper board (table) of the wind chest. For each rank there is a thin strip (slider) of wood or plastic bored with seven holes and arranged so as to slide freely beneath a stationary toe board, also bored with seven holes, over each of which stands a pipe. Drawing a knob (stop, drawstop) adjacent to the keyboard aligns the holes of table, slider, and toe board, thereby setting one rank of pipes in readiness to sound. To each key is linked a hinged valve (pallet) that, when opened by the player's depressing the key, allows air to pass from the constant wind supply into a narrow rectangular note channel (key chamber) running crosswise beneath the three sliders. In order to obtain a desired tone, say, that of the pipe C of the rank Principal, the player draws the knob labeled “principal,” thereby placing that register in readiness, and presses the key C, which pulls on the trace rod (tracker) connecting the key with the C pallet, causing the pallet to move down on its hinge. Air then passes into the C note channel and upward through the C hole in table, slider, and toe board into the C pipe of the principal, which sounds.

(b) Electropneumatic organ. In the electropneumatic organ each pipe has its own individual valve, which is mounted on a leather pneumatic (pouch) that is inflated when the valve is in off (closed) position and the pipe is not sounding. When the pouch is deflated, the valve opens and the pipe above speaks. In this type of

action the depression of a key closes an electric circuit that activates a magnet. The minute armature of the magnet acts as a pneumatic valve, which, unless intercepted by the stop action, exhausts all the pouches controlled by the key. In like manner, the drawing of a stop exhausts a channel that allows the key action to take effect. Thus, as with the slider chest, it is only when the key and stop mechanisms intersect at right angles that a pipe speaks. There are many variants of electric action, some of which are illustrated in Audsley, *The Art of Organ Building* [see Lit.]. In the case of key action, the tracker mechanism has certain advantages [see section XI below].

III. *Keyboards and divisions.* An organ meeting the minimum requirement for a proper rendition of the literature will have two keyboards (\*manuals), each controlling a separate division of five or six stops, and a keyboard for the feet (pedal) commanding two to five stops. Organs having four manuals and pedal with fifty to one hundred stops are common, however, and even five to seven manuals have been employed. The divisions, or “organs,” connected with the various keyboards are called *pedal organ*, *great organ*, *swell organ*, *choir organ*, *positive organ*, *solo organ*, and *echo organ*. (Foreign names such as *Hauptwerk*, *Rückpositiv* [G.] and *récit* [F.] are occasionally used.) Their allotment to the different manuals varies a great deal (except, of course, for the pedal organ), and so does the selection of pipes connected with each of them.

IV. *Couplers, etc.* Practically every organ possesses devices that make the various divisions available on keyboards other than their own. These are the so-called couplers. For instance, coupler swell-to-great makes the swell organ available on the manual for the great organ, so that stops from both can be sounded simultaneously. Similarly, any manual can be coupled to the pedal. Suboctave couplers and superoctave couplers connect one manual with the lower or higher octave of another manual or of itself. [See also Divided stop.]

Changes in \*registration are sometimes desired at moments when the player's hands are too occupied on the keyboard to manipulate a number of stops. To facilitate such changes, special controls are provided in the form of thumb buttons or toe studs. Each of these so-called pistons controls an *ad libitum* selection of stops, which the player can arrange in advance and then can instantly bring into play by a single touch on the piston.

V. *Compass*. The normal compass of the modern organ manual is sixty-one notes or five complete octaves extending from C to c'''. That of the pedal keyboard is thirty-two notes or two and one-half octaves extending from C to g'. The compass has not always been so large. Bach's organs usually had one octave less on the manuals (C to c'') and five keys less on the pedal (C to d'); on the other hand, the English organ of Purcell and Handel, lacking pedals entirely, had a deeper manual compass (G<sub>1</sub> to f'''). The actual pitch range of the organ is much greater than the compass of its keyboards, owing to the fact that there are, in addition to the pipe ranks of normal (unison) pitch (comparable to that of the piano), others whose pitch is one or two octaves lower or higher. The normal pitch is called unison and is indicated by the symbol 8' [read eight-foot; see Foot (2)], the suboctave pitch is 16', and there are three superoctave pitches, designated 4', 2', and 1'. On the pedal the normal pitch, being an octave below that of the manual, is known as 16' pitch, its suboctave being 32'. The frequency of 32' C is approximately 16 vibrations per second while that of the top C of a manual 2' stop is more than 8,000. Thus the real compass of the instrument extends over nine complete octaves.

VI. *Mutation and mixture stops*. In addition to the various octave pitches, called *foundation stops*, there are the so-called *mutation stops*, whose pitch corresponds to one of the harmonics of the unison pitch. For instance, a mutation stop 2 $\frac{2}{3}$ ' is tuned to the third harmonic (twelfth) and hence will sound g' if the key of c is depressed [see explanation under Foot (2)]. Such stops are not to be played alone (which would result in transposition) or with a unison stop of about the same loudness (which would result in parallel fifths), but together with a unison stop of considerably greater force, in which case the mutation stop ceases to be heard individually and merely serves as an artificial harmonic, thus modifying the timbre of the unison stop. Finally there are *mixture stops* (also called *compound stops*), i.e., stops that combine a selection of unison and mutation ranks. These serve the same purpose as the mutation stops just described and must also be drawn together with a sufficiently strong unison stop. Mutation and mixture stops, if properly used, are among the organist's most valuable resources for obtaining a variety of tone color and clear articulation.

VII. *The organ case; expression*. By the 15th century it was customary to place the wind

chests, pipes, and mechanism of the organ in a large wooden cabinet, known as the organ case, closed on all sides but the front. The keyboards and stop controls were centered in front at floor level, while the show pipes (open diapason, principal, prestant, montre) stood in the opening above the keyboards and together with decorative carvings formed a perforated screen through which the sound from pipes inside the cabinet could pass. An important (and original) purpose of the organ case was to protect the delicate pipes and mechanism, but the case was also of musical value in (1) blending the sound, (2) imparting its own cavity-resonances to it, and (3) projecting sound toward the listener. In old organs, both case and wind chest acted as blending agencies, each making use of the tendency of two organ pipes, especially those speaking in unison or octaves, to "draw" or "pull," i.e., to synchronize pitch, in so far as they are able to "hear" each other, either through their common note channel [see II] or via the concentrated sound field inside the case. Cavity-resonances in the case were responsible for an attractive burgeoning of the sound in tenor or bass octaves even from pipes of slender scale, an effect similar to the baritone bloom in antique harpsichords although derived differently, i.e., by air resonance rather than timber resonance. For sound projection the close-fitting cabinet acted as a band-shell, giving the organ good attack even in highly reverberant buildings. In the 17th century, when organs grew to the point of having several divisions, each division was likely to be given its own tone cabinet in the over-all complex of the organ case, and at least one division, the *Rückpositiv* or chair organ, was nearly always separately situated at the gallery railing below the main body of the instrument and behind the player. In performing on such an organ, to change from one manual to another is to move the source of sound from one cabinet to another, producing a stereophonic effect that, when heightened by differences in registration and cabinet resonance, is eminently in keeping with the terraced dynamics of the baroque style. The principle according to which an organ is thus visibly divided into cabinets, each relating to a keyboard, is known as the \**Werk* principle, a system of organization that became unfashionable during the 18th century but that has been revived in the 20th. A tone cabinet that survived the abandonment of the *Werk* principle is the expression chamber or swell box, in effect a cabinet whose opening is covered by a set of Venetian

shutters that can be opened or closed in varying degrees by a foot pedal. Though artificial, this is for the organ the only possible means for varying dynamics, other than the stepwise addition or subtraction of stops.

VIII. *Organ pipes in general.* There are two distinct classes of organ pipe: flue and reed. The flue pipe closely resembles the ordinary tin whistle [see Whistle flute], in which a vibrating air sheet sets up vibrations in the column of air surrounded by the pipe. The complete flue pipe is made up of the following parts: the "body," the cylindrical portion that encloses the column of air; the "foot," usually a tapered cone connecting the body to the wind supply from the chest; and the "mouth," a rectangular opening cut from the body at the point where the foot joins it. At the mouth, the cylindrical body and the conical foot are flattened, and the straight edge thus formed at the top of the mouth is called the "upper lip." Similarly, the so-called "lower lip" is the straight, flattened portion of the foot just below the mouth. The "languid" is a flat piece of metal forming an internal partition between foot and body; along its front edge it is beveled and arranged so as to form, with the lower lip, a narrow slit known as the "flue," through which the wind sheet issues. When a pipe is sounding, the wind sheet, as it rises from flue toward upper lip, flexes in and out of the mouth in a complex way, exciting the resonant air column within the body of the pipe. Flue pipes are extremely sensitive to their geometry at the mouth, so that shaping and adjusting the languid and lips, known as "voicing," requires considerable skill. Of particular interest in voicing is the so-called "nicking," a row of serrations or nicks cut into the edges of the languid and lower lip where they form the flue. An unvoiced metal organ pipe whose flue is not closed up to a hair's breadth produces, when first winded, a strong transient, onomatopoeically known as the "chiff," followed by a coarse and unstable note displaying many nonharmonic overtones. Other conditions being favorable, a small number of shallow nicks will purify and steady the note without dispelling the chiff. Deepening the nicks and increasing their number eventually eliminates the chiff entirely, at the same time tending to make the steady note dull and lifeless. Although the chiff was anathema to 19th-century musicians, used in moderation it was not unfavorably regarded in earlier times and is perhaps better thought of today than ever before, owing to current interest in the horizontal aspect of

music, i.e., the clarification of contrapuntal line, to which the chiff undoubtedly contributes. In tracker organs the chiff can be controlled to a limited extent by the player according to the speed with which he depresses the key.

Flue pipes are tuned by lengthening or shortening the pipe. This is accomplished at the top of the pipe by a sliding sleeve (tuning slide), or by rolling down a strip of metal from the top, or by "coning" the top of the pipe in or out so as to make the top opening smaller or larger.

The type of reed pipe used almost exclusively in the organ is known as the *beating reed* and must not be confused with the free reed employed in the harmonium or reed organ [see Reed II]. The beating reed consists of a vibrating brass tongue, slightly curved, which rolls down over a long opening in the side of a brass tube, or "shallot." The lower end of the shallot is closed so that when the tongue rolls down flat against the carefully flattened surface surrounding the opening no air can pass into the shallot. The upper end of the shallot is connected to the lower end of a resonator or horn, usually conical or cylindrical, whose upper end is open to the air. Shallot and tongue are held firmly together in a heavy block of metal or wood; the resonator is inserted into the top of the block, while the block in turn is inserted into a socket that conveys the wind up from the wind chest. When wind is admitted to the socket it surrounds tongue and shallot, causing the tongue to commence vibrating, which, by alternately opening and closing, sends pulses of air via the shallot into the resonator, thereby exciting the air column enclosed within the resonator and causing a note to issue from its open end. The tone of a reed pipe is extremely sensitive to the shape of its shallot and shallot opening, and especially to the thickness and curvature of the tongue, whose proper adjustment is perhaps the most refined skill in organ building. Tuning and loudness are regulated jointly at two points, first by lengthening or shortening the resonator at its upper end, and second, by a tuning wire in the block that controls the free vibrating length of the tongue.

IX. *Flue pipes.* There are two fundamental kinds of flue pipe: the "principals" and the "flutes." The basic difference between them is the way they are voiced, i.e., adjusted at the mouth, and one speaks of a pipe as being voiced to operate in "principal mode" or in "flute mode." In principal mode the wind sheet vibrates in such a way as to develop in about equal strength the first and second harmonics,

while in flute mode only the first harmonic (fundamental) is emphasized. For a particular pipe to operate in principal mode, either the mouth height (cut-up) must be relatively low or the volume of air passing through the pipe must be large. The same pipe may be voiced in flute mode by reducing the flow of air, or by increasing the cut-up, or both. Principal mode also requires a higher setting of the languid than does flute mode.

(a) Diapason or principal tone. The bodies or resonators of organ flue pipes are made in a large variety of shapes, but the most common is that of the so-called diapason or principal, a cylindrical tube of moderate scale [see Scaling], open at the top. The concerted sound of these pipes is characteristic of the organ alone, and it is the diapason chorus that accounts largely for the sonority known as "full organ." Diapasons may occur at all possible pitches. In an organ of moderate size they are likely to be found at 8', 4', 2½' and 2' pitches on the manuals, at 16', 8', 5½' and 4' on the pedals, and in practically all mixtures [see IX (f) below]. Usually only the 16' and 8' members of the chorus are labeled diapason, those of higher pitch simply being labeled according to their position in the diatonic scale relative to unison, e.g., octave 4', twelfth 2½', fifteenth 2'.

Diapason pipes operate in principal mode. The tone of a single rank is apt to be somewhat assertive and moderately full, with a moderate harmonic development. A considerable variety of diapason tone exists: the violin diapason is of smaller scale and tends toward the string side, while the montre of an 18th-century French organ is quite full and fluty in character.

(b) Flute tone. The most common variety of organ flute is the stopped flute [G. *gedackt*, F. *bourdon*], whose large-scale cylindrical bodies are made of wood or metal with a stopper or plug in the upper end. The stopper has two effects: (1) it acoustically doubles the length of the body so that the note spoken is an octave lower than it would be with the end open; (2) it attenuates the even-numbered harmonics (second, fourth, sixth, etc.). The latter effect, in conjunction with the natural emphasis on first harmonic given by flute-mode operation, causes the stopped flute to produce mainly fundamental (first harmonic) with but a trace of "quint" (third harmonic). An emphasis on fundamental is the hallmark of organ flutes; with their marked quickness of speech, flutes are ideal for rapid passages, particularly when com-

bined with mutations [see (e) below] or a quiet mixture [see (f)].

The *chimney flute* has a small-diameter open tube extending upward from its stopper, while *koppel* and *spindle flute* substitute a form of open-topped, cone-shaped extension for the stopper. All three have greater harmonic development than the stopped flute, owing partly to the encouragement of even-numbered harmonics by the small opening at the top. Stopped and half-stopped flutes occur frequently at 8' and 4' pitches on the manuals and at 16', 8', and 4' on the pedal.

Large-scale open flutes having no stopper, such as the *nighthorn* and *block flute*, are often used at 4' and 2' pitches and as mutations [see (e)]. These do not have the "quinty" sound of the stopped flutes but have greater carrying power and stability in the treble. The harmonic flute, a large-scale open flute of double length with an octave hole drilled at the midpoint of the body, represents an effort to imitate the orchestral traverse flute. It occurs occasionally at 8' though more usually at 4' pitch.

(c) String tone. String-toned stops such as the *cello*, *viola*, *salicional*, and *gamba* have a high harmonic development, causing the tone to be thin and cutting. String tone is actually an extreme form of principal tone; it is produced by using pipe scales that are narrower than normal principal scale and voicing techniques that emphasize the intrinsically bright character of principal mode. Because of their narrow scale, strings articulate with difficulty. They are therefore unsuitable for rapid passages and indeed were never fully developed as organ stops until the 19th century, when sonority replaced agility as the most important feature of a musical instrument. String stops produce a distinctive sonority, particularly when they occur in pairs that are intentionally tuned one sharp to the other so as to produce a slow undulation. Such a pair may be labeled *voix céleste* or *unda maris*.

(d) Hybrids. *Spitzflute* and *gemshorn* ranks commonly have pipe bodies in the form of an inverted cone. This construction brings into prominence the second harmonic, and, according to scale, amount of taper, and the mode of vibration used at the mouth, the tone lies either between principal and flute or between string and flute. Because of its hybrid nature, this class of tone often appears on a small organ or small division where a single stop must do the work of both a flute and a principal. Mutation stops of

$2\frac{2}{3}'$ ,  $1\frac{1}{2}'$ , and  $1\frac{1}{3}'$  pitches are successfully constructed as hybrids.

(e) Mutations. The mutation stop is characteristic of the organ, its chief use being with a unison or octave rank or a combination of such stops to alter the tonal character by artificially bringing into prominence a particular overtone. Mutation ranks greatly increase the tonal variety of the instrument, since each new way of combining them with unisons and octaves produces a strikingly different result. They thus are useful for producing solo combinations and for giving an individual character to each voice line in contrapuntal music of several keyboards, e.g., trios for two manuals and pedal. When the mutation stops called *nazard*  $2\frac{2}{3}'$  and *tierce*  $1\frac{1}{2}'$  are combined with three flutes of 8', 4', and 2' pitches respectively, the effect toward the treble is reminiscent of a trumpet and is known as the *cornet*. Traditionally the cornet is a solo voice for use either by itself or with a trumpet stop, in which case it serves to strengthen the treble register of the latter.

(f) Mixture stops. Mixtures, or compound stops, usually comprise from two to seven principal pipes per note of the keyboard arranged to speak certain harmonics of the note. There are a great many varieties of mixture, but normally the ranks employed speak only octaves and fifths (quints). A typical mixture for a great division might be laid out as follows:

	row I	row II	row III	row IV
C to B :	$1\frac{1}{3}'$	1'	$\frac{2}{3}'$	$\frac{1}{2}'$
c to b :	2'	$1\frac{1}{2}'$	1'	$\frac{2}{3}'$
c' to b' :	$2\frac{2}{3}'$	2'	$1\frac{1}{3}'$	1'
c'' to b'' :	4'	$2\frac{2}{3}'$	2'	$1\frac{1}{2}'$
c''' to c'''' :	8'	4'	$2\frac{2}{3}'$	2'

Here the pitch of each rank is as usual indicated by the length of the C pipe [see Foot]. (In the case of those ranks that do not extend down to C, e.g., the 2' rank, the pipe length given is the one the C pipe would have if the rank were carried all the way down.) Breaks occur here between each B and C, where the highest-pitched rank is discontinued and a new low-pitched rank is introduced. A practical reason for the breaks is the impossibility in the treble of even hearing high-pitched ranks such as the  $\frac{2}{3}'$  and  $\frac{1}{2}'$ ; a musical reason is that high-pitched pipes used in the bass give attack and definition to slow-speaking diapason basses, while multitudinous pipes of comparable length lend mass

to the treble. Each division of a well-appointed organ of moderate size will have a diapason chorus capped by one or more mixtures. Mixtures composed of octaves and quints may bear names such as *mixture*, *plein jeu*, *fourniture*, *Scharf*, and *cymbal*. Mixtures containing also third-sounding ranks (*tièrces*) may appear under labels such as *sesquialtera*, *tertian*, and *terz-cimbel*. All sorts of scaling may occur, from very wide to very narrow.

X. *Reed pipes*. There are three kinds of reed pipe: *chorus reeds*; *semichorus reeds*; and *solo or orchestral reeds*. Chorus reeds belong chiefly to the trumpet family and appear in the modern organ on both manual and pedal divisions at subunison, unison, and octave pitches. *Posaunes*, *trombones*, *trumpets*, *cornopeans*, and *clarions* are in this category. Although their names suggest orchestral tones, they differ in quality considerably from their orchestral prototypes. They are purely organ voices and are used to add power and vigor to the ensemble. They may also be employed for solo work. The trumpet family have conical resonators of full length, i.e., 8' C has a resonator of approximately 8' length.

Semichorus reeds come to us largely from the baroque period and are not imitative, although their names may suggest an orchestral background. The *cromorne*, *schalmey*, and *rankett* are typical examples. The term "semichorus" is used because they may function as chorus reeds, solo stops, or merely timbre creators in combination with other voices. The resonators of this class of reed are often cylindrical and short. They may be half-, quarter-, or even an eighth-length.

The solo or orchestral reeds are imitative of various orchestral instruments, such as the *basoon*, *English horn*, *clarinet*, and *orchestral oboe*. They are used largely as solo stops.

XI. *Tonal structure of the organ*. The organ is unique among instruments in that the choice of voices (i.e., stops) that go into its makeup is arbitrary. The list of the stops in an organ, called the "specification," varies greatly from one organ to another, especially if organs of different periods are taken into consideration. In earlier times, an organ was designed for performing a limited repertory consisting mainly of music of its period. The wide range of the modern repertory, however, has required great emphasis on designing organs on which the music of all periods can be played. This is by no means an easy task when one considers the long lifespan of the instrument. A conscientiously eclectic sample specification might be:

## GREAT

Quintaten 16' (wood)  
Principal 8'  
Spitzflöte 8'  
Octave 4'  
Rohrflöte 4'  
Quint 2 2/3'  
Super octave 2'  
Nachthorn 2'  
Mixture IV-V ranks  
Scharf III-IV ranks  
Cornet II-V ranks  
Double trumpet 16'  
Trumpet 8'  
Clarion 4'

## SWELL (enclosed)

Geigen principal 8'  
Viole-de-gambe 8'  
Viole céleste 8'  
Chimney flute 8'  
Principal 4'  
Lieblich flute 4'  
Fifteenth 2'  
Sesquialtera II ranks  
Plein jeu IV-VI ranks  
Contre hautbois 16'  
Trompette 8'  
Vox humana 8'  
Clairon 4'  
Tremulant

## POSITIVE

Gedackt 8'  
Dulciana 8'  
Principal 4'  
Koppelflöte 4'  
Nazard 2 2/3'  
Octave 2'  
Tierce 1 3/4'  
Larigot 1 1/2'  
Super octave 1'  
Scharf IV ranks  
Cymbel III ranks  
Dulcian 16'  
Krummhorn 8'

## PEDAL

Principal 16'  
Bourdon 16'  
Octave 8'  
Spillflöte 8'  
Quint 5 1/3'  
Choralbass 4'  
Nachthorn 4'  
Blockflöte 2'  
Mixture IV ranks  
Bassoon 32'  
Posaune 16'  
Trompette 8'  
Schalmei 4'

Although this specification might be acceptable to many organists and organ builders, opinion is presently divided over the basic principles of organ construction. Two widely differing principles are in use today, the so-called tracker principle and the electropneumatic principle. The names derive from the kind of key action used, but the differences go beyond any question of key action.

In its purest form, the modern tracker organ embodies the following characteristics: (1) only mechanical connections between keys and valves [see II (a)] and therefore, (2) proximity of key desk and wind chests; (3) a functional and often decorative wooden organ case—essentially a large piece of furniture—standing freely within the auditorium [see VII]; (4) slider wind chests throughout; (5) low wind pressures; (6) use of the *Werk* principle [see VII]. The modern tracker organ thus retains a geometry and a tonal ideal already firmly established in the 17th century, though employing modern materials for the effective operation of its mechanism and often

drawing on registers and sonorities from later periods, e.g., the voix célestes. By contrast, the modern electropneumatic organ, while adopting many sonorities and registers from the 17th century, employs a less predictable geometry. It is usually characterized by: (1) electrical connections between keys and pipe valves, and therefore, (2) free choice of placement for the key desk with respect to the wind chests; (3) free arrangements of the pipes on the wind chests; (4) wind chests having a separate valve for each pipe [see II (b)]; (5) freedom to use both low and high wind pressures; (6) emphasis on the decorative possibilities presented by freely exposed masses of pipes, with minimal adherence to the *Werk* principle, and often with part of the organ recessed in chambers.

A well-built tracker action affords the player a sense of immediacy (through "feedback") that is totally unattainable with electropneumatic action. Taken all together, the unifying effect of a slider chest, a shallow focusing tone cabinet, pipework voiced with a modicum of chuff, and an uncoupled tracker action produces a precision of attack and release akin to that of the harpsichord and piano and invaluable in the performance of contrapuntal music. By contrast, electropneumatic action, while lacking the preciseness that makes for a good keyboard instrument, provides the best means for controlling a very large organ, when attention necessarily focuses on variety and expansiveness of sonority rather than on subtle keyboard articulation. It also provides a means of adapting the pipe organ to the impractical physical arrangements often presented to the organ builder by church and auditorium architects.

XII. *History.* Legend traces the organ back to the "Syrinx" (panpipes) and similar primitive wind instruments consisting of a group of pipes or reeds of varying pitches (rather than a single pipe bored with finger holes). If we regard the organ as a wind instrument that, besides having multiple pipes of fixed pitches, is mechanically supplied with air under pressure and played from a keyboard, then it dates from c. 250 B.C., when the Greek engineer Ktesibios of Alexandria is supposed to have invented the \*hydraulos (as recorded in Hero's *Pneumatika*, c. 120 B.C.). The hydraulos had a set of fixed-pitch pipes, a crude keyboard of limited compass, and a mechanical wind supply regulated by water pressure. While Hero's account is the first recorded instance of a "modern" organ, the hydraulos doubtless had even more primitive antecedents. The hydraulos was used at least until the end of the 5th century.

Its uses were entirely secular, and it was popular at festivals and in outdoor arenas, suggesting that it made a loud sound.

The pneumatic (as opposed to hydraulically regulated) organ made its first recorded appearance c. A.D. 120, when an organ supplied with wind by means of a simple bellows is mentioned in a passage from J. Pollux's *Onomastikon*. Another early reference to this type of organ is found in an epigram of the Roman Emperor Julian the Apostate (A.D. 331–63). Elaborate Byzantine organs with gilded and silvered pipes are described in reports from A.D. 867 to 946. Such instruments were sometimes made as royal gifts. In 757 the Byzantine Emperor Constantine Copronymus is said to have presented one to the Frankish King Pepin, and in 812 Charlemagne received a similar instrument.

In England the organ was known as early as the 7th century, as appears from the writings of Bishop Aldhelm (c. 640–709), who repeatedly praised it for its "mighty voice." A large organ is recorded by the monk Wolstan as having been erected at Winchester Cathedral under the Bishop Elphege (d. 951). It supposedly had 400 pipes and 26 bellows, was played by two organists on two keyboards of 20 keys each, and had an exceedingly powerful sound. During the early Middle Ages virtually all English and Continental organs were built by ecclesiastics.

The hydraulos and all recorded early pneumatic organs up to as late as 1100 had a very crude key mechanism consisting of slides that were simply pulled out or pushed in to open the pipes. In a more advanced model, such slides were connected to large hinged "keys," which were either pushed down like the keys of a carillon or, as Michael Praetorius suggests in his *Syntagma musicum*, vol. ii (1619) struck with the fists. This type of action employed a return spring that facilitated playing.

Prior to the 15th century there was no means of controlling individual ranks of pipes, so that the color or intensity of the sound produced could not be varied. The very earliest organs (i.e., the hydraulos and the most primitive pneumatic organs) had only one set of pipes and, if one is to believe contemporary descriptions, there was no notion of scaling the pipes [see Scaling] such as developed later. According to these early accounts, all pipes of the set were about the same diameter, varying only in length with their pitch. Such a practice would make the longer pipes tend toward a stringlike sound while the treble pipes gave flutelike sounds. The tonal conse-

quences of this were not too serious, since until the 14th century the compass of organs was never more than three octaves, and often less. Eventually builders began to vary the scaling (diameter) of the pipes along with the pitch length to produce a more even timbre throughout the compass. Also, as larger organs were adopted for church use, the number of ranks of pipes began to increase. As a result, the medieval organ developed as a large mixture [F. *grand jeu*; G. *Werck*, *Hintersatz*; Neth. *Blokwerk*]. To the pipes of the fundamental (8') pitch were added others of higher unison pitches (4', 2', 1') as well as those sounding the fifth (2⅔', 1⅓'), which reinforced and brightened the total harmonic structure.

Increasing the number of ranks necessitated the invention of a more efficient playing action than the old slide system. The modern barred wind chest [see Tracker action] had its inception in the 14th century, and from that time on the key control was achieved by opening a spring-loaded valve (pallet) that admitted wind from a common supply into a note-channel communicating with all the pipes for any given note. By the 14th century, the keyboard had become smaller, ranging up to three octaves in compass and having semitones, particularly in the middle range. The earliest preserved examples of \*organ music (in the Robertsbridge Codex in 1325) require a complete chromatic middle octave.

The next step in the organ's development was the provision of means to vary the loudness and timbre of the sound produced. Organs having more than one keyboard had already appeared; that built in 1361 in Halberstadt, Germany, had three manuals and a primitive pedal, twenty bellows worked by ten men, and pipes as long as 31' (approx. C<sub>2</sub>). As far as can be determined, however, each division of this and similar organs was but a mixture, and those variations of color that were possible were due purely to differences in the strength and timbre of the separate divisions.

During the 14th century, along with the development of large but still cumbersome church organs, there appeared a parallel development of a smaller, more refined, and more tractable instrument called a *positive*. This instrument was a self-contained organ small enough to be moved like a piece of furniture. It had one keyboard, no pedals, and no exceptionally large or loud pipes, since it was often used in small rooms or for accompaniment purposes. Smaller than the great church organs, it had a narrower and more man-

ageable keyboard, which was understandably favored by performers. Positives began to be placed in the chancel area of churches to assist the singing of plainsong by the clergy. Soon afterward some organists began to place a positive organ close to the keyboard of the great organ (by now generally located in the rear or side gallery of the church), making it possible to play both loudly and softly. From this it was but a short step to connect a small (positive) organ to the great organ so that both might be played from adjacent keyboards. The positive division so created came to be located on the gallery rail, immediately behind the organist's back (hence the German name, *Rückpositiv*), the keyboards of both organs being located in the front of the main organ.

The use of separate \*stops, whereby the player could select different ranks of pipes to play while others remained mute, seems to have begun in Italy during the first half of the 15th century. The oldest surviving organ with stops, built in 1470, is in the Church of St. Petronio in Bologna. As this development gradually spread across the Continent, an intermediate type of instrument appeared in Germany, having a great organ consisting of an undivided mixture and a smaller positive organ with stops. Gradually, individual stops began to be added to, or detached from, the main mixture of the great organ, leaving in the end individual stops of different timbres and pitches and one or more stops controlling grouped smaller pipes of higher unison and harmonic pitches. This last vestige of the *Blokwerk* survives in the harmonic-corroborating mixture stops of present-day organs in a much refined and improved form. Examples of these intermediate *Blokwerk*-and-positive organs, dating from the 16th century, are in the Abbey Church of Klosterneuburg (near Vienna) and in St. Nicolai, Utrecht (organ moved to the Koorkerk of Middelburg, Holland, in 1885). A. Schlick, in his *Spiegel der Orgelmacher und Organisten* (1511), describes in detail a church organ of the 15th century that has individual and contrasting registers separately controllable, including diapasons (*Prinzipale*) from 8' to 2' pitch, mixtures of differing compositions (*Zimbel*, *Rauschpfeife*), various flute colors, *Gemshörner*, and reed stops (*Trompeten*). Reed stops seem to have appeared scarcely a century before this time. Mechanically, the organ of Schlick's era had almost reached its final form. It had a regulated wind supply and a fairly sophisticated tracker action. It had barred chests and stop controls that put

stops on and off, either by the now common means of sliders or else by the ventil method [G. Springlade].

While the Gothic church organ and the positive organ are the true ancestors of the modern organ, two other instruments developed during the 14th century also deserve mention. These were the *portative organ*, or organetto, and the *regal*. Both were quite small, the former having a set of ordinary pipes of high pitch and a short-compass keyboard, the latter producing sound by means of beating or free reeds. The regal was actually the ancestor of the modern reed organ or \*harmonium. Both the portative and the regal could be carried by means of a strap around the neck, so that the player could work the bellows with his left hand and play on the keyboard with his right.

Beginning in the 16th century, national schools of organ building began to develop, and these took distinct form during the 17th and early 18th centuries, that remarkable golden age of the organ, and continued a separate evolution until well into the 19th century.

A. The German and Netherlands school of organ building was the first to develop a large organ having more than one manual keyboard, a versatile pedal keyboard, and an advanced and quite varied collection of stops of different pitches and colors, including many varieties of flute and reed stops and complex mixture stops. By Praetorius' time a well-developed polyphonic instrument, controlled by an easily manipulated action and keyboards close in size to modern ones, was ready for the genius of Pachelbel, Buxtehude, and J. S. Bach. This was the much lauded baroque organ of Germany and the Netherlands, many outstanding examples of which have been preserved. Of a number of highly gifted builders who worked in this period, the North German Arp Schnitger stands out. During the late 17th and early 18th centuries, the equally brilliant Gottfried Silbermann flourished in South Germany. After the death of J. S. Bach (1750), both organ composition and organ building began a slow decline in Germany and an even slower one in the more conservative Netherlands. During the 19th century German organ builders swept headlong into decadence, seeking novelties for their own sake and cultivating a generally gross tonal quality along with an emphasis on orchestrally imitative stops.

B. By 1600 the French school had developed a versatile and unique type of organ that lasted in remarkably unaltered form until the late 18th

century. Like the German organ, it had a well-developed great organ and a colorful positive organ, but additional manual divisions were likely to be very limited or specialized and short in compass. While French organs probably possessed pedal divisions as early as German organs did, they never became as complete or independent. France's high point came early in the 18th century, which produced two illustrious builders, François Henri Clicquot and Andreas Silbermann (the brother of Gottfried). It was for the rich, silvery instruments of this period with their splendid reed stops and colorful mutations that F. Couperin, P. Du Mage (c. 1676–1751), J. F. Dandrieu, and N. de Grigny (1672–1703) wrote their unique organ Masses and Noëls. During the 19th century a new romantic school of builders sprang up almost full-blown in a few scant decades, led by the gifted Aristide Cavaillé-Coll. The French romantic organ, while largely indebted to the orchestral concept of organ tone, was also outstanding in its own right, and it had a profound influence on the organ of the 20th century.

C. Partly because of the ravages of the Commonwealth period, there remain no complete English organs of the 16th or early 17th centuries. The English organ received its first great impetus from Bernard Smith and Renatus Harris, who did the bulk of their important work c. 1680–1710 and influenced even foreign-born builders such as C. Shriver and J. Snetzler, as well as all English work up to the early 19th century. Tonally, the 18th-century English organ bore many similarities to the French organ of the same period, especially with regard to the chorus work and the use of the tierce mutation, but it tended to be lighter and gentler. The characteristic that differentiated it most from Continental organs was its lack of a pedal. This was partially compensated for by a keyboard compass that extended down to (10 $\frac{2}{3}$ ') G<sub>1</sub> and sometimes F<sub>1</sub> below the normal low 8' C of Continental (and modern) manual divisions. The English 18th-century style continued well into the 19th century. Early in the 18th century a primitive swellbox was introduced, and early in the 19th equally primitive pedal boards. Like the French, the English moved somewhat abruptly into the romantic era, beginning with the work of William Hill (d. 1871) in the 1830's and culminating in the great mid- and late 19th-century cathedral and concert-hall organs of the first Henry Willis, whose style still influences English organ building.

D. The Italian organ took shape early in the 16th century and remained little changed for the next three centuries. While they were among the first organs to have stops, Italian instruments of the 16th through mid-19th centuries seldom had more than one keyboard. Some had pedal boards, but often these were simply permanently coupled to the manual, having no independent pipes of their own. Although they had no mixture stops, they possessed a great variety of separately drawing mutations, commonly including the 22nd and sometimes extending even to the 36th. These mutations, especially the higher-pitched ones, broke back when the pipes became too small. They thus functioned in the chorus as the ranks of a mixture and were largely unsuited for solo use. Flute stops also appeared at several pitches, but reeds were almost nonexistent. A distinctive stop found in many early Italian organs was the *voce umana* (*fiffaro*), consisting of two ranks of mild principal pipes (tuned one sharper than the other, thus producing an undulating sound similar to that of modern celeste stops). The tone of Italian organs tended to be warm but not particularly loud, despite the complex chorus of mutations. The leading Italian builders were mostly members of the Antegnati family, which flourished in Brescia in the 16th and 17th centuries.

E. The Spanish and Portuguese school had a development similar to the Italian and, like it, halted fairly early, in this case in the early 17th century. Spanish organs tended to be somewhat larger and louder than Italian ones. While they, too, had only crude coupled pedals, after the 16th century they often had two and occasionally three manuals, whose stops were commonly divided at c'. What distinguished Iberian organs from all others, however, was their rich and brilliant reed stops, which in most organs of any size were mounted horizontally from the front (*en chamade*) of the case. The first non-Iberian organ builder to see the possibilities in horizontal reeds was France's Cavaillé-Coll. From France their use spread to other countries, and today such reeds can be found all over America and Europe.

F. The earliest organs in America were either imported from Spain or built by imported organ builders in the 16th and 17th centuries for the cathedrals and monasteries of Mexico and Central and South America. There are records of organs being used in Quebec churches as early as the 1660's, at least one of which was sent from Paris. In the early 18th century the German

colonists in Pennsylvania and the surrounding areas began to import small chamber organs and positives from their homeland, and shortly thereafter organs of English make began to appear in New England, New York, and Virginia. By the mid-18th century two indigenous schools of organ building had begun to develop, in eastern Pennsylvania and around Boston. The dominant figure of this period was David Tannenberg (1728–1804) of Lititz, Pennsylvania, who built a number of excellent organs, including at least one with three manuals. After his death the Pennsylvania school rapidly waned, to be superseded by the fast-growing New York and Boston schools. During the first half of the 19th century Henry Erben (1800–84) and George Jardine (1801–c. 1883) were the undisputed leaders of the former, while William M. Goodrich (1777–1833), Thomas Appleton (1785–1872), and the Hook brothers (Elias, 1805–81; and George G., 1807–80) distinguished themselves in the latter. Whereas the Pennsylvania school had built a distinctly German organ in the South German tradition, the Boston school was thoroughly English in its orientation, as was the New York school. Indeed, the Boston group continued to build in almost pure 18th-century English style until the mid-1850's, when the new romantic movement finally began to be felt. By the 1870's and 1880's the revolution in concept and assimilation of European ideas was fully accomplished. Leaders in this new movement were Hilborne Roosevelt (1849–86) in New York, George Hutchings (1835–1913) in Boston, and the Casavant brothers in Montreal. The advent of electropneumatic action at the turn of the century gave free rein to innovators such as John T. Austin, Ernest M. Skinner, and the Englishman Robert Hope-Jones. The last-named was the inventor of the unit organ and the father of the "theatre organ," a totally orchestrally oriented instrument developed for the performance of popular music and the accompaniment of silent movies. Although Albert Schweitzer issued a plea for an "organ reform" as early as the first decade of the 20th century [see Organ reform], it was not heeded in America for at least twenty years. Then came pioneers such as W. Lynnwood Farnam, who commanded world-wide attention by playing the complete works of Bach in recital during the 1920's, and the organ builders G. Donald Harrison (1889–1956) and Walter Holtkamp, who began to explore the way back to traditional organ tone in the 1930's. From the efforts of such individuals and their

many successors the organ in the next three decades regained much of its former stature as a unique instrument with its own literature, both in America and abroad.

**Organ chorale.** A polyphonic composition for organ based on a \*chorale melody (excluding simple harmonizations such as those suitable for accompanying congregational singing). Although the term is commonly used only for the polyphonic settings of German Protestant chorales, the earlier organ settings of hymns of the Roman Catholic Church must also be considered.

I. *Roman Catholic hymn settings.* Beginning in the early 15th century (Codex Faenza), various items of the service that until then had been performed in the traditional plainsong were replaced by organ compositions. Among them were items of the Mass Ordinary [see Organ Mass], the Magnificat, antiphons, and some items of the Mass Proper, notably Introits and Offertories. The hymns also were subject to this process, which, although it hastened the decline of Gregorian chant, became the chief impetus for the development of organ music. The earliest extant organ hymns are found in Paumann's "Fundamentum organisandi" (1452) and in the Buxheim Organ Book (c. 1460–70). These sources include several settings of two German hymns, "Benedicite Allmächtiger Gott" and "Christ ist erstanden," as well as compositions of Latin hymns such as "Veni creator spiritus," "O gloriosa Domina," "Dies est leticie," etc. The original melodies usually appear in the lowest part (tenor), frequently ornamented or paraphrased. Arnolt Schlick's *Tabulaturen etlicher Lobgesangk* (1512) contains a setting of the German hymn "Maria zart" in which, for the first time, the melody is made to stand out clearly in the soprano [see HAM, no. 101]. It is a remarkably early example of the so-called melody chorale, one of the standard types of the 17th-century Protestant organ chorale or organ prelude. Leonhard Kleber's tablature of c. 1517 includes a "Maria zart" by Buchner (designated *Fuga optima*) that may be regarded as an early example of the chorale motet, since every phrase of the melody is treated in imitation. Hans Buchner's "Fundamentum" (c. 1525) contains settings of "Veni creator spiritus" and others, treated in \*cantus planus style or in imitation. An anonymous "In dulci jubilo" from Sicher's tablature [repr. in H. Moser, *Frühmeister der*

*deutschen Orgelkunst* (1930), p. 7] is interesting in that its canonic treatment is remarkably similar to that in J. S. Bach's setting of the same hymn.

The hymns of A. de Cabezón (1510–66) are noteworthy for their strict adherence to the liturgical melodies ("Ave maris stella," "Pange lingua," etc.), which are usually presented in strict *cantus planus* style, without figuration or \**Vorimitation*. Five of his settings are chorale motets [\*Editions XX, 3, pp. 50ff]. Cavazzoni's *Intavolatura* (1542) contains twelve hymns, most of which are also in *cantus planus* style but in faster values (semibreves, instead of Cabezón's breves) and always with *Vorimitation* [see SchGMB, no. 103]. His "Pange lingua" is a particularly impressive chorale motet. John Redford (c. 1485–1545; see HAM, no. 120) often replaces the original plainsong with a derivative melody resulting from the use of faburden technique [see Faburden (2)] or of elaborate paraphrasing. The Mulliner Book of c. 1560 [\*Editions XXXIV, 1] contains organ hymns by Allwood, John Blitheman, and Thomas Tallis. Blitheman's "Eterne rerum conditor" is an early example of chorale variation, as is John Bull's "Telluris ingens conditor" [\*Editions XXXIV 14, p. 134]. The main development of the Roman Catholic organ hymn ended with the *Hymnes de l'Église* (1623) of Jean Titelouze, which contains twelve hymns, each treated as a series of three or four variations called "versets" and obviously meant to be played in alternation with verses (i.e., hymn stanzas) sung in plainsong. Some of the variations are in *cantus planus* style, some in motet style, and still others in the form of a canon above the *cantus firmus*.

II. *The Protestant organ chorale.* In the German Protestant Church the organ chorale assumed a role quite different from that in the Roman Catholic service. In the latter, it served as a substitute for plainsong, from which it inherited its liturgical function. In the Protestant Church, the singing of the chorale became the privilege of the congregation, and it was the organist's duty not only to accompany the singing but also to play the chorale beforehand on the organ as an introduction (hence the German organ chorale is often called \*chorale prelude). This novel function stimulated the development of new techniques of composition. Former devices such as elaborate paraphrasing or faburden technique, as well as the tendency to place the melody in the tenor as a *cantus planus* having structural rather than melodic significance, were

largely discarded. The Lutheran chorales, differing from the Gregorian chants mainly in that they consisted of several clearly marked phrases, were made to stand out in the soprano (melody chorale), sometimes provided with figurative or (later) expressive ornamentation (ornamented chorale), and even in chorale motets were treated so as to be readily recognizable to the congregation.

The outset of this development is marked by a collection of c. 20 compositions in E. Nicolaus Ammerbach's *Orgel oder Instrument Tabulatur* (1571, '83) and 77 compositions in the "Tabulaturbuch auff dem Instrumente" (1598) by Augustus Nörmiger. All these settings have a texture similar to that of the final chorales in J. S. Bach's cantatas, i.e., essentially homophonic but interspersed with polyphonic elements. Considerably longer and more elaborate settings, approaching the chorale motet and even the \*chorale fantasia, are found in the Tablature of Celle (1601). Entirely different are the organ chorales of the Dutch composer J. P. Sweelinck, who cultivated exclusively the chorale variation, a type rarely used before. Sweelinck's contemporary, Michael Praetorius, composed (in addition to six Latin hymns) three Lutheran chorales—"Ein feste Burg," "Christ unser Herr," "Wir glauben all"—as magnificent chorale motets of huge dimensions and complexity. Sweelinck's immediate German successor was Samuel Scheidt, who adopted his master's preference for the chorale variation. Exceptional is his fantasia (actually a chorale motet) "Ich ruf zu Dir," one of the outstanding works of the entire literature, which anticipates in form, style, and expression such works as Bach's \*chorale motet "Jesus Christus unser Heiland" (BG xxv). The historical development between Scheidt and Bach followed two lines, a North German and a Middle German (for the composers, see Organ music II A; the South German organ composers, being Roman Catholic, naturally made no contribution to the repertory). In North Germany there was a distinct preference for extended treatment and for the free, rhapsodic type known as chorale fantasia, while the organ chorales of the Middle German masters are shorter and simpler, chiefly \*chorale fugues, melody chorales, or chorale variations (partitas).

Bach utilized all the forms of the past and, needless to say, attained in them new heights of expression and artistic perfection. The following types can be clearly distinguished: (a) *cantus firmus* (more properly, *cantus planus*) chorale—

the chorale melody in long notes usually in the bass (BG iii, 224; BG iii, 234; NBA iv/2, 3); (b) \*chorale motet—each line of the chorale is treated in imitation, resulting in a succession of "fugues" (BG xxv or NBA iv/2, 87; NBA iv/2, 212); (c) \*chorale fugue—the first line or the initial phrase of the chorale is treated as a fugue (BG iii, 205; BG iii, 239; NBA iv/3, 65); (d) \*melody chorale—the chorale appears as a continuous melody in the soprano, accompanied by contrapuntal parts that usually proceed in definite figures (most of the chorales from the *Orgelbüchlein*; see Figured chorale); (e) ornamented chorale—the chorale is used in the soprano with elaborate and expressive ornamentation (NBA iv/2, 55; *Orgelbüchlein* in BG xxv<sup>2</sup>, 57); (f) chorale canon (*Orgelbüchlein* in BG xxv<sup>2</sup>, 45; BG xxv<sup>2</sup>, 12); (g) \*chorale fantasia—free, North German treatment (NBA iv/3, 16; NBA iv/3, 24); (h) \*chorale variations (partitas)—a number of variations (corresponding to the number of stanzas of the text) on the chorale melody (NBA iv/2, 38). Naturally, these methods of treatment frequently overlap, e.g., the chorale prelude "Num komm der Heiden Heiland" (NBA iv/2, 55) and many others combine the principle of imitation, as in the motet, with the ornamented treatment for the final statement of the "subject."

Among later contributions to the repertory, the chorale preludes of Brahms (op. 122) and H. Kaminsky merit special mention.

Frere, "Bach's *Vorspiele* of 1739" (ML i, 218); C. Macpherson, "Choral-Preludes" (PMA xxxix); E. Fisher-Krückeberg, "Johann Crügers Choralbearbeitungen" (ZMW xiv). Also see under Organ music.

**Organetto** [It.]. A 14th-century name for portable organ; see Organ XII.

**Organ hymn.** See Organ chorale I.

**Organicen, organoedus.** Humanist names for organ player, organist.

**Organista** [L.]. Organ player, organist. However, the term "optimus organista," conferred on Leoninus (c. 1200; see *Ars antiqua*) by the late 13th-century Anon. IV of CS i characterizes this master as a "great composer of organa" [see Organum (2)], not as a "very able organist."

**Organistrum** [L.]. Medieval name for \*hurdy-gurdy.

**Organ Mass** [G. *Orgelmesse*]. Polyphonic composition of the Mass, nearly always the Ordinary, for organ. The Codex Faenza of c. 1400 contains a single Kyrie as well as two Kyrie-Gloria sets, all based on the corresponding items of the Gregorian Mass IV [see Mass A] and composed according to a structural principle encountered in nearly all organ Masses, i.e., alternation of organ music and plainsong [see Alternation]. The pieces are in two parts, the *cantus firmus* appearing in long notes [see *Cantus planus* style] in the tenor against an upper part in lively motion. Similar settings of the Gloria, Credo, and Kyrie are preserved in German sources from c. 1430–50 [see Editions XI, 1]. The Buxheim Organ Book (c. 1460–70) contains a number of items composed in a more advanced style, among them a Kyrie in four-part chordal style. In the 16th century we find complete organ Masses including all five items (sometimes without the Credo), each composed according to the alternation principle, in Germany (Buchner, "Fundamentum," c. 1525), France (Attaignant, *Tabulature pour le jeu d'orgues*, 1531), England (Philipp ap Rhys, in *Brit. Mus. Add. 29996*, c. 1540) and Italy (Giaches Buus, in a manuscript from Castell'Arquato, c. 1540). G. Cavazzoni's *Intabolatura d'organo* (1543?) contains three such Masses, one for feasts of the Lord (*Missa Dominicalis*), one for feasts of Saints (*Missa Apostolorum*; see *HAM*, no. 117), and one for feasts of the Virgin (*Missa de Beata Virgine*). The same three Masses were composed by Merulo (*Messe d'intavolatura*, 1568). All organ Masses belong to the type known as plainsong Mass [see Mass C II a]. The Mass Proper is represented by a number of Introits (Buxheim Organ Book, H. Buchner), Offertories (Redford and other English composers; see Felix namque), and a singular composition by Preston, consisting of the Introit, Gradual, Alleluia, and sequence for Easter Sunday.

In the 17th century the organ Mass was cultivated mainly in Italy and France. Frescobaldi, in his *Fiori musicali* of 1635, provided music for the same three Masses as Cavazzoni and Merulo. However, only the Kyrie is fully represented by a number of plainsong settings, to which are added a number of free organ pieces to be played at the beginning of the Mass (*Toccata avanti la Messa*), after the reading of the Epistle (*Canzona dopo l'Epistola*), after the Credo

(*Ricercare dopo il Credo*), during the Elevation of the Host (*Toccata cromatica per l'elevazione*), and after the Communion (*Canzona post il Communio*). French organ Masses by Nivers (1667), Gigault (1685), Lebègue (1687), F. Couperin (1690), N. de Grigny (1699), and Corrette (1703) are structurally similar to those of the 16th century, consisting of the required number of pieces for the Kyrie, Gloria, Sanctus, and Agnus, usually with the addition of an *Offertoire*. The pieces for the Kyrie are often based on the Kyrie IV [see *LU*, p. 25], while the others are freely composed. Bach wrote what has been called a "German organ Mass" in his *\*Clavier-Übung*, pt. iii.

According to A. Schering (*Die Niederländische Orgelmesse*, 1912), numerous Masses of the Flemish masters that are commonly regarded as vocal compositions were actually intended to be organ music. That this theory is untenable is evident in Schering's renditions for organ [see his *Alte Meister aus der Frühzeit des Orgelspiels* (1913); also *SchGMB*, no. 57]; their highly complex texture is totally contrary to the organ style of the 15th century (Paumann, Buxheim Organ Book).

Paesler, in *VMW v* (Buchner); D. Stevens, in *MD vi* (Philipp ap Rhys), *ML xxxix*, 29 (Preston); K. Jeppesen, in *AMW xii* (Castell'Arquato); A. Schering, "Zur alternatim Orgelmesse" (*ZMW xvii*); A. Tessier, "Les Messes d'orgue de Couperin" (*RM 1924*, no. 1).

**Organ music.** I. *Middle Ages and Renaissance.* Prior to 1300, the organ was played by alternately pushing in and pulling out handles with both hands [see Organ XII]. As a result, organ music could be no more than a monophonic succession of fairly sustained notes. There is evidence, however, of two organists' playing simultaneously and thus performing two-part \*organum. Organs were probably also used to assist singers in performing the long-held notes in the tenors of the organa of Leoninus and Perotinus (c. 1200), and possibly also for the rendition of the tenors of 13th-century motets. The earliest preserved examples of organ music (c. 1325) are \*intabulations of motets and \*estampies in the MS *Brit. Mus. Add. 28550*, the so-called Robertsbridge Codex [see Editions XI, 1]. They are usually assumed to be of English

origin, although certain features, particularly the notation, would seem to point to Italy or perhaps France. A newly discovered source of great interest is the Codex Faenza (c. 1400), which contains some pieces for the \*organ Mass and a large number of intabulations, mostly of secular music (Machaut, Landini, Jacopo da Bologna, *et al*; see D. Plamenac, in *JAMS* iv). Organ music of the 15th century is preserved only in various German tablatures [\*Editions XI, 1], among which the Ileborgh tablature of 1448 [see W. Apel, in *ZMW* xvi] is remarkable for its free \*preludes, Paumann's "Fundamentum organisandi" of 1452 for its elaborations of German songs and instructive pieces [see Counterpoint II], and the \*Buxheim Organ Book of c. 1460–70 for its preludes, Mass compositions, and arrangements or transcriptions of German songs and French chansons. Toward the end of the 15th century Paulus Hofhaimer was famous for his organ playing and improvisation, but only two or three of his organ pieces have survived, along with compositions of his pupils Kotter, Sicher, Buchner, and Kleber [see Lit., Moser, *Frühmeister*]. German organ music reached its first peak in the great master Arnolt Schlick, whose *Tabulaturen etlicher Lobgesangk* (1512; new ed. by G. Harms, 1957) contains a "Salve Regina," "Maria zart," and other liturgical compositions. A recently discovered MS contains, among others, a composition in ten voice-parts, four of them to be played on the pedal [see M.S. Kastner, *Arnolt Schlick, Hommage à l'Empereur Charles-Quint* (1954)]. The German tradition of this period is continued in some extensive tablatures of Polish origin, written c. 1550 [see Poland].

In the 16th century other important developments took place in Italy, Spain, England, and France. The *Recerchari motetti canzoni* of 1523 by M. A. Cavazzoni (Marcoantonio da Bologna) contains the earliest extant organ ricercars [see Ricercar II (b)]. The compositions of his son, Girolamo Cavazzoni—organ Masses, hymns, Magnificats, imitative ricercars, as well as the earliest organ canzonas [see Canzona I]—represent the artistic culmination of Italian 16th-century organ music. M. A. Cavazzoni's works are republished in K. Jeppesen, *Die italienische Orgelmusik am Anfang des Cinquecento* and in \*Editions X, no. 1; those of Girolamo Cavazzoni in \*Editions III, 3 and complete in IX, 6. Andrea Gabrieli (c. 1520–86) made important contributions to the development of the ricercar [see Ricercar I (b)] and wrote the first \*toccatas,

a form whose artistic possibilities were more fully realized by C. Merulo (1533–1604). The earliest extant source of Spanish organ music, a *Libro de cifra nueva* published by Venegas de Henestrosa in 1557 [\*Editions XXXII, 2], contains mostly \*tientos, some of them by the great master A. de Cabezón (1510–66). Other organ works by Cabezón—hymns, versets for the Psalms and the Magnificat, variations, and instructive pieces of rare excellence—are contained in the posthumous *Obras de música* of 1578 [\*Editions XX, 3, 4, 7, 8].

In England there flourished before 1550 a remarkable school of organ composers represented chiefly by J. Redford (c. 1485–1547; see C. Pfatteicher, *John Redford* [1934]), whose numerous liturgical pieces (organ hymns) include some outstanding pieces in motet style. The Mulliner Book of c. 1560 [\*Editions XXXIV, 1] contains liturgical organ compositions by Allwood, Blitheman (c. 1510–91), and Tallis (c. 1505–85) [see "Felix namque"; "In nomine"]. Finally, two French publications of 1531 (Attaignant; see Editions XLIX, Sec. I, 5) give evidence of an early activity whose succession is unfortunately lost for nearly 100 years, the next oldest source of French organ music preserved being the organ books by Titelouze (1563–1633) issued in 1623 and 1626 [\*Editions I, 1].

II. *Baroque*. While Titelouze's organ hymns represent the late Renaissance, the works of his contemporary, Jan Pieterszoon Sweelinck (1562–1621), inaugurated the organ music of the baroque, establishing a new style characterized mainly by extensive use of lively figurations and precise motifs in ever-varying contours and rhythms. Sweelinck wrote long monothematic fantasias [see Fantasia (5)], some of which exploit the \*echo effect of the organ, and also chorale variations based on German Protestant hymn tunes [see Organ chorale II].

A. *Germany*. Of Sweelinck's numerous pupils, Samuel Scheidt (1587–1654) is the most outstanding (*Tabulatura nova*, 1624; new ed. *DdT* 1). His organ compositions—chorale variations of Latin and German hymns, Magnificats, and fugal compositions (*Fuga*, *Fantasia*)—are somewhat less imaginative than those of his teacher but mark the beginning of a new development of German organ music that was to continue until the death of Bach. This development may be divided into three branches: North German, Middle German, and South German. In the first are H. Praetorius (1560–1629), M. Prae-

torius (1571–1621), M. Schildt (1592/3–1667), H. Scheidemann (c. 1596–1663), D. Strungk (1601–94), F. Tunder (1614–67), M. Weckmann (1619–74), J. A. Reinken (1623–1722), J. N. Hanff (1630–1711); D. Buxtehude (c. 1637–1707), V. Lübeck (1654–1740), G. Böhm (1661–1733), and N. Bruhns (1665–97)—composers who developed especially the large forms of organ music (toccata, chorale fantasia, prelude, and fugue) and evolved a free, highly imaginative style that has been termed \*Gothic. The Middle German composers, in Thuringia and North Bavaria, worked with more modest and intimate means and contributed chiefly to the development of the chorale fugue and melody chorale. This line fittingly begins with Bach's great-uncle Heinrich Bach (1615–92), his uncles Johann Christoph (1645–93) and Johann Michael (1648–94; organ chorales in Ritter), and continues with J. Krieger (1651–1735; *DTB* 30), J. Pachelbel (1653–1706; *DTB* 6), J. Kuhnau (1660–1722), J. H. Buttstett (1666–1727), and J. G. Walther (1684–1748; *DdT* 26/27).

An early South German school of organ music is represented by H. L. Hassler (1564–1612; *DTB* 7), C. Erbach (1573–1635; *DTB* 7), J. U. Steigleder (1593–1635; interesting variations on the *Vater unser*; *ricercars*, ed. by Emsheimer, 1928), W. Ebner (1612–65), and J. E. Kindermann (1616–55; *DTB* 32). Italian contrapuntal style and Italian forms such as the *ricercar* and *canzona* are important in their works. A new development began with J. J. Froberger (1616–67), who, as a pupil of Frescobaldi and a friend of French lutenists and clavecinists (Gaultier, Chambonnières), brought to German organ music many new ideas derived from Frescobaldi's novel forms (toccata, variation *canzona*, \*capriccio) and free, idiomatic keyboard style [see *Freistimmigkeit*], while French influence is seen chiefly in his harpsichord music (*suite*). The repertory of the later South German composers, such as J. K. Kerll (1627–93; *DTB* 3), Georg Muffat (1653–1704), G. von Reutter (1656–1738), F. X. Murschhauser (1663–1738; *DTB* 30), J. K. F. Fischer (c. 1665–1746; new ed. by E. von Werra, 1901), and Gottlieb Muffat (1690–1770; *DTB* 58), also has an "Italian division" of *ricercars*, *canzonas*, *toccatas*, and *versets*, and a "French division" of harpsichord music.

B. *Italy*. The Italian organ music of the baroque began with the \*Neapolitans G. M. Trabaci (c. 1580–1647) and A. Mayone (d. 1627), who are important links between Cabezón and Frescobaldi [see Neapolitan school II]. Fresco-

baldi (1583–1643), a unique combination of intellectual scholar and highly imaginative artist, is one of the greatest and most fascinating composers of organ music. A predecessor of Frescobaldi's was E. Pasquini (d. c. 1620), and an immediate successor was M. A. Rossi (publication of 1657). Later Italian organ composers are G. Salvatore (early 17th cent.–c. 1688; \*Editions XI, 3), B. Storace (publication of 1664; \*Editions XI, 7), and D. Zipoli (1688–1726; \*Editions IX, 36).

C. *France*. French organ music of the 17th century is represented by H. Dumont (1610–84), G. Nivers (1632–1714), N. Gigault (c. 1625–1707), N.-A. Lebègue (1631–1702), A. Raison (d. 1719); Jacques Boyvin (c. 1653–1706), F. Couperin (1668–1733), N. de Grigny (1672–1702), L. Marchand (1669–1732), J.-F. Dandrieu (1628–1738), and L.-C. Daquin (1694–1772). Most of their compositions are liturgical pieces in a style that became increasingly secular and "operatic" during the course of the period. They are noteworthy for their emphasis on registration, which is usually carefully indicated [\*Editions I].

D. *England*. None of the Continental forms of organ music was cultivated in England during the 17th century. Instead, composers such as C. Gibbons (1615–76), M. Locke (c. 1630–77), J. Blow (1648/9–1708), H. Purcell (c. 1658–95), J. Clarke (c. 1673–1707), and W. Croft (1678–1727) wrote verses and \*voluntaries in a variety of styles and forms. Quite frequently these took the form of "fugue and postlude," or sometimes that of two fugues followed by a postlude. The fugues are written in a rather perfunctory manner, rapid figurations and homophonic measures appearing side by side with imitative passages. Handel's contribution to the organ repertory consists of his famous twenty concertos for organ and orchestra.

E. *Spain and Portugal*. The Iberian Peninsula produced a huge repertory of organ music whose importance has only begun to be recognized. The Spaniards Sebastian A. de Heredia (c. 1565–after 1620) and F. Correa de Araujo (c. 1576–after 1633; *Libro de tientos*, 1626, new ed. by M. S. Kastner, 1948) wrote mostly \**tientos*, the former in a transitional style, the latter in a colorful baroque style in which the imitative element is almost suppressed by a luxuriant growth of ever-changing and often highly erratic figurations. The Portuguese M. R. Coelho (b. 1583) published *Flores de música* (1620; new ed. by M. S. Kastner, 2 vols. [1959, '61]) containing

*tientos* similar to those of Correa de Araujo as well as organ hymns, versets for the psalms and the Magnificat [see *HAM*, no. 200], and Kyries. Organ compositions by Pablo Bruna and others, probably born c. 1600–20, are preserved in MSS in El Escorial and Barcelona [see W. Apel, in *AnM* xvii]. The great master of the second half of the 17th century was J. B. J. Cabanilles (1644–1712), whose pupil, José Elias (1675–1749), said: “Ante ruet mundus quam surget Cabanilles secundus” (The world will go to ruins before another Cabanilles will arise). His hundreds of organ compositions (about one-half published in H. Anglés, *Joannis Cabanilles Opera omnia*, i–iv) display a fascinating command of a great variety of forms and stylistic devices. Many hundreds of additional organ pieces in Portuguese and Spanish MSS (Bibl. municipal of Oporto, *Libro de cyfra, Livro de obras de orgao*; Madrid, Bibl. nac., 5 vols. compiled by A. Martiny Coll, 1706–09) have only begun to be investigated [see K. Speer, “A Portuguese Manuscript of Keyboard Music,” diss. Indiana Univ., 1956; B. Hudson, “A Portuguese Source of Seventeenth-Century Iberian Organ Music,” diss. Indiana Univ., 1961].

F. *Bach*. In organ music more than any other field, Bach represents the consummate peak of baroque music and, for that matter, of the entire literature. Here as elsewhere, his achievement was principally artistic perfection rather than innovation. Building on the forms and methods of his predecessors, he conferred on the chorale prelude an incomparable expressiveness and on the toccata and fugue a unique architectural structure, while his organ sonatas represent the apotheosis of three-voice counterpoint.

III. *1750 to present*. After Bach, organ music suffered a decline from which it did not recover until c. 1840. The low ebb of organ music c. 1800 is beyond description (for examples, see an article by H. Müller, in *KJ* 1901). Mendelssohn was one of the first to compose organ music of artistic significance. However, his six Sonatas (1844–45), although incorporating elements of Bach's style (fugues, chorales), clearly show the detrimental influence of romanticism on organ composition. Liszt's organ works opened a new period of organ composition, owing to their exploitation of the orchestral and coloristic resources of the instrument. This path was pursued further by France's A. Guilmant (1837–1911), C. M. Widor (1844–1937), and L. Vierne (1870–1937), outstanding organ virtuosos who wrote veritable symphonies for the organ.

Franck's organ pieces, particularly his *Trois Chorales* of 1890, are in a similar style, modified by the spiritual influence of Bach. Much closer to Bach in style and spirit are Brahms' *Chorale Preludes* (*Elf Choralvorspiele* op. 122, 1896). With Reger (1873–1916) romantic organ music came to an imposing close. Huge forms are filled with an exuberance of ideas and a profusion of technical display but bound by great contrapuntal skill in the tradition of Bach. The neoclassical tendencies of the 1920's brought a more sincere revival of the polyphonic tradition of the baroque. H. Kaminski's (1886–1946) compositions are pervaded by a Gothic mysticism, while Kurt Thomas (b. 1904) and Hindemith (three organ sonatas, 1937, '40) represent the tendencies toward objectivism and linear design. In France, a similar trend led to the mysticism and sonorous visions of C. Tournemire, O. Messiaen, and J. Alain. To these should be added the Belgian organ composer Flor Peeters.

**Organ point.** See Pedal point.

**Organ reform** [*G. Orgelbewegung*]. A movement to reform methods of organ building, begun c. 1900 by Albert Schweitzer and others. Its aim is to reestablish in modern practice many of the techniques of 17th- and 18th-century organ building that are considered essential in an organ for the proper interpretation of polyphonic music, particularly that of Bach and his predecessors. Another aim is to foster new growth in organ composition. See Organ XI, XII. C.B.F.

**Organ stops.** See under Organ VIII–XI. For bibl., see under Organ; Organ playing.

**Organ tablature.** (1) The various notational systems that were used to write down early organ music (prior to 1600). They are usually

distinguished as Italian, German, Spanish, etc., organ tablature. However, in Italy as well as in France and England, organ music was notated in virtually the same way as it is today, except for minor details, such as variations in the number of staff lines. Only in Germany and in Spain was organ music (more generally, keyboard music) written in systems that could truly be called "tablature." See Tablature. (2) The manuscripts and printed books of early organ music. As under (1), the name should be restricted to German and Spanish sources. Long lists of organ tablaturs (French, Italian, English, German, and Spanish) are given in *WoHN* ii, 32ff, 270ff, 278.

**Organum.** (1) Latin for organ. In early writings (church fathers, lives of Saints) the term "organum" has as great a variety of meanings as the English word "organ" (part of the body, medium, etc.). Failure to recognize this fact has led to unwarranted conclusions concerning the use of the organ in the 6th to 8th centuries. St. Augustine (A.D. 354–430) says in two different passages that "organum is the name for all musical instruments," adding in one, "not only for that which is big and is inflated by bellows," and in the other, "although it has become customary to use it properly for those which are inflated by bellows" [see W. Apel, in *Speculum* xxiii, 201].

(2) Name for the earliest types of polyphonic music, from the 9th century ("Musica enchiriadis") to c. 1200 (Leoninus, Perotinus). The question of a connection between *organum* = polyphony and *organum* = organ is usually answered in the negative. The fact that until 1100 (if not later) the "push-and-pull" mechanism of organs permitted playing only one line [see Organ XII] seems to rule out this possibility. There is, however, literary and pictorial evidence that organs were occasionally played by two organists in a sort of "four-hand" performance, resulting in the simultaneous sounding of two melodies—i.e., a primitive type of polyphony.

In the broadest sense, organum is a composition consisting of a liturgical (plainsong) tenor to which one or more contrapuntal parts (*duplum*, *tripplum*, *quadruplum*) are added. In earlier organum (prior to 1150) there was, judging from the relatively few preserved examples, no restriction as to the type of plainsong chosen as the basis for organum; syllabic hymns and sequences seem to have been preferred. In this period, therefore,

organum means a general technique of composition. In the school of Notre Dame, organum treatment became restricted to a few types of plainsong, mainly Graduals, Alleluias, and responsories, resulting in a much narrower meaning for the term [see V]. The following phases of the development can be distinguished:

I. *Parallel organum* (c. 900–1050). To the main part, called *vox principalis*, is added a *vox organalis* at the lower fifth or fourth, note against note. Either or both parts can be duplicated at the octave, so that the sound d–a is amplified to A–d–a, d–a–d', D–d–a, d–a–a', d–a–d'–a', etc. (composite organum). In the organum at the fourth the parallelism of the parts is usually observed only in the middle of the phrase, while at the beginning and end the parts move in oblique motion, starting and ending in unison [\**occursus*; see Tritone]. This type, the converging organum at the fourth [Ex. 2], probably is much more representative of the earliest polyphony than the organum at the fifth [Ex. 1], which may have been primarily a theoretical speculation. Of the various sources—\*“Musica (and Scholia) enchiriadis,” treatises of Cologne, Paris, Bamberg, Guido’s “Micrologus” of c. 1040—the first-mentioned is the only one that discusses organum at the fifth. For “organum at the second,” see under Lombardic style; for “organum at the third,” see Gymbel.

II. *Free and contrary organum* (c. 1050–1150). In the second half of the 11th century, contrary motion began to be used side by side with parallel motion (in fourths, fifths, occasionally even thirds) and oblique motion. This type may be called “free organum.” In addition to theoretical sources (*Ad organum faciendum*, in Milan [Ex. 3]; short treatise of Montpellier) there are long compositions written in this style, especially the famous “Ut tuo propitiatus” [HAM, no. 26b] and five Alleluias in Chartres MS 109 [HAM, no. 26c]. The numerous organa in the 11th-century Winchester Troper are written in neumes that make exact reading impossible. The often repeated statement that this source shows clear evidence of contrary motion is very questionable. John Cotton, in his “Musica” of c. 1100, emphasizes the importance of contrary motion, saying that “whenever the original melody rises, the organal part should descend, and vice versa” [Ex. 4]. This method, which may be termed “contrary organum,” became the foundation of the subsequent development of polyphony. As a concomitant, the fourth tends to disappear, or at least be replaced by the fifth as the main con-

sonance after the unison and the octave. The two parts frequently cross.

III. *Melismatic organum* (mid-12th century). This type is characterized by the use of groups of notes in the added part against a single note of the original part, the length of such a group varying from a few notes to long melismas. As a result, the original becomes a succession of “held” tones and came to be called \*tenor. The new style continued to be called “organum,” the older note-against-note style now being termed \*discant. The melismatic treatment, of course, greatly lengthens the composition [cf. HAM, nos. 28a and b; also nos. 26a and 27b]. Examples of pure melismatic organum occur particularly in the Codex Calixtinus from \*Compostela [Ex. 5]. The organa of \*St. Martial often have sections in organal style side by side with others in discant style [see HAM, no. 27a].

IV. *Measured organum* (before and after 1200). In the organa of the school of Notre Dame, the alternation of organal and discant sections became a standard practice and was usually applied so that the syllabic or neumatic sections of the plainsong were composed in a profuse style (up to 40 or more notes against one) and its melismatic sections in a concise style (one to three notes against one). Of the greatest importance was the introduction of measured rhythm,

1  
Sit glo - ri - a Do - mi - ni in se - cu - la

2  
Rex coe - li Do - mi - ne ma - ris un - di - so - ni

3  
Al - le - lu - ia

4  
Lau - da - te Do - mi - num in coe - lis

1. *Parallel organum at the fifth* (“Musica enchiriadis”). 2. *Converging organum at the fourth* (ibid.). 3. *Free organum* (Milanese treatise). 4. *Contrary organum* (Cotton).

5. Melismatic organum (Compostela). 6. Measured organum (Notre Dame; two rhythmic versions, see HAM, no. 29, and Waite, *The Rhythm of Twelfth-Century Polyphony*, p. 120).

according to the rhythmic \*modes. In the earliest Notre Dame organa, all in two parts and presumably composed by Leoninus [see "Magnus liber organi"], modal rhythm is clearly present in the discant sections, though less clearly in the others [Ex. 6; see HAM, nos. 28c, 29]. This type of organum is referred to by theorists as *organum duplum*, *organum purum*, or *organum per se*. Modal rhythm became fully established in the works of Perotinus, who wrote numerous organa in three parts (*organum triplum*; see HAM, no. 31) as well as two gigantic *organa quadrupla*, which represent the acme of organum as well as the end of the development.

V. In the school of Notre Dame (partly already in the earlier schools), polyphonic treatment and, therefore, the term "organum" was restricted to certain types of plainsong, mainly Graduals, Alleluias, responsories, and the \**"Benedicamus Domino."* Note that only the soloist sections of such a chant were used as a basis for polyphonic composition. For example, in a Gradual only the *Incipit* of the respond and the entire verse, except for its conclusion, were composed polyphonically, the remaining portions being supplied by the choir in plainsong [for the structure of the Graduals, see Psalmody II]. This practice strongly suggests that the organum (i.e., polyphonic) sections were performed by a small number of soloists, not a full chorus. The scheme below illustrates the performance of Perotinus' Christmas gradual "Viderunt" in the Cathedral of Notre Dame, c. 1200 (S = soloists, C = choir).

**Organ vers.** See Verset.

**Orgel** [G.]. Organ. *Orgelmesse*, \*organ Mass. *Orgelpunkt*, pedal point. *Orgelwalze*, barrel organ [see Mechanical instruments II].

**Orgelbüchlein** [G.]. Original title of a manuscript by J. S. Bach that contains forty-five organ chorales but was intended to include many more,

since numerous pages are empty except for the name of the chorale. All the compositions are short settings, mostly of the melody-chorale type. The collection was probably made toward the end of Bach's stay in Weimar (1708–17). According to the title inscription, it was designed "to instruct a beginning organist how to set a chorale in diverse manners and also how to acquaint himself with the pedal, this being treated fully *obligato*."

**Orgue** [F.]. Organ. *Orgue de Barbarie*, the barrel organ of the Italian organ grinder, consisting of one or two rows of small organ pipes in a small portable case, operated by turning a handle. *Barbarie* is a corruption of the name of an 18th-century instrument-maker, Giovanni Barberi of Modena. See A. Schaeffner, "L'Orgue de Barbari de Rameau" (*CP Masson*). *Orgue expressif*, \*harmonium. *Orgue positif*, positive organ [see Organ XII].

**Oriental music.** Generic term for the music of the Near and Far East: Arabia, China, India, etc. [see under individual countries; also Ethnomusicology]. Oriental music represents a cultural development comparable to that of Western music, the basic difference being that in the former the emphasis has been on melody and rhythm and in the latter on counterpoint and harmony. "Polyphonic" traits are not uncommon in the music of the East but are limited to rhythmic accompaniment, drones, and \*heterophonic elements.

Oriental music has influenced Western music chiefly through two channels: (1) the Jews and the early Christian Church; and (2) the Arabs in Spain. The former influence persists in Gregorian chant, and the latter in many musical instruments and certain elements of theory and acoustics [see Arab music].

Lit.: C. Sachs, *The Rise of Music* [1943]; Hiroshi Endo, *Bibliography of Oriental and Primitive Music* (1929); R. Lachmann, *Musik des Orients* (1929); *id.*, in *BüHM* xii; R. Lach, "Die Musik der Natur- und orientalischen Kulturvölker" (*AdHM*); separate articles in *LavE*, *NOH* i. See also under Ethnomusicology and specific countries.

**Ornamentation.** Musical ornamentation originated as a spontaneous act by the interpreter who, in performing a written or traditional melody, enlivened, expanded, or varied it through his technique of improvisation. The more or less stereotyped melodic figures that, in

the course of this process, have been substituted for or added to the original notes of the melody are known as ornaments. Throughout the history of music there have been three kinds of ornamentation: I. that left entirely to the improvisation of the performers; II. that in which definite ornaments are indicated by some sort of written sign; III. that in which the ornaments are written out in notes.

I. *Improvised ornamentation.* There is evidence that the early singers of Gregorian chant indulged in extemporaneous ornamentation of the traditional melodies, and that some of the variations created in this manner were eventually incorporated in the MSS. Tunstede (c. 1370) describes a type of improvised harmonization [see *Discantus supra librum*] that also calls for the introduction of improvised figurations [see CS iv, p. 294]. In the 16th century improvised ornamentation, known as *diminutio*, had its center at the papal chapel in Rome, where the singers ornamented and completely transformed works by Willaert, Lassus, Palestrina, *et al.* All the voices of a polyphonic composition were susceptible to ornamentation. Hermann Finck, in his *Practica Musica* (1556), states that "the character of the coloratura depends upon the skill and the individuality of the executant. My own view is that all voices must be ornamented, but not simultaneously, so that each voice will be brought out in turn." Zacconi (*Prattica di musica*, 1592) writes that the art of diminution, also known as \**gorgia*, "charms the listener, especially when in four-, five-, or six-part pieces two voices stand out and sing solos together. It is a delight when one part of the piece is sung with improvised diminutions and the rest played upon instruments." There are a number of manuals for teaching the art of improvised diminution. The two earliest are Sylvestro Ganassi's *Opera intitulata Fontegara* (1535) and Diego Ortiz's *Tratado de glosas* (1553). Ex. 1 shows diminutions by G. dalla Casa (*Il vero modo di diminuir*, 1584) to Palestrina's madrigal "Vestiva i colli." Diminutions (known in Spain as \**glosas*, in England as \**divisions*) were also used in purely instrumental performance. The fame of Merulo, the two Gabriellis, and Cabézon rested largely on the free and vivid improvisation with which they inspired seemingly dry pieces.

In many of the 16th-century treatises specific names are used for certain small melodic formulas that consist of either the repetition of a single note or the rapid alternation of two (or three) adjacent notes. To the former type belongs the

Italian *trillo* (an accelerated \*tremolo); to the latter (\*trills), the *tremolo*, *groppo*, and *ribattuta*, as well as the Spanish *redoble* and *quiebro* and the English \*relish [see Ex. 2]. Caccini, Cavalieri, and

other 17th-century Italian musicians urged using these small ornaments, which they call *effetti*, as a special means of expression. It was in France, however, and under the name *agrèments* that these ornaments finally became stereotyped and were systematized to the extent that it was possible to indicate them by signs or abbreviations and to establish definite rules for introducing them extemporaneously.

Improvised ornamentation and divisions continued to play a large part in musical performance throughout the 17th and 18th centuries. During this period singers probably never executed a solo part as it was written. Corelli [see *HAM*, no. 252], Handel, Tartini, and their contemporaries made their written parts of sonatas for strings mere sketches of what the player should do. The accompanying fragments from

Handel's *Messiah* [Ex. 3] and a flute sonata by Quantz [Ex. 4] illustrate typical 18th-century practice.

Beginning with Gluck, composers gradually suppressed most improvised ornamentation. One important relic of the earlier practice, which persists even in the operas of Mozart and Gluck, is the appoggiatura in recitative. From the time of Alessandro Scarlatti it was customary for composers to write the appoggiatura that appears at the end of almost every phrase of recitative as a harmony note, in order to make the underlying harmony clear to the accompanist [see Ex. 5, where the upper system shows the customary notation and the lower the correct performance; Ex. 6 shows a standard cadence (a) as written and (b) as performed].

II. *Ornamentation as indicated by signs.* Some musical ornaments are so subtle and flexible in rhythm and pitch that they defy expression in ordinary musical notation and can only be represented by signs. The MSS of Gregorian chant contain special signs (sometimes appearing as modifications of the neumes) that probably indicate special effects such as tremolos, stressed notes, vibratos, portamentos, and smothered notes (liquescent neumes; see Neumes I). The only frequently recurring sign for an ornament in the music of the later Middle Ages is the \**plica*, which was derived from the liquescent neumes.

During the 16th century the indication of ornaments by signs was restricted almost entirely to keyboard music. The Germans used special signs for the \*mordent, and in the English virginal books there is a profusion of single and double oblique strokes through the stem of the note, denoting ornaments whose exact nature has not been established. The Italian *grosso* and *tremolo* are sometimes indicated by *g* and *t* in the keyboard pieces of Valente [see *ApNPM*, fac. no. 16, p. 51], Mayone, Trabaci, Strozzi, B. Pasquini, and others. The Spaniard Correa de Araujo used the letter *R* for *redobles*.

By far the most important of all signs for ornaments are those of the French *agréments*, which were systematized during the 17th century and remained in continuous use by all European musicians until the beginning of the romantic period. It should be noted that they were used to the same extent in French harpsichord and organ music, a clear refutation of the common notion that their main purpose was to prolong the sound of the harpsichord. The correct interpretation of these signs constitutes a considerable problem in performing the music of this period, owing to the fact that the nomenclature and signs used for the individual *agréments* lacked uniformity and consistency. Identical ornaments were often called by different names and represented by different signs, while the same name and sign were sometimes given to different *agréments*. The *agréments*, in general, may be divided into the following categories: (1) appoggiatura (also double appoggiatura); (2) trill; (3) turn; (4) mordent; (5) Nachschlag; (6) arpeggio; (7) vibrato. [See the separate entries for each.] The first three types were regarded as essential *agréments*, in that their use was obligatory in certain positions of the musical phrase whether their signs appeared in the score or not. The others were left to the discretion of the performer. It is significant that the only signs to be found in the works of

Mozart and Beethoven are the tiny note representing the appoggiatura, the ~ for the turn, and the *tr* or *t* with a wavy line (*tr*), indicating the trill. The other *agréments* had by then been absorbed by the ordinary notation. Rossini was probably the first composer who—much to the indignation of Stendhal—deliberately abandoned the signs for *agréments*, writing out what he considered necessary in notes (in his opera *Elisabetta*, 1815).

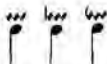

For a detailed study of the baroque ornaments, the tables of signs given with a number of publications are indispensable [e.g., D'Anglebert, in *TaAM* vii, 111; F. Couperin, in *TaAM* x, 78f; Kuhnau, in *TaAM* x, 2f; Georg Muffat, in *DTO* 4, p. 52; Gottlieb Muffat, in *DTO* 7, p. 89]. Very helpful also are the realizations in the modern edition of Loeillet [\*Editions XXVIII, 1; the trill is often wrongly indicated to begin with the main note], Fiocco [\*Editions XXVIII, 3], and in an article by A. Dolmetsch (theme of Bach's Goldberg Variations, "Un Cas d'ornamentation chez Bach," *BSIM* viii, 24–30). The accompanying table shows (without claim to completeness) a variety of signs used for the different types of ornamentation. A long list of signs is given in *GDB* vi, 441ff.

III. *Written out ornamentation.* The embellishment of a simple melody became, at an early date, one of the regular procedures of composition. Frequently, melismatic chants of the Gregorian repertory have been interpreted as ornamented versions of simpler skeleton melodies, e.g., of monotones [see *GDB* vii, 130]. Definite evidence of ornamentation technique has been found in the music, monophonic or polyphonic,

#### I. Dashes.

	Appoggiatura; Nachschlag

- tr* Trill

of the 12th to 14th centuries [see Lit., Hand-schin]. The upper voice of 15th-century \*discant compositions (hymns, Mass sections, etc., by Dunstable, Dufay, *et al.*) is usually an ornamented version of a Gregorian chorale. The accompanying example (Gloria by Dunstable; see Editions XXXIV, 8, pp. 16ff) illustrates the free and highly imaginative treatment that was customary at that time [see also Dufay, in *HAM*,

no. 65]. Numerous other examples exist in the \*melody chorales of the baroque period, particularly in those of Buxtehude [see *HAM*, no. 190b] and Bach (e.g., "Wenn wir in höchsten Nöten sein").

The transcription of vocal works for instrumental performance on the keyboard, lute, or instrumental ensembles is another area where written out ornamentation played an important role, especially during the 16th and 17th centuries [see Intabulation]. Furthermore, many 16th-century pieces for keyboard or lute (whether transcription or independent composition) contain *groppi*, *tremoli*, *minute*, \**tirades*, etc.—ornaments that were customarily improvised by singers and by players of melodic instruments but that, in the case of keyboard and lute music, were written out in groups of rapid notes, as in the accompanying example from Sweelinck's *Fantasia chromatica*. Some of these

formulas gradually became more and more stereotyped until finally they were incorporated in the system of *agréments* and indicated by signs or left to the improvisation of the performer.

Between 1650 and 1750 the practice of writing ornaments in notes was frowned on as detrimental to the visual clarity of the melodic line. J. S. Bach, for instance, was severely criticized by at least one contemporary musician on the ground that "he writes down in actual notes the ornaments and embellishments that performers are accustomed to supply instinctively, a habit which not only sacrifices the harmonic beauty of his music but also makes the melody totally indistinct" (J. A. Scheibe, in *Der Critische Musicus*, May 14, 1737). The example here given (from W. Landowska, *Music of the Past* [1924], pp. 131ff) shows how a passage from the Andante of the Italian Concerto would appear had it been written in the more conventional notation of Bach's time [(a) *Doppelschlag* (turn); (b) *Schleifer*

(double appoggiatura); (c) mordent; (d) *passaggio*; (e) *tirade*. It must be noted, however, that Bach did not invariably adhere to this unorthodox practice; his keyboard suites, for instance, are provided with numerous traditional signs for *agréments*.

Since the late 18th century the pendulum has swung in the other direction, and composers have endeavored to indicate their intentions as precisely as possible, using a minimum of signs and expressing all complex ornaments in such a way that there can be no doubt as to what notes are to be performed, even though, in certain cases, the rhythm of those notes be free, as in the so-called "cadenzas" written in tiny grace notes by Chopin and other romantic composers.

**Orpharion.** An instrument of the lute family that was in use c. 1600. It was shaped like the \*bandora but smaller in size, and had six or more double courses tuned F–G–c–f–a–d'–g'. William Barley's *A new Booke of Tabliture* (1596) contains pieces for this instrument. [For ill. see under Lute.] See W. W. Newcomb, *Lute Music of Shakespeare's Time* (1966); D. Gill, in *GSJ* xii.

**Orphée aux Enfers** [F., Orpheus in the Underworld]. Operetta in two acts by Offenbach (libretto by H. Crémieux and L. Halévy), produced in Paris, 1858. Setting: Greece, legendary times. It is an amusing burlesque of the famous Greek legend [see under Orpheus and Eurydice].

**Orphéon.** Name used by French male choral societies, similar to the American \*Apollo Clubs and German \*Männergesangsvereine. The members are chiefly farmers, workers, and middle-class people. The movement started c. 1835 and spread rapidly. By 1910 there were about 1,200 *Orphéons* in France. A system of public competitions called *Concours Orphéoniques* was inaugurated by Bocquillon-Wilhelm in 1842. Gounod conducted the Orphéon of Paris from 1852 to 1860.

**Orpheoreon.** Same as \*orpharion.

**Orpheus and Eurydice.** The touching fable of the "inventor of music" recovering his beloved Eurydice from Hades and losing her again in the moment of their reunion has been used as an operatic libretto more frequently than any other subject. Among the numerous operas based on this story, Monteverdi's *La Favola d'Orfeo*

(1607), Gluck's *\*Orfeo ed Euridice* (1762), and Offenbach's parody *\*Orphée aux Enfers* (1858) are immortal. A more recent version is E. Krenek's *Orpheus und Eurydike* (1926). It is interesting to note the difference between the tragic close of Monteverdi's opera and the happy ending of Gluck's. In the former, Orpheus loses Eurydice but, as a reward for his great love, is transferred to the stars by Apollo; in the latter, Amor appears and restores Eurydice to life.

**Orpheus in the Underworld.** See *Orphée aux Enfers*.

**Orphica.** A variety of piano, invented by K. L. Röllig of Vienna, 1795.

**Osanna.** See Hosanna.

**Ossia [It.].** Indication for an alternate version, usually one that is easier to execute.

**Ostinato.** A clearly defined phrase that is repeated persistently, usually in immediate succession, throughout a composition or a section. The ostinato differs from other devices of repetition, such as *\*imitation* and *\*sequence* [see Repetition (2)], in that it is reiterated in the same voice and usually at the same pitch. It is this feature of "persistent" repeat that accounts for the name [It., *obstinato*].

The earliest examples of ostinato occur in compositions of the 13th century, e.g., in the motet "En mon chant—Omnes" (MS Munich, gallo-rom., 42; c. 1230), whose *duplum* consists of nine repetitions of a two-measure phrase [Ex. 1]. Several other examples occur among the motets of the Codex Montpellier [see Y. Rokseth, *Polyphonies du XIIIe siècle*, iv, 202], among them one ("Amor potest conqueri") with the short ostinato figure shown in Ex. 2. In another, a street cry, "Frese nouvele, muere france" (Fresh strawberries, wild blackberries) is repeated four times [see HAM, no. 33b]. A well-known English example is the *pes* of "Sumer is icumen in." In the 14th and early 15th centuries the ostinato seems to have been little used, a notable exception being Dufay's *Gloria ad modum tubae*, in which two trumpets constantly alternate with a fanfare motif [Ex. 3]. Ostinato reappeared after 1450 in a large number of motets (*ostinato motets*) in which the tenor consists of short restated phrases. The impression of ostinato, however, is weakened by the use of fairly long rests between the statements and by the fact that these often involve transposition. In Busnois' motet "In hydraulis" the entire tenor consists of the motif

d-c-d [Ex. 4], starting on d, a, d', a, g, a, the whole sung (or played) four times. In Josquin's motet "Salve Regina" the beginning of the plainsong (a-g-a-d) is sung alternately on g' and on d'. Stepwise transposition of a motif occurs in Compère's "Royne du ciel" [HAM, no. 79], in which the bass sings the beginning of the Marian antiphon "Regina coeli" successively on c, d, e, and f. The same method is used more extensively in Josquin's "Miserere," in which a psalm-tone motif, e-e-e-e-e-f-e, recurs eight times on

successively lower degrees from e' to e and then upward through the same steps. A famous ostinato motet by Morales is his "Emendemus in melius" [HAM, no. 128].

A different manifestation of the ostinato technique is the so-called *discanto ostinato*, i.e., an upper part consisting of (or including) numerous restatements of a motif, at irregular intervals and in free modifications. Examples occur in the works of Isaac [see *RiHM* ii.1, p. 166] and particularly in English compositions, such as Taverner's Mass *The Western Wynde* [see HAM, no. 112] and several organ pieces by Redford [see C. Pfatteicher, *John Redford*, p. 40; HAM, no. 120b]. Frescobaldi employed this technique with great virtuosity in his *Capriccio sopra il Cucho* and *Capriccio sopra La Sol Fa Re Mi* [*Primo libro de Capricci*, 1624; see Ex. 5].

In the 16th century the ostinato technique received a fresh impulse from dance music, possibly from Oriental dances, in which it is still prominent today. The Oriental element is particularly conspicuous in a Fantasia for two vihuelas by E. Enriquez de Valderrabano in which the second vihuela plays a one-measure ostinato throughout the entire composition [Ex. 6; see W. Apel, in *MQ* xx, 300]. Two English

dances from c. 1525, "My Lady Careys Dompe" [*HAM*, no. 103] and a "Hornepype" by Hugh Aston, are based on a tonic-dominant ostinato and are the earliest examples of the *basso ostinato* or \*ground. A 19th-century example of a tonic-dominant ostinato is Chopin's Berceuse. See also Chaconne and passacaglia; Aria III.

The ostinato has been revived in music of the 20th century. Composers such as Hindemith and Bartók have been attracted by its polyphonic and rhythmic possibilities as well as its antiromantic precision and straightforwardness [Ex. 7, Hindemith, *Konzert* op. 38, 4th movt.]. For bibl. see under Ground.

**Otello** [It., *Othello*]. Opera in four acts by Verdi (libretto by A. Boito after Shakespeare), produced in Milan, 1887. Setting: Cyprus, late 15th century. *Otello*, together with \**Falstaff* (1893), represents the climax of Verdi's achievement. In these operas Verdi abandoned the aria style of his earlier operas (\**Aida*, etc.) and adopted something like Wagner's principle of continuous composition without, however, sacrificing the peculiarities of his personal style.

**Ôtez, ôter** [F.]. Take off (a stop or the violin mutes).

**Ottava** [It.]. Octave, abbr. *8va* (8). *All'ottava*, *ottava alta*, *ottava sopra*, or simply *8va* written above the notes indicates playing one octave higher than written; *ottava bassa*, *ottava sotto*, or *8va* written below the notes (usually in the bass part) calls for the lower octave. *Coll'ottava* means doubling in the higher (or lower) octave.

**Ottava rima**. See under *Strambotto*.

**Ottavino** [It.]. The piccolo flute.

**Ottoni, stromenti d'ottone** [It.]. \*Brass instruments.

**Ours, L'** [F., The Bear]. Popular name for Haydn's Symphony no. 82, in C (1786), the first of the Paris Symphonies. The name is suggested by the opening theme of the last movement, a "growling" theme in the bass.

**Ouvert and clos** [F.]. In the \*ballades, \*estampies, and \*virelais of the 14th century, *ouvert* and *clos* [L. *apertum*, *clausum*; It. *aperto*, *chiuso*] indicate different endings for repeated sections, corresponding to the modern *prima volta*, *seconda volta*.

**Ouverture** [F.]. \*Overture.

**Overblowing**. See under Wind instruments II, III.

**Overtone**. See under Acoustics IV. Overtones play an important role in music theory, where they have been used to explain the phenomenon of \*consonance, and also as a means for deriving the entire tonal material (scale) from a single sound [e.g., Hindemith, *The Craft of Musical Composition*, 2 vols. (1941, '45)]. See G. Albersheim, "Overtones and Music Theory" (*BAMS* 1948, p. 69).

**Overture**. An instrumental composition intended as an introduction to an opera, oratorio, or similar work. I. *The operatic overture*. The earliest operas, which usually began with a \*prologue, had no overture, or at most a flourish of instruments such as the "Toccata" of Monteverdi's *Orfeo* (1607). Among the first more elaborate overtures are the three \*Sinfonie that precede the three acts of S. Landi's *Il Sant' Alessio* [\*Editions III, 5; the second in *HAM*, no. 208], each in the form of a canzona with several short sections. The "canzona" overture [see Canzona (5) II] was a favorite type in the Venetian opera, where it is usually in the form of an introductory slow movement in duple rhythm followed by a fast movement in triple rhythm (Cavalli, *Giasone*, 1649). Other overtures, hardly different in form, are called "Sonata" (e.g., Cesti, *Il pomo d'oro*, 1667). The Venetian type of overture was the model for Lully's famous French overture (earliest example in his ballet *Alcidiane*, 1658), which became the first standard type of overture. It consists of a slow introduction in pompous style with dotted rhythm, followed by an allegro in imitative style on a short, canzona-like subject, though the imitative treatment is not strictly maintained [see *HAM*, no. 224]. Sometimes the second movement of the French overture ends with a broad adagio passage, which has led to the erroneous idea that this is a three-movement form; this view is not in accordance with the actual examples, in which the closing section (if present at all) is an "allargando" coda to the allegro rather than a separate movement. There are, however, later examples of the French overture in which the closing passage is extended into a "third movement," e.g., that which opens Bach's so-called French Overture (really a French overture followed by a suite; see Suite V). Handel's overture to *Rinaldo* (1711; see *SchGMB*, no. 278) illustrates other methods of amplification, merging with the *sonata da chiesa*.

In the late 17th century Alessandro Scarlatti introduced another type of overture, the Italian overture (earliest example in *Dal male i bene*, overture, c. 1696), consisting of three sections, allegro, adagio, and allegro, an early adumbration of the three movements of the sonata. These sections are in simple homophonic style except the first, which introduces some imitative treatment for the entrances of the voices. The usual name for this type is "sinfonia" [see Sinfonia; ex. in *HAM*, no. 259]. During the first half of the 18th century the French and the Italian types existed side by side. Cases of Italian operas and oratorios with a French overture—which surpassed the other in artistic quality—are not rare (e.g., Handel). The French overture disappeared c. 1750 as a result of the rapidly growing importance of the symphony and sonata as standard forms.

An important feature of the ensuing development was the emphasis on a closer connection of the overture with the opera itself, mainly by incorporation into the overture of material from the opera. This procedure was used in Cesti's *Il Pomo d'oro* and Rameau's *Castor et Pollux* (1735) but did not become accepted practice until after 1750. Still more important is the idea of using the overture to prepare for the mood of the first scene of the play. Perhaps the first example is the overture to Gluck's *Iphigénie en Tauride* (1778), in which the overture announces the approaching thunderstorm of the opening scene. Famous examples of using the overture to set the emotional background for the plot are those to Haydn's *Creation*, Mozart's *Don Giovanni* and *Zauberflöte*, Beethoven's *Leonore* Overtures (not the final *Fidelio* overture), Weber's *Freischütz*, and practically all the overtures by Wagner and his successors. Wagner abandoned the sonata-like structure of the overture in favor of a free *Vorspiel* directly leading into the first scene. His precedent has been followed by most modern composers of opera. In strong contrast to this romantic type is the overture to the 19th century *grand opéra* of French derivation (Rossini, Boieldieu, Auber,

Meyerbeer), which usually is a potpourri of the most prominent melodies of the opera.

II. *The French overture as a suite*. See Suite V.

III. *The concert-overture*. This 19th-century type is an independent orchestral composition written along the same lines as the operatic overture, either as a single movement in sonata form or as a free *Vorspiel*. Well-known examples are Mendelssohn's *Die Hebriden*, Berlioz' *Le Carnaval romain*, and Brahms' *Akademische Festouvertüre*. In this category may also be included the overtures written as an introduction to spoken plays and frequently performed as concert pieces, such as Beethoven's overture to Goethe's *Egmont* and Mendelssohn's overture to *A Midsummer Night's Dream*.

Lit.: H. Botstiber, *Geschichte der Ouverture* (1913); H. S. Livingston, "The Italian Overture from A. Scarlatti to Mozart" (diss. Univ. of North Carolina, 1952); A. Heuss, "Die Venezianischen Opernsinfonien" (*SIM* iv); H. Prunières, "Notes sur l'origine de l'ouverture française" (*SIM* xii).

**Oxford Symphony.** Haydn's Symphony no. 92, in G, composed in 1788. It was performed at Oxford in 1791, when Haydn was there to receive an honorary degree from the university.

**Oxyrhynchos Hymn.** The earliest Christian hymn (c. A.D. 300) for which the music is preserved. It takes its name from Oxyrhynchos, in Egypt, where the papyrus on which it is written was found. The text is in Greek, and the melody is written in Greek vocal notation [see Notation II]. The melody (most recent transcription in E. Wellesz, *A History of Byzantine Music and Hymnography*, p. 126) is essentially Greek in style (descending fifths and sixths) except for the closing "Amen, amen," which shows the smooth melodic motion of a "Gregorian" cadence. Facsimile and six transcriptions in *MGG* iv, 1052. See A. S. Hunt, *The Oxyrhynchos Papyri* (1928); T. Reinach, *La Musique grecque* (1926); H. Abert, in *ZMW* iv; O. Ursprung, in *BüHM* ix, 12.

# P

**P.** Abbr. for piano; for pedal (in organ and piano music); or for [F.] *positif*, i.e., choir organ.

**Pacato** [It.]. Calm.

**Pacific 231.** Symphonic poem ("Mouvement symphonique") by Honegger (1923), named for an American type of locomotive and suggesting its motion from start to full speed to stop.

**Padiglione** [It.]. The bell of a wind instrument. *Padiglione cinese*, Chinese crescent.

**Padovana, padoana.** A 16th-century title that is difficult to define owing to its diverse applications. Etymologically, it means a dance from Padua. In practice it had two meanings: (1) In the first half of the 16th century it was used as a generic term for dances of the *\*pavane-passamezzo* species. The nine dances labeled *pavana* in Dalza's *Intabulatura de lauto* (Petrucci, iv, 1508) are described as *padoane diversi* on the title page of the collection, as are the *passamezzi* in Da Crema's *Intabulatura de lauto* (1546). Dances of the same type in Capirola's lute book (c. 1517; see Gombosi ed., 1955) and, anachronistically, in J. C. Barbetta's *Intavolatura de liuto* (1585) and J. Abondante's *Il Quinto Libro de tabolatura da liuto* (1587) are labeled *padoana*. (2) Toward the middle and in the second half of the 16th century, the term *padovana* or *padoana* was usually applied to a quick dance in quadruple compound meter (12/8) resembling a *\*piva*. Such dances appear in lute tablatures by D. Bianchini (1546), Antonio Rotta (1546), Gorzanis (1561, '63, '64, '6?), Barbetta (1585), Abondante (1587), Radino (1592), and Terzi (1599).

For the most part the inconsistent use of the term in Italian collections is duplicated in German ones, but in Spanish and French sources, with few exceptions, the word *pavana* (pavane, or *pavanne*) is employed as a generic term for dances of both the *pavane-passamezzo* and *padoana-piva* types. In German sources of the 17th century, the title reverts to its earlier 16th-century meaning, and introductory dances of the *pavane-passamezzo* species in suites of Isaac, Posch, Peurl, Schein, and Scheidt are labeled *paduana*.

For detailed description and bibl. see L. H. Moe, in *MGG* x, 566-68.

L.H.M.

**Paean.** Originally a name for Apollo, the term came to mean a song in praise of this god, or a song of praise in general.

**Paganini Etudes.** Six concert etudes for piano by Liszt, based on Paganini's *Capricci* for violin (except no. 3, which is taken from Paganini's *La Campanella*). Schumann also wrote twelve etudes on themes from Paganini's *Capricci*.

**Paganini Variations.** Variations (in two sets) for piano by Brahms, op. 35 (1866), on a theme by Paganini, the same that Liszt had used in no. 6 of his *\*Paganini Etudes*. Brahms' variations combine the utmost technical difficulty with an emotional detachment that is very unusual in the piano literature of the period.

**Pagliacci, I** [It., The Players]. Opera in two acts and prologue by Leoncavallo (to his own libretto), produced in Milan, 1892. Setting: Montalto Calabria, Aug. 15, 1865. Together with Mascagni's *\*Cavalleria rusticana*, *Pagliacci* is the outstanding example of the *\*verismo* movement. Particularly famous is the prologue in which Tonio explains the idea of the plot—an intentional revival of the *\*prologue* of 17th-century opera.

**Paired imitation** [G. *paarige Imitation*]. A special type of imitative treatment, in which the four statements of the theme are arranged so that 1 and 2 appear in close succession, while 3 and 4 enter later in the same combination (except for octave transposition). It is very characteristic of Josquin's style [see Ex. 1, from the motet "Memor esto," meas. 203]. Sometimes the

second pair is made to vary from the first through use of double counterpoint at the octave, fifth, or fourth. The term "paired imitation" is also used for another device, equally common in the works of Josquin, in which each pair consists of two different melodies [Ex. 2, from "Ave Maria," meas. 19]. This device might perhaps be distinguished from true paired imitation by calling it "duo imitation." Both methods are occasionally found in earlier compositions, e.g., by Busnois.

**Paléographie musicale.** See Editions XLII.

**Palestrina.** Opera in three acts by H. Pfitzner (to his own libretto), produced in Munich, 1917. Setting: Rome and Trent, 1563.

**Palestrina style.** A polyphonic *a cappella* style based on the principles of counterpoint, imitation, melodic movement, and consonance and dissonance as used in the music of Palestrina. As early as the 17th century this style, known by such names as *stile antico* or *stile osservato*, had become "classical" in the \*Roman school. It was revived by Baini (1775–1844) in the early 19th century, and later by the \*Cecilian movement. Pope Pius X, through his *\*motu proprio*, gave it new status in church composition. Today the Palestrina style is an important aspect of the study of counterpoint [see K. Jeppesen, *Counterpoint* (1939); A. T. Merritt, *Sixteenth-Century Polyphony* (1940)].

Lit.: K. Jeppesen, *The Style of Palestrina and the Dissonance* (1927); O. Ursprung, *Restauration und Palestrina-renaissance in der katholischen Kirchenmusik der letzten zwei Jahrhunderte* (1924); K. G. Fellerer, *Der Palestrinastil und seine Bedeutung in der vokalen Kirchenmusik des achtzehnten Jahrhunderts* [1929].

**Pallet.** See under Organ II.

**Panama.** Panama's folk music combines the Spanish tradition of the coast, the indigenous inland forms, the African elements brought by Negro slaves, and the internationalism of Panama City. The pentatonic structure of pre-Columbian music survives in the rituals of the

Tule Indians, who still use rudimentary flutes and drums similar to those described by early Spanish chroniclers. The Spanish traditions in Panama were untouched by the influences of Italian opera and 19th-century salon dance music, which so strongly affected most Latin American folk music. Native forms such as the *\*mejorana* or *socavón* and the *\*punto* remained unchanged, and the *\*tamborito* and *\*cumbia* retain their African character to the present day.

Art music developed relatively late in Panama, although information concerning the musical history of Panama City Cathedral is available from the time of Juan de Araujo (1646–1714), who served as music director until 1670 (when he was appointed to the Lima Cathedral; see Peru).

A group of composers born during the last decades of the 19th century produced the first art music composed by native Panamanians. Most of them were amateurs who wrote popular songs and dances, short instrumental pieces in the national vein, and band music. Among them was Jorge Santos (1870–1941), who composed the national anthem. The most outstanding member of this group is Alfredo Saint-Malo (b. 1898), a noted violinist educated in Paris, who at one time was director of the *Conservatorio Nacional* of Panama. Ricardo Fábrega (b. 1905) has won recognition for songs and dances composed in the native manner. The first professionally trained musician of stature was Herbert de Castro (b. 1906), who wrote a number of works in prevailingly impressionist style and became a strong promoter of contemporary music in Panama.

Panama's most distinguished contemporary composer is Roque Cordero (b. 1917), whose works have projected a genuine Panamanian idiom into international music. In addition to writing three symphonies, a Concerto for violin and orchestra, *Capricho Interiorano*, and several solo and chamber works, he has been active as an educator (head of the *Instituto Nacional de Música*) and conductor (of the *Orquesta Sinfónica de Panamá*). Other contemporary Panamanian composers are Gonzalo Brenes, a noted ethnomusicologist whose compositions include a ballet, *Mariana del Monte*; José Luis Cajar, composer of a *Preludio* for orchestra and a Quintet for winds; and Marina Saiz Salazar (b. 1930), composer of a Sonata for piano and *Sejatarpar* for orchestra.

Lit.: N. Garay, *Tradiciones y Cantares de Panamá* (1930); G. Chase, *Composed by Cordero* (1958); N. Slonimsky, "Music, Where the Amer-

icas Meet" (*Christian Science Monitor*, June 8, 1940); R. Cordero, "Actualidad musical en Panamá" (*Buenos Aires Musical* xii, no. 197, Oct. 1957). Also see under Latin America. J.O-S.

**Panconsonant.** A term introduced by M. Bukofzer for a style inaugurated c. 1420 by Dunstable, in which triads are predominant and dissonances are ornamental (\**cambiata* or *échappée*; see Non-harmonic tones I) rather than structural [see under *Ars nova* II]. See M. Bukofzer, in *MGG*, s.v. "Dunstable."

**Pandean pipes.** See Panpipes.

**Pandiatonicism.** A term introduced by N. Slonimsky to describe an important technique in 20th-century music, i.e., the use of the diatonic scale instead of the chromatic scale as a tonal basis without conventional harmonic limitations. The accompanying example (Stravinsky, Piano Concerto) illustrates this style, in which the absence of functional harmony usually results in a certain tonal staticity, offset by a greater interest

in counterpoint, rhythm, and chord spacing. Historically, however, pandiatonicism represents a reaction against both the "panchromaticism" of atonality and the "harmonic chromaticism" of the late 19th century. In fact, a page from, e.g., Stravinsky's *Serenade* (1925) or Poulenc's *Suite* (1920) with their C-major appearance offers a striking contrast to the piling up of sharps and flats in a page from Ravel or Schoenberg.

Pandiatonic style is clearly present in many of Satie's whimsical pieces, written c. 1910 (e.g., *Embryons desséchés*), Debussy's "Doctor Gradus ad Parnassum" (in *Children's Corner* [*Coin des enfants*], 1910), and portions of Stravinsky's *Petrushka* (1911). It became more fully established about 1925 as a concomitant of the \*neoclassical movement. See N. Slonimsky, *Music Since 1900*, rev. ed. (1949), p. xxiv.

**Pandora.** See Bandora.

**Pandoura, pandura.** A long-necked lute of ancient Greece and Rome [see Lute II].

**Pandura.** See Bandurria.

**Panduri, pandur.** A small, bottle-shaped fiddle used in the Caucasus.

**Panharmonicon.** See under Mechanical instruments III.

**Pan-isorhythmic.** A term introduced by W. Apel for 14th- and early 15th-century motets in which isorhythmic technique is applied to all the voice-parts, not only to the tenor. See Isorhythmic. See W. Apel, "Remarks about the Isorhythmic Motet" (*Les Colloques de Wégimont* ii [1955]).

**Panpipes, pandean pipes.** A primitive wind instrument consisting of a number of tuned pipes (vertical flutes; see Instruments III) of different size, which are bound or glued together, usually in the form of a raft. The pipes, usually stopped at one end, are blown across the top, as in the mouth organ. [See ill. under Flute.] The panpipes are among the oldest instruments. They were used in ancient Greece, where they were called *syrinx*, attributed to the god Pan, and played by shepherds, as well as in China, Rumania, and South America. The Peruvian panpipes are called \**antara* and those of Ecuador (made of 33 pipes of cane) *rondador*.

The Chinese panpipes, called *pai-hsiao*, consist of sixteen (formerly twelve) pipes arranged in two whole-tone scales [see Ex.]. It is a ritualistic and symbolic instrument, its shape representing the outspread wings of the mystic bird phoenix, and the arrangement of its pipes in two

groups standing for the male and female elements (the tones of the left half are the *yang lü*, i.e., masculine tones; those of the right half, the *yin lü*, i.e., feminine tones). See China II. See A. H. Fox-Strangways, in *ML* x; J. Tregenna, *The Pipes of Pan* (1926); *SaHMI*; E. M. von Hornbostel, in *Festschrift für P. W. Schmidt* (1928).

**Pantaleon.** An enlarged \*dulcimer invented c. 1697 by Pantaleon Hebenstreit, who also was a virtuoso on this instrument. It reportedly had 186 strings and was played by means of two small hammers. The last virtuoso on the instrument was one Georg Nölle (Noel), who gave performances in England (1767) on an instrument with 276 strings. Toward the end of the 18th century

the name was used for a piano with downstriking action.

**Pantomime.** A silent dramatic performance in which the action is revealed by facial expression, movements, and gestures, with musical accompaniment. The pantomime is distinguished from \*ballet in that it emphasizes dramatic movements rather than dancing; however, the *ballet d'action* is very close to pantomime. Pantomime played an important part in ancient Greece. Toward the end of the pre-Christian era pantomime developed into a virtuoso show, in which a single actor performed entire plays, representing different personages by using masks. Throughout the 18th century, pantomime was extremely popular, with the stock characters Harlequin, Pantaloon, Clown, the Old Man and his Pretty Daughter taken from the Italian *commedia dell'arte*. For these popular entertainments, music was occasionally written by composers of some renown, such as the two Arnes, Dibdib, *et al.* A revival of greater musical significance was inaugurated by André Wormser's *L'Enfant prodigue* (1890). Later examples are R. Strauss' *Josephslegende* (1914) and *Schlagobers* (1924), as well as Stravinsky's *L'Histoire du soldat* (1917) and Bartók's *Der wunderbare Mandarin* (1926). See R. J. Broadbent, *A History of Pantomime* (1901); A. E. Wilson, *The Story of Pantomime*, 2 vols. (1949).

**Pantonality, pantonal.** The inclusion of all tones on an equal basis. The terms are sometimes used instead of \*atonality and atonal.

**Papadike.** See under Byzantine chant III.

**Papillons** [F., Butterflies]. Fanciful title used by Schumann for a set of twelve short piano pieces (op. 2, 1829–31), "butterflies of different colors," as it were. The final piece suggests the end of a ball early in the morning, with the clock striking six. See also under Character piece.

**Paraguay.** The earliest musical accomplishments in Paraguay are associated with the first Jesuit missions in northern Paraná. Soon after the founding of La Asunción (1537), chronicles mention two Spaniards, Juan Gabriel Lezcano and Rodrigo Melgarejo, who taught the Guaraní Indians to perform plainchant and instrumental music. In 1609 the Jesuit mission of San Ignacio Guazú was established, and by 1620 it included a school of music organized by Father Pedro Comental (1595–c. 1670), a Neapolitan mathematician and musician. His work was carried on by a Frenchman, Father Luis Berger (1588–

1639), an accomplished violinist who settled in Paraguay in 1616 and later moved to Buenos Aires [see Argentina]. Little is known about musical life during the remainder of the colonial period.

After independence from Spain (1811), Paraguay underwent a long period of dictatorship and isolation, which is reflected in the country's musical development. European salon music acquired new characteristics in Paraguay, quite different from those in the rest of 19th-century Latin America. The waltz, polka (polka Paraguaya), and galop developed rhythmic and metrical variations peculiar to Paraguay, and the extensive use of the Guaraní language was reflected in certain characteristic features in folk-songs of Spanish origin, as in the Paraguayan *canción* known also as \**purajhei*. This tradition was later revived by José Asunción Flores (b. 1904) in a type of ballad song called \**guaranía*, which many of his followers have also cultivated.

The first important native Paraguayan composer was Agustín Pio Barrios (1885–1944), who wrote mainly for the guitar. Other prominent composers of the 20th century are Fernando Centurion de Zayas (b. 1886), also a conductor and educator; Remberto Gimenez (b. 1899), composer of a *Rapsodia Paraguaya* and of the official version of the national anthem; and Juan Carlos Moreno (b. 1912), who has written piano, chamber, and orchestral works, some based on elements drawn from Paraguayan native music.

Primitive instruments of the Guaraní Indians are still used in Paraguay. Most of them belong to the \**memby* family, a group of wind instruments. A trumpet called *inubia* and several kinds of drum, such as the *trocato*, *matapú*, and *curugú*, are also used, in addition to the *mbaracá* [see Maraca] and \**congoera*.

Lit.: J. M. Boettner, *Música y músicos del Paraguay* (1957?); J. C. Moreno Gonzales, "Los Guaraníes y la música" (*Boletín latino-americano de música* iv, 1938). Also see under Latin America.

J.O.S.

**Parallel chords.** The successive sounding of a fixed chordal combination, consonant or dissonant, through various degrees of the scale. In classical harmony this device is admissible only for the sixth chord and diminished seventh chord, being strictly prohibited for triads, seventh chords, etc., on account of the parallel fifths that would result. In deliberate violation of these principles, French composers, particularly De-

## PARALLEL CHORDS

bussy, introduced parallelism for triads and seventh chords as well as for any dissonant combination involving seconds, fourths, etc. [Ex. 1, *Danse sacrée*, 1904; Ex. 2, *Et la lune descend*, 1907]. This technique, one of the most character-

istic features of \*impressionist music, is in opposition to traditional harmony not only because it violates the rule of parallel fifths and introduces unresolved dissonances but, chiefly, because it rejects the fundamental concept of traditional harmony, i.e., the functional character of the chords. Instead, it establishes the chord as a mere sensuous and sonorous factor. Later composers, such as Stravinsky, Bartók, and Casella, have exploited the percussive quality of parallel chords by using them in rapid succession and in pronounced rhythm [Ex. 3, *Petrushka*].

Although Debussy is rightfully credited with establishing parallelism as a technique, occa-

## PARALLEL (CONSECUTIVE) FIFTHS, OCTAVES

sional examples are found in other 19th-century works (by Rossini, Mussorgsky, Lalo, Délibes; see *LavE* ii.1, 72ff, 632ff). Parallel fourth chords are found in Satie's *Le Fils des étoiles* of 1891 [Ex. 4], and "percussive" parallelism prevails in the introduction to Act II of Puccini's *La Bohème*, 1896 [Ex. 5]. In the 16th century, parallel 1-5-8 chords were quite common in keyboard dances [see Editions XI, 8], and parallel triads were used parodistically in the \*villanella. A "serious" example of remarkable boldness occurs in Monteverdi [see H. Leichtentritt, in *MM* v, 16]. In compositions of the period c. 1400 there are instances of parallel triads without parallel motion [Ex. 6, schematic; see W. Apel, *French Secular Music of the Late Fourteenth Century*, p. 13a].

**Parallel (consecutive) fifths, octaves.** The duplication of the melodic progression of a part (e.g., c-d) by another part at the distance of a fifth (g-a) or octave (c'-d'). Such voice-leading [see Ex. 1, 2] is considered faulty and is strictly prohibited in classical counterpoint. Its avoidance is

a basic feature of the contrapuntal style from the 15th through 19th centuries.

A fifth (or octave) that is reached not in parallel but in similar motion is referred to as a "hidden (covered) fifth" (or octave). This kind of voice-leading is usually admissible, except for certain extreme cases, e.g., when large intervals are involved in both voices, e.g.,  $\begin{smallmatrix} g-c' \\ B-f \end{smallmatrix}$ . Particularly common (and entirely legitimate) is the progression illustrated in Ex. 3. This is called "horn fifths" because it is characteristic of the writing for natural horns.

Parallel fifths and octaves are basic in the early \*organum (10th century) and occur frequently in compositions of the subsequent centuries, e.g., 13th-century motets. The younger Johannes de Garlandia, in his "Optima introductio in contrapunctum" (c. 1300; *CS* iii, 12) was the first to state that "two perfect consonances of the same type should never follow one after the other." Nevertheless, consecutive fifths and octaves are still common in the works of Machaut. From the 15th century on the rule was generally observed, although not always as strictly as later theorists demanded. Ex. 4 shows three cases of unorthodox treatment in Josquin's "Tu pauperum refugium" [*HAM*, no. 90]. Even Bach and Mozart occasionally admitted parallel fifths and octaves. Theorists and writers of the 18th and 19th centuries treated this rule as a "strict law" on the basis of which they not only discovered many "stylistic faults" in Bach but also condemned as crude such early musical styles as the parallel organum of the 9th century or the motets of the 13th century, sometimes even going so far as to object to the mixture stops of the organ [see *Organ* VI]. Today this narrow view has been largely abandoned.

Lit.: F. T. Arnold, "J. S. Bach and Consecutives in Accompaniment" (*ML* xiv, 318); F. E. Gladstone, in *PMA* viii; M. G. Sewall, "Hucbald, Schoenberg and Others on Parallel Octaves and Fifths" (*MQ* xii); M. Shirlaw, "Aesthetics and Consecutive Fifths" (*MR* x, 89ff).

**Parallel key.** See Key relationship.

**Parallel motion.** See Motion.

**Parallel seconds.** See under Lombardic style.

**Parallel thirds.** See under Gymel.

**Paralleltonart** [G.]. Relative (not parallel) key.

**Paramese, paranete.** See under Greece II.

**Parameter.** A mathematical term denoting special variables, e.g., the variable amplitude in a group of sine curves [see *Acoustics* VI and accompanying Ex.]. The term has been introduced into contemporary music (\*serial music, \*electronic music) to indicate variabilities of pitch, rhythm, volume, timbre, etc.

**Paraphonia.** In late Greek and early medieval theory, term used for the intervals of the fifth and fourth, as opposed to \**symphonia* (unison) and *antiphonia* (octave). The fact that *paraphonistae* are mentioned in writings of the 1st and 7th centuries (Longinus; *Ordo Romanus* I) has been

interpreted as evidence of parallel organum long before the "Musica enchiriadis." See P. Wagner, in *RdM*, 1928, pp. 15ff; 1929, p. 4; A. Gastoué, in *RdM*, 1928, pp. 61ff; C.-A. Moberg, in *ZMW* xii, 220; *ReMMA*, p. 252.

**Paraphrase.** A free rendition or elaboration. In music the term may mean: (1) A textual paraphrase, i.e., a free rewriting of a text; e.g., a psalm paraphrase is a new wording of a psalm, usually in poetic language (metrical psalm; see *Psalter*). See under *Contrafactum*. (2) A reworking and free arrangement of well-known melodies, such as Liszt's concert paraphrases of Wagnerian operas.

(3) In early music (14th–16th centuries), a free elaboration of a plainsong melody, comparable to the ornamentation of chorale melodies found in many organ chorales by Buxtehude and Bach. Unlike ornamentation, which is easily recognized as such because it involves smaller note values, paraphrase is a more subtle transformation in which original and additional notes blend into a new melody of homogeneous design. The accompanying Ex. shows a passage from a Gloria (based on the Gregorian Gloria IX) by Dunstable, who was one of the first composers to make extensive use of this technique, which is the opposite of \**cantus planus* style. The same technique is employed in Dufay's *Alma redemptoris mater* [*HAM*, no. 65], as well as in 15th- and 16th-century organ music (Buxheim Organ Book, John Redford). The term "paraphrase Mass" has been applied to 15th-century Masses

Tu so - lus Al - tis - si - mus

(usually single Mass items) having a paraphrased plainsong in one voice-part, as well as to 16th-century Masses in which a paraphrased plainsong (usually a hymn melody) or portions thereof are used in all the voices, producing points of imitation. Probably the earliest example is Josquin's *Missa Pange lingua*. In later compositions of this type (Palestrina) the paraphrase sometimes involves simplification rather than amplification of the plainsong.

In true paraphrase the original notes (often marked x in modern editions) appear in a normal distribution, approximately one to each measure,

Attempts to interpret upper parts of certain Masses as paraphrases involving highly irregular distribution of the plainsong melody—e.g., three or more notes in one measure and the next note perhaps ten measures later—are not authentic [see Discant Mass]. See J. Handschin, “Die melodische Paraphrase im Mittelalter” (*ZMW* x); R. Ficker, “Die frühen Messenkompositionen der Trienter Codices” (*StM* xi); R. L. Marshall, “The Paraphrase Technique of Palestrina” (*JAMS* xvi); *ReMR*, *passim*.

**Parapter.** Term used in a few medieval treatises for tonally irregular antiphons and, possibly, for four irregular modes to be added to the eight normal church modes. Hucbald, in his *De harmonica institutione* (“De modis”; *GS* i, 148), enumerates four *parapteres*, two of which can be identified with two well-known groups of irregular antiphons: the *parapter tertius* with what Regino calls *antiphonae nothae* [see Nothus; Gevaert’s *thème* 29, in *La Melopée antique*, 1895], the *parapter quartus* with the *tonus-peregrinus* antiphons (*thème* 28; see *ApGC*, p. 399f). See A. Auda, *Les Gammes musicales* [1947], pp. 153ff [his reconstruction of the modes, p. 158, is not convincing]; P. Wagner, in *CP Adler*.

**Pardessus de viole.** See Dessus.

**Parhypate.** See under Greece II.

**Paris Symphonies.** Six symphonies by Haydn, nos. 82–87, composed 1785–86 for the *Concerts de la Loge Olympique* in Paris. Three of them have individual names: *L’Ours* (no. 82), *La Poule* (no. 83), and *La Reine* (no. 85).

**Paris Symphony.** Mozart’s Symphony in D (K. 297), written in 1778 during his stay in Paris and performed there at the *Concerts spirituels*.

**Parlando, parlante** [It.]. In singing, an indication that the voice must approximate speech; in a sense, “spoken music,” as distinguished from the “musical speech” of the *\*recitative*. *Parlando* occurs particularly in rapid tempo when the syllables of the text change with every note; see Patter song. In instrumental music, *parlando* (*parlante*) calls for an expressive declamation, suggestive of speech or song. See Beethoven’s *Bagatellen* op. 33, no. 6: “Con una certa espressione parlante.”

**Parlato** [It.]. Same as *\*parlando*, but also used to distinguish the spoken sections in comic opera (ballad opera, *Singspiel*) from those that are sung.

**Parody.** (1) In present-day usage, a satirical imitation, such as may be created in music either by replacing the original text with a comic one or by changing the composition itself in a comic manner [see Satire]. (2) In early practice, replacement of the text, with or (more often) without the implication of caricature. This procedure, although often referred to as parody (e.g., parodies of Lully’s operas), is more properly termed *\*contrafactum* to distinguish it from the “musical” parody described below.

(3) Before 1600 and occasionally in the 17th century, parody means a serious reworking of a composition, involving additions to or essential modifications of the original. The most important use of this technique was in the Mass [see Parody Mass]. However, it was also used in other fields, especially in transferring vocal compositions to lute or keyboard instruments, a process that often involved more than mere *\*intabulation*. One method was to borrow themes from a vocal composition and treat them in a new, usually more expanded manner. An example in point is G. Cavazzoni’s keyboard canzona “Falte d’argens,” a parody of Josquin’s chanson “Faulte d’argent” [see *HAM*, nos. 91, 118]. The same method is used in A. de Cabezón’s “Tiento sobre Cum sancto spiritu” (*\*Editions XX*, 7) a composition based on themes from the “Cum sancto spiritu” section (end of the Gloria) of Josquin’s *Missa de Beata virgine*. A different method of parody is exemplified by a “Glosa sobre el ‘Cum sancto spiritu’” by the Spanish vihuela composer Mudarra (*\*Editions XXXII*, 7, p. 59), in which the same composition by Josquin is divided into three sections marked “Josquin,” each of which is preceded by a freely invented section marked “Glosa.”

Lit. *For* (2): See under *Contrafactum*. *For* (3): W. Steinecke, *Die Parodie in der Musik* (1934); M. Steinhardt, *Jacobus Vaet and His Motets* (1951), pp. 54–59; L. Lockwood, in *CP Reese* (16th cent.); J. Ward, in *JAMS* v and *CP Sachs* (16th-cent. instrumental music); F. Reimann, in *MF* viii (North German tablatures). See also under Paraphrase; Parody Mass; Satire; Villanella.

**Parody Mass** [*L. missa parodia*]. Term for an important practice in 15th- and 16th-century Mass composition, i.e., incorporating into the Mass material derived from various voice-parts or from entire sections of a polyphonic composition (motet, chanson, madrigal). This extensive borrowing distinguishes the parody Mass from the

*cantus firmus* Mass, which employs only one voice-part (tenor or *superius*) of its model [see Mass C II b]. Whereas in the *cantus firmus* Masses there is a fairly uniform practice of employing the borrowed melody as the tenor of each Mass item, in the parody Masses a large variety of methods is used, in regard to both the amount and the treatment of the borrowed material.

The earliest incontrovertible examples of parody Mass are by two late 14th-century Italian composers, Bartolomeo da Bologna and Antonio Zacara of Teramo. The former reworked his *ballata*, "Vince con lena" [Stainer, *Dufay and His Contemporaries*, p. 60] into a Gloria [Van den Borren, *Polyphonia sacra*, pp. 37ff; see especially the "Gratias agimus"]; Zacara wrote an "Et in terra Rosetta," "Et in terra Fior gentil," and "Patrem Deus deorum," in which he incorporated his *ballate* "Rosetta" and "Fior gentil" with the Gloria, and "Deus deorum" with the Credo [see F. Ghisi and N. Pirrotta, in *CP* 1950, pp. 308ff, 315ff]. In the 15th century the parody technique was applied to entire Masses. Among the earliest instances are Faugue's (Ockeghem's?) *Missa Le Serviteur*, which draws on all the parts of Dufay's chanson of the same name [see the table in *ReMR*, p. 113], and Ockeghem's similarly constructed *Missa Fors seulement* [*ReMR*, p. 127]. Several Masses by Obrecht are essentially *cantus firmus* Masses, being based on the tenor of a chanson, but incorporate additional material from the chanson, sometimes entire segments, into the sections during which the tenor pauses (*Missa Fortuna desperata*, *Si dederò*, *Rose play-sant*, etc.).

The 16th-century parody Mass incorporates not fragments taken from individual parts but entire polyphonic segments of the model, in this period usually a motet. A sort of minimum procedure was to use three segments, from the beginning, the middle (often beginning of Part II), and the close of the motet, and employ these in the same position in each Mass movement, with the middle segment serving for the beginning of subsections (Kyrie II, Qui tollis, Et in spiritum, Osanna, Agnus II). These segments are connected by newly composed material, in a manner very similar to that used in the \*tropes of the 10th and 11th centuries. Most of the Masses of Gombert and Clemens non Papa belong to this type. Later composers went even further, breaking up the entire motet into segments and incorporating them, usually in the same order, into the Mass movements. About three-fourths of the Masses

of Palestrina and Lassus are parody Masses. Examples are in *HAM*, no. 146b (de Monte), and *ReMR*, pp. 478 (Palestrina) and 607 (Victoria).

Lit.: F. Ghisi and N. Pirrotta, in *CP* 1950 (14th cent.); L. Schrade, in *AM* xxvii (14th cent.); W. H. Rubsamen, in *BAMS* iv (16th cent.); R. B. Lenaerts, in *MQ* xxxvi (16th cent.); J. Schmidt-Görg, in *KJ* xxv (16th cent.); P. Pisk, in *StM* v (Gallus); J. Klassen, in *KJ* xxxvii-xxxix (Palestrina); H.-C. Wolff, in *CP Anglés* ii (16th cent.).

**Parsifal.** Opera in three acts by Richard Wagner (to his own libretto), produced at Bayreuth, 1882, for the dedication of the *Festspielhaus* [see *Bühne*] and performed there almost exclusively for thirty years. Setting: in and near Montsalvat, Spanish Pyrenees, Middle Ages. The first performance elsewhere was at Munich in 1884 (private). Stage productions produced in violation of the Bayreuth privilege were first held in New York, 1903, and at Amsterdam, 1905. *Parsifal*, Wagner's last work, is written according to the principles of the music drama [see Opera X].

**Part.** (1) In orchestral or chamber music, the music for a particular instrument, such as violin, flute, piano, etc. (2) In contrapuntal music, the single melodic line of the contrapuntal web (fugue in three, four parts). The modern names for such parts, also called voices, are soprano, alto, tenor, and bass. Early designations are: *vox principalis*, *vox organalis* (9th-11th cent.); *cantus*, *discantus* or *cantus*, *organum* (12th cent.); *tenor*, *duplum* (*motetus*), *triplum*, *quadruplum* (13th cent.); *discantus*, *tenor*, *contratenor* (1300-1450); *superius*, *altus*, *tenor*, *bassus*, additional parts being called *quinta vox*, *sexta vox*, *vagans* (1450-1600). See also Treble; Meane. (3) A section of a composition, as in three-part song form.

**Partbooks** [G. *Stimmbücher*]. The manuscript or printed books of the 15th and 16th centuries, each containing the music for an individual voice of a polyphonic composition [see under Score II]. The earliest source of this kind is the Glogauer Liederbuch of c. 1480, written in three partbooks. The usual number of partbooks is four: *Cantus* (*Discantus*, *Superius*); *Altus*; *Tenor*; *Bassus* (*Basis*), abbr. *C* (*D*, *S*); *A*; *T*; *B*. Books for additional parts were marked either *Cantus I*, *Cantus II*, or *Quinta Vox* (*V*), *Sexta Vox* (*VI*), etc.

Publication in partbooks clearly indicates that the music thus written or published is \*ensemble music, either vocal, or instrumental, or mixed.

**Parte** [It.]. (1) Voice-part [see Colla]. (2) 17th-century term for variation [see *Partita*; *Parthie*].

**Parthenia**. A printed collection of \*virginal music, published c. 1611 (1613, 1646, and many later editions). According to the title, it was "the first musicke that euer was printed for the Virginals." It contains twenty-one compositions "by three famous Masters William Byrd, Dr. John Bull and Orlando Gibbons." New editions were published by Rimbault (1847), Farrenc (*Trésor des pianistes*, 1863), M. Glynn (1927), and K. Stone [1951]. A facsimile edition by O. E. Deutsch appeared in 1943. A companion work is the *Parthenia inviolata*, which contains anonymous pieces ("dances and tunes") for virginal and bass viol (only preserved copy in the New York Public Library).

**Parthie, Partia, Partie** [G.]. 17th- and 18th-century names for suite; see *Partita* (2). The French word *partie* means voice-part (*fugue à 3 parties*) or section, movement (*sonate en 4 parties*).

**Partial**. See under Acoustics IV.

**Partial signature**. The use of a signature, practically always b-flat, in some but not all the voices of a polyphonic composition (also called conflicting signature). Prior to 1500 such signatures are extremely common—indeed, much more so than "full" signatures. As a rule, the highest part carries no signature, the b-flat being indicated only with the lower parts. Typical combinations are:  $\flat$ ,  $\flat$ , for two-voice pieces (13th cent.);  $\flat$ ,  $\flat$ ,  $\flat$ , or  $\flat$ ,  $\flat$ ,  $\flat$ , for three-voice pieces (13th, 14th cent.);  $\flat$ ,  $\flat$ ,  $\flat$ ,  $\flat$ , for four-voice pieces (15th cent.). This method of notation does not, as some writers assume, represent an oversight or a meaningless tradition. It has been explained as the adequate expression of a sort of contrapuntal bitonality (Apel, Johnson) or bimodality (Hoppin) and, in contrast to these views, as the practical reflection of the various cadential formations of the period (Lowinsky). See W. Apel, in *AM* x, xi; *id.*, in *ApNPM*, pp. 102ff, 140; E. Lowinsky, in *MQ* xxxi, *JAMS* vii; R. H. Hoppin, in *JAMS* vi, ix; M. Johnson, in *Hamline Studies in Musicology* ii (1947; Landini).

**Partie** [G., F.]. See under *Parthie*.

**Partimen** [Prov.]. See *Tenso*.

**Partimento** [It.]. A 17th- and 18th-century practice of improvising melodies and complete pieces above a written bass; thus, a broadening of the

practice of thoroughbass in which the bass as well as the melody is given. The English \*divisions upon a ground belong to the field of *partimento* playing, which was extensively cultivated in the later baroque period as a means of musical instruction. Gaetano Greco (b. 1680), Francesco Durante (1684–1755), and Giacomo Tritto (1733–1824) wrote *partimenti*. See K. G. Fellerer, *Der Partimento-Spieler* (1940); *id.*, "Gebundene Improvisation" (*DM* xxxi.6).

**Partita** [It.]. (1) The original and proper meaning of the term, as applied to music, is variation. A MS from 1584, containing lute compositions by Vincenzo Galilei, includes a *Romanesca con cento parti*, each *parte* being a variation. In A. Mayone's *Primo libro di diversi capricci* (1603), Trabaci's *Ricercate, canzone . . . partite diverse* (1603), Frescobaldi's *Toccate e partite d'intavolatura* (1615), the autographs of Pasquini, and elsewhere, *partita* always means a variation, the entire composition being correctly called *partite* (plural). In Germany, the term occurs in connection with Froberger's variations "Auf die Mayerin," as well as chorale variations by Georg Böhm ("Freu dich sehr o meine Seele") and Bach ("O Gott, du frommer Gott" and two others). The modern practice of using the singular form *partita* for the entire composition (e.g., "Partita über die Arie"; see J. Wolgast, *Georg Böhm, Sämtliche Werke* [1952], i, 69), is wrong, both grammatically and historically. See F. Torrefranca, in *CP* 1953. (2) To the present-day reader, a *partita* is a suite, a meaning based on the six Partitas in Bach's *Clavier-Übung* i (1731). Possibly this term is derived from the French word *partie*, since in the 1690's suites were occasionally termed *Parthien* (Froberger, 1693; Kuhnau, 1693; Krieger, 1697). Bach's three suites for violin solo are termed *Partia* (not *Partita*) in the autograph. (3) Occasionally, the term *partite* means "pieces," e.g., in the posthumous publication *Diverse . . . Partite di toccate, ricercate, capricci e fantasie . . . di Froberger* (1693).

**Partition** [F.], **Partitur** [G.], **partitura** [It.]. \*Score. See also under *Intavolatura*.

**Part song**. A choral composition in homophonic style, i.e., with the top part the sole carrier of the melody. The term is commonly understood as an antonym of the madrigal, with its emphasis on polyphonic texture, and therefore applies chiefly to choral works of the 19th century, such as were written by Schumann, Mendelssohn, Parry,

Stanford, Elgar, and many others. See also Glee. Sometimes the term is used quite differently, i.e., for the truly polyphonic songs of the pre-madrigal period. Thus, Isaac's "Innsbruck ich muss dich lassen" is designated as a "German part song." See A. Vogel, "The English Part-Song around 1500" (*BAMS* 1940).

**Parture** [F.]. See under *Tenso*.

**Pasacalle** [Sp.]. A Bolivian serenade of gay character, in 2/4 meter, usually performed in the streets by couples who dance either holding hands or separately. J.O.-S.

**Paseos** [Sp.]. A term used by Cabanilles (1644–1712) for compositions very much like a chaconne. Ex. in *HAM*, no. 239.

**Pasillo** [Sp.]. Originally, a Colombian ballroom dance similar to the waltz, but today a dance performed mainly in rural areas. Like the waltz it is in moderate 3/4 meter, but it often employs a characteristic rhythmic pattern with a dotted quarter note on the first beat and a strong accent on the third. J.O.-S.

**Paso doble** [Sp.]. A kind of one-step (though the name means "double-step") in 6/8 meter that became popular about 1926.

**Paspy**. Another name for *\*passepiéd*.

**Passacaglia** [It.], **passacaille** [F.]. See Chaconne and passacaglia.

**Passage**. A term loosely used for a short section of a composition much as in literature (a passage from the Bible). More specifically, passages or passage work refers to sections that contain a brilliant display of virtuosity rather than important musical ideas. Thus, one speaks of "scale passages," "arpeggio passages."

**Passaggio** [It.]. (1) Transition, modulation. (2) Passage work. (3) In the 16th-century art of diminution [see Ornamentation], a generic term for improvised ornaments, usually other than plain scale passages or trill-like figurations.

**Passamezzo, pass'e mezzo**. An Italian dance of the 16th and early 17th centuries similar to a *\*pavane*; indeed, the musical style of the common pavane cannot be distinguished from a *passamezzo*. The dance steps must also have been similar. Arbeau (*Orchésographie*, 1589, f. 33) describes the *passamezzo* as a "pavana played less heavily to a lighter beat," and M. F. Caroso's choreographies for the two dances have the same stylistic characteristics (*Il Ballarino*,

1581, and *Nobiltà di Dame*, 1600). Furthermore, Gervaise (*Sixième livre de danseries*, 1555) uses the term *pavanne-passemaize*. In all probability the *passamezzo* was a type of pavane. Like the pavane, it was usually coupled to a *saltarello*, a galliard, or a *\*padovana*. Dances coupled together were composed on the same melodic and/or harmonic patterns.

The earliest extant example appears in H. Newsidler's *Ein newgeordent künstlich Lautenbuch* (1536) listed as "Welscher tantz Wascha mesa" (Italian dance *Wascha mesa*). The curious *Wascha mesa* is explained in a later collection by Newsidler [*Ein neues Lautenbüchlein*, 1540], in which it is supplanted by the title "Passa mesa: Ein Welscher tantz." The title is not found in Italian books until 1546 (lute tablatures by G. Abondante, D. Bianchini, da Crema, and A. Rotta), but it must have existed earlier, since Newsidler cited it as an Italian dance. It did not occur in Spain but is found in England by the middle of the century (London, Brit. Mus. MS Roy. App. 74, f.38). It also appears in the Flemish collections of Phalèse as early as 1546 and in France in the Gervaise collection printed by Attaignant in 1555.

A large proportion of *passamezzi*, a few pavaues, and at least one-fifth of all 16th-century dances (including *saltarelli*, galliards, *padovane*, etc.) are composed on two harmonic patterns known as the *passamezzo antico* [Ex. 1] and the *passamezzo moderno* (*commune, novo*;

Ex. 2). No particular discant melody was associated with the two harmonic patterns. See O. Gombosi, "Italia: Patria del basso ostinato" (*LRM* vii); *id.*, "Stephen Foster and 'Gregory Walker'" (*MQ* xxx; showing the survival of the *passamezzo* patterns in 19th- and 20th-century

popular music); I. Horsley, "The 16th-Century Variation" (*JAMS* xii); G. Reichert, "Der Passamezzo" (*CP* 1950a); J. Ward, in *MGG* x, 877–80.

L.H.M.

**Passeccaille** [F.]. Passacaglia.

**Passepied** [F.]. A gay, spirited dance in rather quick 3/8 or 6/8 meter that was very popular at the French court under Louis XIV and Louis XV [see Dance music III]. It is said to have come from Brittany. Examples occur in the French

operas (e.g., Campra, *L'Europe galante*, 1697; see Ex.) and in the suites of German composers (J. K. F. Fischer; J. S. Bach, English Suite no. 5).

**Passing tone** [F. *note de passage*; G. *Durchgangsnote*; It. *nota di passaggio*; Sp. *nota de paso*]. See under Nonharmonic tones I.

**Passion music.** A musical setting of the text of the Passion (*Passio Domini nostri Jesu Christi*) according to one of the four Evangelists. In the Roman Catholic rites, the Passion according to St. Matthew is read during Mass on Palm Sunday, that according to St. Mark on the following Tuesday, that of St. Luke on Wednesday, and that of St. John on Good Friday.

Musical settings of the Passion, ranging from the 10th to 18th centuries, naturally show a great variety of styles. A considerable number of terms have been suggested for the purpose of classification—dramatic, oratoric, choral, motet-like, figural, scenic, through-composed, responsorial, etc.—some of which are used with entirely different meanings by different writers. The most useful and least ambiguous of these are discussed below.

A. *The plainsong Passion.* In the Middle Ages the Passions were sung in a manner designed to bring out the contrast between the participants of the story: Jesus, the Jews (*turba Judaeorum*), and the narrator (*Evangelista*, *Chronista*). This was done by using a recitation at three different pitch levels and speeds: low and solemn for the words of Jesus (recitation on *f*, with inflections down to *c*), medium and in normal speed for those of the Evangelist (on *c'*, down to *f*), high and with pronounced agitation for the Jews (on *f'*, down to *c'*). The earliest MSS (9th, 10th cent.) distinguish only between the words of Jesus and other text by marking the former *t* (*tarde*,

slowly), the latter *c* (*celeriter*, quick). Later the letter *s* (*sursum*, high) was added to characterize the Jews. Eventually, the letter *t* was interpreted as the sign of the Cross, †, and the two others adopted different meanings, *C* for *Chronista* and *S* for *Synagoga*. The music is found in the *Cantorinus Vaticanus* and also in the *Officium et Missa ultimi tridui* (for Good Friday).

B. *The polyphonic Passion.* The earliest polyphonic settings known today are found in an English MS from c. 1450 [see G. S. McPeck, ed. ‡*The British Museum Manuscript Egerton 3307* (1963)]. Here only the *turba* sections (also the words of individuals, such as John, Peter, Pilate) are polyphonically composed, those of Christ and the Evangelist being sung in plainsong. Because of the dramatic effect of the contrast of plainsong with polyphony, this type of Passion is called "dramatic Passion" (also "scenic," "responsorial"). Other examples are the Passions in MS Modena, Bibl. Est. lat. 454/5 (c. 1480) and those by Davy (c. 1490), Sermisy (1534), Lassus (1575 and later), Guerrero (1585), Asola, Victoria, and Byrd (1607). The polyphonic portions are usually simple settings (often in *falsobordone* style) of the plainsong melody (in the tenor). In some Italian Passions of the 16th century, the words of Jesus are also composed, plainsong being used only for the Evangelist [see K. von Fischer, in *AMW* xi, 203]. In Germany, the Reformation led to the adoption of the vernacular and, occasionally, to modifications of the traditional plainsong, e.g., the use of an elaborate melisma for Jesus' cry: "Eli, eli, lama asabthani." The earliest Passion of this type, by Johann Walther (St. Matthew, 1550) was very popular and was still performed in 1806 at Nuremberg. Among many other composers who used the same method are A. Scandello (c. 1550), Jacob Mailand (St. John, 1568; St. Matthew, 1570), Thomas Mencken (1610), Matthias Vulpus (1612), Christian Schultze-Delitzsch (1653), and Christian Flor (1667).

Side by side with this tradition was another, musically more elaborate treatment, i.e., the composition of the entire text of the Passion in motet style (motet Passion; also through-composed Passion). The earliest known example is one by Longaval (c. 1510; formerly attributed to Obrecht), whose text is derived from all four Gospels. Others are by Galliculus (1538), Cypriano de Rore (1557), Joachim a Burgk (1568; \*Editions XLVII, 22), Jacobus Gallus (1587), and Leonard Lechner (1594). As a rule, the liturgical plainsong is preserved as a *cantus*

*firmus* in these polyphonic settings, at least in the earlier works, while later composers adhered less strictly to this principle and occasionally abandoned it altogether.

C. *The baroque Passion*. The 17th century saw the application to the Passion of all the dramatic innovations of the baroque era, such as *stile recitativo*, the aria, the orchestra, etc., together with a freer treatment of the authentic text, which was either paraphrased or broadened by free poetic interpolations, thus approaching the oratorio (oratoric Passion). An early work indicative of these new tendencies is the Passion according to St. John by Thomas Selle (1643; \*Editions VIII, 26). Interesting features are the *recitativo* passages, the introduction of "inter-medii," i.e., choral settings of interpolated texts (psalms and Protestant chorales), and the use of different instrumentation for the Evangelist and for Christ. The great figure in this period is Heinrich Schütz (1585–1672). Late in life (c. 1665–72) he wrote three Passions (Matthew, Luke, and John; a fourth, according to Mark, is spurious) in a remarkably austere and even archaic style. Technically they belong to the "dramatic" type of the 16th century, since they employ a *cappella* polyphony for the *turbæ* and unaccompanied recitation for the rest of the text. However, Schütz replaced the traditional plain-song by a "neo-Gregorian" recitative of his own invention [see *SchGMB*, no. 192]. Other Passions of this period are interesting chiefly for their progressive tendencies, such as the use of the orchestra and the introduction of chorales and arias (C. Flor, 1667; J. Sebastiani, 1672; J. Theile, 1673; see *DdT* 17).

D. *The Passion oratorio*. After 1700 the authentic text of the Bible was abandoned in favor of rhymed paraphrases in the sentimental and allegorical style of the day. Particularly popular were C. F. Hunold-Menante's *Der blutige und sterbende Jesus* (composed by Keiser, 1704) and Brockes' *Der für die Sünden der Welt gemarterte und sterbende Jesus*. The latter was set to music by many composers, among them Keiser, Telemann, Handel, and Mattheson. Hand in hand with this textual deterioration went a decline in musical taste, leading to a style that approximates opera more closely than oratorio.

Against this background, Bach's St. John Passion (1723) and, particularly, his St. Matthew Passion (1729) represent a return to proper and dignified Passion style that is no less remarkable than their artistic superiority. Both Passions use

the Biblical text as a basic narrative, set in recitative or (for the *turbæ*) in short choruses. Poetic texts (by Brockes for the St. John Passion, by Picander for the St. Matthew Passion) are used for the arias and large choruses. The form may be described as a succession of cantatas, each closing with a chorale. According to the earliest catalog of Bach's works (1754), he wrote five Passions. However, aside from the two mentioned above, only portions of the St. Mark Passion remain in the *Trauer-Ode* of 1727. A St. Luke Passion, published in *BG* xlv, is spurious.

The ensuing history of the Passion includes such works as Telemann's *St. John Passion* (1741); Passion oratorios by Caldara (1730), Jommelli (1742), and Paisiello (1784), all based on a text by Metastasio (*La Passione di Gesù Cristo*); Johann Ernst Bach's (1722–77) *Passions-oratorium* [*DdT* 48]; two Passions by K. P. E. Bach (1787, '88); and oratorios dealing with the Passion story, such as K. H. Graun's *Der Tod Jesu* (1755), Haydn's *Die sieben Worte am Kreuz* (1785), Beethoven's *\*Christus am Ölberge* (1803), and Spohr's *Des Heilands letzte Stunden* (1835). Compositions of the \**Stabat Mater* and the \**Seven (Last) Words* also are in this category.

The 20th-century Bach revival brought about a remarkable rekindling of the true Passion spirit in works such as the *Markus-Passion* of Kurth Thomas and the *Choralpassion* of Hugo Distler.

**Passy-measure.** Old term for *\*passamezzo*.

**Pasticcio** [It.]. (1) A musical work consisting of contributions by two or more composers. The earliest known example is an ornamented intabulation of Ferabosco's madrigal "Io mi son giovinetta," written by Scipione Stella, G. D. Montella, and Ascanio Mayone (in Mayone, *Secondo libro di diversi capricci*, 1609; new ed. by M. S. Kastner, in *Orgue et Liturgie*, nos. 63 [1964], 65 [1965]). Later examples are the opera *Muzio Scevola* (1721), to which Amadei (sometimes called Pippo), G. B. Bononcini, and Handel contributed one act each; the oratorio *Die Schuldigkeit des ersten Gebotes*, written by Mozart, Adlgasser, and Michael Haydn; Diabelli's *Vaterländischer Künstlerverein* (1823–24), containing, in addition to Beethoven's Diabelli Variations, variations by fifty other composers [see *GD* v, 456; *GDB* viii, 690ff]; the *Hexameron* (1837), a similar collection of variations by Liszt, Thalberg, Pixis, Herz, Czerny, and Chopin; a violin sonata for J. Joachim for which Schumann, Brahms, and Dietrich each wrote a movement; and, for a modern example, *L'Éventail de Jeanne*, a ballet written by ten French composers (1927). See M. Reimann, "Pasticcios und Parodien in norddeutschen Klaviertabulaturen" (*MF* viii).

(2) An operatic medley of the 18th century whose music was selected by the arranger or producer from the works of famous composers in order to entertain the audience with an uninterrupted succession of their favorite songs, a procedure that became immensely popular. See also Opera VIII. See O. G. Sonneck, *Miscellaneous Studies in the History of Music* (1921), pp. 111–79; *id.*, in *SIM* xii.

**Pastorale.** (1) An instrumental or vocal piece written in imitation of the music of shepherds, their shawms and pipes. With reference to the Biblical shepherds who attended the birth of

Jesus, the pastorale took on the character of idyllic Christmas music. Typical features are 6/8 or 12/8 meter in moderate time, suggestive of a lullaby; a tender, flowing melody; and long-held drones. The pastorale (as well as the almost identical *\*siciliana*) originated in Italy, where the rural shepherds (*pifferari*; see *Piffero*) had an old tradition of coming to town on Christmas morning and playing on their shawms. Among the many beautiful examples of this type of composition (one of the earliest being by Frescobaldi) are Bach's Pastorale for organ, the Sinfonia that opens the second part of his Christmas Oratorio, the Sinfonia pastorale in Handel's *Messiah*, and the last movement of Beethoven's *\*Pastoral Symphony*.

(2) In the 16th century, a dramatic performance with an idyllic plot. These were among the most important forerunners of *\*opera*. In the 17th century this genre was cultivated particularly in France. Several of the early French operas, e.g., Cambert's *Les Peines et les plaisirs de l'amour* (1672) and Lully's *Les Fêtes de l'Amour et de Bacchus* (1672), bear the title Pastorale. See L. de la Laurencie, "Les Pastorales . . . avant Lully" (*CP* 1911, p. 139).

**Pastoral Symphony.** Beethoven's Symphony no. 6, in F major, op. 68, published in 1809 under the title "Sinfonie Pastorale, No. 6." The five movements portray, according to Beethoven's inscriptions (in translation): (1) Awakening of Cheerful Feelings on Arrival in the Country; (2) Scene by the Brook; (3) Merrymaking of the Country Folk; (4) Storm; (5) Song of the Shepherds, Joy and Gratitude after the Storm. Beethoven expressly distinguished this work from the more obvious type of program music of his day (battle pieces, etc.) with the remark: "Mehr Ausdruck der Empfindung als Mahlerey" (Expression of feeling rather than painting).

**Pastoris.** See *Reisado*.

**Pastourelle** [F.], **pastorela** [Prov.]. A chanson of the troubadours and trouvères whose subject is a rural love scene, frequently including licentious allusions. The term is of purely literary significance.

**Pater noster** [L.]. Our Father (The Lord's Prayer). A prayer of the Roman Catholic (also, perhaps originally, the *\*Mozarabic* and Gallican) rites, said near the end of the Canon of the Mass. Polyphonic settings, drawing on the plain-song melody (in *Missale Romanum*, 1920, p. 346),

include Josquin's motet "O bone et dulcis Domine Jesu" with the tenor "Pater noster" (and the bass "Ave Maria"), and Palestrina's *Missa Pater noster*.

**Patet.** See under Melody type; Java.

**Patético** [It.]. With great emotion.

**Pathétique.** (1) Popular name for Beethoven's Piano sonata op. 13 (1799). Tchaikovsky chose the name *Symphonie Pathétique* for his last symphony, no. 6, op. 74 (1893). (2) [F.]. With great emotion.

**Pathetisch** [G.]. With great emotion.

**Patter song.** "A kind of song, the humour of which consists in getting the greatest number of words uttered in the shortest possible time" (GDB). This rapid \*parlando style has often been used for comical effects in operas (Mozart's *Don Giovanni*, "Catalogue Aria"; Rossini's *Barbiere di Siviglia*, Act I, sc. ii, "Largo al factotum") and plays an important part in the comic operas of Gilbert and Sullivan.

**Pauke** [G.]. Kettledrum [see Percussion instruments A, 1].

**Pause** [F. *point d'orgue*; G. *Fermate*; It. *fermata*; Sp. *calderón*]. The sign  $\frown$ , also known as "hold" or *fermata*, indicating that the note (or rest) over which it appears is to be prolonged. As a rule, a duration approximately (but not exactly) twice the normal value will prove appropriate. Note that the foreign terms *pause* [F.], *Pause* [G.], and *pausa* [It.] always mean a rest.

The pause is by far the oldest of all the "tempo marks" of present-day musical notation. As early as the 14th century it was used not only for the final note but also for short passages of block harmony designed to underline the significance of especially important portions of the text. Among the earliest examples (late 14th century) are Cuvelier's *ballade* "Se Galaas" [WoGM ii, 115] and Franciscus' "De Narcissus" [W. Apel, *French Secular Music of the Late Fourteenth Century*, p. 90]. The passage "ex Maria virgine" in the Credo of Machaut's Mass, often reproduced in modern editions as *fermata* chords, is actually written in *maximae*. In the early 15th century, *fermata*-marked harmonies occur frequently in the works of Dufay, e.g., in his motet "Supremum est mortalibus" (celebrating the peace between Pope Eugene IV and King Sigismund, 1433), to the words: "Eugenius et rex

Sigismundus." For an example by Arnold de Lantins, see *ReMR*, p. 40.

**Pavane, pavenne** [F.; It., Sp. *pavana*; anglicized *pavan, paven, pavin*]. A 16th-century court dance of Italian provenance. The word is derived from Pava, a dialect form of Padua; music and literature as well as dances from Pava or in the Paduan style were described as *alla pavana*. The earliest extant examples of pavane are found in Dalza's *Intabulatura de lauto* (Petrucci, iv, 1508). The dance became popular early in the century and quickly spread throughout Europe. Other early examples are found in Germany in Judenkünig's *Ain schone kunstliche Underweisung* (1523), in France in Attaingnant's *Dixhuit basses dances* (1529), and in Spain in Milán's *El Maestro* (1535). The dance remained in vogue for most of the century, although its popularity abated somewhat in the last quarter of the period. However, it was restored and revitalized in idealized musical form and attained its highest point of artistic perfection under the aegis of the English virginalists Byrd, Bull, Gibbons, Tomkins, Morley, Farnaby, Philips, Dowland, and others. Under the title *paduana* it flourished briefly in Germany in the early 17th century, where it was used as the introductory movement of the German suite. More recent examples, actually recreations of the earlier idealized dance form, have been written by Saint-Saëns ("Pavane," in *Étienne Marcel*), Ravel ("Pavane de la belle," in *Ma Mère l'oye* and "Pavane pour une infante défunte"), and Vaughan Williams ("Pavane," in *Job*).

The pavane is a slow, processional type of dance, for the most part employing a continuous repetition of basic step patterns: two single and one double step forward followed by two single and one double backward. There are few extant choreographic sources. F. Caroso describes a sophisticated *pavana* with more intricate steps in his *Il Ballarino* (1581). Usually the pavane is followed by one of the faster dances, the \**saltarello*, \**galliard*, \**padovana*, or \**piva*. Most dances of the genre are in a simple quadruple meter (4/4 or 4/2). Musically they resemble the \**passamezzo*; indeed, it is often difficult to distinguish the music of a *passamezzo* from that of a pavane.

A few pavaues are in a simple triple meter (3/4 or 3/2), but this form of the dance is rare [see Milán's *El Maestro*, f.Gv<sup>v</sup>; Abondante's *Intabulatura sopra el lauto* (1546), no. 26; Mudarra's *Tres libros de música*, 1546, bk. 1, f.19<sup>v</sup>; Attaingnant's *Six gaillardes et six pavaues* (1529), no. 2].

For a detailed description and bibl. see L. H. Moe in *MGG* x, 974–77. L.H.M.

**Pavillon** [F.]. The bell of wind instruments. *Pavillon chinois*, the crescent.

**Pavin**. A 16th-century English name for pavane.

**Peal**. See under Change ringing.

**Peasant Cantata**. See *Bauernkantate*.

**Pêcheurs de Perles, Les** [F., The Pearl Fishers]. Opera in three acts by Bizet (libretto by E. Cormon and M. Carré), produced in Paris, 1863. Setting: Ceylon, in the past.

**Pedal**. (1) In musical instruments, an action that is operated by the feet. See Organ III, XI, XII; Piano; Harpsichord; Harp. (2) Short for \*pedal point.

**Pedal clarinet**. Older name for the double-bass clarinet.

**Pedalflügel** [G.]. See Pedal piano.

**Pedal harp**. The modern chromatic harp.

**Pedal harpsichord**. A harpsichord that is equipped with a pedal board, similar to that of the organ, so that the bass can be played with the feet. Several 16th- and 17th-century Italian harpsichords are extant that once had pedal boards pulling down the keys of the manual by means of cords. The pedal boards ranged from eight to fifteen notes all based on C (short octave).

Many traces of French pedal-board harpsichords of the 17th and 18th centuries exist. For example, Jean Denis owned one in 1686, as did Jean LeBègue in 1684. The organist Nicolas Gigault in 1701 possessed an instrument described as “Un clavecin à double claviers à l’unison . . . un clavecin de pedalles à l’octave le tout au ton de chambre” (A harpsichord with two keyboards at the unison [eight-foot pitch] . . . a pedal harpsichord at four-foot pitch, both at chamber pitch). [See F. Hubbard, *Three Centuries of Harpsichord Making* (1965), p. 111.] The harpsichord was probably three-choired,  $2 \times 8'$ ,  $1 \times 4'$ . The pedal harpsichord may have had only a single  $4'$  choir. It will be noted that it is no longer a question of a pedal board operating through pull-downs, but of a separate instrument lying on the floor under the harpsichord. Toward the end of the 18th century French makers began to place pedal boards operating a piano action under their harpsichords.

Both the pull-down and separate-instrument

types of pedal harpsichord are discussed by J. Adlung, who preferred the latter and admitted the former only for the sake of economy (*Anleitung zu der musikalischen Gelahrtheit* [1758], p. 556; *id.*, *Musica mechanica organædi* [1768] ii, 158–61). See J. S. Halle, *Werkstätte der heutigen Künste* (1764), iii, 363.

No genuine pedal harpsichords or harpsichords with pull-down pedal boards have survived, although many extant instruments from several countries show traces of once having been attached to pull-down pedal boards. Analogous systems were also in use to apply the pedal board to the clavichord. See Pedal piano.

F.H.

**Pedalier** [F.]. (1) The pedal board of the organ, or a similar apparatus attached to a piano. (2) See Pedal piano.

**Pedalklavier** [G.]. \*Pedal piano.

**Pedalkoppel** [G.]. The pedal coupler of the organ; see Organ IV.

**Pedalpauke** [G.]. Kettledrums tuned by pedals. See Percussion instruments A, 1.

**Pedal piano** [G. *Pedalflügel*, *Pedalklavier*; F. *piano à pedalier*]. A piano equipped with a pedal board, similar to that of the organ, so that the bass can be played with the feet. The *Pedalflügel*, which had but fleeting success, is known chiefly through the series of “Studien” and “Skizzen” that Schumann wrote for it (op. 56, 58). There also are compositions for this instrument by Alkan and Gounod [see *GD* iv, 95; *GDB* vi, 609]. See J. Handschin, “Das Pedalklavier” (*ZMW* xvii). See Pedal harpsichord.

**Pedal point** [F. *point d'orgue*; G. *Orgelpunkt*; It. *pedale*; Sp. *bajo de órgano*]. A long-held note, normally in the bass, sounding with changing harmonies in the other parts. Sometimes the word “pedal” alone is used. The pedal point represents one of the most natural sources of dissonance, inasmuch as the held note blends easily with every chordal combination (e.g., low C with a D-flat or a B-flat triad; see Ex.). According to

the scale degree of the held note, a distinction is made among tonic pedal, dominant pedal, and subdominant pedal (long note on the tonic, dominant, or subdominant of the key). The terms "inverted pedal" and "internal pedal" denote pedal points that appear not in the bass but in the soprano or middle part.

The pedal point (also called \*bourdon or \*drone) is one of the earliest devices of polyphony—perhaps the earliest—as may be concluded from its extensive use in non-Western music. In Western music it first appears in the organa of the 12th and 13th centuries (schools of St. Martial and Notre Dame), in which the notes of the original plainsong are frequently extended as long-held tones, one each serving as a basis for an entire section. A monumental example of a 13th-century pedal point is the beginning of Perotinus' *organum quadruplum* "Viderunt omnes" [see *AdHM* i, 229], which has been called the "F-major toccata of the 13th century" (with reference to Bach's composition of this name). The term *punctus organicus* (organ point, G. *Orgelpunkt*) probably refers to these organa rather than to the organ. As an organ device, the pedal point appears first in certain compositions by Frescobaldi, e.g., his *Capriccio Pastorale*. Its importance in the organ works of Buxtehude, Bach, etc., is well known. Among later composers, Tchaikovsky showed a particular predilection for pedal points.

**Pedal tone.** See under Wind instruments II; Horn I.

**Peer Gynt Suite.** Two orchestral suites by Grieg, op. 46 and 55, arranged from his incidental music to Ibsen's play *Peer Gynt*.

**Peine entendu, à [F.].** Barely audible.

**Peking opera.** See under China I.

**Pelléas et Mélisande.** Opera in five acts by Claude Debussy (to his own libretto, after Maeterlinck's play of the same name), produced in 1902. Setting: a mythical kingdom, Allemonde, in the Middle Ages. The story is told in a succession of scenes filled with mystic and symbolic meanings, scenes that are not meant to form a continuous plot and that have about the same relation to the closely knit action of Wagnerian opera as Debussy's aphoristic \*impressionism does to the sweep and pathos of Wagner's musical style. As the only significant opera that impressionism has produced, *Pelléas et Mélisande* stands in a class by itself. In reaction

against Wagnerian opera, Debussy's score deliberately avoids emotional stress, providing only a "tonal envelope" of pale colors and incorporeal transparency. Also see under Recitative.

**Pélog.** See under Java.

**Penitential psalms.** Psalms 6, 31[32], 37[38], 50[51], 101[102], 129[130], and 142[143]. For the system of numbering, see Psalm. In music history the penitential psalms are famous particularly through Orlando di Lasso's composition of the whole series of texts (*Psalmi Davidis poenitentiales*, 1560). The same project was carried out by L. Lechner (1587) and others. Later composers have been particularly attracted by the dramatic greatness of Psalm 129[130], "De profundis," and Psalm 50[51], \*"Miserere."

**Pennillion** [sing. *pennill*]. An ancient form of Welsh musical performance executed by a harper and a singer (\*bards), the former playing a well-known harp air and the latter extemporizing words and a somewhat different melody to suit the harper's tune and harmonies. The harper can change his tune as often as he wishes; the singer, after a measure or two, is expected to join with proper words and music, in accordance with the dictates of tradition. The pennillion are probably the last relics of those legendary contests in which the heroes fought against one another not only with weapons but with their wits, solving puzzles and competing with musical instruments. See W. S. Gwynn Williams, ‡*Penillion in English* (1925); E. Jones, ‡*Musical and Poetical Relicks of the Welsh Bards* (1794), pp. 60–74.

**Pentachord.** A five-tone segment of the scale, e.g., from c to g. It is intermediate between the Greek \*tetrachord and the Guidonian \*hexachord, not only technically but perhaps also historically, since the *pentachordum* forms the basis of theoretical demonstrations in the "Musica enchiriadis" of c. 900 [see *GS* i, 175ff].

**Pentatonic scale.** A scale that has five tones to the octave. Among the numerous scales of this kind the following are of special importance: (a) The *tonal* [G. *anhemitonisch*] *pentatonic scale*, i.e., a five-tone scale that has no semitones. Properly speaking, there is only one such scale (aside from transpositions): c d . f g a . c'. However, by using different tones as a tonic, five different "modes" can be derived from it, e.g., c d . f g a . c' d', or f g a . c' d' . f', etc. On the piano, such scales can easily be reproduced by playing the black keys only. The tonal penta-

tonic scale, usually in its "first mode" (on c), occurs in the music of nearly all ancient cultures—China, Polynesia, Africa—as well as that of the American Indians, Celts, and Scots. The ancient Chinese construed it as a succession of ascending fifths and descending fourths: f-c'-g-d'-a [see China II B]. A considerable number of Gregorian melodies are purely pentatonic, and others may have originally been so. (b) The *semitonal* [G. *hemitonisch*] *pentatonic scale* results from omitting the second and the sixth or the second and the fifth degrees of the diatonic scale: c . e f g . b c', or: c . e f . a b c'. Since these scales include two major thirds (*ditonus*) they are also called "ditonic." The second form is of special interest since this is the scale that, in descending motion, prevailed in ancient Greece: e' . c' b a . f e. Semitonal pentatonic scales frequently occur in modern \*Japanese music. (c) A pentatonic scale with equidistant steps is the \*Javanese *sléndro*. This has been used, under the name "pentaphonic" scale, by Alaleona [see A. Eaglefield Hull, in *Monthly Musical Record*, Sept. 1922, p. 212]. See J. Yasser, *A Theory of Evolving Tonality* (1932); B. Szabolcsi, in *AM* xv; W. Wiora, "Älter als die Pentatonik" (*CP Bartók*).

**Percussion instruments.** Generic name for instruments that are sounded by shaking or striking one object with another. In the general classification of instruments they are divided into two categories, *membranophones* and *idiophones* [see Instruments I, II]. Membranophones are by far the oldest of all instruments and exist in enormous variety all over the world [see Drum II]. The following discussion deals with the percussion instruments of the orchestra. They can be divided into two groups, those that produce a sound of definite pitch and those that do not.

A. *Of definite pitch.* 1. *Kettledrum* [G. *Pauke*; F. *timbale*; It. *timpano*; Sp. *timbal*]. The kettledrum is the most important percussion instrument. It consists of a basin-shaped shell of copper or brass over which is stretched a head of calfskin whose tension can be adjusted by screws fixed to the shell, thereby changing the pitch. The instrument is played with two sticks with a wooden handle and a head, usually of hard felt covered with a layer of soft felt, although for special effects different materials may be used. Traditionally kettledrums were used in pairs, one small and one large, which were tuned to the tonic and dominant of the key of the composition. A third drum was added in the early 19th century. Today a number of sizes of kettledrum

are used, four being most common: 30" (D-A), 28" (F-c), 25" (B<sup>b</sup>-f), and 23" (d-a). Each instrument can exceed its basic range of a fifth by several half-tones at either end. The kettledrums may be muffled or muted [see Mute]. Various methods of tuning the drums mechanically by a controlling pedal (pedal drums or pedal timpani; G. *Pedalpauke*) or other device have been invented. Such instruments, which allow the pitch to be changed quickly, are required in, e.g., *Salome* by R. Strauss or Bartók's *Music for Strings, Percussion and Celesta*, where glissandos are performed by the kettledrums.

The introduction of the kettledrum into the orchestra took place in the 17th century. The opening toccata of Monteverdi's *Orfeo* (1607) has what was surely a kettledrum part. M. Praetorius authorized them in certain numbers of his *Polyhymnia Caduceatrix & Panegyrica* (1619), and O. Benevoli's Mass for 53 voices (*Salzburger Festmesse*, 1628) seems to be the first instance of a clearly labeled written out part. Bach often used kettledrums in his cantatas to express joy or triumph.

Lit.: H. W. Taylor, *The Art and Science of the Timpani* (1964); P. R. Kirby, "Kettledrums: An Historical Survey" (*ML* ix, 34); P. A. Browne, "The Orchestral Treatment of the Timpani" (*ML* iv, 334); C. Titcomb, "The Kettledrums in Western Europe" (diss. Harvard Univ., 1952); *id.*, in *GSJ* ix, 56ff.

2. *Glockenspiel* [E.; G.; F. *carillon*; It. *campanette*; Sp. *campanólogo*]. An instrument composed of a series of tuned steel bars of varying length, with or without resonators, arranged in two rows, roughly like a piano keyboard, and struck with two, three, or four small-headed mallets made of rubber, glass, brass, etc. It is generally made in a chromatic range of 2½ octaves, written as in Ex. 1 but sounding two octaves higher. Its most notable characteristic is its

1. *Glockenspiel*. 2. *Xylophone* (not largest size). 3. *Celesta*.

bright, penetrating tone color. Wagner used the glockenspiel in the "Dance of the Apprentices" in *Die Meistersinger*, and Tchaikovsky in the "Chinese Dance" of his *Nutcracker Suite* (1892).

3. *Xylophone*. An instrument resembling the

# PERCUSSION INSTRUMENTS

Percussion instruments (orchestra and band): 1. Timpani (pedal). 2. Tambourine. 3. Glockenspiel. 4. Snare drum. 5. Castanets. 6. Celesta. 7. Bass drum.

Percussion instruments (orchestra and band): 8. Triangle. 9. Cymbals. 10. Gong. 11. Chimes. 12. Xylophone.

glockenspiel in basic construction, except that its bars are wooden. The largest size has a range of  $3\frac{1}{2}$  octaves, written as in Ex. 2 but sounding one octave higher. In tone quality it is dry and "wooden," without lasting resonance. See also Xylophone.

4. *Celesta*. An instrument invented in 1886 that looks like a small upright piano. It may be considered a "keyboard-glockenspiel," since the tone is produced by the striking of steel bars with hammers connected to a keyboard by a simplified piano action. Music for the celesta is notated

on two staves, like piano music, with a written range as in Ex. 3, sounding an octave higher. It is most suitable for light and graceful effects. The instrument was introduced by Tchaikovsky for the "Dance of the Fairy Dragee" of his *Nutcracker Suite* (1892). A more recent variety is the *dulcitone*.

5. *Chimes or tubular bells* [F. *cloches tubulaires*; G. *Röhrenglocken*; It. *campana tubolare*]. A set of metal tubes, vertically suspended in a frame, tuned chromatically from  $c'$  to  $f''$ , and struck with one or two wooden mallets. They are

employed in the orchestra to produce the effect of church bells, e.g., in the finale of Tchaikovsky's "1812" Overture, in Mahler's Symphony no. 2, in Sibelius' Symphony no. 4 (fourth movement), and in many operas.

6. Other percussion instruments of definite pitch are the \*anvil, \*marimba, \*tubaphone, and \*vibraharp.

B. *Of indefinite pitch.* 1. *Snare drum or side drum* [F. *caisse claire*, *tambour militaire*, *petit tambour*; G. *kleine Trommel*; It. *tamburo militare*, *cassa*; Sp. *tambor*, *caja*]. A small cylindrical drum with two heads stretched over a shell of metal. The upper head, which is struck with two drumsticks, is called the "batter head"; the lower, across which are stretched the taut snares (a group of gut or silk strings, in appearance not unlike violin strings, bound with wire), is called the "snare head." The brilliant tone quality of the side drum results largely from the vibrations of the snarehead against the snares. The instrument may be muffled by placing a cloth on the batter head (*coperto*). By loosening the snares a dull sound is obtained. In addition to the roll, which produces a tremolo, there are two other strokes commonly used on the side drum: the *flam*, consisting of two notes [Ex. 4], and the *drag*, a series of strokes fused into a sort of in-

4. *Flam*. 5. *Drag* (*ruff*).

stantaneous roll, preceding an accented note [Ex. 5].

2. *Tenor drum* [F. *caisse roulante*; G. *Rührtrommel*; It. *cassa rullante*; Sp. *redoblante*]. A drum with a wooden shell that is deeper (in relation to its diameter) and larger than the side drum. It has no snares.

3. *Bass drum* [F. *grosse caisse*; G. *grosse Trommel*; It. *gran cassa* or *cassa grande*; Sp. *bombo*]. A large, two-headed cylindrical drum that varies considerably in size, in both width and diameter. It is played with a single large, padded stick. The sound produced is low and heavy. A roll can be performed by two timpani sticks or by a two-headed \*tampon. The bass drum was used by Mozart in his *Die Entführung aus dem Serail* and by Beethoven in the finale of his Ninth Symphony.

4. *Tambourine* [F. *tambour de Basque*; G. *Schellentrommel*, *Tamburin*; It. *tamburino*, *tam-*

*buro basso*; Sp. *panderete*]. A small, shallow, single-headed drum into whose wooden shell loosely hanging "jingles" (circular metal disks) are inserted, usually in pairs. The instrument is played: (a) by striking the head with knuckles, closed fist, back of hand, or player's knee, which gives detached sounds and simple rhythmical figures; (b) by grasping the shell firmly and shaking it, which gives a "roll" of the jingles; (c) by rubbing the thumb along the edge of the head, which gives a tremolo of the jingles; and (d) with the instrument flat, head up, on the player's lap, playing near the rim with fingers or drumsticks.

5. *Triangle* [F. *Triangel*; It. *triangolo*; Sp. *triángulo*]. A small cylindrical bar of steel bent in the shape of an equilateral triangle, open at one end, struck with a short metal rod. Early uses include that in Gluck's *Iphigénie en Tauride* (1779) and in Mozart's *Die Entführung aus dem Serail* (1782) in order to obtain an exotic "Turkish" atmosphere [see Janizary music]. Beethoven used it in the finale of his Ninth Symphony for the "Turkish" variation of the theme, and Haydn in his "Military" Symphony no. 100. For a prominent solo part, see the Piano Concerto in E-flat by Liszt.

6. *Cymbals* [F. *cymbales*; G. *Becken*; It. *piatti*, *cinelli*; Sp. *platillos*]. Large circular brass plates of various sizes, made slightly convex so that only the edges touch when they are struck together. In the center of each cymbal is a deep saucerlike depression with a hole through which a strap is attached, enabling the player to hold it. They are played: (a) by clashing them together with a brushing movement—the ordinary way of playing single notes; (b) by clashing the two cymbals against each other in quick repetition by means of a rotating motion, called "two-plate roll"; (c) by striking a single cymbal (suspended on a stand) with a hard snare-drum stick or a soft timpani stick; (d) by suspending one cymbal and performing a roll on it with two hard snare-drum sticks or two soft timpani sticks; (e) by fastening one cymbal to the top of the bass drum and clashing the other against it, while the player uses his other hand to play the bass drum. See also Cymbals.

7. *Tamtam* or *gong*. A broad circular disk of metal, slightly convex, with the rim turned down, giving it the appearance of a shallow plate with low vertical sides. It is hung vertically, and struck in the center with a soft-headed beater.

8. Other percussion instruments of indefinite

1

Other percussion instruments: 1. Gangsa gambang (saron). 2. Sistrum. 3. Nail violin. 4. Pipe and tabor. 5. Jew's-harp (shown three times actual size in relation to others). 6. Glass harmonica. 7. Turkish crescent. 8. Marimba.

pitch, more rarely used in orchestral scores, are the \*castanets, \*rattle, wood block, \*Chinese temple block, and \*thunder machine. Modern composers have devised many unusual percussive and noise-producing effects. Non-Western instruments, such as the Latin American \*maracas, \*claves, and guiro (a notched gourd scraped with a stick), have been used by Prokofiev (*Alexander Nevsky*) and Stravinsky (*Le Sacre du printemps*). An interesting instance of a purely percussive score is Edgar Varèse's *Ionisation* (1931).

For nonorchestral percussion instruments, see Gambang; Glass harmonica; Jew's-harp; Marimba; Nail violin; Pipe (1); Sistrum; Turkish crescent.

W.D.D.

**Perfect, imperfect.** See Cadence; Interval; Mensural notation II. The *modus perfectus* and *imperfectus* of mensural notation are entirely different from the *modus perfectus* and *imperfectus* of the 13th-century theory of rhythmic \*modes. In the former the terms indicate the ternary or binary value of the *longa* ( $L = 3 B$  or  $= 2 B$ ); in the latter they refer to the final note in the pattern of a mode, this final note being present in the *modus perfectus* and absent (replaced by a rest) in the *modus imperfectus*. The *modi imperfecti*, although discussed at length by theorists (Anon. IV; see *ReMMA*, p. 280), have no practical significance [see *ApNPM*, pp. 223, 445].

**Performance practice** [G. *Aufführungspraxis*]. The study of how early music, from the Middle Ages to Bach, was performed and the many problems connected with attempts to restore its original sound in modern performance. The problems of performance practice vary, of course, according to the period in question. In medieval music the foremost question is that of vocal versus instrumental performance, since long passages and even entire voice-parts of apparently vocal compositions are found without a text, e.g., the tenors of 13th-century organa and motets or the "melismatic" *caudae* of many conductus from the same period. The existence of numerous instruments is well documented by literary sources and particularly by pictorial evidence [see under *Cantiga*], but the musical

sources contain no reference to them. A plausible explanation would be that the compositions are essentially vocal in all their parts and sections, but that occasionally instruments were used in addition to (rather than as a substitute for) voices [see Vocalization]. The secular compositions of the 14th century (French *ballades*, Italian madrigals) often include what in the original appear to be extended vocalizations [see, e.g., *HAM*, nos. 50, 51]. To interpret these as "instrumental preludes, interludes, postludes" can be done only by rearranging the syllables of the text and by artificially interrupting the musical lines. Compositions of the early 15th century, however, frequently include textless passages separated by rests, and these in all probability are intended to be played on instruments, most likely by the singer himself [see, e.g., Dunstable's "O rosa bella" and Dufay's "Mon chier ami"; *HAM*, nos. 61, 67].

Another difficulty results from the fact that the instruments of these periods, such as the psaltery, rotta, vielle, and rebec of the 14th century, or the viol, cornett, and theorbo of the 15th and 16th centuries, all are obsolete. It is only through patient experiments with modern reproductions of these instruments that one may hope to gain a clearer idea of the intended sound of old music. Generally speaking, the lack of clear and unequivocal indications of instruments, accidentals, etc., is not mere negligence by the composer or carelessness by the scribe but an adequate expression—in fact, the necessary concomitant—of the intrinsically antirational viewpoint of the Middle Ages and Renaissance. The idea of writing music for a specific instrument was just as foreign to the 15th-century musician as the idea of using one "correct" spelling for a word was foreign to a writer of this period. For both the only concern was the substance, which remained the same regardless of how it was realized.

In the 16th and 17th centuries the problems of performance practice are relatively simpler. Among them are the correct execution of \*thoroughbass, the performance of \*ornaments, either improvised or abbreviated, the size of the orchestra, and the specifications of tempo and dynamics. Most of these questions have been quite satisfactorily clarified by musicologists. A work such as Bach's St. Matthew Passion should be performed by about twenty players (flutes, oboes, strings, organ, harpsichord) and a similar number of singers; it should be played at moderate speeds, ranging from allegro to ada-

gio, and with a clear distinction of forte and piano, rather than fortissimo and pianissimo with continual crescendos and decrescendos. Although historically oriented performance groups such as *collegia musica* have generally adopted the principles of performance practice, conductors of standard orchestras are still reluctant to do so. In the period after Bach the problems of performance practice largely disappear, owing to the more specific directions of composers for clearly indicating their intentions. See also Ensemble (3).

Grout, *ibid.* (historical authenticity).

**Périchole, La.** Satirical comedy in two acts by J. Offenbach (libretto by H. Meilhac and L. Halévy), produced in Paris, 1868.

**Pericón** [Sp.]. Traditional Argentine dance, very popular in the days of the War of Independence. It consists of fourteen eight-measure sections, each alternating between the tonic and dominant chords within a steady 3/8 meter. Each section employs a different rhythmic pattern, and in some sections the mode changes from major to minor. The *pericón* is danced by a group of couples facing one another.

J.O.S.

**Period.** In traditional music, a division of time, i.e., a group of measures comprising a natural division of the melody; usually regarded as comprising two or more contrasting or complementary phrases and ending with a cadence. Some more recent composers, especially of the \*serial school, extend the concept of period to all elements of traditional music. Thus, sound, as opposed to noise, is actually made up of *periodic* vibration; triads represent the most periodic vibrations of chords; harmony is as periodical as melody, e.g., I-V-I. Similarly, rhythm on various levels—beats, measures, phrases—can be considered periodic, and so can form, notably A B A form, \*rondo form, \*sonata form, etc. The very tonal system itself can be regarded in this way, octaves being the periodic organization of the pitch-space.

H.P.

**Periodicals, music.** I. *Historical survey.* Among the earliest music periodicals (leaving out of account periodical publications of music, etc.) are Mizler's *Neu eröffnete Musikalische Bibliothek* (1735–54), Scheibe's *Der Critische Musicus* (1737–40), *Journal de musique française et italienne* (1764–68), and J. A. Hiller's *Wöchentliche Nachrichten* (1766–70). The most important periodicals thereafter are: *Allgemeine musikalische Zeitung* (Leipzig, Breitkopf und Härtel, 1798–1848, 1863–82); Fétis' *La Revue musicale* (1827–80; merged with *Gazette musicale de Paris* and became the *Revue et Gazette musicale de Paris*); *Le Ménestrel* (Paris, 1833–1940); *Neue Zeitschrift für Musik* (founded by Robert Schumann, 1834; now issued as *Zeitschrift für Musik*; see under IV); *Signale für die musikalische Welt* (Leipzig, 1843–1941); *The Musical Times* (London, 1844–); *Dwight's Journal of Music* (Boston, 1852–81); *Le Guide musicale* (Brussels, 1855–1914, Paris, 1917–18); *The Musical Standard* (London, 1862–1933); *Music* (Chicago, 1891–1902).

There follows a selected list of periodicals still issued (or issued until World War II), classified according to countries, with a special group (VIII) reserved for musicologic publications. Also see the periodicals in the list of abbreviations for this dictionary.

II. *United States.* *Musical Courier* (Philadelphia, New York, 1880–). *The Etude* (Philadelphia, 1883–1957). *The Musician* (Philadelphia, 1896–1917; New York, 1918–). *Musical America* (New York, 1898–). *Music Educators' Journal* (Madison, Wis., 1914–34; Chicago, 1934–). *The Musical Quarterly* (New York,

1915—; see also VIII). *Modern Music* (New York, 1924—). *American Music Lover* (New York, 1935—). *Perspectives of New Music* (New York, 1962—).

III. *England*. *The Monthly Musical Record* (London, 1871—). *Musical Opinion* (London, 1877—). *The Strad* (London, 1890—). *R. C. M. Magazine* (London, 1904—). *The Chesterian* (London, 1915—). *Music and Letters* (London, 1920—; see also VIII). *The Gramophone* (London, 1923—). *Music Review* (Cambridge, 1940; see also VIII).

IV. *Austria, Germany, Switzerland*. *Allgemeine [deutsche] Musikzeitung* (Berlin, 1874–1943). *Die Musik* (Berlin, 1901–15; Stuttgart, 1922–43). [*Musikblätter des*] *Anbruch* (Vienna, 1919–37). *Melos* (Mainz, 1920–34, 1934–36, 1946—). *Schweizerische Musikzeitung* (Zurich, 1861—). *Österreichische Musikzeitschrift* (Vienna, 1946—). *Dissonances* (Geneva, 1923—). *Die Reihe* (Ger. ed., Vienna, 1955—, Eng. ed., Bryn Mawr, Penn., 1958—).

V. *Belgium, France*. *Le Ménestrel* (Paris, 1833–1940). *La Revue musicale* (Paris, 1920–40, 1946–49; 1952—; see also VIII). *La Revue musicale belge* (Brussels, 1925—). *Contrepoints* (Paris, 1946—). *La Revue internationale de musique* (Brussels, 1938–40, 1950—). *Polyphonie* (Brussels, 1947–1956).

VI. *Italy*. *Rivista musicale italiana* (Turin, 1894–1932, 1936–44, 1947—; see also VIII). *La Rassegna musicale* (Turin, 1928–43, 1947). *Musica d'oggi* (Milan, 1919—). *Bollettino bibliografico musicale* (Milan, 1926–33). *Musica e dischi* (Milan, 1945—). *L'Approdo musicale* (Turin, 1958—).

VII. *Other countries*. A. *Europe*. *Ritmo: Revista musical ilustrada* (Madrid, 1942—). *Música: Revista mensual ilustrada* (Madrid, 1944—). *De Muziek* (Amsterdam, 1926–33). *Muziekwereld* (Amsterdam, 1936—). *Mens[ch] en melodie* (Utrecht, 1946—). *Tijdschrift voor muziekwetenschap* (formerly *T. der Vereeniging voor Nederlandsche muziekgeschiedenis*; Amsterdam, 1882–1946; 1948—). *Norsk musikkgranskning* (Oslo, 1937—). *Dansk Musiktidskrift* (Copenhagen, 1925—). *Svensk Tidskrift för Musikkforskning* (Stockholm, 1919—). *Sovetskaia muzyka* (Moscow, 1933–41, 1946—). *Musike kinesis* (Athens, 1949—). *Muzika* (Sofia, 1948—). *Muzsika* (Budapest, 1958—).

B. *Latin America*. *Correio musical brasileiro* (São Paulo, 1921—). *Revista brasileira de música* (Rio de Janeiro, 1934—). *Revista musical chilena* (Santiago, 1945). *Brasil musical* (1944–49). *Nues-*

*tra Música* (Mexico, 1946–52). *Arte musical* (Buenos Aires, 1946—). *Boletín del Conservatorio nacional de música* (Lima, 1943—). *Boletín interamericano de música* (Washington, D.C., Pan-American Union, 1957—).

C. *Asia*. *Toyō Ongaku Kenkyū* (Tokyo, 1937–46, 1951—). *Musica hebraica* (Jerusalem, 1938—?).

VIII. *Musicologic periodicals*. See abbreviations for this dictionary. Also, *Fontes Artis Musicae* (Kassel, 1954—): *The Journal of Musicology* (Greenfield, Ohio, 1939—); *Note d'archivio per la storia musicale* (Rome, 1924–43). See also GDB, "Periodicals."

Lit.: A. *General*: H. Koch, "Die deutschen musikalischen Fachzeitschriften des 18. Jahrhunderts" (diss. Halle, 1923); W. Freystätter, *Die musikalischen Zeitschriften* (1884); E. Rohlf, *Die deutschsprachigen Musikperiodica, 1945–1957* (1961); E. van der Straeten, *Nos Périodiques musicaux* (1893); A. Riedel, *Répertoire des périodiques musicaux* (1954); O. Sonneck, "Die musikalischen Zeitschriften-Literatur" (ZIM i); E. O'Meara, "Music in the 17th and 18th Century Periodicals" (Notes iv); L. Daugherty, *A Bibliography of Periodical Literature in Musicology* (1940—); K. Taut, *Bibliographie des Musikschritftums* (1937–61); J. B. Coover, "A Bibliography of East European Music Periodicals" (*Fontes Artis Musicae* iii–vii, ix).

**Perpetuum mobile** [L.]. A term used by Paganini (*Moto perpetuo*, op. 11), Weber (last movement of Piano Sonata op. 24), and others to denote pieces that proceed from beginning to end in the same rapid motion, e.g., sixteenth notes in presto. Pieces of this type, although not labeled as such, occur also in Chopin's Études.

**Persia** I. *History*. Of major importance in the history of Persian music is the long political and cultural contact between Persia and ancient Greece, which lasted from the 5th century B.C. well into the 3rd century of the Christian era. The Persian expeditions into Greece were followed by Alexander the Great's decisive conquest of the Achaemenid Empire in 330 B.C., a

century of Greek rule in Persia, and four centuries of continued Hellenic influence. During this time, it is not unlikely that a significant musical interchange occurred. To the present day, Persian art music, composed by \*melody types, is still monophonic and organized in tetrachords. Further, Persian music theory (like \*Arab) is Greek in origin. The treatises of the medieval Islamic theorists were modeled after those of Euclid, Aristoxenus, Ptolemy, and others, which were translated into Arabic at Baghdad during the 9th century [see Arab music].

The earliest descriptions of Persian music appear in writings of Greek historians, Herodotus and Xenophon among them. For the Sassanid period (A.D. 226–642) there are sources giving the names of musicians and their compositions, while players of instruments are included in the numerous bas-reliefs and engraved metal plates that survive from this artistic time. With the Arab conquest of Persia in the 7th century, there was such a blending of Persian and Arab music, instruments, and terminology that the question of which music most influenced the other is still debated. Many scientific treatises on music appeared as part of the extensive philosophical writings produced at Baghdad, an intellectual capital of the early medieval world. Of the great music theorists, two were Persian: Ibn Sina (Avicenna, 980–1037), and Safi al-Din (d. 1294). Side by side with great activity in theory, however, was the Islamic disapproval of music in practice that tended to discourage progress in both Persian and Arab music for at least a millennium.

During the Mongol and Timurid periods (1221–1501) the Persians discarded many aspects of Arab culture, and the musical treatises of Shirazi (d. 1310) and Ghaibi (d. 1435) were written in the Persian language. Although the next dynasty, the Safavid (1501–1736), brought forth a rebirth of Persian culture, the renewed religious fervor occasioned by adoption of the Shia sect of Islam as the state religion again discouraged the practice of music. This antimusical atmosphere lasted until about 1900, when public concerts gradually became sanctioned and musicians were no longer considered socially inferior. Today Persian music has entered a new period of development. Stimulated by the introduction of Western music and by extensive patronage of music by the state, considerable attention is now given to the collection and preservation of native Persian music.

## II. Melody types and rhythm. Contemporary

Persian art music is organized into seven *dastgah*, melody types similar to the Arabic *maqamat* and Indian *rāgas*. Although their names are mentioned by theorists as early as the 9th century, the exact configuration of the scales of these melody types is not known until the 13th-century writings of Safi al-Din. In the next seven centuries, variation in the names and structures occurred, and, even today, under the influence of Western music, they are not completely stable. The version of the scales of the *dastgah* given by most contemporary theorists is represented below, transposed to start on the note C. The sign ♭ (*koron*) designates a flat of approximately one-quarter tone (the *sori*, ♯, designates a half-sharp).

<i>Shour and Nava</i>	C D ♭ E <sup>b</sup> F G A <sup>b</sup> B <sup>b</sup> C
<i>Homayoun</i>	C D ♭ E F G A <sup>b</sup> B <sup>b</sup> C
<i>Segah</i>	C D E ♭ F G A ♭ B <sup>b</sup> C
<i>Chahargah</i>	C D ♭ E F G A ♭ B C
<i>Mahour and Rast</i>	
<i>Panjgah</i>	C D E F G A B C

Related to the Shour are four auxiliary *dastgah* (*avaz* or *naghme*)—Abu Ata, Dashti, Afshari, and Bayote Tork—and related to Homayoun is the auxiliary *dastgah* of Esfahan, making a total of twelve melody types.

Each *dastgah* and *naghme* possesses twenty to fifty short melodies or melodic formulas (*gousheh*) that the composer-performer uses as the basis for improvisation. For a performance, the singer or instrumentalist selects a number of *goushehs* within a single *dastgah*, treating them with considerable freedom. The entire collection of melodies in all seven *dastgah* and five *naghme*, now numbering about 500, is called the *radif*. Handed down orally for many centuries, it has been transcribed during the past fifty years by several masters and published in Western notation [see Ex., a *gousheh* from the *dastgah* of Shour].

Rhythm in Persian music, unlike Arab and Indian music, is no longer systematized into the

rhythmic modes (*iqa'at*) described by medieval Persian theorists. Most traditional art music is, in fact, unmeasured and performed in a free rubato manner. The strongest rhythmic factor in music of the *radif* comes from poetry. Like the music of ancient Greece, Persian music is closely allied with poetry. Generally one couplet of classical verse is set to a single *gousheh*, with long melismatic sections and instrumental rhapsodizing between the various *gousheh*. Thus the meter of the poetry imparts a kind of recurrent rhythmic structure to the otherwise unmeasured composition.

III. *Instruments and forms.* Although Western instruments are widely used in Persia, some native instruments are favored for performances of traditional music. The most popular plucked stringed instruments are the *setar*, a long-necked three-stringed lute with pear-shaped wooden body, and its larger counterpart, the *tar*, which has a double belly, covered with a sheepskin membrane. The Persian dulcimer, the *santour* (Arab. *santir*), is also prominent. These three native instruments are comparable to the lute ('ud) and psaltery (kanun), the native instruments most often played today in Arab countries but used only rarely in Iran. The Persian *nay* (flute) and *kamanche* (a spike fiddle held on the player's knee), still used in the provinces, have been replaced by their Western counterparts in the cities. The Persian drum is the *tombak*, held on the player's knee and struck with the palms and fingers of both hands.

Classical Persian music is solo or chamber music, usually performed by a soloist or a small ensemble consisting of singer, instrumentalist, and drummer. In the latter, the texture is \*heterophonic, the instrumentalist and drummer following the lead of the singer. Semiclassical music, of more recent origin, is composed and notated. Played by chamber orchestras of mixed native and Western instruments, these vocal and instrumental pieces (*pish-daramad*, *tasnif*, and *reng*) often have conservative Western harmony and counterpoint.

(the first four books are in Persian, with useful musical examples): Ruhollah Khaleqi, *Nazari be Musiqi* (1938), vol. ii; *id.*, *Sargozasht-e Musiqi-ye Iran* (1954), vol. i; Ali Naqi Vaziri, *Musiqi-ye Nazari* (1934); *id.*, *‡Dastur-e Tar* (1913); Mehdi Barkechli and Moussa Ma'aroufi, *‡La Musique traditionnelle de l'Iran* (1963); Khat-chi Khatchi, *Der Dastgāh* (1962); R. d'Erlanger, *La Musique arabe* (1930-39), vols. i-iv; H. Farmer, "An Outline History of Music and

Musical Theory," in *A Survey of Persian Art*, A. U. Pope, ed. (1939), iii, pp. 2783-2894; E. Gerson-Kiwi, *The Persian Doctrine of Dastgāh-Composition* (1963); E. Zonis, in *MQ* li, 636-48; *id.*, in *Ethnomusicology* viii, 303ff; C. Huart, "Musique Persane," in *LavE* 1.5, 3065ff; M. Barkechli, "La Musique iranienne," in *L'Encyclopédie de la Pléiade* (1960); *Folkways* (record) 8831 and 8832 (A Study Recording of the Twelve Dastgah).  
E.Z.

**Peru.** Long before the Spanish conquest (1526), Peru had a highly developed civilization, the vast Inca empire, which ruled most of northwest South America. Evidence of a fairly sophisticated musical culture is found in the oral tradition of the Incas' descendants and in the numerous panpipes, flutes, bells, shell and tubular trumpets, and drums preserved to the present day. The earliest Peruvian composer of distinction was Gutierre Fernández Hidalgo (c. 1553-1618), who wrote Masses, Magnificats, hymns, music for the offices of Holy Week, and motets. He was active not only in Peru, but also in Colombia, Ecuador, and Bolivia. The outstanding masters in Lima during the early 17th century were Estacio de la Serna and Miguel de Bobadilla. Juan de Araujo (c. 1646-1714) was a composer of liturgical part songs and \*villancicos, and Tomás de Torrejón y Velasco (1644-1728) is most famous for his opera, *La Púrpura de la rosa*, with a libretto by Calderón de la Barca, produced at the Viceroy's palace in Lima in 1701. José de Orejón y Aparicio (d. 1765), the first native Peruvian appointed to the Cathedral of Lima (1742), composed several hymns, psalms, and Masses. Roque Ceruti (d. 1760) was an Italian-born musician who came to Peru as conductor of the Viceroy's private orchestra and also was the palace composer.

José Bernardo Alzedo (1798-1878) is the best-known composer from the early period of independence, primarily because he wrote the Peruvian national anthem (1821). By the end of the 19th century a group of composers in the romantic tradition became the first to support musical nationalism. Among them were Claudio Rebagliati (1843-1909), an Italian who settled in Lima, José María Valle-Riestra (1859-1925), composer of the opera *Ollanta* (1901), and Luis Duncker Lavalle (1874-1922).

Several composers from succeeding generations shared this nationalist tradition but combined it with the aesthetics of early 20th-century music. Prominent among them are Daniel

Alomias Robles (1871–1942), Luis Pacheco de Céspedes (b. 1893), Teodoro Valcárcel (1902–42), Roberto Carpio Valdes (b. 1900), Andrés Sás (b. 1900; also a well-known musicologist), Pablo Chávez Aguilar (b. 1899), Carlos Sánchez Malaga (b. 1904), and Raoul de Verneuil (b. 1899). German-born Rodolfo Holzman (Rudolph Holzmänn), opened the doors to more progressive styles of composition. Many of Holzman's disciples became part of a group of internationally recognized avant-garde composers. Important among them are Enrique Pinilla (b. 1927), Enrique Iturriaga (b. 1918), Celso Garrido-Lecca (b. 1926), Francisco Pulgar Vidal (b. 1929), Olga Pozzi Escot (b. 1931), Edgar Valcárcel (b. 1932), and José Malsio.

Peruvian folk music from the highlands represents to a large extent a direct survival of pre-Columbian traditions. Primarily pentatonic, its melodies have a descending character and are usually in duple meter. The *\*cachua* is a typical form from this region. Songs and dances from the lower coastal regions, such as the *\*marinera*, *tonero*, *\*cumbia*, *socavón* [see *Mejorana*], and similar Creole songs are derived from Spanish models that were transformed by African influences. In many ways this music is similar to Chilean, Argentinian, Bolivian, and Ecuadorian folksongs.

Lit.: R. Stevenson, *The Music of Peru* [1960]; C. Raygada, *Guía Musical del Perú* (1957); R. and M. d'Harcourt, *La Música de los Incas*, rev. ed. (1957); R. Klatovsky, "Music in the Realm of the Incas" (*Musical Times* lxxv, 696ff); C. Vega, "Tonleitern mit Halbtönen in der Musik der alten Peruaner" (*AM* ix); A. Sas, "Ensayo sobre la música Inca" (*Boletín latino-americano de música* i); C. Raygada, "Panorama musical del Perú" (*ibid.* ii); C. Sánchez Malaga, "La Música en el Perú" (*Nuestra Música* ii, 72–77 [1947]). Also see under Latin America. J.O.S.

**Pes** [L.]. (1) Same as *podatus*; see Neumes I, table. (2) Name for the tenor in English 13th- and 14th-century MSS, particularly also for the two lower parts of *\*"Sumer is icumen in."*

**Pesca** [It.]. See under *Caccia*.

**Peter and the Wolf**. An orchestral fairy tale for children by Prokofiev (op. 67, completed in 1936), for a small orchestra and narrator. The narrator tells the story of a boy's capturing a large and ferocious wolf with the aid of friendly animals. Each character (cat, duck, Peter, etc.) is associated with a specific instrument and

melodic phrase, making the work an excellent introduction to the orchestra for young children.

**Peter Grimes**. Opera in three acts by Britten (libretto by M. Slater, based on G. Crabbe's poem, *The Borough*), produced in London, 1945. Setting: the Borough, a fishing village on the east coast of England, about 1830.

**Petrushka**. Ballet by Stravinsky (choreography by M. Fokine), produced in Paris, 1911, by Diaghilev's Russian Ballet. The work, often heard in the form of an orchestral suite at concerts, is one of the landmarks of 20th-century music. Among the many notable features are the percussive parallel chords in the opening scene, the clever caricature of a sentimental valse, and the bold use of bitonality, particularly in the "Petrushka chord" [see under Bitonality].

**Peu, un** [F.]. A little, somewhat.

**Pezzo** [It.]. Piece, composition.

**Pf**. In orchestral scores, etc., abbr. for pianoforte (piano). As a dynamic sign, abbr. for "piano followed by forte."

**Pfeife** [G.]. Fife; organ pipe.

**Pfundnoten** [G.]. The long notes [G. *Pfund*, pound—each, as it were, weighing a pound] that occur in the *cantus firmi* of innumerable polyphonic compositions, from the 13th-century organa to Bach's *cantus firmus* chorales. See *Cantus planus* style.

**Phagotus**. A curious instrument invented in the early 16th century by Afranio Albonese. It is worth mentioning only because it has erroneously been considered the predecessor of the *\*fagott*, i.e., bassoon. Actually it was a fanciful and impractical version of bagpipe. See L. F. Valdrighi, *Il Phagotus di Afranio* (*Musurgiana*, ser. 1, no. 5, 1881); *GD* iv, opp. 132; F. W. Galpin, in *PMA* lxvii, 57–72.

**Phantasie** [G.]. See *Fantasia*. *Phantasiestücke*, *Phantasiebilder*, etc., are romantic titles for imaginative, fanciful pieces with a slight programmatic connotation. See *Character piece*. *Phantasieren* means "to improvise."

**Phantasy**. Title of English chamber works that were written for the Cobbett Competitions, established in 1906. According to the rules of the competition, they had to be in one movement. More than forty such compositions were written between 1905 and 1930. R. Vaughan Williams, W. H. Hurlstone, Frank Bridge, John Ireland,

and Thomas Dunhill were among the contributors. See C. Maclean, in *ZIM* xii.

**Philidor, Collection.** A large MS collection of 17th-century music (chiefly French), compiled by André Philidor (Danican; c. 1647–1730). The collection contains many dance tunes and airs, all the ballets and operas of Lully and a few other composers, as well as all the sacred music in use at the French court chapel. A large part of the collection is now at St. Michael's College in Tenbury, England, and another in the library of the Paris Conservatory. See J. W. Wasielewski, in *VMW* i, 531–45; E. H. Fellowes, in *ML* xii, 116–29; A. Tessier, in *RM* xii [1931], 295–302.

**Philippines.** For about nine-tenths of the Philippine population, a musical tradition nurtured by three centuries (1565–1898) of cultural contact with Spain is exemplified in songs and dances (*kundiman*, *balitao*, *pandango*, *carifosa*, *tinikling*, etc.) with a melody in major and minor, duple and triple meters, and a harmonic accompaniment played by guitar, piano, or an ensemble of steel strings (*rondalla*). Together with brass bands playing marches, overtures, and selections from Italian opera, this type of music constitutes an

cal," "popular," or "jazz."

Generally unknown to the larger audience is a rich variety of aboriginal Malayan music still performed in remote areas that had little or no contact with Western ways. Principally in three regions—northern Luzon; Mindoro; and Palawan, Mindanao, and Sulu—the music is similar to that heard in the islands of Indonesia and the hills of southeast Asia. This whole complex comprises one cultural unit. In the northern Philippines, music is used for festivities such as a peace pact, a head-hunting celebration, or a prestige ceremony, and in the south for a wedding, a thanksgiving for a bountiful harvest, or an Islamic ritual.

Among the mountain people of northern Luzon, gong music that accompanies dancing by couples and groups plays an important role in celebrations. Flat gongs without a boss (*gangsá*), not found elsewhere in the islands, are played in various instrumental combinations (6 gongs; 2 gongs and 1 cylindrical drum; 2 gongs, 2 conical drums, and a pair of iron bars). They are beaten with padded sticks. Among the Kalinga six performers tapping and sliding their palms on six gongs of diminishing size produce a music that might be notated as follows:

= c 116 = ringing sound    = mordeni, short sound    = r h sliding sound    = staccato about    = dampen with l h

1 balbal    etc  
 2 salbat    etc  
 3 katlo    etc  
 4 kapat    etc  
 5 opop    etc  
 6 anungov    etc

important part of the repertory used for celebrations, school programs and, especially, fiestas in honor of a patron saint. Toward the end of the 19th century, in Manila particularly, there were Spanish *\*zarzuelas*, visiting Italian opera companies, and performances by local and foreign artists attended by a well-informed public. Later, with the introduction of modern schools and symphony orchestras, composition and performance included more complex European forms. Today, music in various segments of Philippine society simply means Western music—"classi-

Other musical instruments in this region are the bamboo tube, xylophone blades, tube zither, buzzer, quill-shaped tube, panpipes, flutes (nose, lip-valley, whistle), brass and bamboo Jew's-harp, row of sticks, and musical bow (among the Negrito). A syllabic style of singing with reiterations on pivotal tones is used for song debates, work songs, medicine-man songs, songs for peace pacts, epics, etc., sung either by a leader and chorus or a soloist, in ritual as well as recreational surroundings.

Music in Mindoro shows some Western influ-

ences—harmonic patterns played on a miniature guitar, and diatonic melodies performed on a small violin and a transverse flute.

In the southern Philippines, except for leader-chorus singing in Palawan, musical forms are generally similar to one another. Most valued is a large suspended gong with a wide rim (*agung*), played together with various instruments, such as one or more of the following: another *agung*, cylindrical drum, gongs suspended in a frame, gongs in a row, bamboo zither, two-stringed lute, and other types of gong. The music for the *kulintang* ensemble with five instruments may be written as follows:

♩ = c.96 + = pitch slightly higher than notation

1. *babandil* (small suspended gong)  
2. *dabakan* (tubular drum)  
3. *agung* (2 big suspended gongs)  
4. *gandingan* (heavy gongs, 2 pairs)  
5. *kulintang* (8 gongs in a row)

Generally, the *kulintang* is tuned to a "flexible" pentatonic scale (two small gaps, one big gap, and one small gap of varying dimensions). Other musical instruments of the area are various flutes (ring, lip-valley, beak-type), bamboo horn, reed pipe, shell trumpet, bamboo zither, spike fiddle, violin, small gongs with shallow boss, percussion beams, log drum, Jew's-harp, slit drum, bamboo scraper, stamping tube, and xylophone. Syllabic recitations on key tones of a scale are frequently employed in songs—legends, epics, lullabies, courting or wedding songs, etc.—or in prayers to drive bad spirits from a sick person's body. Among peoples influenced by Islamic culture, melismatic songs are found in Islamic rituals—Friday-noon service, Maolud, Ramadan—or in long narratives (*sindil*, *baat*) sung by special singers. Solo songs are the norm, but some singers are accompanied by the bamboo zither, the lute, and, especially, the xylophone and violin among the Taosug of Sulu.

**Phonograph and recorded music.** The origin of the phonograph traces back to Thomas A. Edison, who in 1877 produced a record made of tin foil on which his own voice could be heard reciting "Mary had a little lamb." This record was a cylinder, as were the all commercial records made by Edison for many years. The invention of practicable disc records (introduced commercially c. 1896) and the beginnings of mass production and marketing of recordings owed much to Emil Berliner, who held the patents on which the Improved Gramophone was based. This machine did not become practicable until the invention of a suitable motor by E. R. Johnson, a Camden, New Jersey mechanic whose factory supplied motors and later entire machines for the enterprise. The marketing was

done by F. Seaman (under contract to Berliner). Eventually internal dissension and lawsuits from competitors broke up this alliance, and Johnson, who developed a new and much better method of making discs, set up his own company, Victor, in cooperation with Berliner.

The types of phonograph and record remained generally the same until 1925, when the Orthophonic Victrola and electric recording were introduced. These instruments, featuring more sonorous sound chambers than those of the earlier machines, were able to bring more music from the records than had been heard before, and the new method of recording, utilizing the microphone that had come into being with radio, marked a tremendous advance in the range and faithfulness of reproduction. The next few years saw the development of the electric phonograph, in which the sound is reproduced entirely by electricity. The next major innovation, comparable in importance to the replacement of the old cylinder by discs, was changing the speed of the turntable from 78 revolutions per minute (RPM) to 33½ or 45 RPM. The slower speed combined with more grooves on the surface of the disc made possible a period of about twenty to thirty minutes of uninterrupted performance as compared to a previous maximum of about five minutes. This advantage of the long-playing (LP, originally a Columbia trademark) record, in addition to greater convenience of storage and transportation, made the older 78 RPM discs obsolete. Fortunately, many of the older discs have been transferred onto LP discs.

Of great importance to the recording industry was the development of magnetic-tape recording, introduced commercially in the 1940's. Recording companies were quick to seize on the many advantages of this medium: longer uninterrupted playing time; freedom from many kinds of distortion inherent in disc recording; potentially lower noise levels; and, especially, the possibility of editing and splicing short sections of tape, an impossibility in disc recording. Mistakes and extraneous noises could be easily eliminated by making a composite recording from portions of several separate recordings (or "takes"). The great majority of commercial recordings of music are made in this fashion, producing a musical result technically more perfect but frequently less spontaneous than a "live" musical performance. Owing to its technical superiority, virtually all sound recordings are now made on tape and then transferred to the desired medium (disc, tape, or film). Because

high-quality tape recorders can be made quite compact and portable, this recording method has become an indispensable research tool for \*ethnomusicology.

Except for a few experiments, all discs issued up to 1958 were monaural (or monophonic), i.e., they employed only one sound channel. But human hearing is binaural, the separation of the two ears enabling the listener to perceive the direction of sound. Although stereophonic recording is easily accomplished on a single magnetic tape (by placing two or more channels side by side), it is much more difficult to achieve on discs. Experimental techniques had been developed as early as c. 1935, but it was only in 1958 that the technical problems of combining two sound channels in a single record groove were finally overcome and stereophonic ("stereo") discs were commercially introduced.

The repertory for the phonograph has undergone considerable change since the early days. Edison's original intention was to produce literally a talking machine, and the musical possibilities of the new instrument were not at first apparent. The earliest repertory of the commercial phonograph, therefore, consisted mostly of vaudeville sketches and monologues. These were gradually supplemented with band records and sentimental songs, for it was possible to reproduce wind instruments with reasonable clarity, and the singing voice emerged recognizably from the wax. Celebrated singers soon began to record their voices, and by the 1890's this practice was quite fashionable. Recordings made from the first Paris performance of *Parsifal* (1882) are believed to be the oldest preserved. About 1900 the record companies in Europe began to see the commercial possibilities of the idea, and a new period in phonograph history began. The first American celebrity recordings were announced in 1903 by the Columbia Company, the list including discs by Marcella Sembrich, Edouard de Reszke, Ernestine Schumann-Heink, Giuseppe Campanari, Antonio Scotti, Charles Gilibert, and Suzanna Adams. Victor was not slow to follow, building up an impressive "Red Seal" catalog to which most of the feted vocalists and instrumentalists of the day contributed. The singers recorded mostly operatic arias, occasionally branching out into the song repertory, and the violinists, cellists, and pianists gave their versions of the lighter classics. At first all accompaniments were played on the piano, but about 1905 many of the singers were busy remaking their selections with orchestra. Owing

to the limitations of reproduction at that time, all kinds of alteration were made in the orchestrations of arias and the instruments were necessarily few in number, but the voices as recorded were unmistakably those of their famous prototypes. Today, collecting early celebrity recordings is a major hobby, and several societies have been formed for the purpose of re-recording or re-pressing old masters on a subscription basis.

In 1913 the Gramophone Company in Europe completed the last of a series of orchestral recordings, securing the services of Arthur Nikisch, who conducted the Berlin Philharmonic Orchestra in Beethoven's Fifth Symphony, and the London Symphony Orchestra in a series of standard works. In the same year the Columbia Company in the United States engaged Felix Weingartner and enlarged its staff orchestra for several recordings under his direction. The first of these were cut versions of the "Liebestod" from *Tristan* and the conductor's arrangement of Weber's "Aufforderung zum Tanz." Several years later (1917) Columbia engaged the Chicago Symphony, conducted by Frederick Stock, the Cincinnati Orchestra under Kunwald, and the New York Philharmonic under Stransky. Victor followed a year later with a series of recordings of Karl Muck and the Boston Symphony, and shortly thereafter Leopold Stokowski began his long series with the Philadelphia Orchestra. The year 1919 saw the first serious attempts at recording chamber music in this country when the Flonzaley Quartet made for Victor a series of abbreviated movements from their repertory.

The issuing of complete symphonies and other larger works received its greatest impetus in Europe. As early as 1907 and 1908 Victor was issuing complete performances of operas (including *Pagliacci* made under the direction of the composer) recorded by the La Scala company in Milan, but it was not until the establishment of electrical recording that the American catalog began to fill up with records made for the sake of the music rather than the artist. After a period of decline, attributed to the competition of radio, records began to enjoy a new popularity comparable to that of the great days of celebrity discs. In the first decade of electric recording the usual repertory of standard works, both instrumental and vocal, had been pretty well covered, and the enterprise of some of the companies, particularly in Europe, made it possible for the phonograph owner to come to know a great deal of music he might never otherwise have had a chance to hear. This fact has certainly been in no

small measure responsible for the general rebirth of interest in the music of the 16th and 17th centuries. Societies were formed for the recording of music whose appeal was expected to be limited, but many of the sets so issued proved sufficiently popular to be subsequently released in the regular commercial catalogues. The music of men like Delius, Hugo Wolf, Sibelius, Kilpinen, and Purcell was issued in such sets, as well as the sonatas of Beethoven, various works of Bach, and several operas of Mozart. A further development has been the issue of records of chamber music with one of the instrumental parts missing, and of accompaniments to songs, for the benefit of amateurs who lack the necessary partners for musical performance.

The amazing growth of interest in records is seen in the amount of literature published on the subject. *The Gramophone* in England and *The American Music Lover* (now *The American Record Guide*) in the United States are magazines devoted entirely to recorded music, and various dealers publish critical bulletins. Many general magazines and newspapers have instituted record-review columns, and in 1936 The Gramophone Shop in New York published an *Encyclopedia of Recorded Music* (new editions of which appeared in 1942 and 1948). Most modern books on music include lists of records, and several critical surveys of recorded music have been brought out.

Another important development has been the introduction of record collections in libraries throughout the world. A project of the Carnegie Corporation has been the assembling of "music sets" for colleges and schools, and the free distribution of these records, books, and scores to selected institutions. Steps are being taken to establish record archives in various libraries, not only to provide the public with a place to listen to music but to preserve many of the important discs no longer on the market. The voices of such singers as E. Caruso, E. Eames, Lilli Lehmann, Victor Maurel, Adelina Patti, Melba, Tamagno, De Lucia, Tetrassini, and Fremstad, and the playing of Paderewski, Kreisler, Ysaÿe, Pachmann, and many others will thus be preserved for posterity.

The output of recorded music includes, needless to say, the entire standard concert repertory and many compositions that are seldom heard in the concert hall. Particularly worth mentioning is the attention that has been given to the music of Bach and the masters of still earlier periods. Most of the latter have been recorded in

sets covering the entire history of music or special phases thereof. The most important of these are: *L'Anthologie Sonore* (Parlophone-Odeon; ed. C. Sachs); *The Columbia History of Music by Ear and Eye* (Columbia 78; ed. P. Scholes); *The History of Music in Sound* (RCA Victor); *Masterpieces of Music before 1750* (Haydn Society); *A Treasury of Early Music* (Haydn Society); *2000 Years of Music*, ed. C. Sachs (orig. Decca 78, then LP, then Folkways LP); *Anthologie de la Musique d'Orgue* (Ducretet-Thomson); *Archiv* series (Deutsche Grammophon Gesellschaft). For recordings of medieval music, see the Record List in *ReMMA*, pp. 465ff, and J. Coover and R. Colvig, *Medieval and Renaissance Music on Long-playing Records* (1964).

**Phonola.** See under Mechanical instruments IV.

**Phorminx** [Gr.]. Homeric name for the \*kithara, or \*lyra.

**Phrase.** A division of the musical line, somewhat comparable to a clause or a sentence in prose. Other terms used for such divisions are period, half-phrase, double phrase, etc. There is no consistency in applying these terms nor can there be, in view of the infinite variety of situations and conditions found in music. Only with melodies of a very simple type, especially those of some dances, can the terms be used with some consistency, e.g., half-phrase for a unit of two measures, phrase for one of four, double phrase or period for one of eight, double period for one of sixteen. Music of the era from c. 1600 to 1900 often

shows a "regular" phrase structure in units of four measures; see *Vierhebigkeit*.

**Phrasing and articulation.** Terms used to describe clear and meaningful rendition of music (chiefly of melodies), comparable to an intelligent reading of poetry. The main (though not the only) means of achieving this goal is the separation of the continuous melodic line into smaller units varying in length from a group of measures to single notes. Properly speaking, phrasing refers to the separation of a melody into its constituent \*phrases, whereas articulation refers to the subdivision of a phrase into smaller units. Often, however, it is difficult to distinguish between the two, partly owing to the vagueness of the term "phrase." Moreover, in practice the term "phrasing" is often applied to what is properly termed "articulation."

The earliest use of phrasing marks (other than written out rests) occurs in Cavalieri's *La Rappresentazione di anima e di corpo* (1600), where the sign  $\text{z}$  is placed above the final note of a phrase [Ex. 1; see *SchGMB*, p. 183]. F. Couperin, in Books 3 and 4 of his *Pièces de clavecin* (1722, '30), used a comma in order to indicate what, in the foreword to these publications, he called "la terminaison des Chants ou de nos Phrases harmoniques." In some cases, the comma serves as a sign of articulation rather than phrasing [Ex. 2; cf. ed. by J. Brahms and K. F. Chrysander, iii, 280]. None of the later composers (Mozart, Beethoven) paid special attention to

phrasing, apparently taking it for granted that the performer would know how to divide melodies into phrases. On the other hand, signs of articulation, such as the various signs for \*legato and \*staccato, are not uncommon in compositions from c. 1620 to 1750 and occur with increasing attention to detail in the works of the

classical, and later, romantic composers. An early example is a passage from Carlo Farina's *Capriccio stravagante* (1627) for violin, noteworthy for its capricious alternation of downbeat and upbeat slurs [Ex. 3; see Keller, p. 45]. J. S. Bach's indications are open to a variety of interpretations. Indeed, his melodies are so complex in structure and so rich in relationships on numerous levels that any indication of phrasing is bound to be one-sided and misleading.

One of the earliest theorists to write about phrasing was Mattheson, who in his *Kern melodischer Wissenschaft* (1737) described it as "the most remarkable and least noticed aspect" of musical language [G. *Klangrede*]. J. A. P. Schulz was perhaps the first to observe (in Sulzer's *Allgemeine Theorie der schönen Künste*, 2 vols., 1771, '74) that phrases often extend over the bar line. In the late 19th century H. Riemann published a number of books dealing in minute detail with all aspects of phrasing and articulation. In his edition of Beethoven's *Sonaten für Klavier* (3 vols., 1885) phrasing and articulation are practically the only stylistic elements considered, and his numerous *Phrasierungsangaben* of compositions by Bach and other masters [see his *Altmeister des Klavierspiels*, 2 vols. (1890?), nos. 96, 97] are provided with such a large number and variety of marks as to make them practically useless (in fact, almost illegible). Riemann's ideas were applied, with more moderation, by numerous editors to works ranging from the 16th century [see *TaAM* i, ii, etc.] to Mozart and Beethoven. Special attention was paid to one particular "law" of phrasing, i.e., Riemann's thesis that every musical phrase begins with an upbeat [G. *Auftakt*]. Undoubtedly this is a principle of considerable importance, but it has been carried *ad absurdum*, often in clear violation of the composer's intentions. Good phrasing and articulation involve the separation of larger and smaller units, but also such other factors as proper accentuation, variety of attack, and subtle crescendos and decrescendos, all of which contribute to the meaningful shaping of a melody. See also *Bowing*; *Expression*; *Expression marks*; *Piano playing*; *Style*.

**Phrygian.** (1) In ancient Greek theory, the octave species d'-d [see *Greece II*]. (2) In the system of

\*church modes, the segment e-e' of the diatonic scale, with e as the tonic (*finalis*). From the modern point of view, it appears as a variety of minor (E minor), the characteristic distinguishing feature being the minor second: e f g a, instead of e f# g a. In compositions in the Phrygian mode,

this characteristic step appears most conspicuously in the cadences (Phrygian cadence; see Ex.). To the harmonically minded, such formulas seem to be not so much a full close in E (VII-I) as a half-cadence in A (IV-V). In this sense the Phrygian cadence is frequently found in the sonatas of Corelli, Handel, and others as a transition from one movement to the next. For an example of Phrygian in modern music, see *Modality*.

In Gregorian chant, the Phrygian mode (modes 3 and 4; *deuterus*) is represented by a large number of chants, many of which, however, show a tendency toward tonal instability, the E-tonality not being established until the end [see *ApGC*, p. 142]. Also noteworthy is the frequent occurrence of a b-flat, particularly in cadences with the general outline f-b<sup>b</sup>-e [e.g., the Communion *Qui meditabitur*, *LU*, p. 529]. In polyphonic music, the Phrygian mode was "discovered" by Ockeghem in his *Missa Mi-mi* and frequently used by Josquin as a vehicle for somber expression, e.g., in his motet, "Tu pauperum refugium" [*HAM*, no. 90]. See also *HAM*, nos. 93 (Hofhaimer), 111 ("Aus tiefer Not").

**Physharmonica.** See under *Harmonium II*.

**Piacere**, a [It.]. See *A piacere*.

**Piacevole** [It.]. Pleasing, agreeable.

**Pianamente** [It.]. Smoothly, softly.

**Pianino** [G.]. Upright piano

**Piano**, abbr. *p* [It.]. Soft; pianissimo (abbr. *pp*), very soft. See *Dynamic marks*.

**Piano, pianoforte.** A stringed instrument whose strings are struck by hammers activated by keys, and which, since the end of the 18th century, has been the principal domestic keyboard instrument in Europe and America. It was originally called *pianoforte* [It. soft-loud; also *forte-piano*] because, in contrast to the earlier harpsichord, the loudness of its sound could be varied by the

Cross section of grand piano action: 1. Keybed. 2. Keyframe. 3. Front rail. 4. Balance rail. 5. Balance rail stud. 6. Back rail. 7. Key stop rail. 8. White key. 9. Key covering. 10. Black key. 11. Key button. 12. Backcheck. 13. Underlever key cushion. 14. Action hanger. 15. Support rail. 16. Support. 17. Fly. 18. Support top flange. 19. Balancer. 20. Repetition spring. 21. Hammer rest. 22. Regulating rail. 23. Hammer rail. 24. Hammershank. 25. Hammer. 26. Underlever frame. 27. Underlever. 28. Damper stop rail. 29. Damper wire. 30. Damper guide rail. 31. Damper head. 32. Damper felts. 33. String. 34. Tuning pin. 35. Sostenuto rod.

touch of the fingers. Today the abbreviated name "piano" is more commonly used.

I. *General.* The piano is, with the single exception of the organ, the most complex of all conventional instruments. It has a greater range than any other instrument—usually more than seven octaves, from  $A_2$  to  $c''''$ —and a dynamic range that, again, is exceeded only by the organ's. The complexity of the piano arises from the fact that the soft felt hammer cannot merely be lifted toward the string like the tangent of the \*clavichord or carried past the string like the plucking mechanism of the \*harpsichord. Instead, the hammer must be thrown up and must immediately rebound from the string so that it will not damp out the vibrations it initiates. Since the hammer must be thrown instead of being lifted, it must move faster than the key that activates it, requiring a lever system (called an *action*) between it and the key. If the action is to give the performer good dynamic control, the distance over which the hammer is thrown after the motion of the key is arrested must be kept small. On the other hand, the hammer must fall far enough away from the string after striking it so that there will be no possibility of its bouncing back up and accidentally restriking the string. This requirement is met by the provision of a device that catches the hammer as it falls (a *backcheck*) and, more important, by an *escapement*, by means of which the lever that lifts the hammer is moved aside just before the hammer's impact on the string. The hammer then falls back farther than it was thrown upward, even while the key is still held down. An action meeting all of these requirements still does not permit rapid repetition of a note, especially when playing softly. This need was met only by the still more complicated *repetition action* or *double escapement*, developed in 1821 by Sébastien Érard (1752–1831). In this action, the hammer falls to an intermediate position and can be thrown upward again before the key returns all the way to its original resting position.

In addition to activating the hammers, the keys of a piano must also control felt-covered dampers, lifting them as a note is struck and allowing them to fall back to silence the strings when the keys are released. Generally, three strings per note are provided in the treble, two in the tenor, and one in the bass. The aggregate tension imposed by these strings, which approaches eighteen tons, is borne by a massive cast-iron frame.

The modern piano is equipped with two or

(especially in America) three pedals, the damper or "loud" pedal at the right, the *una corde* or "soft" pedal at the left, and (if present) the *sostenuto* pedal in the center. On being depressed, the damper pedal raises all the dampers, allowing all the strings to vibrate regardless of what keys are being depressed; this produces a characteristic coloring of the tone and permits legato performance of notes that do not lie beneath the hand. The *una corda* pedal shifts the entire keyboard and action to the right so that each hammer strikes only two of its three unison strings in the treble and only one of its two strings in the tenor. In addition to a reduction in volume, this pedal also produces a characteristic tone color. The *sostenuto* pedal operates to sustain only those tones whose dampers are already raised by the action of the keys. Thus, it permits the sustaining of single notes (e.g., a pedal point in the bass) while both hands are occupied elsewhere, and also provides the means of producing various coloristic effects.

II. *History.* Although interest in providing the harpsichord with some sort of hammer mechanism seems to have been fairly widespread in the first years of the 18th century—perhaps owing to the phenomenal success of Pantaleon Hebenstreit (1669–1750) and his large dulcimer, the \*pantaleon—the piano was created essentially single-handed by Bartolommeo Cristofori (1655–1730) of Florence, shortly before 1709. Cristofori's *gravicembalo col piano e forte* was conceived, as its name implies, as a new variety of harpsichord, whose hammer action could provide gradations of loudness instead of the ordinary harpsichord's "terrace dynamics." The perfection of Cristofori's piano action of 1720, which included both an escapement and hammer check, was such that it was not significantly improved upon for nearly a century, and no instruments even comparable in quality, except for direct copies like those by Gottfried Silbermann (1683–1753), were made until the 1770's. Cristofori's invention was not much appreciated in his homeland, but the description of it published by Scipione Maffei (1711) and printed in German translation in Mattheson's *Critica musica* (1725) appears to have inspired a number of Germans besides Silbermann to experiment with hammer mechanisms. The point of departure for most of the German builders seems to have been the clavichord rather than the harpsichord, and the German piano of the 18th century is, in both conception and tone quality, far more like a loud clavichord

than a dynamically flexible harpsichord. Most of the mid-18th-century German pianos were in fact built in the "square" form of the clavichord (in contrast to Cristofori's and Silbermann's, which were wing-shaped "grands"). The German builders employed a very simple action, radically different from Cristofori's, whose appears to have dropped from sight only to be essentially reinvented in England in the last quarter of the 18th century. In the typical German action, the hammer is pivoted in a fork at the back of the key rather than hinged from a rail fixed above the keys as in Cristofori's design. Most of the early German actions lacked an escapement, which was first incorporated by Johann Andreas Stein (1728–92) c. 1770. This so-called Viennese action yielded a touch that was lighter and shallower than that of Cristofori's instrument and greatly facilitated performance of the sparkling passagework characteristic of piano music before Beethoven's time.

The English piano appears to have descended from Cristofori's in a highly indirect fashion, the first pianos in England having been built by a German expatriate, Johann Zumpe, c. 1765. Zumpe's square pianos employed an escapeless action that was like Cristofori's only in having the hammers hinged from an overhead rail; this action was provided with an escapement, probably c. 1772 by Americus Backers, John Broadwood, and Robert Stodart, and later was to be the point of departure for Érard. Thus, the English action is the ancestor of that found in all modern pianos. It required a touch heavier than that of the delicate Viennese action, but it proved capable of giving greater volume and a wider dynamic range to the performer.

The history of the piano after the perfection of the double-escapement action is largely concerned with the development of metal bracing that could withstand the ever-increasing tension imposed by the thicker strings required for increased loudness and brilliance. The greatest single advance was the invention in 1825 of the one-piece cast-iron frame by Alpheus Babcock, who also was the first to conceive of *cross-stringing*, an arrangement in which the strings of treble and middle registers fan out over most of the soundboard while the bass strings cross over them, forming a separate fan at a higher level. These two features were given what is essentially their present form in the grand piano exhibited in 1855 by Steinway and Sons of New York.

III. *Modern types.* Of the horizontal piano

designs, the clavichord-shaped "square" and the wing-shaped "grand," only the latter has continued to be built in the 20th century. Modern grand pianos range in size from the 9-foot "concert grand" down to 5-foot, 2-inch "baby grands." (These sizes are the normal extremes; there are instruments as long as 11 feet and shorter than 5 feet.) Pianos with their strings arranged in a vertical plane have been built since the middle of the 18th century. The earliest examples appear to have been either "pyramid" pianos, in which the strings were housed in a case that formed a tall isosceles triangle above the keyboard, or "giraffe" pianos, which were essentially grand pianos set on end. The 19th century saw the introduction of "cabinet" pianos with tall rectangular cases, as well as the diagonally strung "cottage" piano of Robert Wornum (1811), which is the true ancestor of the modern upright. Large upright pianos more than 4 feet high have been largely superseded by lower instruments: the "studio upright" (about 46 inches high), the "console" (about 40 inches high), and the "spinet" (about 36 inches high). The spinet frequently differs from the others in having a special action that operates from below the keys. See also Keyboard; Pedal piano; Sostenente piano; Electronic instruments.

Hansing, *Das Pianoforte in seinen akustischen Anlagen* (1950); H. Brunner, *Das Klavierklangideal Mozarts und die Klaviere seiner Zeit* (1933); "Experimental Pianofortes" (PMA lvii); *id.*, in CP 1930; S. M. Cleeve, "The Future of the Piano" (*Musical Times* lxxxvii, 201, July 1946); C. Parrish, "Criticisms of the Piano When It Was New" (MQ xxx). See also under Keyboard instruments. E.M.R.

**Piano arrangement.** See Arrangement.

**Piano concerto.** See Concerto II, III (c).

**Piano duet.** A composition for two pianists playing on either one or two instruments. Such compositions are also called "for four hands" [F. *à quatre mains*; G. *vierhändig*; It. *a quattro mani*; Sp. *a cuatro manos*].

(a) *Duets for one instrument* (organ, harpsichord, piano). As early as the 8th century some

organ music was performed by two organists, each playing one melody (with the hands alternating in pulling out and pushing in slides), both together performing organum [see Organum (2)]. From c. 1600 there is a "three-hand" organ composition, *Ut re my fa sol la*, by William Byrd, bearing the remark: "The playnesong Breifes To Be played by a second person" [see S. Tuttle, *William Byrd, 45 Pieces for Keyboard Instruments*, pp. 86ff], as well as two four-hand compositions, an *In nomine* by Nicholas Carleton [see H. Miller, in *MQ* xxix] and a *Fancy* by Thomas Tomkins [*Two Elizabethan Keyboard Duets*, ed. F. Dawes (1949)]. A continuous tradition, however, did not begin until the late 18th century. A famous picture of 1762 shows the young Mozart and his sister playing together. Among the earliest extant compositions are six sonatas by Johann Christian Bach (1735–82), Mozart's four-hand Sonata in D (K. 381; 1772), Burney's *Four Sonatas or Duets for two Performers on One Piano Forte or Harpsichord* (1777), Haydn's *Il Maestro e lo scolare* (1778), and seven compositions (six sonatas, K. 19d, K. 381, K. 358, K. 497, K. 521, K. 357; one set of variations, K. 501) by Mozart, composed between 1765 and 1787. Besides Mozart, the only great composer who was seriously interested in four-hand music was Schubert. Brahms wrote a set of variations on a theme by Schumann (op. 23); Max Reger *12 Walzer-Capricen* (op. 9), *Sechs Burlesken* (op. 58), *Sechs Stücke* (op. 94), and others; and Hindemith a *Sonate* (1938).

(b) *Duets for two instruments*. The *Libro de cifra nueva* by Venegas de Henestrosa (1557) contains a chanson, "Belle sans paire," by Crecquillon, arranged "a doce para dos instrumentos," i.e., in twelve voice-parts for two harpsichords or organs [\*Editions XXXII, 2, p. 158]. An English example from the late 16th century is "For two Virginals" by Giles Farnaby [see Fitzwilliam Virginal Book, i, 202]. Bernardo Pasquini (1637–1710) wrote 14 three-movement sonatas for two harpsichords, each consisting of two figured basses only. In France, *pièces à deux clavecins* were written by F. Couperin ("Allemande à deux Clavecins," several other pieces; see new ed. by Brahms-Chrysander, 4 vols., ii, 160; iii, 250, 262, 264, 284) and by Gaspard Le Roux (*Pièces de clavessin*, 1705). A sonata for two harpsichords reproduced in the complete works of Bach (*BG*, vol. 43.i, p. 47), but actually composed by his son W. F. Bach, has received little attention. The present-day repertory begins with Mozart, whose Sonata in D (K. 448; 1781) is one of the

most famous pieces for two pianos. Other notable compositions are his Fugue in C minor (K. 426; 1783), two Sonatas by Clementi (op. 12, 46), Schumann's Andante and Variations in B<sup>b</sup> major (op. 46), a Rondo by Chopin in C major (op. 73), Variations by Sinding, several compositions by Busoni, Debussy's *En Blanc et noir* (1915), and, among later contributions, a Sonata by Hindemith (1942) and a Concerto and Sonata by Stravinsky (1935, 1944). More numerous are arrangements for two pianos, among which those made by the composers themselves are particularly worth mentioning (Brahms, F-minor Quintet and Variations on a Theme by Haydn; Busoni, *Fantasia contrappuntistica*, originally written for piano solo).

Altmann, *Verzeichnis von Werken für Klavier vier- und sechshändig sowie für zwei und mehr Klaviere* (1943); A. M. Henderson, in *PMA* lii; F. Niecks, in *ZIM* v; H. Miller, in *MQ* xxix.

**Pianola.** See under Mechanical instruments IV.

**Piano music.** The literature proper for the piano starts with the sonatas that Clementi, Haydn, and Mozart wrote from c. 1775 on, and includes among its contributors practically all the composers of the 19th and 20th centuries. Nobody would think of excluding from this repertory the works of J. S. Bach, although they were written for the harpsichord and clavichord. The sonatas of Domenico Scarlatti have likewise joined the piano repertory. There are, moreover, numerous earlier keyboard composers—Byrd, Sweelinck, Frescobaldi, D'Anglebert, and others—whose works could well be performed on the piano, provided they were played with a proper regard for style [see W. Apel, *Masters of the Keyboard*, p. 5].

I. *The beginnings*. The earliest known pieces for the piano (though written in true harpsichord style) are by Lodovico Giustini, who in 1732 published sonatas for the "cembal di piano e forte detto volgarmente di martelletti" ("... commonly called the one with hammers"; see R. Harding, in *ML* xiii; new ed. by R. Harding, 1933). These, however, remained as isolated as Cristofori's instrument [see Piano II], and it was not until about forty years later that the piano began its triumphal career. One of its first cham-

pions was J. F. Edelmann (1749–94) in Paris. Clementi's first sonatas of 1773 are perhaps the earliest pieces to make use of the distinctive powers of the instrument. Of K. P. E. Bach's six publications "für Kenner und Liebhaber," the first (1779) is called "Sechs Clavier-Sonaten," probably indicating free use of any of the three keyboard instruments, while the others (1780–87) expressly call "fürs Forte piano." On the other hand, the original editions of almost all the Beethoven sonatas up to op. 27 (including the "Moonlight" Sonata) bear the inscription "Pour le clavecin ou pianoforte," an inscription for which the publishers probably were responsible [see Harpsichord II].

II. *Classicism (1780–1830)*. This is the greatest and best-known period of piano music, and too extensive to describe in detail. One might point out a few of the most obvious advances in exploiting the resources of the instrument, such as the amazing degree of virtuosity attained in Beethoven's Waldstein Sonata, Appassionata, and piano concertos, the transcendental technique of his latest sonatas (op. 106ff), and the "orchestral coloring" that appears in Schubert's great but somewhat neglected sonatas. Beethoven's Bagatelles mark the beginning of an important type of 19th-century piano music, the \*character piece.

III. *Romanticism (1830–1910)*. This period, too, is too rich and familiar to describe in detail. The piano pieces by Schumann, Chopin, Liszt, and Brahms form the standard repertory, and indeed overshadow many other compositions that would be equally or more worthy of attention (particularly Schubert). Mendelssohn, formerly the most favored composer, has fallen into a not entirely deserved eclipse from which he seems to be re-emerging. Weber's sonatas also could be put to use as a relief from the monotony of many recital programs.

About 1870 the national composers began to make their novel contribution to the piano repertory, with Edvard Grieg as the pioneer. Relatively easy to play and yet highly effective, his pieces, as well as those of Dvořák, Smetana, MacDowell, Albéniz, Granados, and De Falla, are greatly favored by players and listeners. The contrary can be said of Max Reger and Ferruccio Busoni. Grandiose compositions such as the former's *Variations and Fugue on a Theme by Bach* or the latter's *Fantasia Contrappuntistica*, though extremely interesting, make technical and intellectual demands on the performer that are out of proportion to their general appeal.

Alexander Scriabin's Etudes and Sonatas are largely in the same category. Debussy, on the other hand, developed a very attractive piano style and succeeded in exploiting entirely novel resources of the instrument [see Impressionism]. His coloristic technique left its imprint on the works of Ravel as well as numerous other composers of the 20th century.

IV. *The 20th century*. At the outset of this period stand Arnold Schoenberg's *Drei Klavierstücke* op. 11 (1909), whose \*atonality shocked the musical world of the time, as did his *Sechs kleine Klavierstücke* op. 19 (1911). The piano literature of the ensuing three decades reflects, of course, the general trends that characterize this extremely tumultuous and varied period. A central position is held by Béla Bartók, who as early as 1908 (*14 Bagatellen* op. 6) exploited the "percussive" effects of the piano (see also his *Allegro barbaro* of 1911), and whose *Mikrokosmos* (6 vols., 1926–37), consisting of 153 short pieces, is a veritable manual of 20th-century pianism in all its aspects. Other outstanding contributions include Hindemith's *Reihe kleiner Stücke* op. 37 (1927), three Sonatas (1936), and *Ludus tonalis* (1943), and Stravinsky's Sonata (1924) and *Serenade en la* (1925). The avant-garde tendencies of serial and electronic music are reflected in the extremely complicated piano scores of O. Messiaen, P. Boulez, and K. Stockhausen (1950 and later).

**Piano playing.** Although there is some disagreement among artists and teachers as to how the piano should be played, many basic, universally accepted rules for pianism have been determined. It is surprising, therefore, that many piano teachers (and, as a result, many pianists) are ignorant of some of these basic principles, particularly those that have been developed and accepted in the last hundred years.

I. *The playing apparatus.* The pianist uses a flexible system of levers (fingers, hand, forearm, upper arm, torso) connected by four joints (knuckles, wrist, elbow, shoulder). Sound is produced by moving: (a) the fingers from the knuckles; (b) the hand from the wrist; (c) the forearm from the elbow; (d) the upper arm from the shoulder. The first of these, the *finger action*, is by far the most important and is the basis of piano technique. The second, *wrist action*, is useful for playing passages in light, quick staccato, e.g., rapid octaves. The elbow is important mainly because it permits a rocking action of the forearm necessary for tremolos and Alberti bass figures. In the older school a straight downward movement of the forearm, called "elbow staccato," was taught, but this is of little value since it causes the fingers to make a circular motion. Such waste is avoided by using *arm action*, in which the whole arm moves from the shoulder, enabling the hand to rise vertically above the keys and then drop from a greater or lesser distance. This technique is important for the execution of powerful fortissimo chords. While the other actions (finger, wrist, and elbow) require muscular activity, arm action is executed by relaxing the muscles and using the weight of the arm.

II. *Basic piano technique.* In addition to the four actions described above, there is a fifth method of producing sound, which might be called "minimized arm action": the finger is placed on the key, and the arm is slightly raised and then relaxed as in the visible arm action. This method produces a "singing" tone and

allows for minute control of dynamic nuances not otherwise obtained. This action is by no means restricted to producing single tones, but can be used for rapid passages if it is combined with "minimized finger action" (the fingers constantly touching the keys) and with a transfer of the arm's weight from one finger to the next. This "close technique" (which is much easier to learn than to describe) is the basic technique of truly accomplished piano playing. Only through this technique do melodies sound like a "living organism" rather than the dead sum of so many single notes, which is the inevitable result of pure finger action. If it is combined with a rotating movement of the hand, rapid figures (e.g., quick turns), difficult and unsatisfactory when played by the fingers alone, become easy. In fact, all the other movements of levers and joints find their proper place naturally and easily within the basic frame of this technique. Thus the stiffness so often found in older methods of playing is eliminated at the outset.

Although the systematic teaching of the close-finger and arm-weight techniques is relatively new, there is no doubt that the great pianists of earlier periods used them. Particularly informative in this respect is Forkel's description of Bach's playing (*Ueber Johann Sebastian Bachs Leben, Kunst und Kunstwerke*, 1802; new ed. 1925, pp. 28ff): "According to Bach's manner . . . the five fingers are curved so that . . . each of them is placed immediately above its respective key. This position requires that the finger should not *fall down* on the key nor (as is frequently done) be *thrown*, but merely should be *carried* through the movement with a certain feeling of security and mastery."

The discovery of arm-weight playing and its revolutionary possibilities led some pedagogues to an extreme reaction against the pure finger method of the older school. Such a radical point of view, however, is unwise. Finger development is the most important factor in piano playing, and thus the finger exercises of the old school still have a legitimate place in modern piano instruction, their main function being to develop strong, independent fingers that can support the arm's weight and direct it to the individual key. There are, however, cases in which more active finger participation (i.e., lifting them higher) is desirable in order to bring out, e.g., the crispness and brilliancy required by Mozart or the dry and percussive sound called for in the music of Bartók, Hindemith, Stravinsky, and others. The trill is perhaps the only figure that calls for pure

finger action. Its brilliant execution is therefore one of the most difficult feats of piano playing.

III. *The wrist.* The proper use of the wrist in piano playing is often neglected. The smooth combination of a supple, flexible wrist with prehensile fingers is indispensable. One of the most useful functions of the wrist is in shaping a musical phrase. The general principle is to begin a phrase with the wrist at keyboard level, gradually lift the wrist as the phrase develops, and drop it again as the phrase comes to an end. With a tapering phrase, however, the wrist should be lifted toward the end. Sideways motions of the wrist are also important. They are used mainly for widely spaced broken-chord figures, e.g., in Chopin's A-flat Etude. The principle is to move the wrist (almost ahead of the fingers) in such a way that each finger, if called into action, forms the straight prolongation of the arm. In playing chords the wrist acts as a shock absorber. For percussive and harsh effects, a stiff wrist may be used, but as a rule the wrist should be flexible and elastic to make the sound full and sonorous. In octave-playing the wrist may be used in one of two ways: light, quick octaves require an up-and-down movement of a flexible wrist (particularly for octave repetitions on the same keys), while octave passages in forte or fortissimo call for arm action combined with a fixed wrist.

IV. *Sense of touch.* Many difficulties in elementary piano instruction result from the teacher's failure to develop the pupil's sense of touch on the keys. Beginners, trying to find a note, may fall into the habit of shifting their eyes constantly up and down between music page and keyboard. The hesitations that mar the playing of otherwise promising students are often caused by this habit. While trying to avoid such hesitations, students may develop the even more detrimental habit of haphazardly playing from memory. The only remedy is to show the pupil how to find the intervals (third, fifth, octave, etc.) through his sense of touch, i.e., without looking at the keys. Wide jumps (which for this reason should be avoided in the first two or three years of piano playing) are an exception to the rule. How much a well-developed sense of touch facilitates sight-reading is obvious [see Sight-reading III].

V. *Touch and tone quality.* The word "touch" is widely used in piano teaching to denote (somewhat vaguely) the method of producing different tone qualities, ranging from soft and lyrical to harsh and percussive. The theory of touch assumes that the piano permits not only dynamic gradations of sound (*pp*, *p*, *mf*, etc.), but at a given

intensity, additional variations of timbre so that *mf* may be, e.g., "lyrical," "decisive," or "percussive." Whether this is possible or not is a hotly contested issue. One group holds that the percussive noise accompanying the attack of a tone determines its quality (timbre) and proposes that, by varying the speed and force of finger action, different timbres can be produced in each dynamic register. The other group holds that no such variation is possible with a single sound ("a piano key struck by Paderewski and the same key struck by an umbrella sound absolutely the same"), and that the varieties of timbre noticeable in the playing of accomplished pianists result from the relationship of varying intensities produced either simultaneously (as in chords) or successively (as in melodies). In any case, the perception of tone quality, even if not scientifically measurable, is an important illusion.

VI. *Mental approach.* Certain mental processes are as important as the purely technical methods: "Brains as well as hands play the piano" [see T. Fielden, in *PMA* lix]. Particularly important is a "look-ahead" attitude, a mental anticipation of the actual playing by the fingers. A well-developed sense of touch is the first step in this direction. Difficult passages are mastered by "positioning" the hand, i.e., analyzing the changing hand positions needed for a passage, and using preparatory hand movements that lead to the new position while the fingers are still occupied in the old one. Another application of the same principle is the so-called "long hand," or "pre"-formation of wide skips often encountered in left-hand accompaniments.

VII. *History.* Information about 16th-century keyboard technique (clavichord, organ) is contained in Tomás de Santa María's *Llibro llamado arte de tañer Fantasia* (1565; see O.inkeldey, *Orgel und Klavier in der Musik des 16. Jahrhunderts*, 1910) and in Girolamo Diruta's *Il Transilvano* (1593, 1609). Extremely difficult passages occur in the works of the \*virginal composers, particularly those of John Bull (rapid scales in parallel thirds for the left hand, repeated notes, etc.). J. S. Bach contributed to the development of a modern fingering system [see Fingering], whereas his contemporary, Domenico Scarlatti (1685–1757), explored the virtuoso resources of the harpsichord to the fullest (crossing hands, wide skips, extensive arpeggios).

The "old school" of piano playing (emphasizing finger technique) is represented by M. Clementi (1752–1832), J. N. Hummel (1778–1837), and C. Czerny (1791–1857). Beethoven, Chopin,

Liszt, and Anton Rubinstein were probably in full command of the advanced methods of modern pianism, but Ludwig Deppe (1828–90) was the first to point out the importance of arm-weight [see Amy Fay, *Music-Study in Germany*, c. 1880]. T. Leschetizky (1830–1915) established systematic training in the new playing style. R. Breithaupt (1873–1945) introduced the principles of relaxation, *Rollung* (rolling and rotating hand movements), positioning, and coordination of finger and arm, but had a tendency to underestimate the importance of finger training. The same applied to the relaxation school of T. Matthay (1858–1945) who, with his emphasis on freedom and suppleness, to some extent discredited a good cause. See *Fingering*.

Levinskaya, *The Levinskaya System of Pianoforte Technique and Tone-colour* (1930); Arnold Schultz, *The Riddle of the Pianist's Finger* (1936); Y. Bowen, *Peddalling the Modern Pianoforte* (1936); J. Dichler, *Der Weg zum künstlerischen Klavierspiel* [1948]; C. A. Martienssen, *Die individuelle Klaviertechnik* (1930); W. Bardas, *Zur Psychologie der Klaviertechnik* (1927); F. A. Steinhausen, *Ueber die physiologischen Fehler und die Umgestaltung der Klaviertechnik* (1905); H. Klose, *Die Deppesche Lehre des Klavierspiels* (1886); T. Fielden, "The History of the Evolution of Pianoforte Technique" (*PMA* lix).

**Piano quartet.** See under *Quartet*.

**Piano-violin.** See *Sostenente piano*.

**Piatti** [It.]. Cymbals.

**Pibgorn, pibcorn.** See under *Clarinet family IV*; Reed II. See H. L. Balfour, in *Journal of the Anthropological Institute* xx, 142ff.

**Pibroch.** A type of Scottish bagpipe music consisting of highly ornamented variations on a theme called *urlar*. They were formerly written in a curious notation called *canntaireachd*, in which syllables such as *em*, *en*, *dari*, *dili*, etc. stand for tones or stereotyped motifs. See J. P. Grant, in *ML* vi, 54–63; A. Mackay, *A Collection*

of *Ancient Piobaireachd*, rev. ed. (1839; repr. 1899).

**Picardy third** [F. *tierce de Picardie*]. The major third as used for the final chord of a composition in a minor key. This practice originated c. 1500 when, for the first time, the third was admitted in the final chord of a piece. An early example is in Tromboncino's *frottola* "Non val aqua" of c. 1500 [see *HAM*, no. 95]. The extent to which it was used prior to 1550 is difficult to assess, this being largely a problem of *\*musica ficta*. In the second half of the 16th century the practice became fairly common. In A. Willaert's *Musica nova* of 1559 the final chord always includes the major third, in plagal as well as in authentic cadences. The Picardy third continued to be used until the end of the baroque period (c. 1750). No plausible explanation has been found for the name "tierce de Picardie," first used in J.-J. Rousseau's *Dictionnaire de musique* (1767).

**Piccolo** [It.]. Abbr. for piccolo flute; see *Flute I* (b).

**Pickelflöte** [G.]. Older name for piccolo flute. The modern German name is *kleine Flöte*.

**Pictures at an Exhibition.** Collection of descriptive piano pieces by M. P. Mussorgsky, composed in 1874. Each piece illustrates a picture by the Russian painter Victor A. Hartmann (d. 1873) shown at a memorial exhibition of his paintings in 1874. The highly "picturesque" pieces are preceded and connected by a recurring "promenade" theme suggesting the walk from one picture to the next. The work is usually heard in an orchestral version by Ravel.

**Piedi** [It.]. See under *Ballata*.

**Pien.** In *\*Chinese music* *pien* (pronounced *biann*) denotes the two tones that are a semitone below the fifth degree and the octave note respectively on a diatonic scale. Thus they are *f#* and *b* on a scale from *c* to *c'*. The term is often used by modern writers with reference to other kinds of music [see *Gregorian chant V*] in which certain degrees of the scale are considered less important than others and therefore are treated as mere ornamental or passing tones. R.C.P.

**Pièno** [It.]. Full; *organo pieno*, full organ; *a voce piena*, with full voice.

**Pierrot lunaire** [F., Pierrot in the Moonlight]. Cycle of twenty-one short pieces for a "singing narrator" (*\*Sprechstimme*) and chamber orchestra (flute, violin, clarinet, cello, piano, etc.) by

A. Schoenberg, op. 21 (1912), based on poems by A. Giraud in a German translation by O. E. Hartleben. The poems, highly decadent and macabre (one of them describes Pierrot contentedly smoking tobacco out of a human skull), are composed in a novel melodramatic style, accompanied at times by the full group of instruments and sometimes by only one or two.

**Piffero** [It.]. Old term for various popular wind instruments, such as the shawm, fife, and bagpipe, all of which were used by shepherds. Hence, the name *pifferari* for the peasants who, in the 18th century, went to Rome every Christmas morning to play there in imitation of the Biblical shepherds. Berlioz still heard them. For *pifferari*, see Pastoral.

**Pincé** [F.]. (1) See under Mordent. (2) Term for plucked instruments (lute, harp, etc.) and for pizzicato.

**Pini di Roma** [It., Pines of Rome]. Symphonic poem by Respighi (1924), depicting four musical "landscapes" near Rome (the Villa Borghese, a catacomb, the Janiculum [a hill named after the god Janus], and the Appian Way). In the third section a recording of the song of an actual nightingale is introduced.

**Piobaireachd** [Gael.]. \*Pibroch.

**P'ip'a**. See Pyiba.

**Pipe**. (1) A small instrument of the recorder type that was held and played with the left hand only, while the right hand played the tabor, a small drum. [For ill. see under Percussion instruments.] The playing of the pipe and tabor [Prov. *galoubet* and \**tambourin*; Sp. *flaviol* and *tamboril*; Cat. *fluviol* and *tambori*] was popular as early as the 13th century, as is shown by the famous miniatures of the Cantigas MSS of the Escorial [ill. in *GDB* iii, opp. p. 176; iv, opp. p. 500]. It was the usual accompaniment to the \**farandole* and the English morris dance, and is still used for the Spanish \**sardana*. See D. Fryklund, *Le Galoubet provençal* (1939). (2) Generic name for various groups of instruments: all the \*wind instruments; the woodwinds; the flutes; the pipes of the organ; primitive instruments in the shape of a simple tube.

**Pique Dame** [F.]. See *Queen of Spades*, *The*.

**Piston**. Piston valve [see Valve].

**Pitch**. (1) [F. *hauteur*; G. *Tonhöhe*; It. *intonazione*; Sp. *entonación*]. The location of a musical sound in the tonal scale, proceeding from low to high. The exact determination of pitch is by frequency (number of vibrations per second) of the sound; see Acoustics I. Pitch as a physiological sensation also depends to a small degree on other factors (e.g., intensity), which are, however, negligible from the musical point of view; see Stevens and Davis, *Hearing* (1938).

(2) [F. *diapason*; G. *Kammerton*, *Stimmung*; It. *diapason*; Sp. *diapasón*]. The absolute pitch of one specific note, standardized for the purpose of obtaining identical pitches on all instruments. The present-day standard of pitch is  $a' = 440$  (double) vibrations (cycles) per second. This standard was universally adopted in 1939 by an international conference held in London under the auspices of the International Standards Association. It replaced the old standard of 435 that had been fixed by the Paris Academy in 1859 (*diapason normal*) and confirmed, under the term "international pitch," at a conference held in Vienna in 1885.

Before these agreements there was a confusing variety of pitches. Bach frequently had to transpose his orchestral and choral parts owing to different tuning of organs in various churches, or had to score woodwind parts in C, for example, while the parts for organ, voices, and strings were scored in A (a different scoring for voices and strings was unnecessary since these could easily be adapted to the pitch of the organ). These discrepancies resulted from the use throughout the baroque period of different pitch levels for different ensembles: *Kammerton* (chamber pitch) for domestic instrumental music; *Chorton* (choir pitch, organ pitch) for church organs and, consequently, for sacred choral music; *Cornett-ton* for the brass instruments used by town musicians. The confusion in this matter has been compounded by numerous modern writers concerned more with terminology than with historical fact [see, e.g., the contradictory statements in H. Riemann, *Musiklexikon*, 11th ed., 1929, pp. 316 and 856]. By far the clearest account, though not trustworthy in every detail, is found in N. Bessaraboff, *Ancient European Musical Instruments* (1941), pp. 357–59, 377–78, and 442. Following his suggestion, the different pitches are represented below by pitch names (disregarding microtonic deviations), the standard pitch of the present day ( $a' = 440$ ) being represented by the key of C. The standard pitches used during the baroque period were as follows:

	Praetorius ( <i>De Organographia</i> , 1619)	Common designation after Praetorius
B <sup>b</sup>	<i>Tertia minore</i>	<i>Tief Kammerton</i>
B	<i>Chorton</i>	<i>Hoch Kammerton</i>
C <sup>#</sup>	<i>Kammerton</i>	<i>Chorton</i>
D	<i>Cornett-ton</i>	<i>Cornett-ton</i>

The names in the right column are used below.

The *hoch Kammerton* must be regarded as the standard instrumental pitch from c. 1700 to c. 1820. Thus, Bach's instrumental compositions (as well as the symphonies of Haydn, Mozart, and Beethoven) sounded a semitone lower than they do when performed today [see Absolute pitch]. On the other hand, his organ works and cantatas (which involved organ participation) sounded a semitone or even a whole tone higher than today. Following is a list of some characteristic data covering the period from c. 1700 to 1850:

Pitch	Date	Source
B <sup>b</sup>	396 1716	Strasbourg, Silbermann organ
B	422 1751	Handel's tuning fork
	422 1780	Mozart's tuning fork
	427 1811	Paris, <i>Grand opéra</i>
C	440 1834	Scheibler (Stuttgart pitch)
	446 1856	Paris, <i>Grand opéra</i>

Long lists given by A. J. Ellis and N. Bessaraboff also include pitches from earlier centuries but their accuracy is highly questionable. For instance, Ellis' calculations of the "low" and "high" organ pitch in Arnolt Schlick's *Spiegel der Orgelmacher* (1511) have been rejected by Kendall, and Kendall's calculations by Mendel.

Lit.: A. J. Ellis, *The History of Musical Pitch* (1880); N. Bessaraboff [see above]; W. L. Sumner, "A History of Musical Pitch" (*Hinrichsen's Musical Year Book* vii [1952], 233ff); R. Kendall, "Notes on Arnold Schlick" (*AM* xi); R. Mendel, "Pitch in the 16th and Early 17th Centuries" (four parts in *MQ* xxxiv); *id.*, "On the Pitches in Use in Bach's Time" (two parts in *MQ* xli, 332ff, 466ff).

**Pitch aggregate.** A collection or cluster of pitches (usually, but not necessarily, simultaneous). See under Aleatory music.

**Pitch names.** I. The accompanying table gives the English, German, French, Italian, and Spanish names for the tones of an octave.

English:	C D E	F G A B
German:	C D E	F G A H
French:	ut ré mi	fa sol la si
Italian:	do re mi	fa sol la si
Spanish:	do re mi	fa sol la si
English:	C-sharp	C-flat
German:	cis	ces
French:	ut dièse	ut bémol
Italian:	do diesis	do bemolle
Spanish:	do sostenido	do bemol
English:	C-double-sharp	C-double-flat
German:	cisis	ceses
French:	ut double-dièse	ut double-bémol
Italian:	do doppio diesis	do doppio bemolle
Spanish:	do doble sostenido	do doble bemol

Note that in German a sharp is denoted by the suffix *-is* and a flat by the suffix *-es*, a double-sharp by *-isis* and a double-flat by *-eses*. Irregular formations are: *B*, B-flat, instead of *Hes*; *Es*, E-flat, instead of *Ees*; *As*, A-flat, instead of *Aes*. Note particularly that the English B is in German *H* (pronounced *hah*), and that the English B-flat is in German *B*.

II. Unfortunately there is no uniform practice for indicating different octaves. The accompanying table shows the system employed in this dictionary and widely used elsewhere (1), together with two others, (2) and (3). The chief source of confusion is that some writers designate middle c (the C in the middle of the keyboard) by *c'* and

1.	C <sub>1</sub>	C	c	c'	c''	c'''	c''''
2.	CCC	CC	C	c	c'	c''	c'''
3.	C <sub>2</sub>	C <sub>1</sub>	C	c	c <sup>1</sup>	c <sup>2</sup>	c <sup>3</sup>

others by *c*. Method (3) is perhaps the simplest and most logical; however, it has not been widely accepted. See R. W. Young, in *Journal of Musicology* i, no. 2, pp. 5-8.

For other systems of pitch designation, see Solmization; Letter notation.

**Pitch pipe.** (A device used since the 18th (17th?) century to set the pitch for a choir or to tune stringed instruments. In its early form it was a wooden pipe with a movable stopper that made it possible to raise or lower the sound according to graduated marks. Present-day pitch pipes, used mostly by amateurs, are in the form of a disk containing a free reed whose length can be regulated, or consist of a number of pipes giving the pitches of, e.g., the strings of a guitar. The most accurate device, used for professional tuning, is the tuning fork.

**Più** [It.]. More; *più allegro*, more quickly; *piuttosto allegro*, rather quick.

**Più tosto.** See *Tosto*.

**Piva.** (1) An Italian term for bagpipe. (2) The fastest measure (*misura*) or step unit of the *bassa danza* (\**basse danse*). It consisted of a series of rapid steps (*passetti presti*) embellished by leaps and turns. In one of the dances, Domenico da Piacenza suggested that three measures of the *piva* be danced in a herringbone or zigzag pattern. (3) One of the fastest dances of the early 16th century. Seven examples of music survive in Dalza's *Intabulatura de lauto* (Petrucci, iv, 1508), where they appear as the third dance of a suite including a \*pavane, a \*saltarello, and a *piva*. All are in compound quadruple meter (12/8). The last dances of the other two suites in the collection are of the same genre as the *piva* but are called *spingardo*. One isolated *piva* in the *Intabulatura di lauto* of M. Barberüs (ix, 1549) is in the 6/8 meter of a *saltarello* or galliard.

For a detailed description and bibl., see L. H. Moe in *MGG* x, 1313–15.

L.H.M.

**Pivot chord.** See under *Modulation*.

**Pizzicato** [It.; abbr. *pizz.*]. For violins (violas, etc.), indication that the string is to be plucked with the finger, as it regularly is in guitars, harps, etc. The earliest known use of pizzicato occurs in Monteverdi's *Combattimento di Tancredi e Clorinda* (1624), where it is indicated by the remark: "Qui si lascia l'arco e si strappano le corde con duoi ditti" (Here the bow is laid aside and the strings are plucked with two fingers; see *HAM*, no. 189). Other early instances of the technique occur in Reinhard Keiser's *Adonis* (1697) and Handel's operas *Agrippina* (1709) and *Il Pastor fido* (1712), Paganini introduced the virtuoso technique of plucking the strings with the left hand in alternation or simultaneously with bowed tones.

**Placido** [It.]. Calm, tranquil.

**Plagal cadence** [G. *Plagalschluss*]. The cadence with the subdominant preceding the tonic: IV–I. This cadence, also known as the Amen cadence because it was traditionally used for the "Amen" at the end of hymns, was prominent in early music (15th, 16th centuries). It became obsolete or archaic during the 18th and 19th centuries and again became important in 20th-century music, particularly in the works of Hindemith. This revival is concomitant with the modern aversion to the leading tone, which is the characteristic note of the authentic cadence. See *Cadence*.

**Plagalis, plagius** [L.]. A plagal mode; e.g., *primus plagius*, first plagal mode. See *Church modes*.

**Plainchant.** Another name for; see *plainson*, *Gregorian chant*.

**Plain-chant musical** [F.]. A 17th-century French type of plainson, characterized by the use of more "expressive" melodic progressions than in Gregorian chant, of accidentals (leading tone), and of strictly measured note values (half and quarter notes) in the free arrangement of "metric rhythm" [see *Rhythm* II (b)]. The rhythmic principles in *plain-chant musical* are obviously derived from the \**vers mesuré* of the 16th century. *Plain-chant musical* originated c. 1620 and spread all over France in the 17th and 18th centuries but is now extinct. Henri Dumont (*Cinq Messes en plein-chant*, 1701), F. Bourgoing, Chastelain, and G. Nivers wrote many melodies

Kyrie

(all monophonic) in this style [see Ex.: beginning of a "Messe royale" by Dumont, which was included as "Missa regia" in the *Liber gradualis* of 1895, ed. Dom Pothier]. See A. Gastoué, in *TG* ix, 81–92; *id.*, *Cours . . . de chant grégorien* (1917), pp. 84ff; A. Quittard, *Un Musicien en France . . . Henry du Mont* (1906), pp. 175ff.

**Plainson.** Term derived from \**cantus planus*, a 13th-century name for \*Gregorian chant. It is used synonymously with the latter, but also is employed as a generic term for the ancient style of monophonic and rhythmically free melody that is common to various Western liturgies (Gregorian, \*Ambrosian, \*Gallican, \*Mozarabic chant) as well as of those of the East (Byzan-

tine, Syrian, Armenian chant). It may also be used for similar kinds of non-Christian liturgical music (Jewish, Hindu) in order to indicate that this music is neither harmonic nor strictly measured.

**Plainsong and Mediaeval Music Society.** See Editions XLIII.

**Plainsong Mass.** In the proper sense of the word, a monophonic Gregorian Mass, either the Proper, the Ordinary, or both combined. Usually, however, the term is used for a special type of polyphonic Mass composition in which each movement is based on a corresponding item of a Gregorian Mass Ordinary; see Mass C II a. Occasionally it is used for a *cantus firmus* Mass [see Mass C II b] based on any plainsong melody, e.g., *Alma redemptoris mater*.

**Plainsong notation.** The notation of Gregorian chant; see Neumes. The term has also been used for the notation of medieval secular monophony [G. *Choralnotation*]; see Monophonic notation.

**Plainte** [F.]. (1) See Lament (2). (2) A baroque ornament, either a \*portamento (in 17th-century viol music) or a \*Nachschlag.

**Plaisanterie** [F.]. Name for a playful movement in the suites of the 18th century; also, a collection of pieces in the light style of \*rococo.

**Planc, planh** [Prov.], **planctus** [L.]. See Lament (2).

**Planets, The.** Programmatic suite for orchestra, organ, and women's chorus by G. Holst (1914–16), describing in successive movements the astrological nature of seven planets.

**Plantation songs.** See under Negro music.

**Plaqué** [F.]. Indication for notes of a chord to be played simultaneously, as opposed to \*arpeggio.

**Plate numbers.** A device used by publishers to keep track of the engraved metal plates from which music was printed. The plate numbers appear as small figures, usually at the bottom of pages. Some publishers, e.g., Pleyel, also used letters to identify their plates. Plate numbers often enable musicologists to date a composition fairly precisely when no other chronological evidence is available.

Lit.: O. E. Deutsch, *Music Publishers' Numbers* (1946; G. ed. 1961); O. W. Neighbour and A. Tyson, *English Music Publishers' Plate Numbers in the First Half of the Nineteenth Century* (1965); A. Zakín, "Pleyel's Plate Numbers" (New York

Public Library, 1966); R. S. Hill, "The Plate Numbers of C. F. Peters' Predecessors" (*PAMS* 1938); K. Meyer and I. M. Christensen, "Artaria Plate Numbers" (*Notes*, no. 15); W. B. Squire, "Publishers' Numbers" (*SIM* xv). J.LaR.

**Platerspiel** [G.]. Old term for bladder pipe; see Bagpipe.

**Player piano.** See under Mechanical instruments IV. Also see S. Grew, *The Art of the Player-Piano* (1922).

**Plectrum.** A small piece of horn, tortoise shell, wood, ivory, metal, etc., used to pluck certain stringed instruments, such as the Greek lyre and the modern mandolin and zither. The quills of the harpsichord are a mechanized form of plectrum.

**Plein-jeu** [F.]. Full organ. Also, name for pieces written for the full organ. *Demi-jeu*, half organ, i.e., softer registration.

**Plena** [Sp.]. In Santo Domingo, name used for certain work songs consisting of short lines (sometimes an entire quatrain) sung by a leader and answered by a chorus in meaningless syllables called *chuins*. In Puerto Rico the *plena* shows strong Negro influence, as it does in Santo Domingo, but has developed into a narrative folk ballad about a real event. After each stanza, sung by a soloist, the chorus answers with the same refrain. The music of the Puerto Rican *plena* is in 2/4 meter and usually employs the following rhythmic pattern:

**Plenary Mass** [G. *Plenarmesse*]. A polyphonic Mass composition that includes both the Ordinary and the Proper. All \*Requiem Masses belong to this type, which otherwise is very rare. Examples are Dufay's *Missa Sancti Jacobi* and the Mass (for Marian feasts) by Reginald Liebert [*DTO* 53], both from the early 15th century.

**Plica** [L.]. A notational sign of the 13th century calling for an ornamental tone to be inserted following the note to which it is connected. The sign for the *plica* is an upward or downward dash that is attached to single notes (*longa*, *brevis*) as well as to the final note of a ligature (*ligatura plicata*). The direction of the dash indicates whether the grace note is higher or lower than the main note (usually a second or, more rarely, a third, depending on the position of the next note). The accompanying example shows three *plicae longae*

[1, 2, 4], characterized by a longer dash on the right side, two *plicae breves* [3, 7] with a longer dash on the left side or two dashes of about equal length, and two *ligaturae plicatae* [5, 6]. See *ApNPM*, *passim*.

The *plica* developed from the liquescent \*neumes of Gregorian chant. According to 13th-century theorists (Pseudo-Aristoteles; see *GS* i, 173ff) it was sung in a special manner, probably a tremolo [see Tremolo III]. The theory advanced by H. Riemann (*Mus. Wochenblatt*, 1897, p. 17), and adopted by P. Runge (*Die Sangesweisen der Colmarer Handschrift*, 1896), that the *plica* played a prominent part in the music of the minnesingers is erroneous. The German scribes of the 14th and 15th centuries used notational characters shaped like the *plica* notes of 13th-century music but without their meaning. See H. Anglés, in *CP Fellerer*.

**Plut.** [L.]. Abbr. for *pluteus*, shelf (of a library).

**Pneuma.** See *Neuma* (2).

**Pneumatic action.** See under Organ II.

**Pochette** [F.]. \*Kit.

**Poco, un poco** [It.]. Little; a little, somewhat. Derivative forms are *pochetto*, *pochettino*, *pochissimo*.

**Podatus.** See under Neumes I.

**Poetic meter.** I. Poetic meter, with its regular patterns of accented (strong) and unaccented (weak) syllables or, in ancient Greek terminology, of *thesis* and \**arsis*, is very similar to musical meter with its various schemes of accented and unaccented notes. The terminology of ancient Greek poetry therefore is frequently used for corresponding schemes of musical rhythm. The chief patterns (called "feet") of the Greek system are:

	Poetic	Musical
Iamb	~ - ~ -	$\frac{3}{4}$
Trochee	- - - -	$\frac{3}{4}$
Dactyl	- ~ ~ ~	$\frac{4}{4}$
Anapest	~ ~ ~ ~	$\frac{4}{4}$
Spondee	- - - -	$\frac{4}{4}$
Tribrach	~ ~ ~ ~	$\frac{3}{4}$

The sign  $\cup$  indicates a short syllable, the sign — a long one. Each of the examples here includes two feet.

This terminology is used particularly for the 13th-century system of rhythmic modes, in which, however, nearly all the musical schemes differ in some detail from those indicated above [see Modes, rhythmic].

II. According to the number of feet contained in a line of verse, one distinguishes between *dimeter* (two feet), *trimeter* (three), *tetrameter* (four), *pentameter* (five), and *hexameter* (six). For instance, dactylic hexameter (Homer) consists of six dactyls, the last of which usually lacks one *arsis* (*katalectic*): —  $\cup$  —  $\cup$  —  $\cup$  —  $\cup$  —  $\cup$  —  $\cup$ . In classical verse, in the case of an iambic or trochaic foot, however, the numbering proceeds in pairs of feet (*dipody*, i.e., two feet). Thus, a line including four iambs,  $\cup$  —  $\cup$  —  $\cup$  —  $\cup$  —, is called iambic dimeter (not tetrameter). In hymnody certain standard meters have special names, e.g., *common meter*, indicated thus: 8 6 8 6 (the figures give the numbers of syllables in each line). Here each line may be considered an iambic dimeter, the lines "8" complete, the lines "6" *katalectic*, with one *arsis* and *thesis* missing at the end.

III. In applying metrical schemes to words (versification), there are two principles that determine on which syllables the *thesis* falls and on which the *arsis*, one ancient and one modern. In ancient poetry the division of lines into feet was quantitative, based on the principle of short and long syllables [*G. Silbenmessung*], whereas in modern poetry the division is accentual, based on the principle of weak and strong syllables [*G. Silbenwägung*]. The former method is indicated by the signs  $\cup$  —, the latter by  $\times$  '.

In modern poetry the *thesis* and *arsis* syllables are essentially the same as they are in prose; in other words, poetic accentuation follows the

natural accent of the words, e.g. (for the sake of clarity, secondary accents are omitted here):

Meantime we shall express our darker purpose

[See *Cursus*.] In Greek and Latin poetry, however, *thesis* and *arsis* were not determined by accent, as the following example shows:

Prose accent: Maecenas atavis edite regibus

Poetic meter: — — — — — — — — — —

(For the rules governing ancient poetry, see any Greek or Latin grammar.) The early Christian hymns, e.g., those of St. Ambrose, are essentially quantitative, although not always strictly so. Often they are written so that the accents are both quantitative and accentual. The rhymed sequences of the 12th and 13th centuries (Adam de St. Victor; *Stabat mater*) are purely accentual.

IV. The musical sources of the 13th and later centuries often show a disregard for the natural accent. Thus, the iambic verse, "O natió nefándi géneris," whose poetic structure would suggest the first mode, is cited in the "Discantus positio vulgaris" of c. 1225 as an example of the third

mode, hence a dactylic verse: "O nati-o nefan-di gene-ris" [see CS i, 96-97]; similarly, Franco of Cologne quotes the verse "Eximie pater et regie," changing the accentuation from x ' x x ' x x ' x x to ' x x ' x x ' x x ' x x '.

There are similar ambiguities in the poems of the troubadours and trouvères, owing to the peculiar indifference to accentuation of medieval (and, to some extent, modern) French, in contrast to English or German. Practically all poems in decasyllabic (ten-syllable) lines can be read either as iambic pentameter or as dactylic tetrameter, e.g.:

(a) x ' x ' x ' x ' x ' x ' x ' x ' x '  
Quar eusse je cent mile mars d'argent

(b) ' x x ' x x ' x x ' x x ' x x ' x x ' x x '

While (a) is no doubt the correct literary accentuation, the notation of the melody as found in the "Chansonier Cangé" clearly shows the pattern of the third mode, as under (b) [see J.-B. Beck, *Die Melodien der Troubadours* (1908), pp. 132, 138]. Since the majority of troubadour and trouvère melodies are notated without indication of note values, this ambiguity often presents great difficulties in determining the "cor-

rect" rhythm [see Monophonic notation]. An example in point is the *Reis glorios* of Guiraut de Bornelh (d. c. 1250), which has been interpreted both in the first and in the third mode [see HAM, no. 18c, versions 1 and 3]. See also Modal theory.

Lit.: C. F. Abdy Williams, "The Aristoxenian Theory of the Rhythmical Foot" (MA ii); I. Krohn, "Der metrische Taktfuss in der modernen Musik" (AMW iv); F. Rosenthal, "Probleme der musikalischen Metrik" (ZMW viii).

**Pohjola's Daughter.** Symphonic poem by J. Sibelius, op. 49 (1906), based on a story from the \*Kalevala.

**Poi** [It.]. Then, afterward. *Poi la coda*, "then the coda," usually given at the end of the trio to indicate that the resumption of the scherzo is to be followed by the coda: S-T-S-C.

**Point.** (1) The upper end of the violin bow. (2) Point of perfection, of division, etc. [see *Punctus*]. (3) In the motets of the 16th century, *point of imitation* means a section of the polyphonic texture in which a single subject, connected with a small division of the text, is treated in imitation. These points are the structural parts of the motet, which consists of a succession of them. They are usually marked off diagonally rather than vertically, so that the conclusion of one point overlaps the beginning of the next. Ex. in HAM, no. 114; SchGMB, no. 107.

**Point d'orgue** [F.]. (1) The \*pause and its sign. (2) \*Pedal point. (3) A \*cadenza in a concerto, so called because its beginning is customarily indicated by a pause sign placed above the preceding chord of the composition proper.

**Pointing.** See under Anglican chant.

**Polacca** [It.]. Generic name for Polish dances, usually the polonaise. However, the "Polacca" in Bach's Brandenburg Concerto no. 1 shows hardly any affinity to the polonaise. See Polonaise.

**Poland.** I. To 1600. Aside from liturgical books, the earliest example of Polish music is the famous war song, "Bogurodzica" (Mother of God), dating from the 13th century [see MGG x, 1388]. The earliest known Polish composer is Mikolaj z Radomia (Nicolas of Radom; early 15th cent.), who wrote a Magnificat, three Glorias, and three Credos, all in three-part writing [see F. Ludwig, in AMW vii, 430]. A continuous development in Polish music began

in the 16th century with Sebastian of Felsztyn (b. c. 1480), who wrote motets, hymns, and a Mass, all in Flemish style, and published several theoretical books between 1519 and 1543. He was followed by Wacław Szamotulczyk (psalms), Martinus Leopolda (Martin Lwoczyk; 1540–89), Thomas Szadek, and Mikołaj Gomolka (c. 1535–1609), all brought up in the tradition of the Flemish school or, later, of Palestrina. In 1543, King Sigismund I founded the \*Rorantists chapel. Three organ tablatures (Tablature of Johannes of Lublin, 1537–48; Tablature of Cracow, 1548; Tablature of Warsaw [Krasinski Libr.], also called T. of Martin Leopolda, c. 1580) contain c. 400 keyboard compositions, liturgical organ music, intabulations of vocal music, preludes, dances, etc. Toward the end of the 16th century Polish dances appeared at the Saxon court, as is shown by a number of pieces ("Polnischer Tantz") contained in the tablature of Nörmiger of 1599 [see Colorists]. Their music, however, does not show any specific national traits.

II. 1600–1900. Under King Sigismund III (1587–1632), Venetian polychoral music was cultivated at the Warsaw court and at numerous private chapels of the nobility. About 1625, opera was established at the court, under the direction of Marco Scacchi (1602–c. 1685) of Rome. Noteworthy composers of vocal and instrumental music were M. Zieleński, A. Jarzębski, M. Mielczewski, B. Pękiel, J. Różycki, S. Szarzyński, and G. G. Gorczycki (c. 1664–1734). About 1700, many Christmas songs were written [see Koleda].

During the first half of the 18th century, when Poland was ruled by the Kings of Saxony (Augustus II, Augustus III), musical activity declined considerably. The Polish opera came to new life under Mathias Kamiński (1734–1821), who between 1780 and 1800 composed numerous operas in the style of the \*Singspiel. Josef Kozłowski (1757–1821) is interesting mainly as a composer of numerous \*polonaises, as is his pupil, Prince Michael Oginski (1765–1833). Joseph Elsner, known mainly for being Chopin's teacher, wrote numerous operas of which only the titles have been preserved, as well as symphonies, chamber music, songs, and a famous Passion oratorio. He also founded the first conservatory at Warsaw (1820), where Chopin studied. Even more important was Karol Kurpiński (1785–1857), a composer of operas, conductor, and teacher. The foremost instrumental composer of the "classical" period of Polish

music was Ignacy Feliks Dobrzyński (1807–67; two symphonies, chamber music).

Frédéric Chopin (1810–49), whose father was French and mother Polish, was the first to make Polish music famous throughout the world. Along with Schumann and Mendelssohn he founded romanticism, to which he imparted a distinct national tinge, particularly in his polonaises and \*mazurkas. Stanisław Moniuszko (1819–72) wrote numerous songs, many of which became a part of the national treasure of Poland. His opera *Halka* (1848; expanded 1858) is the first Polish national opera. Five of his fifteen operas belong to the permanent repertory of Polish opera houses. His most important successor was Władysław Zelenski (1837–1921), who composed operas of some merit but deserves mention mainly for his chamber music in a moderately romantic style, influenced by Schumann and Mendelssohn. Henryk Wieniawski (1835–80) became world-famous as a violin virtuoso and composed two well-known violin concertos as well as other pieces for his instrument. Ignacy Jan Paderewski (1860–1941) occupied a similar place in piano music, to say nothing of his outstanding position in Polish political life.

III. 1900—. The next generation is represented mainly by Karol Szymanowski (1882–1937), an outstanding modern composer. Successively influenced by R. Strauss, Scriabin, and, after World War I, Debussy, he arrived, c. 1920, at a mature style of his own, a mixture of romantic and impressionist elements but at the same time consciously Polish, and in his latest works, tending towards atonality and constructivism. Among his most important works are a *Stabat mater*, the ballet *Harnasie* (1926), a *Symphonie Concertante* for piano and orchestra, and his *Second Violin Concerto* (1933). Ludomir Różycki (1883–1953) was celebrated as both teacher and composer. Other important modern composers are Karol Rathaus (1895–1954) and Aleksander Tansman (b. 1897), who both emigrated to the U.S. in the 1940's, Stanisław Wiechowicz (1893–1963) and Tadeusz Szeliński (b. 1896), who became interested in neoclassicism, as did Jerzy Fitelberg (1903–51), Roman Palester (b. 1907), and Michał Spisak (b. 1914). Witold Lutosławski (b. 1913) is a popular present-day composer of Poland. Since 1955 a number of composers have taken advantage of more open contact with the West. Lutosławski, T. Baird, K. Serocki, and others have incorporated the new influences into their styles. The

## POLKA

avant-garde, represented by W. Szalonek (b. 1927), W. Kilar (b. 1932), H. Górecki (b. 1933), and K. Penderecki (b. 1933), have been strongly influenced by Western developments yet continue to show imagination and individuality in their compositions.

rev. J.S.

**Polka.** A Bohemian dance in quick duple meter with characteristic rhythms. It originated c. 1830 in Bohemia and soon spread to the European salons, causing a veritable "polkamania" that lasted until the end of the century. The polka was introduced into art music by Smetana (*The Bartered Bride*; *From My Life*; *Bohemian Dances*), Dvořák, and others. See Dance music IV.

The polka Paraguaya is an offshoot of the European polka in which the accompaniment has triplet rhythm against the binary meter used in the melody. A common pattern is the following:

## POLONAISE

add. by J.O.S.

**Polo.** An Andalusian (south Spanish) dance in moderate 3/8 meter with frequent syncopations of the \*hemiola type [see Ex.] and rapid coloraturas sung to words such as "Ay," "Olé," etc. The dance movements show Oriental influence, being movements of the body rather than of the feet. Two famous polos were written by Manuel Garcia (1775–1832), "Yo soy el contrabandista"

and "Cuerpo bueno" [see *LavE* i.4, 2293ff], the latter of which was used by Bizet in the prelude to Act IV of *Carmen*. A modern example is found in De Falla's *Seven Spanish Popular Songs*, no. 7.

**Polonaise** [F.]. A Polish national dance of a stately and festive character. The music (a) is always in moderate triple meter, (b) consists of (usually) phrases without upbeat and with feminine ending, and (c) often includes measures containing a short repeated rhythmic motif. About 1800 it acquired its classic form, which, in addition to the features named above, is characterized by the specific rhythmic pattern shown in Ex. 1.

An example of this type is Beethoven's Polonaise op. 89, shown in Ex. 2.

The origin and early history of the polonaise are obscure. It seems to have originated in connection with court ceremonies and processions. Beginning in the late 16th century, dances entitled "Polnischer Tanz," "Chorea polonica," "Polacca," etc., appear in various sources, e.g., a manuscript by Löffelholz (1585; see W. Merian, *Der Tanz in den deutschen Tabulaturbüchern* [1927], p. 187), the "Tabulaturbuch" by Nörmiger (1598; see *ibid.*, pp. 241ff), Besard's *Thesaurus harmonicus* (1603), Biagio Marini's *Sonate, symphonie, canzoni* (1629; see *BuMBE*, p. 44), etc. None of these, however, bears any resemblance to the polonaise. The earliest known examples with the above-mentioned

traits (a), (b), and (c) are polonaises written by J. S. Bach (French Suite no. 6, see Ex. 3; Orchestral Suite no. 2). A large number of vocal polonaises are found in Sperontes' *Singende Muse an der Pleisse* [DdT 35/36]. J. G. Goldberg (for whom Bach wrote the \*Goldberg Variations) composed 24 polonaises in a routine rococo style, while W. F. Bach wrote 12 polonaises in a highly idealized style with great artistic imagination.

The classic polonaise, characterized by the rhythmic pattern in Ex. 1, emerged c. 1800 in Poland in the works of J. Kozłowski (1757–1831) and Prince M. Oginski (1765–1833). Well-known 19th-century examples are by Beethoven [Ex. 2], Schubert (*Polonaises* for four hands, op. 61, 75), Weber (op. 21, 72), Liszt (*Deux Polonaises*, 1851), Mussorgsky (in *Boris Godunov*), Tchaikovsky (in *Eugene Onegin*), and above all, Chopin, who made the polonaise the symbol of Polish heroism and chivalry.

In the 17th and 18th centuries, under such titles as *polonez*, *polonesse*, \**polska*, \**polacca*, *taniec polski*, *galanterie polone*, etc., there appeared throughout Europe a variety of pieces in numerous media, which occasionally but not necessarily bear some resemblance to the classic polonaise.

The polonaise also plays an important role in Polish folk music. The earliest known examples

are in a MS collection by Joseph Sychra from 1772, considerably later than those found in art music.

Lit.: H. Dorabalska, *Polonez przed Chopinem* (The Polonaise before Chopin; 1938); A. Lindgren, in *CP* 1901; F. Starczewski, in *SIM* ii; T. Norlind, in *SIM* xii; Z. Steszewska, in *Muzyka* v, no. 2; J. W. Reiss, in *Poradnik Muzyka* 1950, no. 12, 1951, nos. 1, 2. See also under Mazurka.

**Polska.** A Swedish dance, probably of Polish origin, similar to the mazurka rather than the polonaise. Ex. in *GD* iv, 219, *GDB* vi, 848, and W. Niemann, in *SIM* v, 99. See E. Ala-Könni, *Die Polska-Tänze in Finnland* (1956).

**Poly-, multi-.** Prefixes meaning "many" or "diverse." Applied to music, they are often used indiscriminately but could be employed to differentiate two kinds of "diversity," vertical and horizontal. Thus, "polyrhythmic" or "polymetric" would mean the simultaneous use of different rhythms or meters, and "multirhythmic" or "multimetric" their successive occurrence. Similarly for polytonal and multitonal. See Homo-, iso-; also Multimetric, Polymetric.

**Polychoral style.** Term used for compositions in which the ensemble (chorus with or without the orchestra) is divided into several (usually two or

three) distinct groups performing singly (in alternation) as well as jointly. Italian terms are *coro battente* and *coro spezzato* (broken choir), the latter of which also implies separate placement of the groups. The earliest known ex-

amples of this technique are in the works of Ruffino Bartolucci, who was musical director at the Cathedral of Padua from 1510 to 1520. Willaert used it in his *salmi spezzati* (broken psalms) found in publications of 1550 and 1557. The common notion that G. Zarlino in his *Istituzioni armoniche* (1558) credited Willaert with the invention of the *coro spezzato* is not correct. Zarlino merely says that Willaert formulated some rules for composing pieces employing *coro spezzato*. The polychoral style was also cultivated by Andrea Gabrieli (c. 1520–86), who wrote a *Deus misereatur nostri* for three four-part choruses, and was fully exploited by G. Gabrieli (c. 1557–1612; see Ex.). It is a characteristic feature of the \*Venetian school. Its development was furthered by the alternate playing on the two organs of St. Mark's at Venice, which were installed in the two apses of the cathedral. Accordingly, different choruses were placed with the organs and elsewhere in the building. The polychoral style persisted throughout the baroque period, particularly in Rome (Orazio Benevoli; see Roman school) and Germany (Händl, Hassler, Schütz), the latest examples being found in Bach (first movement of the St. Matthew Passion).

The term "polychoral" is also used, less appropriately, for compositions performed by two groups that merely alternate, without joining forces. The earliest record of this method is an Italian MS from the second half of the 15th century (Modena, Bibl. Est. lat. 454/455). Such pieces should be called "antiphonal" rather than "polychoral." Nor is "polychoral" a wholly accurate term for the *decani* and *cantoris* choirs of the Anglican rites. These sing alternately as well as together, but in the latter case merely duplicate their parts, so that the result is an increase of volume rather than voice-parts.

Lit.: L. Reitter, *Doppelchortechnik bei Heinrich Schütz* (1937); A. E. Ray, "The Double-Choir Music of Juan de Padilla" (diss. Univ. of Southern California, 1953); E. Hertzmann, in *ZMW* xii; H. Zenck, in *CP* 1949 and *MF* ii (Willaert); G. d'Alessi, in *JAMS* v (Bartolucci); W. Boetticher, in *AMW* xii (Lasso); M. Bukofzer, in *Studies in Medieval and Renaissance Music* (1950), pp. 181–84 (cod. Modena); D. Launay, in *RdM* 1957, p. 173 (France, 17th cent.); D. Arnold, in *ML* xl, 4, and *MF* xii (A. Gabrieli).

**Polychord.** See under Monochord.

**Polychronion.** See under Acclamation.

**Polymetric.** Term used for modern editions of 16th-century vocal music in which the bar lines are placed at irregular intervals according to the requirements of the musical and textual phrases, resulting in a succession of different meters. This practice might better be called "multimetric," while "polymetric" would be reserved for the simultaneous use of different meters, e.g., 2/4 against 3/4 or 6/8 [see under Polyrhythm]. See Poly-, multi-.

**Polyphony** [F. *polyphonie*; G. *Mehrstimmigkeit*; It. *polifonia*; Sp. *polifonia*]. Music that combines several simultaneous voice-parts of individual design, in contrast to \*monophonic music, which consists of a single melody, or \*homophonic music, which combines several voice-parts of similar, rhythmically identical design [see also Heterophony]. The prefix "poly-" [from Gr. *polys*, many] should not be taken literally, since as few as two parts can make perfect polyphony—better, indeed, than six or eight. Polyphony is largely synonymous with counterpoint, except for a difference of emphasis [see Counterpoint].

There are numerous theories regarding the "origin of polyphony," but none is more than hypothetical. Some scholars regard the earliest extant examples of polyphony (c. 900) not as a beginning but as a "first culmination" of a development whose origin, they believe, lies in Oriental and primitive music [see *ReMMA*, pp. 249ff].

Lit.: M. Schneider, *Geschichte der Mehrstimmigkeit*, i, ii (1934–35); L. B. Spiess, "Polyphony in Theory and Practice from the Ninth Century to the Close of the Thirteenth Century" (diss. Harvard Univ., 1942; rev. 1947); P. Wagner, "Über die Anfänge des mehrstimmigen Gesanges" (*ZMW* ix); E. Steinhard, "Zur Frühgeschichte der Mehrstimmigkeit" (*AMW* iii); F. Ludwig, "Die mehrstimmige Musik des 14. Jahrhunderts" (*SIM* iv); *id.*, "Studien über die Geschichte der mehrstimmigen Musik im Mittelalter" (*SIM* v); M. Schneider, "Kaukasische Parallelen zur mittelalterlichen Mehrstimmigkeit" (*AM* xii); P. Collaer, "Polyphonies de tradition populaire en Europe méditerranéenne" (*AM* xxxii); for additional bibl. see *ReMMA*, p. 451f.

**Polyrhythm.** The simultaneous use of strikingly contrasted rhythms in different parts of the musical fabric. In a sense, all truly contrapuntal or polyphonic music is polyrhythmic, since rhythmic variety in simultaneous parts more than anything else gives the voice-parts the individuality that is essential to polyphonic style [see Texture].

Generally, however, the term is restricted to cases in which rhythmic variety is introduced as a special effect that is often called "cross rhythm." Two types can be distinguished: contrasting rhythms within the same scheme of accents (meter) [Ex. 1, a and b]; contrasting rhythms involving a conflict of meter or accents [Ex. 1, c and d]. The latter is sometimes termed "poly-

metric." Polyrhythmic designs play a prominent role in music of about 1400 and in 20th-century music. A passage from Baude Cordier's "Amans ames secretement" of c. 1400 [Ex. 2; *ApNPM*, p. 175] and one from Hindemith's *Klaviermusik*, op. 37 [Ex. 3] serve as illustrations. The bass part of the latter actually is in 3/8 meter but is written in 4/8 for the sake of easier reading.

**Polytextuality.** The simultaneous use of different texts in various parts of a composition. Polytextuality is a characteristic trait of the early motets, from c. 1225 to 1400 [see Motet A, I and II]. It is implicitly present in the *cantus firmus* Masses of the 15th century, particularly those based on a liturgical *cantus firmus*. Thus, in Regis' *Missa Ecce ancilla Domini* and in Obrecht's *Missa Sub tuum praesidium* the text and melody of the respective antiphons are retained. In addition, there are other *cantus firmus* texts and melodies used as well as the Mass Ordinary text; they may occur together, in sequence, or in alternation [see *ReMR*, p. 195]. In the *Missa L'Homme armé* by Regis the *cantus firmus* carries the text "Dum sacrum mysterium." However, in Morales' Mass on the Spanish song *Tristezas me matan*, the original Spanish text is retained. Both Josquin and Morales wrote a number of "bilingual" motets; see Motet B I. See also Motet-chanson; *Quodlibet* III.

**Polythematic.** See Monothematic, polythematic.

**Polytonality.** See Bitonality, polytonality.

**Pommer, Pomhart** [G.]. Corruptions of \*bombarde [see Oboe family III].

**Pomp and Circumstance.** Five concert marches for orchestra by Elgar, op. 39 (nos. 1 to 4 composed 1901–07, no. 5 in 1930). The title is taken from Shakespeare's *Othello*, Act III: "Pride, pomp and circumstance of glorious war."

**Ponticello** [It.]. The bridge of stringed instruments. *Sul ponticello*, see Bowing (k).

**Pontifical** [L. *pontificale*]. See under Liturgical books I (13).

**Porgy and Bess.** Opera in three acts by George Gershwin (libretto by D. B. Heyward, adapted from D. B. and D. Heyward's play, *Porgy*, with lyrics by Ira Gershwin), produced in New York, 1935. Setting: Charleston, S.C., in the recent past. The music features the styles of blues, jazz, and Negro spirituals.

**Porrectus.** See under Neumes I.

**Port.** Old Scottish term for an instrumental piece, usually for the harp. See *GD* iv, 232; *GDB* vi, 882.

**Portamento** [It.]. (1) A special manner of singing in which the voice glides gradually from one tone to the next through all the intermediate pitches. A similar effect, frequently but erroneously called \*glissando, can be obtained on the violin and trombone. In vocal compositions the portamento is indicated by a slur connecting two notes of different pitch when the notes have different syllables; otherwise the slur means repetition of the same vowel. If the effect of portamento is desired on the interval with one vowel, the word "portamento" is printed. See *Portato*. (2) The term is also used for anticipation or appoggiatura.

**Portative organ.** A small portable organ of the late Middle Ages (12th–15th cent.). It was held with the left arm and resting on the left knee, in such a way that the keyboard was nearly at a right angle to the upper body. Thus it could be played only with the right hand (the small bellows were operated by the left hand) and therefore was a pure melody instrument, like the recorder or panpipes. An Italian 14th-century name is *organetto*. The blind master Francesco Landini was celebrated for his playing of the organetto. The famous illumination from the Squarcialupi Codex [see, e.g., *BeMMR*, opp. p. 168] shows him with this instrument. Giovanni da Prato, in his *Paradiso degli Alberti* (c. 1389), gives a vivid description of Landini's playing, saying it was "so beautiful that even the birds listened to it." Paintings of the 14th and 15th centuries frequently show the organetto in the hands of angels [see *SaHMI*, pl. XVI, opp. p. 272, and pl. XVIII, opp. p. 304]. See H. Hickmann, *Das Portativ* (1936); H. Wolff, in *ZMW* xv; L. Parigi, in *LRM* 1949, p. 40.

**Portato** [It.]. A manner of performance halfway between legato and staccato [see *Legato*]. The use of the term \*portamento for this is misleading and should be avoided.

**Port de voix** [F.]. (1) In modern French, same as \*portamento. (2) One of the most important French *agréments* of the 17th and 18th centuries. Essentially it is an upward-resolved suspension or appoggiatura, generally expressed by sign or a particular notation [see *Appoggiatura* (2)]. Usually, however, both appoggiatura and resolution are repeated, so that the ornament consists of four notes, the last three forming a *pincé* (\*mordent). In keyboard music this fuller execution is usually indicated by combining the sign for *port de voix* with that for the *pincé* [see *Ex.*, J.-H.

1. Port de voix. 2. Port de voix pincé.

d'Anglebert, *Pieces de clavecin* (1689)]. In music for the voice and all other instruments the *pincé* was taken for granted.

P.A.

**Portée** [F.]. Staff.

**Porter (portez) la voix.** See *Port de voix* (1).

**Portugaliae musica.** See Editions XLIV.

**Portugal.** I. *To 1700.* In the 13th century Kings Alfonso III (reigned 1248–79) and Diniz (Denis; reigned 1279–1325) attracted Provençal troubadours to their courts. Very likely they aroused interest and following among native musicians, one of whom, Martim Codax (late 13th cent.), is known through seven songs that were discovered in 1914 in the binding of a 14th-century MS of Cicero's *De officiis* [see *ML* v, 29f; I. Pope, in *Speculum* ix]. John I (reigned 1385–1433) was a munificent and lavish ruler who kept a large orchestra at his court for festivities and ceremonial occasions. A collection of anonymous three-part songs from c. 1500 is preserved in the Cancioneiro of Elvas [see *Cancionero* (2)]. In the 16th century Portuguese musicians such as Damião de Goes (1501–74; well known as a historian, diplomat, and traveler), Cosme Delgado (c. 1530–96), and Manuel Mendes (c. 1550–1605) came under the influence of Flemish polyphony, but very little of their work has been preserved (a motet, "Ne laetaris," by Goes in Glareanus' *Dodecachordon*).

About 1600 a splendid school of Portuguese polyphonic music emerged, known as the school of Évora. To this belong Duarte Lobo (c. 1565–1646), Manuel Cardoso (1571–1650), Felipe de Magalhães (d. 1648), João Lourenço Rebello

(1609–61), and Diogo Dias Melgaz (1638–1700). To these must be added King John IV (1604–56), who studied music under Rebello, composed many works for church use (of which two motets are preserved), wrote a book and pamphlet in defense of Palestrina, and founded the world-famous library whose destruction in the Lisbon earthquake of 1755 meant the loss of innumerable priceless musical works. A contemporary of Lobo's was Manuel Rodrigues Coelho (b. 1583), who in 1620 published an important collection of organ music (*Flores de música*; \*Editions XLIV, 1 and 3), containing *tentos* (ricercars) and liturgical compositions [see *HAM*, no. 200]. Recently, several extensive MS collections of Portuguese organ music from the end of the 17th century have come to light, among them a *Libro de cyfra* and a *Livro de obras de órgão* of 1695 (both in the Bibl. Mun. of Porto). They contain *tentos*, *jogos de versos*, *entradas*, *batalhas*, and other pieces [see Lit., B. Hudson, K. Speer].

II. 1700–present. Under King John V (1706–50) Portuguese music came under the influence of Italian musicians. Domenico Scarlatti stayed at the Portuguese court from 1721 to 1729, and his influence is seen in the works of Carlos de Seixas (1704–42), who wrote numerous “toccatas” and “sonatas,” some of which are interesting forerunners of sonata form [see S. Kastner, *Cravistas Portuguezes*]. Even more penetrating was the Italian influence on opera, which came entirely under the domination of Neapolitan composers. Among the first Portuguese composers of operas was Francisco Antonio de Almeida (d. c. 1755). He was followed by João de Sousa Carvalho (1709–98), whose pupil, Marcos Portugal (1762–1830), became the greatest Portuguese opera composer. João Domingos Bomtempo (1775–1842) was Portugal's first composer of symphonies, writing orchestral works in the style of Haydn and Mozart. Unfortunately he had no followers of note.

In the 20th century, José Vianna de Motta (Mota; 1868–1948) was a champion of nationalism (*Portuguese Scenes*; *The Lusiades* for chorus and orchestra). Freitas Branco (1890–1955) combined impressionist idioms with national elements. Ruy Coelho (b. 1892) has written many operas, ballets, and symphonic and chamber works in the national tradition. Frederico de Freitas (b. 1902) composed orchestral and instrumental pieces in the impressionist vein. Other important modern composers include Oscar da Silva (b. 1870), Cláudio Carneiro (b. 1895), Croner de Vasconcelos, Armando Fernandes,

Fernando Lopes Graça (b. 1906), Joly Braga Santos, and Ivo Cruz (b. 1901). Among modernists interested in serial or electronic music are Filipe Pires, Jorge Peixinho, and Alvaro Cassuto.

Kastner, *Contribucion al estudio de la música española y portuguesa* (1941); *id.*, *Carlos de Seixas* [1947]; A. Pinto, *Música moderna portuguesa* (1930); M. de Sampayo Ribeiro, *A Música em Portugal nos séculos xvii e xix* (1938); J. E. dos Santos, *Polifonia clássica portuguesa* (1938); M. Joaquim, ed., *Composições polifón de Duarte Lôbo*, vol. i (1945); B. Hudson, “A Portuguese Source of Seventeenth-Century Iberian Music” (diss. Indiana Univ., 1961); K. Speer, “A Portuguese Manuscript of Keyboard Music from the Late Seventeenth Century” (diss., Indiana Univ., 1956); S. Kastner, *Cravistas Portuguezes*; A. T. Luper, “Portuguese Polyphony in the Sixteenth and Early Seventeenth Centuries” (*JAMS* iii); F. D. Perkins, “Music in Portugal Today” (*LBCM*, also *MQ* li); \*Editions XLIV. For Portuguese folk music, see under *Fado*.

**Portuguese hymn.** The hymn “Adeste fideles” (O come, all ye faithful), so called because it was frequently used, c. 1800, in the Portuguese chapel at London.

**Pos.** Abbr. for \*position, or [F.] \*positif, or [G.] \*Posaune.

**Posaune** [G.]. Trombone.

**Positif** [F.]. \*Choir organ.

**Position.** (1) With reference to chords (close, open position), see Spacing. (2) On the violin, etc., positions are the places on the fingerboard to which the left hand shifts in order to obtain higher or lower tones. Thus, on the G-string the first position covers the fifth from g to d', g being the open string and the four successive notes, a, b, c', d', being stopped by the four fingers. The second position starts with the first finger on b and ends with the fifth finger on e', third position starts on c', etc. Moving from one position into another is known as a “shift.” Both terms apply also to the trombone with reference to the position of the slide. The home position is called the

first, and each successive position lowers the pitch a semitone.

**Positive organ** [F. *orgue positif*; G. *Positiv*]. A medium-sized medieval organ, which was not built into the walls of the church but was a self-contained instrument that could be moved by two or four men. It had one manual, no pedal, and only flue pipes, often in two rows (4' and 2'). A famous illustration is found on Van Eyck's Altar of Ghent. There also was a very small positive that was set on a table. It was as "portable" as the \*portative, but differed from it in that it was played with both hands, the bellows being worked by an assistant. It was exclusively a domestic instrument.

Later the name was used for a special section of the church organ in which there were flue stops (principal, etc.) suitable for the accompaniment of the choir; hence, synonymous with \*choir organ, *Positif* [F.], *Rückpositif* [G.]. See Organ III, VII, XII. See H. Bornefeld, *Das Positiv* (1947); E. Bonitz, *Das Positiv und die Zukunft* (1951); R. Quoicka, *Das Positiv in Geschichte und Gegenwart* (1957); F. W. Galpin, in *MA* iv.

**Post Epistolam** [L.]. Alternative name for the Hallelujah of the Ambrosian Mass; see Ambrosian chant.

**Post Evangelium** [L.]. An item of the Ambrosian Mass; see Ambrosian chant.

**Postlude**. An organ piece played at the conclusion of the service, during the exit of the congregation. It is usually improvised. The term is also used for a \*coda.

**Potpourri** [F.]. A medley of popular tunes, operatic airs, patriotic songs, etc., which are played in succession, connected by a few measures of introduction or modulation. The name (literally "rotten pot," i.e., a dish made of many ingredients) was used as early as C. Ballard's collection of \**brunettes* (*Brunetes ou petits airs tendres*, 3 vols., 1703–11). J. B. Cramer was the first to use it for the 19th-century drawing-room piece.

**Poule, La** [F., The Hen]. Popular name for Haydn's Symphony no. 83, in G minor (1785), no. 2 of the \*Paris Symphonies. The name seems to refer to the second theme of the first movement, which vaguely suggests a hen cackling.

**Poussé, poussez** [F.]. Up-bow; see Bowing (a).

**Pp**. Abbr. for pianissimo. Sometimes ppp and pppp are used to indicate still greater degrees of softness.

**P. R.** In French organ music, abbr. for *Positif-Récit*, i.e., choir organ and swell organ coupled.

**Praeambulum** [L.]. A 15th- and 16th-century name for \*prelude.

**Praeconium paschale** [L.]. Name for the *Exsultet jam Angelica turba* [see *Psalmus idioticus*], which is sung on Holy Saturday during the Blessing of the Paschal Candle (Easter Vigil). The text is given in *LU*, p. 776M; a melody (obviously of a relatively late date) is in the *Officium et Missa ultimi tridui* (1947), p. 227. For older melodies, see P. Wagner, *Einführung in die gregorianischen Melodien*, vol. iii (1921), pp. 229ff. See *Psalmus idioticus*.

**Praefatio** [L.]. See Preface.

**Praelegenda** [L.]. Name for the Introit in \*Gallican and \*Mozarabic chant.

**Praeludium** [L.]. See Prelude.

**Prague Symphony**. Mozart's Symphony in D (K. 504), composed in 1786 in Vienna and first performed (1787) in Prague, where it was enthusiastically received. It has no minuet.

**Praltriller** [G.]. See under Inverted mordent.

**Préambule** [F.], **preambulum** [L.]. Same as \*prelude.

**Precentor**. (1) The director of music in a cathedral or monastic church. (2) Deacon, elder, or "chorister" in the Puritan churches of New England in the 17th and 18th centuries who "lined out" the psalm and hymn tunes. See Lining.

**Preces** [L.]. In the rites of the Latin and Anglican churches, name for supplications in the form of versicles and responses. They play an important role in the \*Gallican and \*Mozarabic rites, where they were sung during the Mass on certain penitential days. Several Mozarabic *preces* are reproduced, with the designation "ex Liturgia Gothica," in the publication *Variae Preces* (rev. ed., 1939, pp. 112, 114, 135, 264; in this title the word "Preces" has no specific significance). Many Gallican *preces* (*Variae Preces*, p. 266) are preserved, and these make up the largest remnant of Gallican chant. Both the Mozarabic and the Gallican *preces* usually have a refrain form, R V<sub>1</sub> R V<sub>2</sub> R V<sub>3</sub>. . . . In the Roman Catholic rite the *preces* play a much lesser role, being confined to the Office of Prime on ordinary Sundays [*LU*, p. 231]. However, the \*litanies belong to the same type of chant. In the Anglican Prayer Books, *preces* means the por-

tion of Morning and Evening Prayer that begins with the versicle "O Lord, open Thou our lips." There are polyphonic settings of the *Preces* by Tallis, Morley, and others, that by Tallis being the one most widely used [see *The Hymnal* 1940, p. 699]. See Suffrages. See W. Meyer, "Die *Preces* der mozarabischen Liturgie" (*Abhandlungen der Königlichen Gesellschaft der Wissenschaften zu Göttingen*, Philologisch-historische Klasse. Neue Folge, vol. xv, no. 3, 1914); R. P. G. Prado, "Mozarabic Melodics" (*Speculum* iii).

**Precipitando** [It.]. Rushing, impetuous.

**Preface** [L. *praefatio*]. In the Roman Catholic Mass, a solemn declaration of praise beginning (after short versicles and replies) with the words "Vere dignum et justum est." It is, together with the immediately following Sanctus, an introduction to the Canon of the Mass, hence the name [see Mass A, table, nos. 12–14]. In addition to the Common preface [LU, p. 3f] there are a number of Proper prefaces for special feasts, all beginning with the same words [LU, pp. 8ff]. The "Tones for the Prefaces" given in LU, p. 109f are used for the initial versicles and replies. An example of a recitation tone for the preface itself is found in *Officium hebdomadae sanctae et octavae paschae* (1962), pp. 456, 458.

**Prelude** [L. *praeludium*; F. *prélude*; G. *Prä-ludium*, *Vorspiel*; It., Sp. *preludio*]. A piece of music designed to be played as an introduction, e.g., to a liturgical ceremony or, more usually, to another composition, such as a fugue or suite. This connotation, which prevails throughout the entire early history of the prelude [see below], was lost in the 19th century, when Chopin, Scriabin, and Debussy used the word as one of numerous noncommittal titles for piano pieces [see Character piece]. How completely the term lost its proper meaning is evident in the fact that even the most pedantic listeners do not seem to have objected to twenty-four preludes being played in succession. With few exceptions the prelude has always been restricted to instrumental solo music, that is, to keyboard instruments and the lute [see Ensemble (3)].

The history of the prelude is of particular interest since it represents the earliest type of idiomatic keyboard music as opposed to types based on or modeled after vocal music (liturgical organ music, intabulations, *ricercars*, and *canzonas*). Its history can be divided into three periods. In the first period (c. 1450–1650) the prelude is a single composition that may be used

for any suitable purpose, sacred or secular; in the second period (c. 1650–1750) the prelude becomes the "first movement" of a special composition to which it is inseparably connected; in the third period (19th century) it becomes an independent piece to which no function or other composition is attached.

I. The preludes of the 15th and early 16th centuries are mostly short pieces (ten to twenty measures long) remarkable for their free keyboard style, made up of passages and chords, in marked contrast to the strict contrapuntal style of contemporary vocal music. This repertory includes about fifty pieces (*praeambula*) in the Illeborgh tablature (1448); in C. Paumann's \**Fundamentum organisandi*\* (1452); in the \*Buxheim Organ Book\* (c. 1460–70); in H. Kottler's tablature (c. 1520); and in L. Kleber's tablature (c. 1520; ex. in HAM, no. 84; MQ xxiii, 213; ApMZ i). Similar although frequently longer are the lute preludes in the tablatures of F. Spinaccino and J. A. Dalza (*Intabulatura de lauto* i, ii, iv, 1507–08; pub. by Petrucci), Judenkünig (1523), Hans Newsidler (1536), H. Gerle (1552), and others. The preludes of the Petrucci publications are called *recercari* [see Ricercar II (a)] or *tastar de corde* [Ex. in HAM, no. 99; SchGMB, nos. 63b, 93; ApMZ i, 20]. Toward the end of the century John Bull wrote a number of preludes [see HAM, no. 178] that are noteworthy for their virtuoso character and to which the simultaneous lute pieces by J. B. Besard (*Thesaurus harmonicus*, 1603; see ApMZ ii, 24) offer a striking contrast of style and expression. See also *Intonation*.

II. About 1650 composers began to combine the prelude with a special composition. The prelude as an introduction to suites or a suite-like series of pieces was used by Louis Couperin, who created a unique type of prelude, completely free in rhythm and, therefore, notated without the conventional note values [see rev. ed. by P. Brunold and T. Dart [1959]; also TaAM viii, 40, where the "Transcription" on p. 43 completely obscures the basic character of the composition; for a similar prelude by D'Anglebert, see HAM, no. 232]. Particularly remarkable are the preludes to the lute suites of E. Reusner (1636–79; ex. in HAM, no. 233, and RiMB; see also H. Riemann, in SIM vi). Handel preferred a prelude in a free, improvisory style for his suites, whereas Bach's introductory pieces to suites and partitas are full-sized *concerto grosso* movements, overtures, toccatas, or sinfonias. The combination of the prelude with a fugue

that became classic with Bach can be traced to organ preludes of the early 17th century, which, after a section in free style, continue and close with a short fugal section. A piece such as the "Praeludium" of Heinrich Scheidemann (c. 1596–1663) in \*Editions XLI (*Vierte Reihe*, i, p. 16) or the "Praeludium" by F. Tunder (1614–67) in *HAM*, no. 215, may be considered the beginning of this interesting development, which, half a century later, led to the monumental "Praeludium cum Fuga" of Buxtehude [Ex. in *HAM*, no. 234] and finally to those of Bach. For a closely related form of keyboard music, see Toccata. For the chorale prelude, see Organ chorale II.

III. The 19th-century prelude is represented by the preludes of Chopin and his numerous imitators, chiefly Scriabin (90 preludes), Debussy (24 in two books), and Rachmaninoff (op. 23). These are essentially pianistic character pieces. Except for those of Debussy, they are usually based on a short figure or motif that is exploited by means of harmonic modulations. See L. Hibberd, "The Early Keyboard Prelude" (diss. Harvard Univ., 1941); W. Apel, "Der Anfang des Präludiums in Deutschland und Polen" (*The Book of the First International Musicological Congress . . . of Frederick Chopin*, ed. Z. Lissa [Warsaw, 1963], p. 495).

**Prélude à l'après-midi d'un faune.** See *Après-midi d'un faune*, *L'*.

**Préludes, Les.** Symphonic poem by Liszt (first perf. 1854), based on a poem of the same title by Lamartine.

**Preparation.** A harmonic device whereby the impact of a dissonant note in a chord is softened by first sounding it as a consonant note in the preceding chord. In the strict counterpoint of the Palestrina style dissonant notes always are prepared, while in Bach's this principle is largely discarded. See Nonharmonic tones, particularly appoggiatura.

**Prepared piano.** A piano whose sound is artificially altered by various devices, e.g., metal clips or metal bolts attached to the strings; strips of paper, rubber, felt, etc., inserted across the strings; altered tuning of the unison strings, etc. The prepared piano was introduced by John Cage (b. 1912).

**Presa** [It.]. In canons, a sign, usually like an S, to indicate the place where the imitating voice or voices enter.

**Pressante** [It.]; **pressez** [F.]. Urgent, hurrying.

**Pressus.** An ornamenting neume; see Neumes I (table).

**Presto** [It.]. Very fast, faster than allegro. *Prestissimo* denotes the greatest possible speed. See Tempo marks.

**Priamel** [G.]. A 16th-century misspelling of *Praeambel*, i.e., prelude. The explanation in Brenet's *Dictionnaire de musique* is erroneous.

**Prick song.** A 16th- and 17th-century English term for a written or printed composition, distinguishing it from the oral tradition of plain-song, folksong, popular dance music, etc., as well as from improvised music.

**Prim** [G.]. \*Prime (1).

**Prima donna** [It.]. Originally, the singer of the principal female role of an opera, as distinguished from the *primo uomo*, the leading male singer, and the *seconda donna*, the second female singer. These parts were basic in the plot construction of 18th-century operas, as can be seen, e.g., in Mozart's *Don Giovanni* and *Figaro*. In the 19th century the term came to mean a conceited, jealous, capricious operatic star, a meaning also extended to her male counterpart, both in performing and conducting. See H. S. Edwards, *The Prima Donna*, 2 vols. (1888); K. Homolka, *Die grossen Primadonnen* (1960).

**Prima (seconda) prattica** [It.]. Early 17th-century terms used (first by Monteverdi?) to distinguish the polyphonic style of the 16th century from the monodic style of the 17th. Synonyms are *stile antico* and *stile moderno*.

**Prima vista** [It.]. Playing without previous study. See Sight-reading.

**Prima volta, seconda volta** [It.]. The different endings for the first and second performances of a repeated section. In scores, abbreviations such as 1. and 2. are used. The practice of using different endings occurs occasionally in Gregorian chant, e.g., in the Offertory "Eripe me . . . Domine," which in its full form with two verses [see C. Ott, *Offertoriale*, no. 30] can be diagrammed as  $O-e_1 V_1 O-e_1 V_2 O-e_2$  ( $O$  = Offertory;  $V$  = verse;  $e$  = ending), with  $e_1$  closing on the "dominant" b and  $e_2$  on the tonic e. It appears fully established in the *ballades* and *virelais* of Machaut; see *Ouvert* and *clos*.

**Prime** (1) The interval "zero," i.e., unison. (2) The third of the canonical hours. See Office.

**Primgeiger** [G.]. First violinist, also concertmaster.

**Primitive music.** See Ethnomusicology.

**Prince Igor** [Rus. *Knyaz Igor*]. Opera in four acts by Borodin (to his own libretto), composed between 1871 and 1887, the year of his death, completed by Rimsky-Korsakov and Glazunov, produced in St. Petersburg, 1890. Setting: semilegendary Russia, 1185. Best known are the Polovtsian Dances, which are often heard in concerts, and the selections adapted for the Broadway musical *Kismet*.

**Principal.** In German organs, the "open diapason," in 8', 16', 32', and 4' [see Foot]. In American and British organs, a 4'-open diapason only, or an 8'-open diapason on the pedal.

**Printing of music.** The printing of music began soon after the invention of movable letter type (Gutenberg's Bible, c. 1455). A *Psalterium*, printed in 1457 by Gutenberg's associates, Johann Fust and Peter Schöffer, has printed staves on which the notes were written by hand. The earliest method used for the complete reproduction of music was *double printing*, in which the staff lines and notes were printed in two different processes, usually the former in red and the latter in black. Various printers of the 15th century used this method for liturgical books (missals), e.g., Ulrich Han (Rome, 1476), Jörg Reyser (Würzburg, 1481), Octavianus Scotto (Venice, 1482), J. Sensenschmidt (1485), and Erhard Ratdolt (1487). In the early 16th century it was perfected by O. dei Petrucci (first printed book, the *\*Odhecaton*, 1501), the only music printer who can be compared to Gutenberg. Equally skilled was Peter Schöffer, who printed the beautiful publication of Arnolt Schlick's *Tabulaturen* (1512). Most printers, however, found double printing too difficult and replaced it with two other methods, which, with many variations and improvements, have persisted side by side until the present day: (a) *block* or *sheet printing*, and (b) *type printing*.

(a) In *block printing*, the block for the entire page of music is prepared as a whole. While woodcuts, such as those used in N. Burtius' *Musices opusculum* (1487; printed by De Rugeris in Bologna), yielded extremely clumsy results [ill. in *GD* iv, 254; *GDB* vi, 929], hand-engraved metal plates proved very satisfactory, as is shown by the beautiful publications of the Roman printers Simone Verovio (*Diletto spirituale*, 1586; C. Merulo's *Toccate*, 1597, 1604), and

Nicola Borbone (Frescobaldi's *Toccate*, 1637), by the *\*Parthenia*, etc. Not infrequently the composers themselves engraved their music, as, for instance, Johann Ulrich Steigleder (*Ricercar Tabulatura*, 1624) and probably also Bach (*Clavier-Übung* iii). Throughout the 17th and 18th centuries engraving was the most common method of printing. American publishers imported engraved plates from England (as early as 1690), Paul Revere being the first American to engrave music (c. 1760). An important advance was made in the early 18th century by John Walsh who c. 1710 (1730?) mechanized the process of engraving with the use of punches, long tools having a note or other character at one end, which were struck with a hammer. A combination of punching and hand-engraving (e.g., for long lines) is still used today. About 1800, Senefelder's lithographic process (writing on a smooth stone with a greasy ink) was used for music publications; C. M. von Weber helped perfect this method and in 1800 lithographed his op. 2 himself. Later the stone was replaced with a copper plate covered with beeswax on which the musical signs were scratched. When the plate was etched with acid, the signs appeared as grooves in the copper plate. In the modern *offset process* (also called *photolithography*) the characters are first hand-engraved (with the aid of punches) on a lead plate from which a clear proof on paper is drawn. Eight or sixteen such proofs are pasted on a large sheet and a negative photograph is made. The negative is reproduced photographically on a sensitive zinc plate (covered with a photographic emulsion), which, after treatment with acid, shows the signs engraved.

(b) In *type printing*, movable type, comparable in size to letter type, is put together in order to prepare the block for the printing. In the 16th century such type consisted of a note combined with a small section of the staff, as illustrated.

Although this method proved successful for printing *\*partbooks* (vocal music), in which each staff carried only one melodic line, it was very tedious and costly for keyboard music, which frequently included chords. Examples of keyboard music printed in this manner are Attaingnant's books of 1529. Type printing was largely abandoned after 1600 but was reintroduced, greatly improved, by J. G. I. Breitkopf (1755), who used tiny pieces of type, one each for note-

heads, stems, flags, etc., that were put together in a complicated mosaic. This troublesome method is used today chiefly for short musical examples inserted in printed books and for plainsong.

**Profession of music.** I. *Teaching.* The largest number of opportunities for a musical career are in teaching, which also is the surest and steady method of earning an income.

a. Public schools. Teaching in public elementary and high schools usually requires a teaching certificate based on completion of a degree program in an accredited institution. Often the teacher is asked to give instruction in one or more subjects besides music.

b. Private schools, elementary and secondary. The requirements for teachers in private schools vary greatly. Most private schools require a B.A. and often an M.A. degree. In some instances a single teacher is employed for all classroom teaching—theory, history, solfège, appreciation, etc. He may also be required to teach an instru-

ment or voice, direct a chorus or band, etc., or to teach another subject in addition to music.

c. Colleges and universities. The B.A. degree is prerequisite (or B.S., or B.Mus.). The M.A. is more and more widely required, while the Ph.D. is indispensable for obtaining positions in top-ranking colleges and universities. A balance of musical knowledge (theory and history) with performing ability is ideal, the one or the other being stressed according to the teacher's special abilities. A knowledge of the other arts is receiving wider recognition as an important part of the understanding of music.

d. Music schools. Here the emphasis is more specifically on performance. Although the better music schools include on their staffs teachers of theory and history, they also have a place for the virtuoso, whose interest is primarily in performance and in training performers.

e. The private music teacher. Except for a few "stars" who have become famous as performers, the private teacher's career tends to be uncertain. Moreover, anyone who wishes to do so may take on pupils, with the result that many incompetent persons set themselves up as teachers. More security results from cooperation with high schools and colleges, which may refer students to private teachers for instruction. Private teaching often is done on a part-time basis, e.g., by church organists, orchestra players, and occasionally by school music teachers. In addition, recognized concert artists frequently accept a few gifted pupils.

II. *Performing.* Performing as a soloist on the concert or operatic stage is the most "glamorous" profession, but the number of such opportunities is limited compared to the quantity and quality of talented performers available. Frequently performance is combined with teaching. Conducting is an even more limited field. There may be a good future for local concert artists—performers who appear principally in a given region, where they also participate, as teachers or otherwise, in the musical life of the community.

Symphony orchestras (and a few opera and ballet companies) provide employment for good instrumental players, and the growth in recent years of good orchestras in smaller cities has created new opportunities. Musical shows and operettas offer employment to orchestral players but seldom on a permanent basis. Many musicians find semipermanent work in small groups, playing popular and dance music.

Churches employ a large number of musicians and singers, usually for quite a small fee. Many

churches, however, pay their organist and choir-master enough to enable him (usually with the help of private lessons) to support himself.

III. Various other activities are open to professional musicians. Some of them, such as composition, offer little in material returns. Others, such as writing and arranging for motion pictures, radio, or television, recording for the phonograph, acting as commentator for radio programs, or making arrangements for popular bands or folk singers generally pay handsomely but employ a relatively small number of persons. Newspaper criticism pays very little, with a few important exceptions. Opportunities for music librarians have increased during the past few years and may become even broader in the future.

E.B.H.

**Program chanson.** See under Chanson (2); Program music III.

**Program music.** I. *General.* Music inspired by a program, i.e., a nonmusical idea, which is usually indicated in the title and sometimes described in explanatory remarks or a preface. Thus, program music is the opposite of \*absolute music. Although examples of program music are found in nearly all periods from at least the 14th century, it was not until the 19th century that it became a serious rival of absolute music, to the point of ousting the latter—at least temporarily—from its dominating position. About 1900, many persons, particularly writers on music, believed that in order to be understandable music must “express something” or “tell a story.” In pursuit of this idea, Bach’s Forty-eight Preludes and Fugues were given descriptive titles (Queen Carmen Sylva of Rumania), and some writers maintained that the word *giocosso* at the head of a sonata movement indicated a particular mood of the composer and hence a program (F. Niecks). Today such views are a thing of the past, and it is generally agreed that music is an art in its own right, that it must work with its own tools, and that too great a reliance on outside program will weaken rather than enhance a composition’s artistic merit [see Aesthetics of music III]. In fact, one cannot help feeling that a good deal of the

interest of composers in program music is owing to a lack of purely musical imagination, a lack for which they try to compensate with an interesting program. In the last analysis, there are two types of program music: music that is good regardless of the program, and music that is mediocre or poor although it is a skillful rendition of the program. Although the former category includes such outstanding compositions as Beethoven’s \*Pastoral Symphony and Berlioz’ *Symphonie fantastique*, as well as such remarkable works as R. Strauss’ *Till Eulenspiegel* and Debussy’s *Prélude à l’après-midi d’un faune*, the great majority of program compositions tend to fall into the second category.

Programmatic ideas are frequently found in the works of 17th- and 18th-century composers. F. Couperin with his numerous program pieces [see below] and Bach with his word painting in arias and choral preludes have frequently been cited to support the cause of 19th-century program music. The old masters, however, did not identify themselves with the programmatic thought but used it only as a point of departure, from which they derived not much more than the

1

So schnell ein

rau schend Was - ser schießt

2

8

*p*

Quasi cadenza

*pp*

*pp*

general design of the initial theme. A comparison of Bach’s aria “So schnell ein rauschend Wasser schießt,” from the cantata *Ach wie flüchtig* [Ex. 1], with Debussy’s *Reflets dans l’eau* [Ex. 2], both “interpreting” water, clearly illustrates this difference. Moreover, early program pieces in

which the programmatic idea is pursued as thoroughly as in modern examples are usually mediocre from the musical point of view. This is particularly true of the program chansons of Janequin and the battle pieces [see *Battaglia*] of Byrd, Kerll, and others, among which Beethoven's \**Wellingtons Sieg* is no exception.

II. *Methods*. In the history of program music, a general trend from the pictorial (objective) to the psychological (subjective) approach can be observed. Prior to 1600, composers limited themselves to imitating natural sounds (birds, battle-cries, thunder, trumpet fanfares, etc.), bodily movements (flight, running, hobbling, throwing, falling, stopping), and words closely associated with movement (e.g., heaven = high; death = fall; see Word painting). Beginning in the 17th century, basic emotions or feelings were "translated" into music through associated movements or sounds. Thus, anguish is portrayed by a trembling or staggering motion, confidence by secure and wide steps, joy by a melody reminiscent of laughter, sorrow by descending steps in chromatic succession [see Chromaticism], etc. These examples illustrate the two basic methods of program music, imitation of sounds and imitation of movements, each used either directly or indirectly by way of association. These devices remained the chief vehicles of 19th-century program music, although they came to be used with much greater subtlety and refinement. In addition, the modern orchestral palette offered greater possibilities for convincing portrayal and faithful imitation. While Beethoven's Pastoral Symphony introduces the musical cries of the nightingale, cuckoo, and quail, Wagner very skillfully imitated the toad and serpent (in *Das Rheingold*), and R. Strauss a flock of sheep (*Don Quixote*). The climax of this trend (and, in a sense, the *reductio ad absurdum* of program music) is found in Respighi's *The Pines of Rome*, where the problem of imitating the nightingale is solved by simply using a recording of an actual nightingale's song.

III. *History*. Several of the Italian \**caccie* of the late 14th century show an attempt to imitate in music the vivid scenes described in their texts, e.g., street cries, sounds of horns, the general commotion of a hunting scene, a fishing trip, a fire. From the same period dates a "bird motet" by Jean Vaillant, which recurs, with a German text ("Der May"), among the compositions of Oswald von Wolkenstein [Ex. 3; see *HAM*, no. 60]. More deliberate in approach but much less imaginative are the program chansons by Jane-

quin (c. 1528)—"Le Chant des Oyseaux," "La Chasse," "L'Alouette," "La Guerre"—the last of which, suggested by the famous battle of Marignano (1515), was followed by a host of imitations [\*Editions XXV, 7; *HAM*, no. 107]. H. Newsidler's "Der Judentanz" (1544; *ApMZ* i, no. 10) is an amusing example of caricature [see Satire in music], and Byrd's *The Bells* is remarkable for its artistic ingenuity, far superior to the naïve attempts of John Munday to imitate "Lightning," "Thunder," and "Faire Wether" [see *Fitzwilliam Virginal Book* i, 274 and 23]. Passing over the numerous instances of programmatic portrayal in operas, oratorios, etc., some outstanding examples of instrumental program music of the baroque period are Froberger's beautiful *Lamento sopra la dolorosa perdita della Real Maestà di Ferdinando IV* [see *HAM*, no. 216; see also *Lament*]; Poglietti's satirical *Aria allemanda con alcuni variazioni* [*DTO* 27; also *TaAM* viii]; J. Kuhnau's *Biblische Historien* (depicting the fight between David and Goliath, the marriage of Jacob, etc.; see *DdT* 4; *HAM*, no. 262); the numerous descriptive pieces by F. Couperin (*Pièces de clavecin*, 1713–30; see *HAM*, no. 265), including an interesting anticipation of Schumann's *Carnaval* [see *Ménestrandise*]; Rameau's "La Poule" and "Les Cyclopes" (*Pièces de clavecin*, 1706) or "Ramage des oiseaux" [*HAM*, no. 27]; and Bach's "Capriccio sopra la lontananza del suo fratello dilettissimo" (Capriccio on the departure of his beloved brother; c. 1704), a successful imitation of Kuhnau's program pieces. Perhaps the most startling example of baroque program music is a "Tableau de l'opération de la taille" for viol and harpsichord by Marais (1717), describing the painful details of a surgical operation [reproduced in *LavE* ii.3, p. 1776]. Between 1750 and 1800 mediocre musicians served an easily satisfied audience with battle pieces of very low quality [see *Battaglia*].

Beethoven's \*Pastoral Symphony of 1807–08 marks the beginning of 19th-century program music. His remark, "Expression of feelings rather

than painting," also applies to Schumann's approach (*Kinderszenen*, etc.), except for pieces such as *Carnaval*, with its realistic references to the scenes of a masked ball. There followed Berlioz, with his autobiographical *Symphonie fantastique* (1830–31), and Liszt, who in his numerous symphonic poems created the type of program music that was to become dominant in the ensuing decades of the 19th century [see Symphonic poem]. The 20th-century development brought a sharp reaction against program music as a goal in itself, employing musical portrayal chiefly for the purpose of caricature and jest [see Satire].

Ringbom, *Über die Deutbarkeit der Tonkunst* [1955]; A. Wellek, "Doppelempfinden und Programmusik" (diss. Vienna, 1928); W. P. James, "Music Pure and Applied" (*ML* ii, 373); H. Antcliffe, in *PMA* xxxvii; M. D. Calvocoressi, "Esquisse d'une esthétique de la musique à programme" (*SIM* ix); M. Brenet, "Essai sur les origines de la musique descriptive" (*RMI* xiv, xv); K. Schubert, ‡*Die Programm-Musik* [1933].

**Program symphony.** A composition written in the general form of a symphony (in several movements) and based on a programmatic idea [see Program music]. Examples are Beethoven's \*Pastoral Symphony, Berlioz' \**Symphonie fantastique*, Liszt's *Faust Symphony*, and R. Strauss' \**Alpensinfonie*. Each movement of these symphonies has its own title, indicating one aspect of the general program. See Symphonic poem I.

**Prolation** [L. *prolatio*]. See Mensural notation II. In the early 14th century the term meant either all the mensurations (*modus*, *tempus*, and *prolatio*) or the four combinations of *tempus* and *prolatio* (Vitry's "quatre prolations"). The latter meaning exists in Ockeghem's *Missa prolationum*, so called because each of the four voices sings in a different mensuration (in modern terms, 2/4, 3/4, 6/8, 9/8).

**Prologue.** In early operas and ballets, an introductory scene in which one or several narrators, representing deities, virtues, etc., give a brief summary of the opera or of its symbolic meaning. The prologue sometimes developed into a small play with an entirely independent action, designed to serve as a dedication to or eulogy of the royal or noble patron. An example is the pro-

logue of Lully's *Phaëton* (1683), which consists of an overture plus twelve different pieces. The simple narrative prologue of the earliest operas (Caccini's and Peri's *Euridice*, 1600; Monteverdi's *Orfeo*, 1607) was successfully revived by Leoncavallo in *I Pagliacci* (1892). See H. Leichtentritt, in *PAMS* 1936.

**Prolongement** [F.]. The sostenuto pedal of the piano.

**Prometheus.** (1) Ballet by Beethoven; see *Geschöpfe des Prometheus*. (2) A symphonic poem by Scriabin, *Prometheus, Poem of Fire* (op. 60, 1910), for large orchestra, piano, organ, choruses, and \*color organ. The first (and only?) performance with color organ took place in New York in 1915. The music is based on the so-called mystic (Promethean) chord [see under Fourth chord].

**Pronunciation.** See A. J. Ellis, *Pronunciation for Singers* (1877; E., F., G., It.); C. J. Brennan, *Words in Singing* [1905]; E. Wilcke, *German Diction in Singing* [1930]; M. Marshall, *The Singer's Manual of English Diction* (1953).

**Prooemium** [L.]. Humanist (16th-century) name for prelude.

**Proper** [L. *proprium*]. In the Roman Catholic liturgy, a term used in two ways: (1) In the classification of feasts, the Proper of Saints (*Proprium Sanctorum*) includes the feasts in honor of a specific Saint (St. Andrew, St. Lawrence), while the Common of Saints (*Commune Sanctorum*) includes those in honor of lesser Saints grouped in categories such as Martyrs, Doctors, Virgins, etc. The feasts of the Lord are set apart as Proper of the Time (*Proprium de Tempore*), "time" meaning the time or life of the Lord. (2) In the classification of chants for any of the above-mentioned feasts, some are classed as Proper and others as Ordinary; see Ordinary and Proper. The section in *LU*, pp. 317–1110, contains mostly the proper chants for the Proper of the Time.

**Prophecies.** Lessons from the Book of Prophets in the Old Testament. In the Roman Catholic rites they are read (or chanted; see the Tone for the Prophecy, *LU*, p. 102f) chiefly on the four Ember Days and on Monday, Tuesday, and Wednesday of Holy Week, as a part of the Mass. The longest readings are the nine (formerly twelve) Prophecies of Holy Saturday [*LU*, pp. 754ff], some of which, however, are from other books of the Scriptures. In Anglican churches, these are sung on Saturday evening.

**Proportional notation.** Same as \*mensural notation. The term refers to the use of note values in the proportion of 2 to 1 (imperfect) or 3 to 1 (perfect).

**Proportions.** (1) In \*mensural notation, the diminution or (more rarely) augmentation of the normal note values in arithmetic ratios. For example, the sign  $\frac{4}{3}$  indicates that, in the subsequent passage, each note is reduced to three-fourths of its normal value (the so-called *integer valor*), in other words, four notes of this passage are equal in duration to three notes of the preceding passage [Ex. 1].

The most important proportions are *proportio dupla*, *tripla*, and *sesquialtera*, which call respectively for a diminution of the note values in the ratios of 1:2, 1:3, and 2:3. The first is usually indicated by a vertical dash drawn through the sign of mensuration,  $\text{C}$ ,  $\phi$ , [Ex. 2a], and the others by figures [Ex. 3a; 4a]. In the accompanying illustrations, Ex. 2 shows *proportio dupla* (2 *S prop.* = 1 *S int. val.*); Ex. 3, *proportio tripla* (3 *S prop.* = 1 *S int. val.*); Ex. 4, *proportio sesquialtera* (3 *S prop.* = 2 *S int. val.*). In Ex. 2 under the sign  $\text{C}$  the beat (\**tactus*, rendered as a quarter

note) is represented by the *brevis*, while under the normal signs of mensuration,  $\text{C}$ ,  $\phi$ , it falls on the *semibrevis*. Therefore the latter were called *alla semibreve* and the former \**alla breve*, a name that persists as the only vestige of the proportional system. The reduction indicated by *sesquialtera* could also be produced by \*coloration. Regarding *proportio tripla*, see *Proportz*. See also Time signatures.

The system of proportions, although relatively simple in principle, presents certain difficulties for which the reader is referred to special

studies on mensural notation (*WoHN*; *ApNPM*). Occasionally composers went quite far in devising proportional tricks, combined with canonic riddles. Nonetheless, these cases are on the whole not numerous or typical enough to justify any sweeping statements regarding the speculative and "purely intellectual" character of early Flemish music. The normal use of proportions was, through training and experience, just as familiar to the choir singer of the 15th century as operatic roles are to the modern singer. In their more complex applications they offered a combination of intellectual and artistic enjoyment for which there is no analogy today.

(2) In early treatises on musical acoustics the proportions indicate the relationships of vibrating strings and hence denote intervals. For example, *dupla* 2:1 is the octave, *tripla* 3:1 the twelfth (compound fifth), *sesquialtera* 3:2 the fifth, *sesquitercia* 4:3 the fourth. See Acoustics III.

**Proportz, Proportio** [G.]. In the German dance literature of the 16th century, a \**Nach Tanz* in quick triple time that follows a main dance in slower duple time. Both dances have the same melody in different meters. This is actually implied in the name, which indicates the application of a \*proportion to the original melody. Nominally this proportion was *proportio tripla* (another name for such a *Nach Tanz* was *Tripla*); actually, however, it was *proportio sesquialtera*. Therefore, three notes of the *Proportz* equal in duration two notes of the main dance. The accompanying example (Ammerbach, *Herzog Moritz-Tanz*) shows the exact rhythmic relation-

ship between the two [see W. Merian, *Der Tanz in den deutschen Tabulaturbüchern* (1927), p. 77]. See H. Riemann, "Tänze des 16. Jahrhunderts à double emploi" (*DM* vi.3).

**Proposta** [It.]. The subject (*dux*) of a fugue, as opposed to *risposta*, the answer (*comes*).

**Proprietas.** See under Ligatures II.

**Proprium missae** [L.]. The Proper of the Mass. See Mass A, B.

**Prosa** [L.], **prose** [F.]. Medieval name, retained to the present day in France, for the \*sequence. Originally it seems to have been used specifically for the sequence texts, as opposed to their music; hence the designations *sequentia cum prosa* or *prosa ad sequentium*, found in some early French MSS. The *prosa* were not in any measured poetic meter, so that the term, given its older meaning ("elevated diction"), is quite logical. *Prosarium* [F. *prosaire*] is a medieval book containing sequences. See *Prosula*. See H. Husmann, "Sequenz und Prosa" (*AnnM* ii, 61-91).

**Proslambanomenos** [Gr.]. The lowest tone, A (not G), of the Greek scale, so called because it was added below the lowest tetrachord, e-d-c-B. See Greece.

**Prosomoion**. See *Idiomelon*.

**Prosula** [L.]. Medieval term for certain kinds of textual trope, i.e., for textual insertions adapted to the melismas of the original chant, resulting in a syllabic setting. In MSS of the 11th century they are indicated by *Prosl.* or *Psl.* They are found mostly in Alleluias and Offertories. The oldest example is a 9th-century "Psalle modulamina" underlaid to the verse of the Alleluia "Christus resurgens." An Alleluia-*prosula* (or Alleluia-trope) differs from the sequence (\**prosa*) in that the former is an Alleluia with an amplified text (the original words of the verse are skillfully worked into the fuller text), while the sequence is an addition to the Alleluia that often shows no musical relationship to the mother chant. See Trope. See *ApGC*, p. 433; J. Smits von Waesberghe, in *CP* 1958, p. 251.

**Protestant church music (German)**. Martin Luther (1483-1546), who founded the German Protestant Church, retained many elements of the Roman Catholic liturgy, particularly the Mass Ordinary (also the Gradual and Communion), but replaced the Latin texts with German translations. To these he added the sermon and his great contribution to the development of music, the *Kirchenlied*, known as the German Protestant \*chorale. Important developments of the 17th century are the \*organ chorale and church cantata [see Cantata III]. L. Senfl (c. 1490-1543), H. Schütz (1585-1672), and J. S. Bach (1685-1750) are probably the greatest of the many great masters who contributed to the development of Protestant Church music. See

Church music III (also for bibl.); Psalter; Anglican chant; Anglican church music.

**Protus** [Gr.]. See under Church modes I.

**Prussian Quartets**. (1) A set of three string quartets by Mozart, in D, B-flat, and F (K. 575, 589, 590), composed 1789-90 and dedicated to Friedrich Wilhelm II, King of Prussia, who in 1789 had invited him to Berlin. The cello parts are unusually elaborate, obviously intended to please the King, who played this instrument. (2) The name is also used for Haydn's string quartets op. 50, nos. 1-6, for which the title page of the Artaria first edition (1787) bears a dedication to Friedrich Wilhelm II.

**Ps**. Abbr. for \*Psalm. In German scores, abbr. for *Posaune*, i.e., trombone.

**Psallenda**. An item of the Vesper service of \*Ambrosian chant, somewhat comparable to the Magnificat antiphons of the Roman rites.

**Psalm** [F. *psaume*; G. *Psalm*; It., Sp. *salmo*]. The Book of Psalms has been, no doubt, the single most important source of text in music history. In their original form the psalms were not pure poetry but songs, perhaps with instrumental accompaniment. However, the inscriptions of many psalms do not, as was formerly assumed, refer to instruments but to standard melodies to be used for a given psalm. For instance, the inscription translated in the King James Version as "To the chief musician upon Gittith (Shoshannim, etc.);" [see Ps. 8, 45] actually means: "To be sung to the main melody 'Wine-press' ('Lilies,' etc.)," terms that indicate \*melody types similar to the Arab *maqamat* [see *SaHMI*, pp. 124ff].

The Book of Psalms contains 150 poems. The numbering system in the Latin version of the Bible, used in the Roman Catholic services, differs slightly from that of the English version. The English nos. 9 and 10 correspond to no. 9 of the Vulgate (Latin version) and the English no. 147 corresponds to nos. 146 and 147 of the Vulgate. Therefore, for all the psalms between nos. 10 and 147 the English number is one digit higher than the Vulgate's. References in this dictionary are to the Latin number, with the English number (if needed) added in parentheses (or brackets), e.g., Psalm 49 (50).

In the original Hebrew, the psalms are poems based mostly on the principle of accentuation. Each psalm consists of a number of verses (marked ♪ in the liturgical books of the Roman Catholic Church), each of which consists of two (sometimes three) parts that correspond to each

other, often expressing the same thought or contrasting thoughts. They were sung to music somewhat similar to that of the Gregorian psalm tones, which are obviously derived from ancient Hebrew models such as exist to the present day among Jewish communities in the Near East [see Jewish music II].

The psalms were used as texts for the music of many Christian Churches, except for the Lutheran, whose music is based on \*chorale texts. For the psalm music of the Roman Catholic Church, see Psalmody; Psalm tones; for that of the Anglican, see Anglican chant; for that of the Reformed Churches, see Psalter; for the polyphonic composition of psalm texts, see Psalm composition. See also Penitential psalms.

**Psalm composition.** The psalms have often been used as texts for polyphonic compositions. Aside from early polyphonic settings of Graduals and Alleluias (Winchester Troper, school of Notre Dame), whose texts are nearly always taken from psalms, this activity began in the 15th century. The earliest example is Binchois' fauxbourdon-like setting of the entire Psalm 113 (114), "In exitu Israel" [see J. Marix, *Les Musiciens de la cour de Bourgogne*, p. 196]. Simple homophonic settings of the psalms were widely used throughout the period from c. 1450 to 1600. Examples are the three-part settings for alternating choruses in MS Modena, Bibl. Est. lat 454-455 (c. 1450-1500); the numerous four-part settings in \*falsobordone style in MS Jena, Univ. Bibl. 34 (c. 1500-20); Willaert's \*polychoral *Salmi spezzati* (1550); and the Spanish *fabor-dones* for voices (Guerrero, Victoria, and others; see Editions XX, 6) or for organ (A. de Cabezón; see *ibid.*, 3, pp. 32ff).

Of greater musical interest are the 16th-century settings of psalm texts in motet style (psalm motets). Probably the first and, at the same time, the greatest master in this field was Josquin, who used psalm texts for more than thirty of his motets ("De profundis," "Dominus regnavit," "Domine, ne in furore"; see Editions VIII, 33). Among the later contributions, Lasso's *Psalmi Davidis poenitentiales* of 1560 [see Penitential psalms] are noteworthy. In the field of organ music, Cabezón was the first to write a complete set of psalm \*versets, four versets for each psalm tone [see Alternation]. Most of the \*anthems use psalm texts in English translation.

In the 17th and 18th centuries paraphrased psalm texts were used, e.g., in Schütz's *Psalmen Davids* (1619) and Benedetto Marcello's *Estro*

*poetico-armonico* (8 vols., 1724-26). Often single psalm verses were composed. Examples are Viadana's *Exaudi me* (Ps. 69:16) and F. Couperin's *Qui dat nivem* (Ps. 145:16); see HAM, nos. 185, 266. In Germany, cantatas were occasionally based on psalm texts, e.g., by Andreas Hammerschmidt, Tunder, and Buxtehude. Bach used psalms for his motets "Lobet den Herrn, alle Heiden" (Ps. 116 [117] and "Singet dem Herrn" (Ps. 148 [149] and 149 [150]), as well as for his early cantata, "Der Herr denket an uns" (Ps. 114 [115]: 12-15). In some of his later cantatas he based the initial chorus on a psalm verse, e.g., "Du Hirte Israel, höre" (Ps. 79 [80]: 1) and "Herr, gehe nicht ins Gericht" (Ps. 142 [143]: 2).

Among 19th-century psalm compositions, those by Schubert (Ps. 23, op. 132), Mendelssohn (cantatas and motets), Brahms (op. 29, no. 2), Liszt (Ps. 13, for tenor solo, chorus, and orchestra), and Bruckner (Ps. 150) are outstanding. Important 20th-century compositions are Reger's *Der 100. Psalm* (1908), Kodály's *Psalmus Hungaricus* (1923), Honegger's *Le Roi David* (1921), Stravinsky's *Symphonie des Psaumes* (1930), Milhaud's various works based on psalm texts, and Britten's *Psalm 150*. See also Penitential psalms; Miserere; Psalter; Bay Psalm Book.

Lit.: M. Cauchie, "Les Psaumes de Janequin" (*CP Laurencie*); B. Widmann, "Die Kompositionen der Psalmen von Statius Olthof" (*VMW* v).

**Psalmellus.** In \*Ambrosian chant, name for the Gradual.

**Psalmody, Gregorian.** The psalms are by far the most important texts used in Gregorian chant [see Gregorian chant II]. In the early days of Christian worship the service consisted only of psalm singing, and in spite of the many fundamental changes that took place in ensuing centuries the psalms retained their dominant position in the Roman liturgy. This development, which may have taken place between the years 400 and 800, led to a variety of forms and types for the different items of the chant, each item receiving the structure proper to it from the standpoint of the liturgy. All these forms stem from three original types: direct psalmody, responsorial psalmody, and antiphonal psalmody. The last two terms originally meant two different methods of performance, alternation between soloist and chorus (responsorial) and alternation between two half-choruses (antiph-

onal). However, this distinction is no longer valid [see Responsorial singing] and the terms have only historical and stylistic significance, the responsorial types being the more elaborate of the two.

I. *Direct psalmody* means singing a psalm (or a number of verses thereof) without any textual addition or modification. This method survives in two types, one for the Mass and the other for the Office for the Dead. The former is the \*Tract. The latter is known as *psalmus directaneus* (in *directum*, *indirectum*) and means singing a psalm to a psalm tone but without antiphon [see under III below]. For this method, which is rarely used, special psalm tones called *tonus in directum* are provided.

II. *Responsorial psalmody* was directly taken over from the Jewish service. Originally, the entire psalm was sung by a soloist (*cantor*), with the chorus (congregation; eventually the church choir, or *schola*) responding after each verse with a short affirmative phrase such as Amen, Alleluia, etc. (A direct model for this exists in Ps. 135 [136], in which each verse ends with the sentence: "For his mercy endureth forever.") The resulting form may be indicated as follows:

(R) V. R V. R V. etc. R

(R is the recurrent \*respond, V stands for the verses of the Psalm; straight underlining indicates choral performance; dotted lines mean solo performance; the length of the underlines, i.e., long or short, and the number of dots, i.e., one to four, indicate the relative length of the section.) Although originally the singing of the cantor consisted of a simple recitation in the style of an inflected monotone, similar to that of the psalm tones, there developed, probably in the 4th to 6th centuries, more elaborate methods of singing that finally led to a highly melismatic style of singing psalm verses. A similar development took place with the responds, which, originally sung by the congregation, eventually passed over to the trained chorus (*schola*) and grew considerably longer, both in text and music. Naturally the increase in length of the single sections, verses as well as respond, necessitated a drastic reduction in the number of sections (a similar development is that leading from the \*canzona to the \*sonata). Instead of singing an entire psalm, single verses were selected, varying in number from four to one. The respond was also cut, so that it was not repeated in full after each verse but in a reduced form, its initial half (or third) being omitted.

It is in these more or less radically reduced forms that responsorial psalmody entered the Gregorian repertory. In only a few special chants does the original scheme survive to some extent. An unusually full example is the responsory "Aspiciens a longe" for Matins on the First Sunday in Advent [see *Processionale monasticum*, p. 18]. Its scheme is:

R V<sub>1</sub> R' V<sub>2</sub> R'' V<sub>3</sub> R''' D. R

R is the respond: *Aspiciens a longe, ecce video Dei potentiam venientem, et nebulam totam terram tegentem. \*Ite obviam ei, et dicite: †Nuntia nobis si tu es ipse ‡qui regnaturus es in populo Israel.* In the repetitions of the respond, this is successively shortened from the beginning, as indicated by the signs \*, †, ‡ (R': *Ite*, etc.; R'': *Nuntia*, etc.; R''': *qui regnaturus*, etc.). The letter D stands for the Lesser \*Doxology, the first part of which, *Gloria patri et filio et spiritui sancto*, is frequently added in the forms of responsorial (and antiphonal) psalmody as a final "verse." A chant of almost equally complete structure is the responsory "Libera me," sung at the Burial Service [LU, p. 1767; HAM, no. 14]. Yet another responsory showing the rondo structure of the early responsorial psalmody is the "Subvenite" of the Burial Service [LU, p. 1765].

Aside from such isolated examples, the surviving categories of responsorial chant are still shorter. The most important of these types are the \*responsory, the short responsory (*responsorium breve*), the \*Gradual, and the \*Alleluia. The following table shows the usual form of these chants:

- (1) Responsory: R V. R' or R V. R' R or R V. R' D. R
- (2) Short responsory: R R V. R' D. R
- (3) Alleluia: R' R V. R
- (4) Gradual: R V. or R V. R

The signs - and ... - indicate respectively soloist beginning (\*incipit of a choral section) and choral conclusion of a solo section. Examples for (1) are found in LU, pp. 725ff, 721ff, 375. The short responsory has a fairly long (somewhat variable) scheme, but short and simple melodies in each section. The accompanying example of a short responsory [LU, p. 229] will also help clarify the structure of the other, more melismatic chants. In the Alleluias the response consists of the word "Alleluia" only. This is sung first by the soloist (R'), after which the chorus repeats it and continues with the \*jubilus on (*allelui*)a—(R). With the Graduals the repetition

1. R. Chri-ste Fi-li De-i vi-vi \* Mi-se-re - re no-bis  
 2. R. Chri-ste Fi-li De-i vi-vi Mi-se-re - re no-bis  
 4. Mi-se-re - re no-bis  
 6. R. Chri-ste Fi-li De-i vi-vi Mi-se-re - re no-bis

3. V. Qui se - des ad dex - te - ram Pa - tris

5. D. Glo-ri-a Pa-tri, et Fi-li-o, et Spi-ri-tu-i Sanc-to.

of the respond is optional [see *LU*, p. 320f].

III. *Antiphonal psalmody* originally consisted of the psalms sung by two alternating half-choruses. This method was introduced into the Western Church by St. Ambrose (A.D. 1333–97) in imitation of Syrian models. The exact procedure in the early antiphonal psalmody is not known; there may have been alternating performance for the two halves of each single verse, or (more likely) for each pair of verses [see *Antiphon, History*].

The antiphonal method of psalm singing was at an early time enriched by the addition of a short sentence sung by the whole chorus (perhaps originally the congregation) after every two verses, which was called antiphon (A). There resulted a rondo-like scheme: A V<sub>1</sub> V<sub>2</sub> A V<sub>3</sub> V<sub>4</sub> A etc. A, similar in structure to that of early responsorial psalmody. As in the latter, the full scheme survives only in special chants, such as the \*invitatory at the beginning of Matins, in which Ps. 94, "Venite exultemus Domino" (Ps. 95, O come, let us sing unto the Lord) is sung according to the following scheme [see *LU*, p. 368; also pp. 765, 863, 918, 1779]: A A V<sub>1</sub> V<sub>2</sub> A V<sub>3</sub> V<sub>4</sub> A' V<sub>5</sub> V<sub>6</sub> V<sub>7</sub> A V<sub>8</sub> V<sub>9</sub> A' V<sub>10</sub> V<sub>11</sub> A D A' A. (A is the antiphon *Christus natus est nobis, Venite adoremus*; A' stands for the second half alone; the verses of the Latin text [here, the Itala Bible] do not always agree with the divisions of the English version). A similarly extended structure (A V<sub>1</sub> A V<sub>2</sub> A V<sub>3</sub> A D<sub>1</sub> A D<sub>2</sub> A) occurs in the antiphon *Lumen ad revelationem gentium*, sung in alternation with the verses of the canticle *Nunc dimittis* during the distribution of the candles on the feast of Purification [*LU*, p. 1357].

Aside from such special chants, there are four standard types of chant that are considered derivatives of antiphonal psalmody, the Office psalms and the \*Introit, \*Offertory, and \*Communion of the Mass. The Office psalms are complete psalms sung to a psalm tone (the same for each verse) and introduced and closed by a short antiphon: A V<sub>1</sub> V<sub>2</sub> etc. V<sub>n</sub> A [see *Psalm tones*]. The form of the Introit is A V D A (D is the Lesser Doxology; see above). In the Offertory and Communion the verse has been entirely lost, so that only the antiphon remains. In the *Ordo Romanus primus* from c. 775 both Introit and Communion are described as consisting of several verses sung in alternation with the antiphon, the doxology appearing in the middle rather than at the end. The Offertories had one, two, or three verses as late as the 11th or 12th century [see C. Ott, *Offertoriale sive versus offertoriorum*]. See *ApGC*, pp. 179ff; H. Avenary, "Formal Structure of Psalms and Canticles in Early Jewish and Christian Chant" (*MD vii*).

**Psalm tones.** In Gregorian chant, the recitation melodies used for singing (complete) psalms during the Office [see *Psalmody III*]. There are eight such tones, one for each church mode, and all in the character of an inflected \*monotone. The main note of the recitation, called *tenor* (*repercussio, tuba*, reciting note), is always the fifth degree of the mode [see *Church modes II*]. In

Ps. 1 (tonus 1.D)

intonation tenor flexa tenor mediatio

accordance with the binary structure of the psalm verses, the psalm tone falls into halves, the first half consisting of intonation, tenor, and mediation, and the second of tenor and termination. If the first half is too long to be sung in one breath, there is another slight inflection at the breathing point, the *flexa*. The accompanying example (verse 1 of Ps. 1: *Beatus vir, qui non abiit in consilio impiorum, et in via peccatorum non stetit, et in cathedra pestilentiae non sedit*; see *LU*, p. 923) shows all these details.

Each psalm is sung with an enframing \*anti-

phon that occurs in full at the end and is reduced to its first word or two (incipit only) at the beginning, except on greater feasts ("Doubles"), when the whole antiphon is sung before as well as after. The antiphon determines not only the psalm tone, which must be in the same mode as the antiphon, but also its termination, for which a number of different formulas called *differentiae* (differences) are provided. The one to be chosen is designed so as to lead back smoothly to the initial note of the antiphon, as sung after the last verse of the psalm. It is indicated, e.g., as follows: Ant. 8.c (mode 8 with the ending on c). Since the *Gloria patri . . . seculorum amen* [see Doxology] invariably serves as a last verse of the psalm, the liturgical books give the *differentia* with the syllables \*E u o u a e (= *seculorum Amen*). The antiphon *Beatus populus* with some verses of Psalm 143 serves as an example (note that the intonation is sung only with the first psalm verse). See also *HAM*, no. 11.

An exceptional psalm tone is the *tonus peregrinus*, which has different tenors for its first and second halves. It is used for the psalm *In exitu Israel* [LU, p. 160]. See H. Gaïsser, in *TG* vii, p. 129. For *tonus directaneus* see Psalmody I.

**Psalmus idioticus** [L.]. A literary production of the 3rd and 4th centuries consisting of texts written in imitation of the psalms. Among the few surviving examples are the Gloria of the Mass, the Te Deum, and the "Exsultet" [see *Praeconium paschale*].

**Psalter.** Name for the Book of Psalms translated into the vernacular (English, French, Dutch Psalter), frequently in rhymed versions (metrical

Psalter) and provided with music for congregational singing [for a Psalter of the 3rd century, see Hymn I]. Collections of prose psalms set to \*Anglican chant are also known as psalters.

For all branches of the Christian faith as well as for Judaism, the Book of Psalms has been a perennial resource. It was natural, therefore, that the Reformed Churches should, with one exception (the German), turn to it for texts. The earliest and most influential of the psalters was the French or Genevan Psalter, begun in Strasbourg in 1539 and completed, with metrical versions by Marot and Bèze and music by Bourgeois, in Geneva in 1562. Bourgeois adapted existing melodies, some of them from secular sources, and composed others to fit the various meters. In conformity with the Protestant trend toward musical simplification, the settings are almost uniformly one note to a syllable. Calvin opposed the setting of psalter melodies in parts, but it was inevitable, of course, that they should be so treated. Among the composers who contributed part settings of the French Psalter were Bourgeois (1547, 1560), Goudimel (1564, 1565), Claude Le Jeune (1564; also settings in \**vers mesuré*, 1606), Mauduit, and the Dutchman Sweelinck (1604–21). Ex. in *HAM*, nos. 126, 132.

The Dutch Psalter is represented by the \*Souterliedekens collections of 1540 (S. Cock) and 1556–57 (Susato). In 1566 the French Psalter was adopted in the Netherlands, replacing the Dutch versions.

During the persecutions under Queen Mary, about the middle of the 16th century, many English Protestants fled to Geneva, where they came under the influence of the French Psalter. As a result, the so-called Anglo-Genevan Psalter was published with the help of both Englishmen and Scots. The French style is strongly represented in this work, and even after the refugees returned to Britain the Scottish Psalter of 1564 perpetuated the French influence, whereas the English Psalter pursued a quite different course with regard to both verse and music. Among the better-known English Psalters are the "Old Version" of Sternhold and Hopkins, completed and published by Day in 1562; Ravenscroft (1621); Playford (1671; another in 1673); and the "New Version" of Tate and Brady (1696). The English type of psalm tune consists of a number of shorter notes between two longer ones. Such a fixed pattern tends, after many repetitions, to be monotonous, and it compares most unfavorably with the free-flowing and infinitely varied melodies of the French prototype.

Another group of refugees came under the influence of the French form, this time in Amsterdam, where Henry Ainsworth in 1612 brought out a Psalter for the benefit of the English "Separatists" called The Ainsworth Psalter. Thence it traveled to America with the Pilgrims in 1620. Its hold on its devotees must have been remarkable, for though the highly influential \*Bay Psalm Book appeared in 1640, Ainsworth's Psalter was not entirely displaced for many years thereafter.

In the early 18th century in both England and America, the grace or ornament became popular in psalm singing. Clerical protests against this practice are similar to other attempts in music history to preserve a medium that was becoming outmoded. The music of the Psalter was, if praiseworthy for its dignity, very monotonous. Aside from the fact that the pace was probably painfully slow, the custom of "lining out" disrupted the sense of the text and destroyed musical continuity. In the 18th century the \*hymn began to make its way among English-speaking Protestant congregations. Its eventual adoption with a corresponding neglect of psalm singing was neither completely profitable nor wholly to be deplored. However, Scottish devotion to the Psalter remained so strong that not until 1861 did the Established Church of Scotland authorize the singing of hymns.

A.T.D.

**Psaltery.** A class of ancient and medieval instruments (also called \*zithers) consisting of a flat soundboard over which a number of strings are stretched. They are plucked with the fingers or a plectrum. This manner of playing distinguishes the psaltery from the \*dulcimer, which is struck with hammers. In the general classification of instruments, the term is used for a group that includes, among others, the harpsichord, a keyed psaltery [see Instruments IV, A, 1, a].

The name *psalterion* is encountered in Greek literature, probably meaning a harp [see *SaHMI*, p. 136, also p. 115f]. In a letter attributed to St. Jerome (c. 330–420) a *psalterium decacordum* (ten-stringed psaltery) depicted in the shape of a rectangle is interpreted symbolically, the strings representing the Ten Commandments and the sides of the frame the four Gospels. From the 14th to 16th centuries psalteries of various shapes were used. One of the most common was shaped like a symmetrical trapezoid, sometimes with the slanting sides curved inward. Such instruments were called *caño* or *canon*, after their Arab model, the \**kanun*. Another type, shaped like half of a trapezoid, was called *medio canon* or *micanon* (sometimes corrupted into *medicinale*). This shape, which persisted in the winged form of the harpsichord and piano, slightly resembled a pig's head and so was called *istromento di porco* by M. Praetorius (*Organographia*, 1619). Among the more recent types of psaltery are the Austrian \*zither and Finnish kantele. See also Bell harp. See ill. under Zither.

**Psychology of music.** The study of the relationship of music to the human mind. From very early times people have been aware of such a relationship and have described in more or less definite terms how the human mind is affected by music [see Affections]. Specifically the term applies to a relatively new field involving the use of scientific methods of investigation. The first impulse for such studies came from Helmholtz' *On the Sensation of Tones* (*Die Lehre von den Tonempfindungen*, 1863), primarily a physiological study. Carl Stumpf (1848–1936) was the first to apply the scientific method (experiments, tests, statistics) to musical-psychological phenomena—particularly to the problem of consonance and dissonance—in his *Tonpsychologie* (2 vols., 1883, '90) and other publications. Another important step was taken by Ernst Kurth who, in his *Musikpsychologie* [1931], proceeded from the "psychology of tone" to a more penetrating "psychology of music" based not

only on the perceptive but also on the interpretative faculties of the human mind (*Gestaltlehre*, psychological dynamics, tension, anticipation, etc.). Stumpf's experimental approach to the problem was continued and enlarged by G. Révész, C. E. Seashore, A. Wellek, and many others.

Among the main fields of research today are: sound perception, especially the problem presented by the phenomenon of the \*octave; consonance and dissonance (Stumpf's theory of *Tonverschmelzung*; see Consonance, dissonance I d); \*absolute pitch; \*key characteristics; tone and color synesthesia [see Color and music]; musical talent and aptitude [see Tests and measurements in music]; special aptitudes of the child prodigy, the blind, the deaf; heredity and musical talent; \*music therapy; reading of music; and sexual and psychoanalytical aspects of music.

**Public school music.** See Music education in the United States II. See also article in O. Thompson, *The International Encyclopedia of Music and Musicians* (1939), bibl. pp. 2270ff.

**Publishing, music.** Music publishing began with Octavianus Scotus of Venice, who in 1481 printed the first *Missale Romanum* with music, and Ottaviano dei Petrucci of Venice, who in 1498 obtained from the Seignory a twenty years' monopoly on the printing of music (other than plainsong). Petrucci's first publication was the famous \**Odhecaton* of 1501, which was followed by a score of important books of Masses, motets,

and *frottole*. Thirty years later, Pierre Attaignant founded a publishing house at Paris, which from 1528 to 1550 issued books of lute music, organ music, motets, Masses, and thirty-five books of chansons. In the latter part of the 16th century, as a result of generally improving economic conditions and the increase in music production and consumption, quite a number of music publishers were at work: The Gardano firm in Venice (1538–1685); Verovio in Rome (1586–1608; the first publisher of engraved music; see Printing of music); Jacques Moderne at Lyons (1532–67); Christophe Plantin at Antwerp (1578–1639); Nicolas du Chemin at Paris (1549–76); Pierre Phalèse at Louvain, later Antwerp (1545–1674); Tielman Susato at Antwerp (1543–60 and later); and the firm of Ballard and Le Roy at Paris, which, founded in 1551, continued to exist until c. 1814, using its first type for more than 200 years. In England Tallis and Byrd were granted a monopoly on music printing in 1575, which in 1598 was transferred to Morley. The publishing, however, was done by Thomas and Michael East, who issued practically all the books of English madrigals from 1587 till 1638. There followed Playford, from 1648 to 1700, and in the 18th century, the house of Walsh (c. 1695–1766), the first music publisher to use "high-pressure" methods, including a good deal of pirating [see Lit., Pincherle]. At the same time the house of Roger flourished in Amsterdam and that of Haffner in Nuremberg [see Haffner collection]. About 1750 the world-famous house of Breitkopf (later Breitkopf & Härtel) published its first music books, using a new typographic method that revolutionized the printing of music [see Printing of music (b)]. In 1773 the house of Schott (Mainz) was founded, which together with Artaria (1778, Vienna) published many of Beethoven's works. There followed Simrock of Berlin (1790), Peters of Leipzig (1814), Bote and Bock of Berlin (1838), and Steingräber of Leipzig (1878). Modern music publishing in England started with Novello (1811) and continued with Augener (1853), Chester (1860), and numerous others.

Music publishing in the United States began in the last two decades of the 18th century. Publishing houses known to have existed before 1790 include John Aitken (1785), Thomas Dobson (1785), and Alexander Reinagle (1787), in Philadelphia; and Thomas Dobson (1787) and George Gilfert (1787) in New York. In the following decade about twenty more names were added to the list, e.g., Joseph Carr (1794) in Baltimore, and

G. Graupner (1800) in Boston. [See H. Dichter and E. Shapiro, *Early American Sheet Music* (1941), pp. 165ff.] The first publishing house of importance was Ditson in Boston (1835). There followed Schirmer (Beer & Schirmer, 1861; Schirmer, 1866), and Carl Fischer (1872) of New York, Theodore Presser (1884) of Philadelphia, and many others.

**Puerto Rico.** Material concerning Puerto Rico's four and one-half centuries of music history (since its discovery in 1493) deals mainly with folk music. Early 16th-century chroniclers report performances of a dance called *el Puertorrico* in Peru, Chile, and other South American Spanish colonies. This was most likely the forerunner of the *\*seis*, a dance familiar to the islanders during the 16th, 17th, and 18th centuries. Further evolution of this form resulted in the *contradanza* [see

*Contredanse*], which has inspired many composers from the 19th century to the present. Among the earliest of them were Aurelio Dueño (d. 1870) and Carlos Segnet (c. 1837-87). By the end of the 19th century this dance showed the additional influences of both Italian opera and French romanticism, and, in the hands of such composers as Manuel Gregorio Tavárez (1843-83), it became a stylized form used by such composers as Julian Andino (1845-1926), Casimiro Duchesne (1852-1906), and Federico Ramos (1857-1927).

The most famous 19th-century Puerto Rican composer is Juan Morel Campos (1857-96), whose creative output went far beyond the *contradanza*, including music for the church, theater, and instrumental ensembles. He also helped train a large number of composers who reflected his influence in their cultivation of the *danza puertorriqueña*; the most prominent of these were Juan Peña Reyes (1898-1948), Juan Rios Ovalle (c. 1863-1928), and Juan F. Acosta (b. 1893). Their contemporaries and successors, Braulio Dueño Colón (1854-1934), Jesús Figueroa (b. 1878), José E. Pedreira (1904-59), Narciso Figueroa (b. 1906), and José J. Quintón (1881-1925), also produced major forms, especially chamber music and solo instrumental music.

Puerto Rico's 20th-century music still reflects the influences of the traditional dance forms, even in abstract works by such composers as Amaury Veray (b. 1922), Russian-born Jack Delano (b. 1914), and Luis Antonio Ramírez (b. 1923). The best-known Puerto Rican contemporary composer is Hector Campos-Parsi (b. 1922), who studied in both the United States and France and whose works have won international recognition.

In addition to the traditional *\*seis* and *contradanza*, the *\*plena* and *sonduro* are exclusively Puerto Rican folk forms whose popularity equals that of the *\*guaracha*, *\*bolero*, *\*son*, and *\*punto*, all forms of Cuban origin that were adopted in Puerto Rico as a result of the continual contact between the two islands.

Puerto Rico also has an outstanding composer of popular songs, Rafael Hernández, who became well known in New York shortly after World War I.

J.O-S.

**Pui.** See *Puy*.

**Pulcinella.** Ballet by Stravinsky, produced in Paris, 1920. The music is a modern setting of

numerous passages from anonymous works formerly thought to be by the 18th-century composer Pergolesi. Many of the melodies are intact, while the accompaniment is cleverly altered into a sophisticated 20th-century idiom that is often \*pandiatonic. See Neoclassicism.

**Pumhart** [G.]. Old term for bombarde; see Oboe family III.

**Punctum.** (1) See under Neumes I. (2) Same as \**punctus*.

**Punctus** [L.]. (1) In \*mensural notation, a sign like the dot of modern notation and having the same meaning, but also having a function somewhat like that of the modern bar line. In its first meaning it is called *punctus additionis* or *augmentationis* and is used for binary (imperfect) notes to which it adds one-half of their value. In the latter meaning it is called *punctus divisionis* and is used only in triple meter (*tempus perfectum*, *prolatio perfecta*) in order to mark off groups of perfections (i.e., of three semibreves, or three minims) for the sake of clarity. In the accompanying example, the second, third, and fifth dots are *puncti additionis* while the others are *puncti divisionis*.

The system of *puncti* has been unnecessarily complicated by early theorists who deal in detail with a number of other *puncti*, such as *punctus perfectionis*, *imperfectiois*, *alterationis*, *syncoptionis*, etc. Unfortunately these unnecessary complications have been perpetuated by modern writers. Especially misleading is the "simplified" explanation [see S. T. Warner, in *PMA* xlv] that distinguishes only between the *punctus divisionis* and *punctus perfectionis*, since a further distinction must be made between the *punctus perfectionis* in perfect mensuration and the *punctus perfectionis*—properly, *additionis*—in imperfect mensuration. For a fuller explanation, see *ApNPM*, *passim*.

(2) In the \**estampies* of the 13th and 14th centuries the various sections, each of which is repeated, are called *punctus* (*primus punctus*, *secundus punctus*, etc.).

**Punta, punto** [It.]. Point. *A punta d'arco*, with the point of the bow (of the violin); *punto d'organo*, the pause and its sign.

**Punto** [Sp.]. Gay rural Cuban folksong of Spanish origin, usually sung to the accompaniment of the \**bandurria* and \**claves*. It is generally in 3/4 meter unexpectedly alternating with 6/8, and rarely in 2/4 meter with occasional shifts to 3/4 and 6/8. It has a short melody that is repeated for each line of a quatrain, alternating with short instrumental interludes. The music is always in the major mode, with seventh chords predominating over the tonic. Freedom of expression and use of descending vocal portamentos are characteristic of the form. J.O-S.

**Purajhei.** Paraguayan folksong that musically reflects strong European 19th-century influences but is sung to Guaraní texts, whose euphonic character gives the songs a highly individual, flowing sweetness. J.O-S.

**Purfling.** The inlaid border of violins, etc., consisting of three small slips of wood, the middle one black, the other two white. Besides its ornamental value, it helps prevent chipping of the edges.

**Puritani di Scozia, I** [It., The Puritans of Scotland]. Opera in three acts by Bellini (libretto by C. Pepoli, based on a play by F. Ancelot and X. B. Saintine), produced in Paris, 1835. Setting: near Plymouth, during the English Civil War.

**Puritans and music.** See under United States. Also see P. Scholes, *The Puritans and Their Music in England and New England* (1934); W. S. Pratt, *The Music of the Pilgrims* (1901).

**Puy, pui.** Name for medieval French societies that sponsored literary and musical festivals, held regularly with competitions and prizes. They are documented as far back as the 11th century (earliest troubadours) and existed as late as the 16th century. The most famous was the *Puy d'Évreux*, held annually on St. Cecilia's Day from 1570 till 1614 (founded by Guillaume Costeley and others). Among its laureates (*roy du puy*) were Orlando di Lasso, Titelouze, and Du Caurroy. The *puy*s of the troubadours served as a model for similar competitions of the German minnesingers, such as the "Sängerkrieg auf der Wartburg," which Wagner used as the basis for *Tannhäuser*. See also Meistersinger III; Tenso.

**Puzzle canon.** Riddle canon [see Canon II].

**Pyiba, pyipar** (*p'i-pa, p'i-p'a*). A Chinese pear-shaped short lute with a rather flat body and four strings [see ill. under Lute], usually tuned A-d-e-a. On the traditional model the frets, when pressed over the A-string will produce the notes B-c-c#-d-e-f-f#-g-a-b-c+-d'-e'-f#'-g+-a'. The pyiba player uses a variety of finger techniques. Some distinctive features of pyiba music are the sustained rolls on one or more strings, the long portamento, the gradual crescendo and decrescendo, and numerous kinds of percussive effect. The repertory ranges from pieces expressing deep pathos to comical parodies.

The name pyiba was used in the 3rd century for a hand-plucked stringed instrument with a long neck and round body. In the 6th century a short lute with a crooked neck, played with a large plectrum, was introduced into China from the Middle East. This instrument survives in its original form in the present-day *biwa* of Japan, where 8th-century specimens can still be seen. In China, it went through modifications in shape and arrangement of the frets. It is now played mainly with the fingers instead of a plectrum. The pyiba figured prominently in T'ang (T'ang) dynasty (618-906) orchestras. It was also used to accompany songs and dances and as a solo instrument. Numerous romantic anecdotes and poems have been written about it. Unlike the \*chyn, which traditionally belongs to the scholars and philosophers, the pyiba has always been associated with popular entertainment. Today, the pyiba is played as a solo instrument, in instrumental ensembles, and as accompaniment to singing in certain theatrical performances. Although it has popular appeal, its demanding technique keeps it from being readily accessible to dilettantes and amateurs.

Since the 1920's there have been serious efforts to revive interest in the pyiba. A notable exponent was Liou Tianhwa (1895-1932), a virtuoso pyiba player and composer of a few widely known pieces for it. Other outstanding contemporary players today are Lii Tyngsong, Tsaur Anher, Suen Peirjang, Leu Jennyuan (Lui Tsun-yuen), and Leu Peiryuan. One result of the revival has been a change in the positions of some of the frets; on the newer models they have been rearranged to produce a complete chromatic scale.

As far as is known, there are about ten pyiba music collections in existence. Most of these have been published, the earliest in 1819. Besides descriptive pieces, they also include lengthy

works in the form of a medley or variations on a theme or on a group of thematic materials. The traditional notation for the pyiba consists of pitch symbols and abbreviated Chinese characters indicating the finger techniques. In all these collections, beats indicating larger units of time are given. At the beginning of the 20th century, a manuscript with twenty-five pyiba compositions dating from sometime before the mid-10th century was discovered in the Duenhwang caves of northwest China. The notation is a tablature indicating strings and frets closely related to the notation still used for the *biwa* and the mouth organ (*shō*) in *gagaku* today.

Kishibe, "Origin of the P'i-pa" (*Transactions of the Asiatic Society of Japan* xv [1940], pp. 259-304); L. Picken, "Origin of the Short Lute" (*GSJ* viii, 32ff); *SaHMI*, pp. 189ff.

R.C.P.

**Pyknon** [Gr.]. In the ancient Greek scale [see Greece II], the lower segment of the enharmonic and chromatic tetrachords, containing the two microtones or semitones. In either case, this segment was smaller than the interval above it. Its three notes were sometimes described (in descending order) as *oxypyknon*, *mesopyknon*, and *barypyknon*. The theory of Sachs, connecting these notes with a fixed pentatonic tuning of the lyre and with the structure of Greek notation, is dubious [see Greece IV], though it is generally possible that these and other notes were rendered on the lyre by stopping strings.

I.H.

**Pythagorean hammers.** Pythagoras is said to have discovered the basic laws of music by listening to the sound of four smith's hammers, which produced agreeable consonances. They turned out to weigh 12, 9, 8, and 6 pounds respectively. From these figures he derived the octave (12:6 = 2:1), fifth (12:8 = 3:2), fourth (12:9 = 4:3) and whole tone (9:8). See, e.g., Guido's "Micrologus," ch. xx (ed. Smits van Waesberghe, p. 228).

**Pythagorean scale.** A scale, said to have been invented by Pythagoras (c. 550 B.C.), that derives all the tones from the interval of the pure fifth,  $\frac{3}{2}$  [see Acoustics III]. The tones of the diatonic scale are obtained as a series of five successive upper fifths and one lower fifth:

$$\begin{array}{ccccccc} F & c & g & d' & a' & e'' & b'' \\ \frac{2}{3} & 1 & \frac{3}{2} & \left(\frac{3}{2}\right)^2 & \left(\frac{3}{2}\right)^3 & \left(\frac{3}{2}\right)^4 & \left(\frac{3}{2}\right)^5 \end{array}$$

By reducing these tones to a single octave (c-b), the following scale results:

$$\text{Frequency: } 1 \quad \frac{9}{8} \quad \frac{81}{64} \quad \frac{4}{3} \quad \frac{3}{2} \quad \frac{27}{16} \quad \frac{243}{128} \quad 2$$

$$\text{Intervals: } \frac{9}{8} \quad \frac{9}{8} \quad \frac{256}{243} \quad \frac{9}{8} \quad \frac{9}{8} \quad \frac{9}{8} \quad \frac{256}{243}$$

[For the calculation of the frequencies and intervals, see Intervals, calculation of, I-III; see also the tables under Intervals and under Temperament.] The Pythagorean whole tone is slightly larger than that of the well-tempered scale (204 cents instead of 200), while the semitone is considerably smaller (90 instead of 100). Likewise, the Pythagorean third is 8 cents higher than the well-tempered third, which in turn is higher than the "pure" third (408, 400, and 386 cents).

The Pythagorean semitone was called *limma* (left over) or *diesis* (difference) because it was obtained by subtracting two whole tones from the fourth. Like all tones of the Pythagorean system, it can be represented by powers of 3 and 2:

*diesis*

$$\frac{2^2}{3} : \left(\frac{3^2}{2^3}\right)^2 = \frac{2^2}{3} \times \frac{2^6}{3^4} = \frac{2^8}{3^5} = \frac{256}{243} = 90 \text{ cents}$$

The difference between the whole tone and the semitone was called *apotome* (cut off). Its value is:

*apotome*

$$\frac{3^2}{2^3} : \frac{2^8}{3^5} = \frac{3^2}{2^3} \times \frac{3^5}{2^8} = \frac{3^7}{2^{11}} = \frac{2187}{2048} = 114 \text{ cents}$$

In the Greek scale it appears as the interval between b-flat and b natural. It is slightly larger than the *diesis*. In medieval theory these two semitones were distinguished as *semitonium majus* (*apotome*) and *semitonium minus* (*diesis*). Their difference—or that between the whole tone and two *dieses*—is the Pythagorean comma:

*comma*

$$\frac{3^7}{2^{11}} : \frac{2^8}{3^5} = \frac{3^7}{2^{11}} \times \frac{3^5}{2^8} = \frac{3^{12}}{2^{19}} = \frac{531441}{524288} = 23 \text{ cents}$$

The accompanying diagram illustrates the processes just described.

*a* = *apotome*. *c* = *comma*. *d* = *diesis* (*limma*).

The succession of Pythagorean fifths can be continued beyond the tone b, leading to chromatic tones f#, c#, etc., and finally to b##, which is slightly higher than c, the interval between the two pitches again being the Pythagorean comma of  $\frac{3^{12}}{2^{19}}$  (the ratio of 12 fifths to 7 octaves). See under Circle of fifths. The Pythagorean system was also known in China [see China II], possibly earlier than in Greece [see F. Kuttner, in *CP* 1958, p. 174]. See E. Krenek, "Proportionen und pythagoräische Hämmer" (*Musica* xiv, 708ff).

## Q

**Qānūn.** See Kanūn.

**Q.-L.** Customary abbr. for R. Eitner's *Quellen-Lexikon* [see under *RISM*].

**Quadran pavan.** English name (late 16th cent.) for the *\*passamezzo moderno*, used by Bull, Morley, and other Elizabethans, probably so called

because it was in the major mode using B natural (*B quadratum*) whereas the *passamezzo antico* was in the minor and used B-flat. See O. Gombosi, in *MQ* xxx, 145.

**Quadratnotation** [G.]. \*Square notation.

**Quadreble.** See under Sight.

**Quadrille** [F.]. (1) A French dance of the early 19th century performed by two or four couples moving in a square. It consisted of five figures (*Le Pantalon*, *L'Été*, *La Poule*, *La Trénise* and *La Pastourelle*, *Finale*), the music for which, alternating between 6/8 and 2/4 meter, was chosen from popular tunes, operatic airs, and even sacred music. The dance was very popular during the Napoleonic era and remained fashionable until it was replaced by the \*polka. (2) In 17th- and 18th-century French ballet (Campra, Lully), *quadrille* is the name of the group of dancers (4, 6, 8, or 12) who performed the figures of an \*entrée. See Dance music IV.

**Quadrivium**. In the medieval system of education, the four "mathematical arts"—arithmetic, geometry, music, and astronomy—as opposed to the *trivium* of "rhetorical arts"—grammar, logic, and rhetoric. In this scheme music was not considered an art in the modern sense but a science allied with mathematics and physics (acoustics).

**Quadruple counterpoint**. See Invertible counterpoint.

**Quadruple-croche** [F.]. See under Notes.

**Quadruple fugue**. A fugue with four different subjects, such as the last (unfinished) piece of Bach's \**Art of Fugue*. See Double fugue.

**Quadruple meter, time**. See Meter.

**Quadruplet**. A group of four notes, to be played in the time of three.

**Quadruplum**. See Duplum.

**Quality**. (1) Tone quality; see Tone color. (2) As opposed to quantity, see Poetic meter III.

**Quantity**. See under Poetic meter III.

**Quarrel of the Buffoons**. See War of the Buffoons.

**Quart, Quarte** [G.]. The interval of the fourth. As a prefix in the names of instruments, it indicates that the instrument is a fourth higher (*Quartflöte*, *Quartgeige*) or a fourth lower (*Quartfagott*; see Oboe family II, D) than the normal instrument.

**Quartal harmony**. Term for a harmonic system based on the \*fourth, as distinguished from the common system of \*tertian harmony, based on the third. Quartal harmonies have been recommended for replacing tertian harmonies in harmonizations of Gregorian chant [see J. Yasser,

*Mediaeval Quartal Harmony* (1938); also in *MQ* xxiii, xxiv]. See Accompaniment V.

**Quarter note**. See under Notes.

**Quarter tone**. An interval equal to one-half semitone, there being twenty-four quarter tones to the octave. See Microtone. Quarter tones have been frequently used since World War II by serial composers such as Boulez, Stockhausen, and others. Boulez has demonstrated how a serial principle of organization, which can be generalized to any number of elements (i.e., not necessarily restricted to the twelve chromatic semitones), can accommodate quarter tones. See P. Boulez, *Penser la musique aujourd'hui* [1964]; *id.*, "Eventuellement . . ." (*RM* 1952, no. 212). Also see under Microtone. E.S.

**Quartet** [F. *quatuor*; G. *Quartett*; It. *quartetto*; Sp. *cuarteto*]. A composition for four instruments or voices. Also, the four performers organized to play or sing such compositions. By far the most important combination is the \*string quartet. A number of piano quartets (for piano, violin, viola, and cello) have been written: 2 by Mozart, 4 by Beethoven, 3 by Mendelssohn, 2 by Schumann, 3 by Brahms, 2 by Dvořák, 2 by Fauré, 1 by Chaussou, 1 by Copland, etc. See J. Saam, *Zur Geschichte des Klavierquartetts* (1933); W. Altmann, *Handbuch für Klavierquartettspieler* (1937).

The "vocal quartet," i.e., a polyphonic composition for four voices, was established c. 1450 by the early Flemish composers, although there are isolated earlier examples, such as Perotinus' *organa quadrupla* [see Organum; *Ars antiqua*] and Machaut's Mass. Much of the music of the 16th century (motets, Masses, madrigals, chansons, etc.) is written in four parts, although there was a tendency toward increasing the number of parts to five, six, and more. In the 17th century four-part writing was limited chiefly to the English \*glee and the German \*chorale. In the 19th century the *a cappella* quartet was extensively cultivated by glee clubs, *Liedertafel*, etc. Four-part writing has traditionally served as the basis for studies in harmony and counterpoint.

**Quartfagott, Quartflöte, Quartgeige** [G.]. See under Quart; also Violin family (a).

**Quartole** [G.], **quartolet** [F.]. \*Quadruplet.

**Quartsextakkord** [G.]. The second inversion of the triad (six-four chord).

**Quatreble**. See under Sight.

**Quattro** [It.]. Four. *Quattro mani*, four hands; *quattro voci*, four voices.

**Quatuor** [F.]. \*Quartet.

**Quaver**. See under Notes.

**Queen, The**. See *Reine, La*.

**Queen of Spades, The** [Rus. *Pikovaya Dama*]. Opera in three acts by P. Tchaikovsky (libretto by M. Tchaikovsky, rev. by the composer, based on a story by Pushkin), produced in St. Petersburg, 1890. Setting: St. Petersburg, end of the 18th century.

**Quempas**. Abbr. for L. *Quem pastores laudavere* (He, whom the shepherds praised), a Christmas song that was popular in Germany in the 16th century. The term was used as a generic designation for Christmas songs, particularly in the term *Quempas Singen*, i.e., the singing of carols by students in Latin schools, an activity in which Luther participated. The alms earned by singing from house to house were often a welcome addition to a student's meager income [see *Currende*]. *Quempasheft* was the collection of carols that every student copied for himself.

**Quer-** [G.]. Cross, transverse. *Querflöte* (transverse) flute; *Querpfefe*, fife; *Querstand*, false relation.

**Querelle des bouffons** [F.]. See War of the Buffoons.

**Queue** [F.]. The stem of a note. *Piano à queue*, grand piano.

**Quick-step**. In military parlance, a \*march in quick steps (c. 108 per minute). Also, music for such a march.

**Quiebro**. See under Ornamentation I.

**Quilisma** [L.]. The most important of the early "ornamental" neumes; see Neumes I (table). See C. Vivell, in *Gregorianische Rundschau* iv, v (several installments); *ApGC*, pp. 113ff.

**Quilt canzona**. English equivalent of G. *Flickkanzone* (patch canzona), a term introduced by H. Riemann for a type of canzona consisting of rapidly changing, extremely short sections in contrasting styles. An example of this relatively rare type is a canzona by J. H. Schein [see comp. ed. by Prüfer, i, 41]. For another example, by G. B. Grillo (1608), see *RiHM* ii.2, 127.

**Quindezime** [G.]. The interval of the fifteenth, i.e., the double octave.

**Quinta falsa** [L.]. False (i.e., diminished) fifth.

**Quinta vox** [L.]. See under Part (2); Partbooks.

**Quinte** [F.]. (1) Interval of the fifth. (2) Obsolete French name for viola (*quinte de viole*).

**Quinte, Quint** [G.]. Fifth. *Quintenparallelen*, parallel fifths. *Quintenzirkel*, \*circle of fifths.

**Quintern** [G.]. A 16th- and 17th-century name for the guitar or similar instruments. See K. Geiringer, in *AMW* vi.

**Quintet** [F. *quintette*, formerly *quintuor*; G. *Quintett*; It. *quintetto*; Sp. *quinteto*]. Chamber music for five players. The string quintet is usually for two violins, two violas, and cello (the repertory includes 12 by Boccherini, 6 by Mozart, 3 by Beethoven, 2 by Mendelssohn, 2 by Brahms, 1 by Bruckner, 1 by Vaughan Williams, etc.). The less usual combination of two violins, viola, and two cellos prevailed in Boccherini (113) but survived only in Schubert's famous Quintet in C, op. 163. A piano (clarinet, etc.) quintet is a composition for piano (clarinet, etc.) and string quartet. The literature of piano quintets includes Schubert's op. 114 (Trout Quintet, for piano, violin, viola, cello, double bass), Schumann's op. 44, Brahms' op. 34, and compositions by Dvořák, Franck, Reger, Pfitzner, Fauré, Elgar, Hindemith, Bloch (in quarter tones), Shostakovitch, *et al.* See W. Altmann, *Handbuch für Klavierquintettspieler* (1936).

Vocal quintets are usually for two sopranos, alto, tenor, and bass. There is a large literature of vocal music in five parts in the madrigals, *balletti*, etc., of the late 16th century (Lasso, Lechner, English madrigalists).

**Quintfagott** [G.]. See under Oboe family II, C.

**Quintierend** [G.]. See under Wind instruments III.

**Quintole** [G.], **quintolet** [F.]. Quintuplet.

**Quinton** [F.]. According to some authorities (Sachs, Bessaraboff), a violin with five (instead of four) strings tuned g d' a' d'' g''; according to others, a French 17th-century viol (*pardessus de viole*) with five (instead of six) strings tuned g c' e' a' d''.

**Quintoyer** [F.]. See under Wind instruments III.

**Quintsaite** [G.]. E-string of the violin.

**Quintsextakkord** [G.]. Six-five chord; see under Seventh chord.

**Quintuor** [F.]. Old name for quintet.

**Quintuple meter.** The measure of five beats. Quintuple meter can usually be considered a compound of 2/4 and 3/4, or, less frequently, of 3/4 and 2/4. Examples are found in Chopin's Sonata op. 4, Tchaikovsky's Symphony no. 6 [Ex. 1], Wagner's *Tristan*, Act III, Scene 2 [Ex. 2], and K. Loewe's ballad "Prinz Eugen." Quintuple meter is used very frequently in 20th-century music, e.g., in Rachmaninoff's *The Isle of the Dead* (1909).

Quintuple meter was known in ancient Greek music as Cretic meter [see the "First Delphic Hymn," *HAM*, no. 7a]. In Western polyphony it appeared in the late 14th century, resulting from the juxtaposition of a perfect and an imperfect value (black and white *semibrevis*; see the anonymous *Fortune* discussed in *ApNPM*, p. 400f). In the Sanctus of Isaac's *Missa paschalis* the same rhythm is expressed by half-blackened breves, each equal to a black plus a white *semibrevis* [see *WoHN* i, 420]. Sequential passages based on five-beat patterns are not uncommon in the works of Obrecht and Isaac. In all these instances quintuple meter is used in one part only and therefore is likely to be obscured by the regular pulse of the other parts. One of the earliest compositions written entirely in quintuple time ( $5 = 4 + 1$ ) is a "Felix namque" in the English MS Brit. Mus. Roy. App. 56 (c. 1530). Other examples are found in Spanish music, e.g., in several pieces in the *Cancionero de Palacio* of c. 1500 (\*Editions XXXII, 5; see nos. 59, 102, 151, probably not correctly transcribed by Anglés), in the *tientos* of Correa de Araujo, 1626 (\*Editions XXXII, 12, p. 31), and in the \*zortziko.

**Quintuplet.** A group of five notes played in the duration of (normally) four.

**Quire.** Obsolete spelling for choir.

**Qui tollis** [L.]. Section of the \*Agnus Dei of the Mass [see under Mass]. Medieval settings of the Agnus Dei frequently begin with these words, the initial words being sung in plainsong.

**Quodlibet** [L.]. A humorous type of music in which well-known melodies or texts are combined in an advisedly incongruous manner. The following types can be distinguished:

1. *The polyphonic quodlibet.* In this type, by far the most interesting one, different melodies or snatches of melodies are used simultaneously in different voice-parts of a polyphonic composition. This method appears in some 13th-century motets, in which refrains of trouvère songs occur in the upper voice against the liturgical melody (borrowed from Gregorian chant) in the tenor [see Refrain III; also Motet II]. A particularly interesting example is no. 178 of the Codex Montpelier. In the 15th and 16th centuries numerous quodlibets were written in which different folk tunes are combined contrapuntally, the only license being that the time values may be lengthened or shortened according to the requirements of consonance. One of the earliest examples, in the Glogauer Liederbuch of c. 1480 [see Liederbuch], contrasts the then famous "O rosa bella" melody with snatches of German folksongs [see *HAM*, nos. 80, 82]. A composition by Tinctoris (*Proportionale musices*; CS iv, 173) combines fragments of "O rosa bella," "L'Homme armé," "Robinet tu m'as la mort donné," and other material. Several quodlibets are found in the Chansonier of Seville [see D. Plamenac, in *MQ* xxxvii, xxxviii]. An outstanding composer of quodlibets was Ludwig Senfl [see *SchGMB*, no. 85], and comprehensive collections were published by Wolfgang Schmelzl (*Guter, seltzamer und künstreicher deutscher Gesang*, 1544) and Melchior Franck (*Musicalischer Grillenvertreiber*, 1622). These pieces proved extremely valuable sources of 16th-century German folksong [see Lied II]. The best-known example of this type is the final variation of Bach's \*Goldberg Variations, in which two popular melodies of his day, "Ich bin so lang nicht bei dir g'west" (Long have I been away from thee) and "Kraut und Rüben" (Cabbage and turnips) are artfully combined within the harmonic frame of the theme [see Ex.].

(a) Ich bin so lang nicht bei dir g'west

(b) Kraut und Rüben

ha-ben mich ver-trie-ben

Of a more serious nature are *quodlibets* combining different liturgical melodies. Several examples are found in the *Mensuralkodex des Nikolaus Apel* [\*Editions XVIII A, 32], e.g., one combining the hymn "Exsultet caelum" with the antiphon "Vos eritis" (no. 12). Particularly famous is a motet by Gombert, which combines the "Salve Regina," "Ave Regina," "Alma redemptoris mater," and four other chants [see *ReMR*, p. 345]. Its title, "Diversi diversa orant," reveals the prayerlike significance of the liturgical *quodlibet*. To the same category belongs a composition by Kindermann, based on three Protestant chorales [see *DTB* 32, p. 13].

II. *The successive quodlibet*. A simpler type of *quodlibet* is that in which various melodies are quoted in succession, as in a potpourri. This technique is used in several of the above-mentioned *quodlibets*, e.g., in the upper part of the motet from the Codex Montpellier and in the lower parts of the "O rosa bella" *quodlibet* from the Glogauer Liederbuch. Several compositions in the collections of Schmelzl and Franck also are of this type.

III. *The textual quodlibet*. The term *quodlibet* is also used for pieces that contain a mixture of borrowed texts without involving borrowed musical material. As in the musical *quodlibet*, the texts may occur simultaneously or successively. The polytextual motet of the 13th century is frequently cited as an example of textual *quodlibet*, but it should be observed that in all such motets (except in a special type, the refrain motet) the texts of the upper parts are not borrowed but freely invented, while the tenor has no full text but only an \*incipit. Clearer examples of the textual *quodlibet* are certain 15th-century

Masses mentioned in the entry Polytextuality and the motets by Josquin and Morales quoted under Motet B 1 (e.g., Josquin's *Stabat mater* with "Comme femme"). The text of a number of 18th-century pieces consists of a nonsensical succession of jocose and deliberately incongruous sentences. To this type belongs a *quodlibet* believed to be an early work of J. S. Bach's [pub. by M. Schneider, in *Veröffentlichungen der Neuen Bachgesellschaft*, xxxii.2]. It consists of a large number of short texts (the "seafaring allusions" mentioned by C. S. Terry in an article in *ML* xiv have a clearly obscene meaning) set to music evidently without using pre-existing melodies. Possibly this piece, rather than the truly polyphonic *quodlibet* from the Goldberg Variations, illustrates the "improvised *quodlibet* singing" that, according to K. P. E. Bach, was traditional in his family for many generations. Numerous examples of the same type are found in Valentin Rathgeber's *Tafelconfekt* of 1733 (\*Editions XVIII, A, 19). See also Moser, Lit.

Other terms for *quodlibet* are \*cento or centone, *fricassée* [F.], and *incatenatura* [It.]. The Italian terms *misticanza* and *messanza*, as well as the Spanish \*ensalada, seem to mean "potpourri" rather than *quodlibet*. See also Pasticcio. For *quodlibet* Mass, see Mass C, II, b.

Lit.: K. Jeppesen, in *CP* 1939 (Venetian *centone*); D. Plamenac, in *CP* Sachs (Seville Chansonier, *quodlibet*); R. Becherini, in *Collectanea historiae musicae i* (*incatenatura*); E. Bienenfeld in *SIM* vi (Schmelzl Liederbuch); K. Gudewill, in *CP* 1961 (origin); R. Eitner, in *MfM* viii, ix, Beilage (Germany, 15th–16th cent.); H. J. Moser, ‡*Corydon*, 2 vols. (1933).

## R

**R.** In early orchestral music, \**ripieno*; in French organ music, \**récit*; in Gregorian chant (**R**), \*responsoy.

**Rabab.** Arabic name for various bowed string instruments found in Islamic countries. They occur in various shapes, e.g., elongated boat,

halved pear, trapezoid, rectangle, etc., and usually have three strings. With the spread of Islam the rabab was carried both eastward, to Malaya and Indonesia (early 15th century), where it is called *rebab*, and westward, via Spain into Europe (8th or 9th cent.), where it was known as *rabec*, *rabeca*, *rebec*, *rebelle*, *ribibe*, *ribible* (Chau-

cer), *rubeba*, *rubèbe* (Machaut), *rybybe*, etc. Jerome of Moravia, in his "Tractatus de musica" (c. 1280), describes the rubeba as having two strings tuned a fifth apart and played with a bow [CS i, 152]. The most common European form was in the shape of an elongated pear and its most common name was *rebec*. In France it was used as late as the 18th century by street fiddlers, who were forbidden to use the violin. A genuine specimen, dating from the 15th century, is preserved in Bologna [see B. Disertori, in *RMI* xlii]. See ill. under Violin.

**Rabel.** See *Mejoranera*.

**Racket.** See under Oboe family III.

**Raddolcendo** [It.]. Becoming softer.

**Raddoppiare** [It.]. To double, usually at the lower octave.

**Radel** [G.]. A 14th-century name for a canon or \*round. See *ReMMA*, p. 377; also \*Rota (2).

**Radical bass.** Same as \*fundamental bass.

**Radio and television broadcasting.** Although radio broadcasting as a regular public service in the United States was inaugurated in November, 1920, it was not until large networks were established (National Broadcasting Company [NBC], 1926; Columbia Broadcasting System [CBS], 1927; and others) that broadcasts of serious music became available to a wide audience. Some years earlier, Walter Damrosch had made his first broadcast (a lecture-recital on Beethoven, Oct. 29, 1923), which led to a decade-long nationally broadcast "Music Appreciation Hour."

(1) "*Live*" performances. Many serious music broadcasts are performances that are only incidentally relayed to radio listeners or television viewers. The two annual series that have endured the longest and secured the most loyal group of listeners are the Sunday afternoon subscription concerts of the New York Philharmonic Society (heard since 1930) and the Saturday matinee performances of the Metropolitan Opera Association of New York (since 1931). Intermission time at the Philharmonic concerts is used for talks about the music being presented. Originally the orchestra's official annotator, Lawrence Gilman, was in charge. In the mid-1930's talks of a lighter nature were given by Deems Taylor. In recent seasons these intervals have been used for taped musical productions usually not directly connected with the concert.

The Opera series has offered a fairly conservative repertory (c. 80 operas, mostly in their original languages) in thirty seasons. Beginning in the 1950's, television has been increasingly turning to the concert hall. Leonard Bernstein and the New York Philharmonic have televised Young People's concerts, and the Boston Symphony is seen eight times a year, with each concert repeated at least once.

(2) *Performances for broadcasts.* Since the early 1930's all the networks have made significant contributions in music performances designed especially for radio listeners. NBC arranged 110 programs of "Music of the Americas"; the Mutual network presented long sequences devoted to Bach cantatas, Mozart concertos and operas, and American stage works; and for several years CBS presented Sunday morning organ recitals by E. Power Biggs playing in Harvard University's Busch-Reisinger Museum. In 1938 NBC assembled an excellent orchestra especially for radio concerts, conducted by Arturo Toscanini. After Toscanini's retirement in 1954, the orchestra continued to exist for several seasons as the Symphony of the Air but was eventually disbanded. Sporadically, leading composers have received commissions for works written especially for broadcasting. CBS was active in commissioning such men as R. Harris, A. Copland, W. Piston, L. Gruenberg, and R. Thompson. Gian-Carlo Menotti's *The Old Maid and the Thief*, the first opera commissioned for broadcasting (NBC, 1939), has also proved one of the most durable works in this medium. After a hiatus during World War II the practice of awarding special commissions was revived. For example, conductor-composer Daniel Pinkham received a foundation grant to compose four choral works for first performance on the WGBH educational network founded by WGBH in Boston, and younger composers, such as Rorem, Kay, Flanagan, and Wuorinen, have received similar commissions.

Numerous television stations have offered segments and sequences from the standard operatic repertory. In addition, NBC formed an opera company (founded by Samuel Chotzinoff) to create productions especially for the new medium. The company offered three or four television performances a year and for two seasons tried national tours of live performances. Here, too, Menotti scored a success with an opera created specifically for the medium, *Amahl and the Night Visitors* (NBC, 1951), which has replaced *Hänsel und Gretel* as the Christmas favor-

ite of opera groups, both amateur and professional, all over America.

(3) *Recorded music.* Broadcasting recorded music not only has gained widespread public acceptance but has had enormous influence on listening habits and tastes. Station WQXR in New York pioneered in this development, devoting more than 80 per cent of its broadcasting time to recordings of serious music, and for several years even having its own resident string quartet. Many educational stations, founded and supported by colleges and universities, have followed this pattern. An important development for the broadcasting of recorded music was the invention of FM (frequency modulation) radio, which had a vastly superior sound, free from static and with a much wider frequency response, i.e., the listener could hear both higher and lower pitches, making the broadcasts sound much more like the original source. Unfortunately, many FM radio stations, opened before and during World War II, failed owing to lack of funds. In 1949 Columbia Records released its first "Long Playing" records, which contained nearly ten times the amount of music and had much greater fidelity of sound than the older, faster-rotating records. This development led to a widespread demand for high-quality home playbacks and simultaneously a renewed interest in FM radio. [See phonograph and recorded music.] The availability of a wide repertory of serious music through FM radio and records has altered listening habits and added to the public's musical sophistication. Listeners no longer ask for Gershwin's *Rhapsody in Blue* or Grofé's *Grand Canyon Suite*, favorites of the 1930's and 1940's. Instead, requests may range from Obrecht to Dittersdorf to Messiaen. Since many radio stations devote themselves exclusively to broadcasting recorded music, live performances arranged for radio are rare. There are, of course, exceptions. WNYC in New York has an annual American music festival between Lincoln's and Washington's birthdays, which still offers first performances. WGBH in Boston has also been active in presenting studio performances, in both radio and television. [See (2).]

(4) Educational broadcasts *about* serious music have been important since the early days. During the 1930's and 1940's CBS presented series such as "Exploring Music," "Essays in Music," and "The Story of Song." G. Wallace Woodworth of Harvard University has conducted radio "listener-rehearsals" preparing

audiences in the Boston area for the broadcasts by the Boston Symphony Orchestra, as well as teaching a television course for college credit called "Two Centuries of Symphony."

R.A.; rev. W.H.C.

**Radleyer** [G.]. \*Hurdy-gurdy.

**Raffrenando** [It.]. Slowing down.

**Rāga.** See under India; Melody type.

**Ragtime.** A style of American popular music that reached its peak c. 1910–15. Its harmony is conventional, based largely on the tonic, dominant, and subdominant triads of the major mode, with a regular phraseology. However, ragtime was created (often by improvisation) and performed primarily by pianists (who rejected, as in later jazz, subtler pedal effects in favor of a percussive tone), with or without a group of additional instruments. Hence its

Examples from a set of ragtime pieces published c. 1898–1901.

melody became more instrumental in style (most of the rags had no text). Ragtime was made popular by the pianist Ben Harvey, who published his *Ragtime Instructor* in 1897. Also see Jazz.

**Raindrop Prelude.** Popular name for Chopin's Prelude in D-flat op. 28, no. 15, so called because the continuously repeated note A<sup>b</sup> (G<sup>#</sup> in the middle section) suggests the dripping of rain.

**Rake's Progress, The.** Opera in three acts by Stravinsky (libretto by W. H. Auden and C. Kallman, inspired by the set of prints by Hogarth), produced in Venice, 1951. Setting:

England, 18th century. The libretto, generally admired for its excellence, combines elements of *Don Giovanni* and *Faust*. The work is a modern revitalization of late 18th- and early 19th-century opera (Mozart to Bellini), with recitative and other similarities to scores of that period.

**Rákóczi March.** A Hungarian national air, composed by Janos Bihari in 1809, in homage to Prince Ferencz Rákóczi (1676–1735), who led the Hungarians in a revolt against Austria. The melody was used by Berlioz in his *La Damnation de Faust* and *Marche hongroise*, as well as by Liszt in his *Rhapsodie hongroise*, no. 15.

**Ralenti** [F.]. To slow down.

**Rallentando**, abbr. *rall.* Same as *\*ritardando*.

**Range.** See Voices, range of.

**Rank.** In organs, a complete set of pipes of the same type, controlled by one \*stop knob or tablet. A mixture stop, however, has several ranks, according to the number of pipes combined in the production of a single tone. See Organ II; Register.

**Rankett.** See under Oboe family III.

**Rant.** Name for a 17th-century dance found, e.g., in the fantasies (suites) of John Jenkins and in Matthew Locke's *Melothesia* (1673). Judging from the music, the term may well be an abbreviation of *corranto*, i.e., \*courante.

**Ranz des vaches** [F.; G. *Kuhreigen*, *Kuhreihen*]. A type of Swiss mountain melody sung or played on the \*alphorn by herdsmen to summon their cows. About fifty such melodies are traditionally used in various districts of the Alps. They all show the irregularity of rhythm and melodic design that is the hallmark of ancient folk music. Indeed, one of them, beginning with the words "Lobe, Lobe," occurs as early as 1545, in Rhaw's *Bicinia*. A *Kuhreigen* of 1710 (in T. Zwinger, *Fasciculus dissertationum medicarum*) is reproduced in the B. & H. edition of Franz Liszt, *Pianofortewerke* iv, p. iv. It shows the augmented fourth, another characteristic trait of these melodies.

The *ranz des vaches* has been repeatedly used in operas about Swiss subjects, e.g., in the overtures of Grétry's and Rossini's *Guillaume Tell*, and in W. Kienzl's *Der Kuhreigen*. See A. H. King, in *MQ* xxxi; A. Glück, in *VMW* viii.

**Rape of Lucretia, The.** Opera in two acts by Britten (libretto by R. Duncan after A. Obey's

play), produced in Glyndebourne, 1946. Setting: Rome, 510 B.C. The work is organized in the manner of a Greek tragedy, with two characters representing the male and female choruses, who comment on the action from the viewpoint of each sex. The score is of chamber-music dimensions, calling for only seventeen instruments.

**Rappresentativo.** See under *Stile rappresentativo*.

**Rappresentazione di anima e di corpo, La** [It., The Representation of Soul and Body]. Stage work by Emilio del Cavaliere, produced in Rome, 1600. It is usually regarded as the first \*oratorio. The music consists almost exclusively of recitative and short choruses.

**Rapsodie Espagnole** [F., Spanish Rhapsody]. Descriptive suite for orchestra by Ravel, composed in 1907. Its four movements are: (1) *Prélude à la nuit*; (2) *Malagueña*; (3) *Habanera*; (4) *Feria*. The third movement is an orchestral version of an unpublished "Habanera" for two pianos, written in 1895.

**Rasch** [G.]. Quick.

**Rasgado, rasgueado** [Sp.]. In guitar playing, strumming the strings with a finger to produce an arpeggio.

**Ratisbon Edition.** See under Liturgical books II.

**Ratsche** [G.]. Cog \*rattle.

**Rätselkanon** [G.]. Riddle canon. See Canon III.

**Ratswahlkantate** [G.]. A cantata (no. 71) by J. S. Bach, "Gott ist mein König," written in 1708 for the election of the town council of Mühlhausen (Thuringia), where he was organist (1707–08).

**Rattenando, rattenuto** [It.]. Holding back.

**Rattle.** An instrument of the percussion family, similar to the toy of that name, consisting of a wooden cogwheel that revolves against a flexible strip of wood or metal. It is used in R. Strauss' *Till Eulenspiegel*. In the classification of instruments, "rattle" is a generic term for shaken idiophones [see Instruments I, B]. These are among the oldest and most widely distributed instruments. An example is the Latin American \*maraca, consisting of a gourd filled with pebbles or dry seeds and shaken by means of a wooden handle.

**Rauscher** [G.]. An 18th-century term for the French *batterie* [see Batterie (3)] or for a quick figure involving repeated notes.

**Ravvivando** [It.]. Quickening.

**Razor Quartet.** Popular name for Haydn's String Quartet, no. 61 (op. 55, no. 2), in F minor, composed in 1788. Haydn jokingly gave it to his publisher, Bland, in exchange for a new razor.

**Razumovsky Quartets.** See Russian Quartets.

**Re.** See under Solmization.

**Reading Rota.** Another name for \*"Sumer is icumen in," a \*rota that may have been composed by a monk from Reading.

**Real answer, real fugue.** See under Tonal and real.

**Rehab.** See Rabab.

**Rebee.** See Rabab. For ill. see under violin.

**Rebube** [F.]. Obsolete name for \*Jew's-harp.

**Recapitulation.** See under Sonata form.

**Recercada, recercar.** Same as \*ricercar.

**Récit** [F.]. A 17th-century term, derived from \**récitative*, for a vocal solo piece, usually in aria style; e.g., *récit de basse*, bass aria. In organs, the term is used similarly, i.e., for a solo organ stop and for the entire solo organ (*clavier de récit*); also as a title for an organ piece with a distinct melodic part (as opposed to earlier, contrapuntal organ music). An inscription such as *Récit de tierce en taille* means solo passage (*récit*) in a middle part (*taille*) for the left hand, played on the organ stop tierce.

**Recital.** A public performance by one or two players (as opposed to concert, used for a group of three or more). The term was first used for performances by F. Liszt in London in 1840.

**Recitative** [F. *récitative*; G. *Rezitativ*; It., Sp. *recitativo*]. I. A vocal style designed to imitate and emphasize the natural inflections of speech. It is usually employed with more or less narrative prose texts, particularly in operas, where it serves to carry the action from one aria (ensemble, chorus) to another. In the recitative, the purely musical principles of vocal melody, phrase, and rhythm are largely disregarded, being replaced by speechlike reiteration of the same note, slight inflections, irregular rhythms, purely syllabic treatment of the text, etc. Despite the intrinsic limitation of recitative style, a large variety of types have developed, which are briefly discussed below.

II. The recitative plays a very important role in Gregorian chant, where it is employed for the speechlike singing of psalms [see Psalm tones], prayers, readings from the Prophets, Epistles, Gospels, etc. There is no doubt that this method is of Jewish origin [see Jewish music I]. About 1600 a new type of recitative appeared in secular music, not through the influence of the Gregorian recitative but as a result of attempts to revive the chorus of ancient Greek drama. [See *Nuove musiche*; Monody; Opera III.] The earliest operas (Peri's, Caccini's *Euridice*, 1600) were written throughout in a carefully and impressively designed declamatory style, which is quite different from the later \**parlando*. The accompanying example from Caccini's *Euridice* (1600) is typical of this early Florentine recitative [Ex. 1]. During the 17th century this *recitativo arioso* [see Arioso] developed in a number of directions:

(a) Taking on more distinct phrasing, melodic character, and definite form, it grew into the aria; there are examples in Monteverdi and the Roman and Venetian composers, though not yet fully set apart from the recitative portions (e.g., P. Cavalli's *Il Giasone*, 1649).

(b) With the development of the aria as a distinct type, the recitative gradually became faster and less melodic. Examples of this style are already present in M. A. Cesti (*Il Pomo d'oro*, 1667) and C. Pallavicino (*La Gerusalemme liberata*, 1687). It was not until the 18th century, however, that this *parlando* style was generally introduced into opera. It was known as *recitativo secco* [It. *secco*, dry—with reference to its lack of expressiveness]. This type remained in use throughout Italian 18th-century *opera seria* and in the operas of Mozart and Rossini [see Ex. 2, from Mozart's *Don Giovanni*].

(c) Whereas both the early Florentine and the *recitativo secco* were sung to thoroughbass accompaniment only, a fuller accompaniment (including strings) was introduced for recitatives of special importance. Monteverdi was one of

G: A-mi-co, che ti par?

2

L: Mi par ch'ab-bia-te un'

Va là, che se'il gran gon-zo

a-ni-ma di bron-zo.

the first to use this device in the closing measures of his famous "Possenti spirito" (in *Orfeo*, 1607), and Schütz used it similarly for the part of the Evangelist in his *Historia der Auferstehung Jesu Christi* (1623). The use of ensemble accompaniment naturally led to a more strictly measured recitative, dramatic rather than declamatory, the *recitativo accompagnato* or *stromentato*. It assumed considerable importance in 18th-century opera, where it was usually reserved for the climactic scenes of the drama and served to introduce the most brilliant arias of the work. Bach, in his St. Matthew Passion, used it consistently for the part of Christ and for the recitatives preceding an aria [Ex. 3].

3 flutes

Vl. da gamba (Bass.) Ja frei-lich will in

B.c.

uns das Fleisch und Blut zum

(d) A special type of recitative, involving frequent changes of meter (4/4, 3/4, 2/4), developed in France under Lully [Ex. 4] and spread, with necessary adaptation to the language, to England (Purcell). This recitative represented an attempt to set down in exact note values the rhythm, accents, and inflections of the French

language, on a principle similar to the 16th-century *\*vers mesuré* [see also Rhythm II (b)].

4

En-fin il est en ma puis-san-ce, ce fa-tal en-ne-

mi, ce sup-per-be vain-queur.

(e) Finally, Schütz in his latest works, the Passions, developed a highly impressive "archaic" type of recitative, entirely unaccompanied, a baroque revival of the Gregorian *\*psalm tones* [see *SchGMB*, no. 192].

The most outspoken adversary of Italian opera and its stereotyped parlando recitative, Richard Wagner, revived the truly musical recitative: his "unending melody" is actually a highly dramatic and expressive recitative. An interesting contrast to the emotionalism of Wagner's recitative is the subdued recitative of Debussy's *Pelléas et Mélisande*.

The free character of the recitative has repeatedly been imitated in instrumental music. Examples occur in J. Kuhnau's *Musicalische Vorstellung einiger biblischer Historien* (1698), Bach's *Chromatic Fantasy and Fugue*, Beethoven's Piano Sonata op. 31, no. 2 (first movement, recapitulation) and op. 110 (slow movement), Schumann's *Kinderszenen* ("The Poet Speaks"), etc.

Borrel, "L'Interprétation de l'ancien recitatif français" (*RdM* 1931, p. 13); E. O. Downes, "Secco Recitative in Early Classical Opera Seria (1720-80)" (*JAMS* xiv); J. A. Westrup, "The Cadence in Baroque Recitative (*CP Jeppesen*).

D.J.G. and W.A.

**Reciting note.** See under Psalm tones.

**Recorded music.** See Phonograph and recorded music.

**Recorder** [F. *flûte à bec*; G. *Blockflöte*; It. *flauto diritto*; Sp. *flauta de pico*]. The most important type of whistle (or fipple) flute, i.e., end-blown, with a "whistle" mouthpiece [see Whistle flute]. Its tone quality is highly individual, soft and

slightly reedy, in part produced by a wide, tapering conical bore. The recorder attained virtually its final form in the late Middle Ages; by the 16th century it formed a complete family of instruments from treble to bass that played an important part in the music of the late Renaissance. By the early 18th century only three or four sizes of recorder remained in use. Parts for recorder were marked "flauto" by J. S. Bach and most of his contemporaries, the cross flute (the modern instrument) being called "German flute," "flûte traversière," or "flauto traverso." Bach and Handel occasionally made use of a "flauto piccolo" or "flautino," a small recorder usually an octave higher in pitch than the flauto. After 1750 the recorder gradually passed out of use.

In the early 20th century a revival took place, begun by Arnold Dolmetsch in England and followed after 1918 by German manufacturers using mass-production methods, and finally, on a much smaller scale, by makers in the United States. Modern instruments are generally made in four sizes, named by German and British makers as follows:

German	British	Range
Soprano	Descant	c''-d''''
Alto	Treble	f'-g'''
Tenor	Tenor	c'-d'''
Bass	Bass	f-g''

Two systems of boring finger holes are used in modern instruments; one used by certain German makers, with a lowered fifth hole, usually called "German" fingering, has not gained wide acceptance, and the 18th-century system, called "English" or "baroque" fingering, is now most used. For the alto (treble), widely popular as a chamber-music instrument in the 18th century, there is an important literature written expressly for it by composers of nearly every nationality; much of this music has been reprinted. See ill. under Flute.

**Reco-reco.** Brazilian native scraper, made of a notched gourd, or of a bamboo cane with carved transverse notches, or of a cylindrical metal tube with a piece of corrugated tin fixed to it. The instrument is scraped with a small wooden or metal stick. It is also known by the names *reque-reque* and *caracaxá*. A similar type of scraper called *guïro* is used in the Antilles. J.O-S.

**Recoupe** [F.]. See under *Basse danse*.

**Recte et retro** [It.]. See under *Retrograde*.

**Recueilli** [F.]. Meditative, contemplative.

**Redobles** [Sp.]. See under *Ornamentation* I.

**Redowa, rejdowak.** A Bohemian dance in moderately quick triple meter, similar to the mazurka. It became popular c. 1850.

**Réduction** [F.]. Arrangement. *Réduction pour le piano*, arrangement for piano.

**Reed** [F. *anche*; G. *Zunge, Blatt, Rohrblatt*; It. *ancia*; Sp. *lengüeta*]. I. A thin, elongated piece of cane, metal, or other material that is fixed at one end and is free to vibrate at the other end. The reed is the sound-producing agent in various musical instruments, chiefly the woodwinds, bagpipes, harmonium, accordion, harmonica, and the reed stops of the organ. The best cane reeds are made from *Arundo donax*, a species of tall grass that is grown in southern France (Fréjus region).

There are two principal types of reed, *idiophonic* and *heterophonic* [G. *harte* and *weiche Zungen*]. Idiophonic [Gr., own sound] reeds are made of a hard, heavy material, usually metal, and can produce a sound of one pitch only, this being determined by their length and thickness (similar to, e.g., a tuning fork). Such reeds are used in the \*harmonium, \*accordion, \*harmonica, Chinese \*sheng, \*regal, and in organ reed stops. In the last they are combined with a pipe that serves to reinforce the sound [see *Organ* VIII]. Heterophonic [Gr., other sound] reeds are made of a flexible, light material, usually cane, and can produce a wide range of pitches but only if they are attached to a pipe whose length determines the pitches. In instruments such as the oboe or clarinet, the sounding length of the pipe

can be varied by covering different holes, so that a whole scale can be obtained from the reed.

II. There are two main kinds of heterophonic reed, *single reeds* (clarinet, saxophone) and *double reeds* (oboe, bassoon). With the former only one reed vibrates against a slot of the pipe; with the latter two reeds, separated by a slight opening, vibrate against each other. In a sense the lips of the trumpet or horn player form a pair of heterophonic double reeds.

Another distinction is that between *free* and *beating reeds*. In the former type, used in the harmonium, the reeds move in and out of a slot just wide enough to let the reed pass "freely"; in the latter type, used chiefly in the organ, the opening of the slot is somewhat smaller than the reed so that the reed "beats" against the frame [see Organ VIII]. The reed of the clarinet also is a beating reed.

A special type of reed is the *covered reed*, a reed (single or double) enclosed in a cap perforated by a hole into which the player blows, thus controlling the reed indirectly. This device, which precludes expressive and dynamic nuances, was used in various early instruments, e.g., in the cromornes, while in the \*pibgorn the reed is enclosed in a funnel-shaped mouthpiece that is pressed tightly around the lips.

**Reed pipes, stops.** See under Organ VIII, X.

**Reel.** A dance performed by two or more couples facing one another and performing figures of eight. It is common in northern Europe and North America, the American variety being known as "Virginia reel." The music consists of four or eight measures in moderately quick duple meter, which are repeated over and over again. See under Strathspey.

**Réexposition** [F.]. Recapitulation.

**Reformation Symphony.** Mendelssohn's Symphony no. 5, op. 107, in D minor, composed in 1830 for the tercentennial of the Augsburg Conference, where Luther openly declared the establishment of the German Reformed (i.e., Protestant) Church.

**Refrain.** I. In poetry, one or two identical lines recurring at the end of each stanza of a strophic poem. It is equivalent to the musical term "burden." In a musical composition, each repetition of the refrain is, of course, set to the same melody, so that the term refers to both textual and musical repetition. The refrain is often called "chorus," since it is often sung by the full chorus while the stanzas (verses) are solo.

II. In the antiphonal and responsorial singing of the early Christian Church, an exclamation such as Amen, Alleluia, or a short phrase was repeated by the congregation or choir after each psalm verse or pair of verses [see Psalmody II, III]. The refrain poem, cultivated in the 12th and 13th centuries by the \*trouvères, was the basis for various refrain forms. The simplest of them was the \*ballade, usually a poem with three stanzas of eight lines each (the last two lines constituting the refrain), the musical scheme for a stanza being a a b C. (Refrain texts are usually printed in italics. In the schemes shown here, one letter, large or small, denotes the same music; capital letters indicate the same text as well as music, therefore a refrain; small letters indicate different texts.) Another 13th-century refrain form is the \*virelai, with the stanza structure A b b a A, in which the closing refrain serves also as the initial refrain for the next stanza. The medieval rondeau, unlike the other forms, normally has only one stanza—A B a A a b A B [see Rondeau (1)]—in which the textual and musical repetition takes place. In the Italian 14th-century \*ballata the refrain is called \*ripresa, and in the Spanish \*villancico it is *estribillo*.

III. The refrain texts, particularly for the rondeaux, were often lines taken from earlier poems that, owing to their popularity, were so well known as to be part of a courtly education. Thus, the term "refrain" may mean a line of text taken from some other literary work. In the first half of the 13th century there was a large stock of well-known refrains, usually of amorous character, such as "C'est la fin koi que nus die, j'amerais," or "En ma dame ai mis mon cuer, et ma pensée" [see HAM, nos. 19f and 28i; also nos. 19d and 32d], which were freely borrowed for new songs as well as for the upper parts of French motets. Three examples of their use are: (a) The *chanson avec des refrains*, a strophic song, concluded each stanza with a different refrain, i.e., one of the stock refrains [ex. in AdHM i, 195 f]. (b) The *refrain motet* included refrain quotations in the text of the upper parts, usually at the end. This was a common practice in French motets from c. 1250. (c) The *motet enté* began with the first half of a refrain, which was followed by new material and concluded with the second half of the refrain [see Enté]. There are even a few motet texts (and one conductus text) that consist entirely of refrains [ex. in AdHM i, 240, E], in the manner of a \*cento. While philologists have fully investigated textual borrowing in motets, the extent of musical

borrowing has not yet been completely studied. In some instances, a refrain was incorporated into a motet along with a tenor melody borrowed from plainsong (a *\*quodlibet* technique). The reverse—borrowing from a motet (first phrase of the *duplum*) to create a refrain—was also common. Borrowing refrains continued until the late 15th century [see M. F. Bukofzer, in *MQ* xxviii, 33]. A complete list of 13th-century refrains is given in F. Gennrich, *Bibliographisches Verzeichnis der französischen Refrains des 12. und 13. Jahrhunderts* (1964).

Alternation between variable and repeated portions of a composition reappears in the 17th-century instrumental *\*ritornello* as well as in the rondeaux of the French clavecinists [see Rondeau (2); Rondo].

Lit.: F. Gennrich, *Musikwissenschaft und Romanische Philologie* (1918).

**Regal.** A small portable organ, probably invented c. 1450 and much used during the 16th and 17th centuries, which had reed pipes only [see Reed]. The reproduction in *GDB* vi, 288 shows how it was built. The origin of the name is uncertain [see the conjectures in *GDB*; *SaHMI*, p. 308; *SaRM*, p. 318]. By the 16th century, the reed pipes of the regal had been incorporated into the organ, which until then had had only flue pipes, and the term “regal” came to mean the ranks of reed pipes, which were given such names as *Geigenregal*, *Trichterregal*, etc. Monteverdi prescribed the regal in his *Orfeo* (1607) to accompany the song of Charon. A particularly

small type of regal was the *bible regal*, so called because it could be folded together like a book. See *SaHMI*, p. 309.

**Regina caeli laetare** [L.]. One of the four antiphons B.V.M. See Antiphon (2).

**Regisseur** [F.,G.]. The artistic or stage director of an opera. The G. *Regie* corresponds generally to “production”; the *Regiebuch* contains the operatic text with indications for the stage setting.

**Register.** (1) In organs, the full set of pipes controlled by one stop; hence, practically identical with organ *\*stop*. A register may include one or (in mixture stops, etc.) several *\*ranks*. (2) In the human voice, the different portions of the range, which are distinguished, according to their place of production and sound quality, as “head register,” “chest register,” etc. There is considerable disagreement among singers and voice teachers regarding vocal registers. Some say the voice has two registers, high and low; many claim three registers, high (head), middle (throat), and low (chest); others subdivide still further. Formerly the registers played a prominent part in teaching and writing about singing, but today the whole idea is generally considered of little importance.

**Registration** [G. *Registrierung*]. The art of using and combining organ registers. While modern organ composers frequently indicate the registration of their compositions (at least in a

Regal.

general way), such indications are rare in early organ music. Before 1700 French organ composers were practically alone in prescribing specific registrations, employing titles such as "Récit de cromorne en taille" (Cromorne as solo stop for the tenor part). Authentic details regarding Bach's registration are available in a few pieces, notably the chorale preludes "Ein' feste Burg" (Peters ed. vi, no. 22: *Rückpositiv* and *Oberwerk*), "Christ lag in Todesbanden" (Peters vi, no. 15: *piano* and *forte*), and the "Dorian" Toccata (Peters iii: *Oberwerk* and *Positiv*). See E. H. Geer, *Organ Registration in Theory and Practice* (1957). See also under Organ; Organ playing.

**Regola dell' ottava** [It.]. In the thoroughbass practice of the 17th and 18th centuries, a scheme

whereby each tone of the octave is provided with a suitable chord, as in the accompanying example. Such schemes were helpful for the realization of simple basses that had no figures indicating more elaborate chords. See E. Borrel, in *TG* xxi, 175ff; A. Tirabassi, in *CP* 1924 and *CP Borren*.

**Rehab.** See Rabab.

**Reigen** [G.]. Round dance.

**Reimofficium** [G.]. Rhymed versions of the liturgical texts for the Offices of Saints. They were very popular from the 11th through 16th centuries, until they were abolished by the Council of Trent (1545–63). See *AdHM* i, 89; P. Wagner, *Einführung in die Gregorianischen Melodien* i, 300ff; K. Meyer, in *AMW* iii.

**Reimsequenz** [G.]. The rhymed sequence of the 12th century. See Sequence II B.

**Reine, La** [F., The Queen]. Nickname for Haydn's Symphony no. 85, in B flat (no. 4 of the \*Paris Symphonies), composed c. 1786. The name refers to Queen Marie Antoinette, who is said to have been particularly fond of this work.

**Reine Stimmung** [G.]. \*Just intonation.

**Reisado** [Port.]. A native Brazilian play commemorating the journey of the Magi to Bethlehem, similar in many ways to the *Pastoris*, which depict the shepherds' adoration of the infant Jesus. Music and dance were an important part of these plays. A dance known as *Bumba meu Boi* (My Good Ox), which was added to the *reisado* as a kind of epilogue, is still performed in certain rural areas of Brazil. J.O.S.

**Réjouissance** [F.]. In 18th-century music (Bach, *Orchestral Suite* no. 4), name for a light, playful piece, generally in quick triple meter.

**Related key, relative keys.** See Key relationship.

**Relative pitch.** (1) The pitch of a tone (e.g., E) in relation to a standard tone or given key (e.g., C). It may be expressed as an interval (major third), or by means of solmization syllables (mi), or by relative frequencies ( $\frac{3}{4}$ ). (2) The ability to recognize and indicate relative pitch, e.g., to recognize the tone E as the major third above C, or to sing this tone if the major third above C is demanded. This faculty is a fundamental requirement for a musician, much more important than \*absolute pitch.

**Religious dances.** Dignified ceremonial dances, performed by clergy in connection with some part of the service, were not uncommon in France and Spain from the 12th to 14th centuries. An early 14th-century MS from Sens contains a responsory for the feast of St. Stephen with the inscription: "ad processionem in navi ecclesie Senonum precentor debet ballare" (to [during?] the procession through the nave of the church of Sens the precentor should dance), as well as a responsory for the feast of St. Columba with a similar inscription [see Lit., Chailley]. The Spanish \*"Llibre Vermell" contains a two-part composition, "Stella splendens" [see *AnM* x, 72f], in a simple style and in the form aa' bb aa', with the remark: "Sequitur alia cantilena . . . ad trepidium rotundum" (Here follows another song . . . for a sacred round dance). It also says that the pilgrims should avoid "cantilenas vanas atque tripudia inhonesta" [see Anglés, p. 54]. Religious dancing has survived to the present day in the Cathedral of Seville; see *Seises*.

Gougaud, "La Danse dans les églises" (*Revue d'Histoire ecclésiastique* xv [1914]); H. Spanke, "Tanzmusik in der Kirche des Mittelalters" (*Neuphilologische Mitteilungen* xxxi [1930]); Y. Rokseth,

"Danses cléricales du XIIIe siècle" (*Publications de la Faculté des Lettres de l'Université de Strasbourg*, fasc. 106 [1945]); H. Anglés, "El Llibre vermell . . . y la danza sacra" (*AnM* x); J. Chailley, "Un Document nouveau sur la danse ecclésiastique" (*AM* xxi); J. Amades, "Danses rituels d'iniciació" (*CP Anglés* i).

**Relish.** An ornament used in performing early English music for lute, viol, and keyboard. The term "single relish" was used for any ornament formed by the alternation of two adjacent notes. The "double relish," a complex ornament similar to the French *\*double cadence*, consists

essentially of a trill upon each of two successive notes [see Ex.].

P.A.

**Remettez** [F.]. In organ music, indication to take off a stop.

**Renaissance, music of the.** The music of the period c. 1430–1650, preceded by the Middle Ages and followed by the baroque. There is little disagreement about when it ended, since 1600 is one of the clearest landmarks in music history [see History of music; Baroque music]. However, there is much less unanimity about its beginning, which has been placed as early as 1300 (H. Riemann, H. Bessler) and as late as 1520 (C. van den Borren). Today most musicologists agree that 1430 marks the approximate beginning of Renaissance music, making it nearly coeval with the Renaissance in the visual arts (c. 1400: Ghiberti's bronze doors of the Baptistery of Florence). Thus Dunstable (c. 1385–1453), Dufay (c. 1400–74), and Binchois (c. 1400–67) would be the first representatives of Renaissance music. However, the traits usually regarded as characteristic of the Renaissance as a broad cultural movement (rebirth of classical art and learning, independence of thought, humanist tendencies, etc.) were not present in music, at least not in the initial stage. Moreover, whereas the Renaissance in literature and the visual arts was originally (and for a long time) exclusively Italian, Renaissance music originated and developed exclusively in northern France and Belgium. Music flourished in Italy in the 14th century but declined during the era of Fra Angelico (1387–1455), Donatello (1386–1466), Brunelleschi (1379–1446), and their successors.

Renaissance music, therefore, represents a movement that initially had no connection with the Renaissance in general. Like the term *\*baroque*, the term Renaissance serves mainly to place an important and well-defined period of music history within the over-all cultural development. That a new musical development did begin in the second quarter of the 15th century is certainly true. Tinctoris, writing c. 1476, speaks of an *ars nova* that began forty years ago, adding that music written before that time was not worth hearing.

By and large, Renaissance music shows the general traits of "classicism" in contrast to the "romantic" tendencies of the 14th and 17th centuries [see Classicism]. Clarity, balance, euphony, and expressiveness within well-regulated limits are among its characteristic features, especially in its later development. Its most outstanding technical achievements are the development of a *\*panconsonant* style; a gradual tendency toward functional harmony with prepared cadences; four-part polyphony with equal participation of all the voice-parts; imitation; and, in the 16th century, methodical treatment of dissonances, close consideration of the text, etc. See Burgundian school; Flemish school; Humanism; *Musica reservata*.

Lit.: *ReMR*, *passim*; L. Schrade, in *CP* 1952; H. C. Wolff, in *CP* 1952; R. E. Wolf, in *RBM* ix; H. Bessler, in *AMW* xxiii.

**Renforcer** [F.]. To reinforce, to increase in loudness.

**Renversement** [F.]. Inversion (of intervals, chords, subjects).

**Repeat.** The signs **||** at the beginning and **||** at the end of a section, which call for repetition of this section. If the latter sign alone appears, the repetition is to start from the beginning of the composition (e.g., the exposition of sonata form).

**Repercussio, repercusa** [L.]. Names for the reciting note (tenor) of *\*psalm tones*. Neumes such as *bistropa*, *tristropa* [see Neumes I] are called repercussive neumes because they involve repeat of the same tone.

**Répertoire International des sources musicales.** See *RISM*.

**Repetenda** [L.]. In Gregorian chant, *repetenda* or *versus ad repetendum* designates psalm verses that were added *ad libitum* to a chant when the occasion required. They were used at least from

the 8th through the 11th centuries, particularly for Introits and Communions, since the opening and closing ceremonial of the Mass took a varying amount of time. Thus, the Introit of Easter Sunday appears in the early sources as follows: Ant. *Resurrexi*; Psalm. *Domine probasti*; Ad repet. *Tu cognovisti*. The term is also used for the refrain in hymns, such as the *Gloria laus* of Palm Sunday.

**Repetitio** [L.]. Besides meaning "repetition," the term is sometimes used for a concluding section, e.g., the *Abgesang* of a \*Bar form [see *HAM*, no. 81a]. See under Ritornello (1).

**Repetition.** (1) A special device of the piano action that permits the quick repetition of a tone (invented by S. Érard). See Piano I.

(2) In musical composition, repetition is one of the most important principles of structure. Its importance becomes clear when one considers that repetition of a musical idea or a motif includes such devices as sequential treatment, imitation, ostinato, variation, and repeat of entire sections. The last is the basis of nearly all musical forms (A B A; A A B A; A B A C A D A; etc.; see Forms, musical). In a broader sense, repetition also includes such basic concerns as the equal length and comparable rhythm of phrases (four measures); in fact, the very presence of uniform meter throughout a piece constitutes an element of repetition.

In contrapuntal music four principal devices of repetition are used: repetition in the same part at the same pitch (\*ostinato); repetition in the same part at a different pitch (\*sequence); repetition in a different part at the same pitch (\*Stimmtausch); repetition in a different part at a different pitch (\*imitation).

Lit.: C. A. Harris, "The Element of Repetition in Nature and the Arts" (*MQ* xvii); R. Lach, "Das Konstruktionsprinzip der Wiederholung" (*Sitzungsberichte der Akademie der Wissenschaften in Wien*, vol. cci [1925]).

**Répétition** [F.], **ripetizione** [It.]. Rehearsal. *Répétition générale* [F.], dress rehearsal.

**Repicador.** See under *Mejoranera*.

**Replica** [It.]. Repeat. *Senza replica* indicates omission of the repeats, as, e.g., of the sections of the minuet or scherzo after the trio.

**Répons** [F.]. \*Responsory.

**Réponse** [F.]. Fugal answer.

**Reports.** A 17th-century English term for \*points of imitation or some other kind of contrapuntal treatment. Playford's *Introduction to the Skill of Music* (12th ed., 1694) mentions "imitation or reports," and the Scottish Psalter of 1635 contains tunes treated in the style of an anthem and inscribed "Psalms in Reports."

**Reprise** [E., F., G.]. (1) Repetition. The term is used particularly in connection with \*sonata form, but unfortunately with two different meanings. Originally, it referred to the repetition of the exposition before the development, usually indicated by the \*repeat sign. This meaning is intended in K. P. E. Bach's *Sechs Sonaten für Clavier mit veränderten Reprisen* (1760), in which the repetition of the exposition is written out in a varied form. Today, however, the term usually means the recapitulation, i.e., the repetition of the exposition after the development section [see under *Durchführung*]. (2) In 17th-century French music, the second section of pieces in binary form is called *reprise*, e.g., in practically all the dances in the suites of Chambonnières and D'Alembert. See under Ritornello (1).

**Reprisenbar** [G.]. See under *Bar* form II.

**Reproaches.** See *Improperia*.

**Requiem Mass.** A musical setting of the Mass for the Dead (*Missa pro defunctis*), so called because it begins with the Introit "Requiem aeternam dona eis Domine" (Give them eternal rest, O Lord). The liturgical structure of this Mass is essentially like that of any other \*Mass, except that the joyful portions of the Ordinary (Gloria and Credo) are omitted and the Alleluia is replaced by a Tract, after which the sequence "Dies irae" (by Thomas of Celano, 13th cent.) is added. For the plainsong music of this Mass, see *LU*, pp. 1807ff.

The polyphonic composition of the Mass for the Dead differs from the normal Mass chiefly in that it includes not only the items of the Ordinary (Kyrie, Sanctus, Agnus Dei), but also, and in fact more prominently, those of the Proper (Introit, Gradual, etc.). Thus it is of the type known as \*plenary Mass. It should be noted that rarely (if ever) were all the items of the Gregorian Mass included in the polyphonic composition. The selection varied greatly, although in the 16th century there were certain standard practices in Italy, Spain, and the Netherlands.

Since a Requiem by Dufay (mentioned in his will) has been lost, the earliest extant example is one by Ockeghem. It consists only of Introit,

Kyrie, Gradual (the old "Si ambulem" instead of the later "Requiem aeternam"), Tract ("Sicut cervus" instead of "Absolve Domine"), and Offertory. A large number of 16th-century settings exist, among them those by La Rue [\*Editions VIII, 11], J. Prioris (pub. by Attaignant, 1532), A. de Fevin, Morales [\*Editions XX, 1], Guerrero (*Liber primus missarum*, 1566), Palestrina (*Missarum liber primus*, 1554), Lasso (1589), and finally, Victoria's great *Officium defunctorum*, written in 1603 for the death of the Spanish Empress Maria. In all these works the "Dies irae" is not composed but sung in plainsong, as are the opening intonations of the various portions, while the composed sections use the liturgical melodies more or less freely as a *cantus firmus*. The 17th-century composers were particularly attracted by the dramatic words of the "Dies irae." The 17th-century Requiems of C. Straus (c. 1575–1631), H. I. F. von Biber (1644–1704), and J. K. Kerll (1627–93), reproduced in *DTO* 59, all use tremolo effects for the words "Quantus tremor." Among the 18th-century settings for chorus and orchestra, Jommelli's and, above all, Mozart's Requiem are outstanding. Among 19th-century composers of the Requiem are Cherubini, Berlioz, Dvořák, Bruckner, Verdi, Saint-Saëns, and Fauré. Brahms' *Ein deutsches Requiem* (op. 45, 1868) is an impressive work based on German texts freely chosen from the Scriptures. Important 20th-century examples are M. Duruflé's Requiem, op. 9 (1947) and B. Britten's *War Requiem*, op. 66 (1961). See C. W. Fox, "The Polyphonic Requiem before about 1615" (*BAMS* vii); R. J. Snow, in *JAMS* xi.

**Rescue opera.** See under Opera IX.

**Reservata.** See *Musica reservata*.

**Res facta** [L.]. A term used by modern musicologists for a type of composition (usually 15th-century) that is fully written out in all parts, as distinguished from improvised counterpoint, such as *\*discantus supra librum*. The term was introduced by J. Tinctoris, but his explanations (*Liber de arte contrapuncti*, CS iv, 85; *Diffinitorium*, CS iv, 187) are somewhat contradictory and do not agree with the interpretation above. Perhaps the term should be abandoned altogether. See E. T. Ferand, in *JAMS* x.

**Resolution.** In harmonic analysis, the succession of a dissonant note, e.g., an appoggiatura, by the corresponding consonant note [Ex. 1]; or of a dissonant chord, e.g., a seventh chord, by a con-

sonant chord. If the seventh chord is followed by the tonic, the resolution is regular [Ex. 2]; otherwise it is irregular [Ex. 3]. Ex. 4 illustrates the

resolution into another dissonance, a very common and important means of obtaining "harmonic flow."

**Resonance.** The transmission of vibrations from a vibrating body to another body. This phenomenon takes place only when the two bodies are capable of vibrating at the same frequency (or a harmonic thereof). If, e.g., two tuning forks of the same frequency (i.e., same pitch) are placed close together and one of them is struck with a hammer, the other will immediately vibrate and emit the same sound. In the case of vibrating strings, the possibilities for resonance are considerably wider, owing to the presence of harmonics. On the piano, e.g., the string C sets up resonant vibrations in the strings c, g, c', e', etc., as seen in an experiment described under Acoustics IV). The resonance of the piano strings causes the change in timbre that occurs when, by means of the damper pedal, the dampers are lifted from the strings. Another name for this effect is sympathetic vibration. See also Sympathetic string.

Important to musical instruments are the "general resonators," bodies that react with sounds of any frequency or pitch. To this type belong the soundboard of the piano and the belly and back of the violin, which co-vibrate and reinforce any sound produced on the strings. Resonance is one of the factors in the study of *\*architectural acoustics* [see this entry and also Acoustics for bibl.]. See A. Seiffert, in *ZMW* xi.

**Resonanzsaiten** [G.]. *\*Sympathetic strings*.

**Resonator.** Any acoustical implement, usually in the shape of a hollow vessel, that serves to reinforce sounds by resonance. Resonators in the form of a glass globe with a small opening were used by H. Helmholtz to prove the existence of harmonics. Others, shaped like hollow cylinders, are used with the Javanese xylophones and *\*marimba*. Using the term as a synonym for globular flute results from (or leads to) confusion with Helmholtz' scientific devices.

**Respond.** A term meaning \*responsory, \*response, or, preferably, the main section of a responsorial chant (corresponding to the antiphon section of antiphonal chants) as opposed to the verse. Thus, a responsory or a Gradual consists of respond and verse. See Psalmody II.

**Response.** (1) In Anglican churches, the choral or congregational reply to the versicles (in the \**preces* and \**suffrages*), the petitions (in the \**litany*), and the Commandments of the \**Decalogue*. The term "Festal Responses" usually refers to the five-part harmonizations in Tallis' *Preces and Responses*, with the plainsong melody in the tenor. See Versicle. (2) In the Reformed churches, a short piece such as "Hear our prayer, O Lord" or a manifold Amen, sung by the choir, usually after a pastoral prayer. These are more in the nature of independent compositions, since the tradition in Reformed churches does not include singing of the minister's portions.

V.P.D.

**Responsorial singing.** In Gregorian chant, the performance of a chant by one or more soloists (*cantor, cantores*) in alternation with the choir (*schola*), as opposed to performance by two alternating half-choruses, known as \*antiphonal singing. Originally each method was restricted to particular portions of the liturgy, the responsorial to the elaborate chants (responsories, Graduals, Alleluias, Offertories) and the antiphonal to the simpler ones (psalms, Introits, Communions); see Psalmody II, III. Today all these chants are sung responsorially, antiphonal performance being used only for certain non-psalmodic chants, e.g., the Kyrie, Gloria, or the bilingual Sanctus on Good Friday [LU, p. 737]. For the book called *Liber responsorialis*, see Liturgical books I, 14. See C. Gindele, "Doppelchor und Psalmvortrag im Frühmittelalter" (MF vi); *ApGC*, pp. 196ff.

**Responsory** [L. *responsorium*]. In the Roman Catholic rites, a type of chant sung principally at Matins as a musical postlude to a lesson. Since Matins includes nine lessons (three for each Nocturn), it has nine responsories, the last of which is usually replaced on Sundays and feast days by the \**Te Deum*. More than a thousand responsories are found in 12th- and 13th-century MSS. A few of these, from the Matins of Nativity, Maundy Thursday, Good Friday, Holy Saturday, Pentecost, Corpus Christi, and the Office of the Dead, are included in the *Liber usualis*. Many more are found in the *Liber res-*

*ponsorialis* (1895), which, in accordance with monastic usage, has twelve responsories for each Matins. Responsories are also sung during Processions, e.g., that of Palm Sunday, and the *Processionale monasticum* (1893) contains processional responsories for all the major feasts. All these responsories are long, elaborate chants, consisting of respond, one or more verses, and the doxology. They are known as great responsories (*responsoria prolixa*), in distinction to the much simpler short responsories (*responsoria brevia*), which are sung after the short lesson (the so-called chapter) of the daytime hours [see, e.g., LU, p. 229]. These are indexed in the *Antiphonale Romanum*, but not in the *Liber usualis*. The formal structure of both types is outlined under Psalmody II. For *responsorium graduale*, see Gradual.

In the 16th century the great responsories were frequently composed as motets (responsory motets), with the respond in the *prima pars* and the verse and repeated portion (second half) of the respond in the *secunda pars*. Such motets usually are in the form ab cb (a = first, b = second half of the respond, c = verse). Tallis' setting of "Audiui vocem" (*Processionale monasticum*, p. 236) is based on the very old principle—consistently employed in the organa of Notre Dame [see Organum V]—of composing the solo sections only, the choral sections being added in plainsong [see HAM, no. 127].

**Ressortir** [F.]. To emphasize.

**Rest** [F. *pause, silence*; G. *Pause*; It. *pausa*; Sp. *silencio*]. See under Notes.

**Restatement.** Same as recapitulation in \*sonata form.

**Resultant bass.** Name for organ pipes in which the acoustical phenomenon of resultant (differential) tones is used to produce the lowest registers; also called acoustic bass. See Combination tone.

**Resultant tones.** Same as \*combination tones.

**Resurrection Symphony.** Mahler's Symphony no. 2, in C minor, completed in 1894. The fourth movement is a setting for alto solo and orchestra of "Urlicht" (Primordial Light, a song from *Des Knaben Wunderhorn*); the fifth and last movement is a setting of Klopstock's poem "Auferstehung" (Resurrection), for soprano solo, chorus, and orchestra.

**Retardation.** An uncommon term for suspension, particularly a suspension resolving upward.

**Retirada** [It.]. In Italian ballets and suites of the 17th century, a closing movement, as opposed to the *\*intrada*. Biagio Marini wrote suites consisting of *Entrata-Ballo-Gagliarda-Corrente-Retirada* [see P. Nettl, in *ZMW* ix, 538].

**Retroensa** [Prov.]. *\*Rotrouenge*.

**Retrograde**. A melody read backward, i.e., beginning with the last note and ending with the first. Synonymous terms are crab motion, *cancrizans* [L.], *Krebsgang* [G.], *al rovescio*, and *recte et retro* [It.]. See Ex. 1.

Although this procedure (unlike *\*inversion*) completely obscures the original melody for the listener, it has not infrequently been used as a structural device. The earliest example is a 13th-century clausula, "Nusmido," in which the tenor has the liturgical melody "Dominus" in retrograde motion [see F. Ludwig, *Repertorium* (1910), i, 80]. Retrograde motion is one of the most common procedures of the 14th- and 15th-century riddle canons. It is indicated by inscriptions such as: "Ma fin est mon commencement" (Machaut), "Ubi  $\alpha$  ibi  $\omega$ " (with reference to the first and last letters of the Greek alphabet), "Cancriza" (walk like a crab), "Canit more Hebraeorum" (sing as the Hebrews read, i.e., from right to left), "Vade retro Satanas" (Retreat, Satan), or a word spelled backward, e.g., "Ronet." In the 18th century Haydn used crab motion as a humorous trick in a "Menuet al Rovverso," third movement, Symphony no. 47 (also in his A-major Violin Sonata, no. 4, and the

A-major Piano Sonata, B. & H. edition, no. 26). The minuet consists of a ten-measure phrase, ending on the dominant, which is played in retrograde to form the second half of the minuet (dominant to tonic). The trio is constructed in the same manner (two twelve-measure sections). The whole two-phrase minuet is then repeated in retrograde ("al rovescio"), which, however, sounds exactly the same as the original minuet. [See *GDB* vii, 267; also see *Rovescio*.] For a retrograde minuet by K. P. E. Bach, see *Nagel's Musik-Archiv* No. 65, no. 6a. Beethoven used

crab motion in the final fugue of the Hammerklavier Sonata, op. 106.

Retrograde inversion is the combination of retrograde motion and inversion [see Ex. 2]. The Postlude in Hindemith's *Ludus tonalis* is the retrograde inversion of its Prelude. Retrograde motion and inversion are of basic importance in *\*serial music*. For retrograde canons, i.e., the simultaneous use of a melody and its retrograde form (*recte et retro*), see Canon I.

**Revolutionary Etude**. Nickname for Chopin's Etude in C minor, op. 10, no. 12, written in 1831 after he heard that Warsaw had been captured by the Russians.

**Rf., rfz.** [It.]. Abbr. for *\*rinforzando*.

**Rhapsodie aus Goethe's 'Harzreise im Winter'** [G., Alto Rhapsody]. Composition by Brahms, op. 53 (1869), for contralto, men's chorus, and orchestra, based on a fragment from Goethe's *Harzreise im Winter* (Winter Journey through the Hartz Mountains).

**Rhapsodies hongroises** [F., Hungarian Rhapsodies]. A group of about twenty piano compositions by Liszt, in the character of free fantasies based on Hungarian themes. Most of them open with a slow introduction and continue with a fast, dancelike movement in imitation of the Hungarian *\*csárdás*.

**Rhapsody**. Originally, a section of a Greek epic (e.g., the *Iliad*) or a free medley of such sections sung in succession. Musicians have used the term with different meanings, chiefly for free fantasies of an epic, heroic, or national character (F. Liszt, *Rhapsodies hongroises*; J. J. Raff; É. Lalo; A. Dvořák; B. Bartók). In Brahms' *Rhapsodien* for piano (op. 79 and op. 119, no. 4) the name seems to refer to their *ballade*-like character, whereas in his *Rhapsodie* in C, op. 53, for contralto, male chorus, and orchestra, the title may refer to the fact that it is written to a section of Goethe's *Harzreise im Winter*. The free, "rhapsodic" element appears to be emphasized in Gershwin's *Rhapsody in Blue*. See V. Jankelevitch, *La Rhapsodie* [1955].

**Rheingold, Das**. See *Ring des Nibelungen, Der*.

**Rhenish Symphony**. Schumann's Symphony no. 3, in E-flat, op. 97, composed in 1850 after a trip along the Rhine. The fourth movement was inspired by a ceremony in Cologne Cathedral.

**Rhetoric**. See Figures, doctrine of.

**Rhumba. \*Rumba.**

**Rhyme, musical.** A term used for a composition consisting of sections having an identical ending: a + e b + e. Early examples occur in Gregorian chant, notably in some hymns (e.g., "Te lucis"; *LU*, pp. 367, 540) in the \*Alleluias, and in the Offertories with verses [see *ApGC*, p. 373; see also *ReMMA*, p. 107f, for an example from Ambrosian chant]. Musical rhyme is an essential feature of the \*estampies and is frequently present in the *ballades* of Machaut and his successors [see *HAM*, nos. 45, 47].

**Rhythm. I. General.** In its primary sense, the whole feeling of movement in music, with a strong implication of both regularity and differentiation. Thus, breathing (inhalation vs. exhalation), pulse (systole vs. diastole), and tides (ebb vs. flow) all are examples of rhythm.

Rhythm and \*motion may be analytically distinguished, the former meaning movement in time and the latter movement in space (pitch). A melody can be separated into a rhythm skeleton and a motion skeleton, but each qualifies the other. In Ex. 1, a particular pattern of note values is given five different rhythmic meanings through five different relationships to meter.

On the other hand, the two melodic fragments in E-flat major [see Ex. 2] have the same rhythm in the sense of relative note values and accent, but in the more general sense of the feeling of movement they are by no means alike. In Ex. 2a the

rhythm is qualified by the relative finality of leading-tone-to-tonic; in Ex. 2b the rhythm implies further movement (flow) toward the note G. Nevertheless, "foot rhythms" such as ♩, short-long, with the long note accented, and related phenomena (e.g., dotted rhythm, modal rhythm) constitute perhaps the only particular cases for which the general term "rhythm" will be acceptable to most—perhaps all—musicians.

**II. Classification.** There are two main categories of rhythm, isometric and multimetric.

(a) In \*isometric rhythm, every time value is a multiple (or fraction) of a beat, and the measures are equal and are normally accented on the first beat. In modern notation, the measures are marked off from one another by bar lines. See Ex. 1a-d. This is, aside from exceptions mentioned below, the rhythm of traditional Western music.

In isometric music, phrasing usually becomes a metric as well as a formal phenomenon. Especially in dance music and in music based on dance rhythms, there is a strong tendency to group the measures in two's and powers of two (2, 4, 8, etc.). Regularity of phrasing produces a meter on a higher level, so that isometric groups of measures become units of time, and the space of time measured by these units may in turn become a unit in a yet larger group, and so on.

(b) In multimetric rhythm [see Poly-, multi-], every time value is a multiple (or fraction) of a beat, but there is no regularly recurrent accent, owing to free alternation of different measures [see Ex. 1e]. This type is much more important in music history than is generally recognized. Gregorian chant, in its Solesmes rendition as well as the "mensuralist" interpretation [see Gregorian chant VI], belongs to this category (the common idea that Gregorian rhythm is "free" is actually misleading; a certain freedom of performance, involving ritardandos and accelerandos, may be applied to any type of rhythm and meter). The same is true of modern Russian and \*Syrian chant, as well as the humanist \*ode and \*vers mesuré of the 16th century, the \*plain-chant musical, and the French \*recitative of the 17th century. Multimeter became prominent in the works of modern composers such as Stravinsky, Bartók, and Hindemith, in which it frequently is notated as

\*syncopation, i.e., a temporary displacement of regular meter and accent.

The measurement of time is not always by means of a rhythm rationalized in terms of beats and multiples and fractions thereof. So-called "free" rhythm is like multimetric rhythm without a fixed unit of time: measure is by groups of notes, but the relative lengths of the notes themselves are not measured. Such free rhythm appears in various Oriental (Indian, etc.) songs and some ancient European folk music, e.g., Hungarian. Obviously, such rhythm cannot be expressed in Western musical notation, which is essentially based on the idea of a common unit of time. For an interesting attempt to escape the rhythmic fetters of Western notation, see under *Prelude II* (L. Couperin). Free rhythm is also present whenever a striking deviation from strict rhythm is demanded, e.g., by *rallentando*, *accelerando*, *rubato*.

III. *History.* (a) *Prehistory.* Practically all the extant examples of Greek music are isometric. Some of them employ irregular meters, such as  $5/8$  and  $8/8 + 7/8$  [see *HAM*, no. 7]. The early Christian hymns, especially those of St. Ambrose, are usually thought to have been sung in ternary meter (long plus short), but the evidence for this theory is somewhat doubtful [see *Ambrosian chant*]. The same applies to numerous hymns of later centuries, all of which are written in strictly measured verses, e.g., "O salutaris hostia," but are sung to melodies that often have several notes per syllable and therefore are not easily adaptable to rendition in strict meter [see Ex. 3]. Similar problems arise in connection with

the rhymed sequences of Adam de St. Victor (d. 1177 or 1192) and the repertory of the troubadours, trouvères, minnesingers, etc. See *Monophonic notation*; *Modal theory*.

(b) *Modal rhythm.* Not until shortly before 1200 did isometric rhythm become definitely established through the modal rhythm [see *Modes, rhythmic*] of the organa, clausulae, etc., of the school of Notre Dame. Credit for this important innovation must be ascribed to Leoninus. While his organa (*dupla*) seem to represent an intermediate type, including sections in

modal rhythm along with others in the free rhythm of the earlier period (\*St. Martial), his successor, Perotinus, established the exclusive use of modal (hence metric) rhythm [see *Organum* (2), IV; also *Ars antiqua* II]. The system of six rhythmic modes and their associated *ordines*, which developed shortly after 1200, is the first attempt at a methodical treatment of rhythm and meter. It prevailed for the rest of the century, later being broadened by the introduction of smaller values (two to seven semi-breves) in the place of one breve (the quarter note of  $3/4$  meter).

(c) *Rhythm in the polyphonic era, 1300–1600.* About 1250 the first attempts to introduce duple meter were made. A remark in a contemporary treatise (Pseudo-Aristotle; see *CS* i, 271) refers not only to this daring innovation but to the strength of contemporary opposition: "... If somebody were to ask whether a song can be formed by imperfect [i.e., duple] *longae* [half notes] exclusively just as it can be formed by perfect *longae* [triple or dotted half notes], the approved answer is no; since nobody can sing a succession of pure imperfect *longae*." In order to understand this position, it must be remembered that, to the 13th-century musician, triple meter was "perfect" because it had a "beginning," "middle," and "end"; duple meter, on the other hand, had a "beginning" and "middle" but no "end" and was therefore "imperfect." Musicians, however, did not bow to such scholastic reasoning, and shortly after 1300 duple and triple meter were recognized as equal in all degrees, from the *maxima* to the *semiminima* or, as one might say today, from the whole note to the quarter note, so that all meters,  $2/4$ ,  $3/4$ ,  $6/8$ ,  $9/8$ , became available. This system, which is the basis of \*mensural notation, was established by Philippe de Vitry (c. 1320). Hand in hand with this freedom of meter went a rapid advance in the use of rhythmic subtleties and finesses, such as dotted rhythm, triplets, \*hemiola formations, \*syncopation, and \*polyrhythms [see under \*Poly-, multi-]. Toward the end of the 14th century polyphonic music achieved a complexity of rhythm and meter that has never again been paralleled in all history [see *Polyrhythm*, Ex. 1]. These complexities largely disappeared in the Burgundian school (Dufay) and the subsequent Flemish schools (Ockeghem, Obrecht, Josquin). While composers of the 15th century preferred ternary meter, those of the 16th adopted binary meter as their standard meter and, within this framework, developed the technique of contra-

puntal rhythms that is the very essence of true counterpoint [see Texture]. However, irregular groupings and phrases are common, particularly in the works of the early Flemish masters (Ockeghem, Obrecht), so that the underlying meter is often obscured. In modern transcription this results in syncopation, but actually the formations are multimetric [see Ex., from the Kyrie of Ockeghem's *Missa Mi-mi*].

(d) Classical rhythm. With the abandoning of polyphonic music and the introduction of accompanied melody (1600; see Baroque music), isometric rhythm superseded the multimetric. This change, which had extensive antecedents in the dance music and the more popular vocal music of the late Renaissance, had two results: (1) the effect of the measure-to-measure rhythm became much simpler, because of the strong accents in regular recurrence that pervade and regulate the entire fabric; and (2) the regularly recurring pattern was used over greater spans of time than before, which in turn (with the important help of tonality) led to the emergence of the large piece. This classical rhythm, which is most simply and clearly realized in the dance, became the matrix for rhythmic development in all music from c. 1600 to 1900. About 1700 there arose, particularly with Antonio Vivaldi (d. 1741), a precise and energetic rhythm in quick notes that is well known from many fugal themes of Handel and, especially, from Bach's Brandenburg Concertos. After 1750, metric developments are relatively uninteresting until Beethoven, who in his late piano sonatas employed complete syncopation as a means of escaping from the "tyranny of the bar line" [see Syncopation]. His example was followed by Schumann and Brahms, who, familiar with the music of earlier periods, often used \*hemiola formations.

(e) The 20th century. The 20th century has seen a tremendous rise of interest in rhythmic

and metric variety. Multimetric music has been regenerated. Slavic dances with their lively rhythms, jazz with its complicated syncopations, the modern machine with its relentless motorism, neoclassicism with its return to polyphonic styles, and the general tendency to explore to the limit whatever was neglected in the 19th century—all these contribute to giving variety of rhythm and meter a place in contemporary music such as it had not had for many centuries [see Serial music IV]. For more details see Jazz; Syncopation; Polyrythm.

Finally, those readers whose concept of rhythm is primarily derived from the temporal phenomena of measure-music [see Measure] are referred to the entry Meter.

**Rhythmic modes.** See Modes, rhythmic.

**Ribattuta** [It.]. See under Ornamentation I.

**Ribeba** [It.]. \*Jew's-harp.

**Ribibe, ribible.** See Rabab.

**Ribs.** The sides of instruments of the violin family, connecting the back and the table.

**Ricercar(e), ricercata, recercada** [It.]. Terms that, during the 16th and 17th centuries, were used for various types of instrumental music that differ considerably in style and purpose. By far the most important of these is the imitative

ricercar [see I]. The other connotations, however, should not be overlooked in order to understand fully the general meaning of this term, for which the word "study" is a reasonably good equivalent. Such a "study" may be contrapuntal [I] or technical or instructive [II]. It should be noted that 16th-century prints and MSS often present the term ricercar interchangeably with *fantasia*, *tiento*, and *preamble*.

I. *The imitative (contrapuntal) ricercar*. This is, to a certain extent, the instrumental counterpart of the (vocal) motet. Its chief characteristic is the imitative treatment of one or more themes, the themes sometimes being slow and lacking rhythmic as well as melodic individuality (e.g., theme of the E-major fugue from Bach's *Well-Tempered Clavier*, vol. ii). Such pieces were written for instrumental (occasionally even vocal) ensembles and for the organ. The former were published in partbooks, the latter in scores, either on two staves (*\*intavolatura*) or (in the 16th and 17th centuries) occasionally on four staves (*partitura*). There is, however, evidence that the ensemble ricercar was occasionally also played on keyboard instruments in the Veggio MS at Castell'Arquato [see H. C. Slim, in *JAMS* xv], and in the arrangements from the *Musica nova* of 1540 (new ed. H. C. Slim [1964], nos. XI–XIII). These arrangements appear as keyboard compositions (*tientos*) in the *Libro de cifra nueva* of 1557 [\*Editions XXXII, 2].

(a) The ensemble ricercar. Instrumental pieces in the style of the motet were written by Isaac (c. 1450–1517) and Hofhaimer (1459–1537). Some of Isaac's "Instrumentalsätze" [e.g. *DTO* 28, nos. 42, 51] and Hofhaimer's "Carmen in re" ("in sol"; see H. J. Moser, *Paul Hofhaimer* [1929], nos. 22–23) might well be considered the point of departure for the ricercar. The earliest ensemble pieces called "ricercar" are found in the *Musica nova* of 1540 (Willaert, Julio da Modena) and in publications by Jacques Buus (1547, '49), Giuliano Tiburtino (1549; also eight by Willaert), Willaert (1551, '59), and Annibale Padovano (1556). Stylistically, these are very similar to motets, being written in a vocal ambitus and in a continuous texture with numerous overlapping points of imitation, frequent crossing of voice-parts, without ornamentation and passagework, etc. The close relation to vocal practice is indicated by titles such as "per cantar et sonar" (*Musica nova*), "da cantare et sonare" (Buus, 1547), or "da cantare a quattro voci" (Merulo, 1607), inscriptions indicating that these ricercars could be sung (in *\*vocalization*)

as well as played on viols, recorders, cornetts, etc. Moreover, singers frequently utilized ricercars by adding solmization syllables (Tiburtino, 1549; Fuenllana, *Orphenica lyra*, 1554; P. Vinci, *Motetti e ricercari*, 1591). The ensemble ricercar was cultivated until about 1620, the latest (?) publication being by Antonio Cifra (1619). Others are by Palestrina (?; see Lit., Ritter), Merulo (1574, 1607), Malvezzi (1577), and Stivori (1589, '99).

(b) The organ ricercar. The history of the imitative ricercar for keyboard begins with the four ricercars in Girolamo Cavazzoni's *Intavolatura cioè recercari canzoni himni magnificati* of 1542/43 [see *HAM*, no. 116]. They show many of those peculiarities of style and structure that make the organ ricercar a type in its own right, not a mere "textless motet," as is largely the case with the ensemble ricercar. The most important trait is the employment of a relatively small number of themes, each of them extensively treated in a lengthy section that comes to a full stop. Other traits, not found in the ensemble ricercar, are free-voice writing, cadential coloraturas, and passages in toccata style. Andrea Gabrieli wrote a number of ricercars (pub. posthumously, 1595, '96), in which the tendency towards elaborate treatment of a small number of themes becomes even more apparent. Five of these ricercars are monothematic; others are based on two or three themes. In addition, Gabrieli made extensive use of special contrapuntal devices such as augmentation, diminution, inversion, double counterpoint, and combination of different themes, thus bestowing on the ricercar the character of learnedness that was later to be associated with it. In Italy the organ ricercar was also cultivated by Merulo (1567), Mayone (1603, '09), Antegnati (1608; \*Editions XI, 9), Trabaci (1603, '15), Frescobaldi (1615; also some in the *Fiori musicali*, 1635), Salvatore (1641), Storace (1664), Battiferri (1669), Fontana (1677), and Pasquini (\*Editions XI, 5). German (chiefly South German) composers of ricercars were H. L. Hassler (c. 25 ricercars; some in *DTB* 7), Erbach (c. 35 ricercars; some in *DTB* 7), Steigleder (1624), Froberger (*DTO* 8), Krieger [see *HAM*, no. 249a], Poglietti, and Pachelbel (*DTB* 6). Bach ended the development with his famous ricercar (acrostic: *Regis Iussu Cantio Et Reliqua Arte Canonica Resoluta*—Upon the King's Demand, the Theme and Additions Resolved in Canonic Style) from *Das Musikalisches Opfer*, 1747.

II. *The nonimitative ricercar*. Numerous 16th- and 17th-century compositions bearing the name

ricercar are quite different in style and form from the type described above. In a way, they may be characterized as "studies" in technique and instruction rather than counterpoint.

(a) For the lute. The earliest pieces called "ricercar" are the lute ricercars in Petrucci's *Intabulatura de lauto* i, ii, iv (1507/8; iii is lost). Unrelated to the motet, they are short pieces in free lute style, consisting chiefly of sequential passages and chords, much like a prelude. Counterpoint is reduced to a bare minimum, and imitation is usually absent [see *HAM*, no. 99; *SchGMB*, no. 63b]. However, not all these pieces are preludes (as suggested by various writers), because several pieces by Dalza in Petrucci's Book iv consist of a "tastar de corde" (touching of the strings), a "ricercar dietro" (ricercar thereafter), and a "Recercar detto coda." Here the *tastar* evidently takes the place of the prelude proper; in fact, the ricercar is, by comparison, somewhat more "constructed" and may have served to exploit the technical resources of the lute [see *HAM*, no. 99]. Certainly an early function of the ricercar was an associative one: those by Bossinensis (Petrucci, bks. i and ii, 1509, '11) are designated by a system of letters to be played with his arrangements of *frottole* for solo voice and lute. In the later literature for the lute (Francesco da Milano, 1536, '46, '47, etc; Simon Gintzler, 1547 [see *DTO*, 37]; Valentin Bacfarc, 1552; Vincenzo Galilei [for original lute pieces from *Fronimo*, 1584, see Editions XXIII, 4]), the ricercar more and more approaches the style of the imitative ricercar, apparently owing to the greater skill of the lutenists, who by then regarded the polyphonic style as idiomatic for their instrument. The practice of incorporating pre-existent polyphonic music in ricercars resulted in the parody ricercar [see J. Ward, in *CP Sachs*, pp. 208–28].

(b) For the organ. The earliest organ pieces called ricercar are found in Marco Antonio Cavazzoni's *Recerchari, motetti, canzoni* (1523). Like the lute pieces, they have no connection with the motet. They are long compositions showing a mixture of chordal elements, passagework, and sporadic imitation of short motifs. In spite of their length they apparently served somewhat as a prelude, each of the two ricercars being followed by a piece in the same key, a *Salve virgo* and an *O stella maris*—evidently the "motets" of the title. Four ricercars by Giacomo Fogliano (\*Editions X, 1) and those by Claudio Veggio [see Lit., article by Slim] show increased use of imitation and represent the transition to

the imitative ricercar of Girolamo Cavazzoni.

(c) For viols, etc. Theorists such as Silvestro Ganassi (*Regola Rubertina*, 1542/3; ed. by M. Schneider, 1924) and Diego Ortiz (*Tratado de glosas*, 1553; rev. ed. by M. Schneider, 1936) use the term "ricercar" for instructive pieces designed to demonstrate the skillful playing of the viola da gamba. Ganassi's pieces are interesting for their extensive use of double stops [see *HAM*, no. 119], while those by Ortiz illustrate the art of variation and ornamentation. Clearly in the same category are 17th-century ricercars for cello solo (without accompaniment) by Giovanni Battista degl'Antonii (op. 5, 1690) and Domenico Gabrielli (1689; see *SchGMB*, no. 228).

(d) For voice. A pedagogic purpose is clearly indicated in an extensive repertory of 16th- and 17th-century "ricercari a due voci" (F. Guami, 1588; G. Metallo, 1603 and later editions; C. Gentile, 1642; C. Piochi, 1671), i.e., two-voice untexted compositions designed primarily for singers, since in several of the publications above they are referred to as vocal exercises, to be performed, of course, in \*vocalization. Orlando di Lasso's "Cantiones sine textu" [see comp. ed. i, 8ff] belong to the same category. As late as 1774, G. Martini in his *Esemplare ossia saggio* (p. 295) speaks of "the masters who compose ricercars and solfeggios." These pieces are particularly interesting as potential predecessors of Bach's two-part inventions.

The neoclassical movement of the 20th century has led to a revival of the ricercar, e.g., in B. Martinu's *Tre Ricercari*, in A. Casella's *Due Ricercari sul nome di Bach*, and in Stravinsky's *Cantata*.

l'origine des ricercatori pour luth" (*CP Laurence*); A. Einstein, "Vincenzo Galilei e il duetto didattico" (*LRM* xi); H. C. Slim, "Keyboard Music at Castell' Arquato by an Early Madrigalist" (*JAMS* xv); J. Ward, "Parody Technique in 16th-century Instrumental Music" (*CP Sachs*).  
rev. H.C.S.

**Ricochet** [F.]. See under Bowing (e).

**Riddle canon.** See under Canon (1), III.

**Ridotto** [It.]. Reduced, i.e., arranged (for piano, etc.).

**Riduzione** [It.]. Arrangement.

**Rienzi.** Opera in five acts by Wagner (full title, *Cola Rienzi, der Letzte der Tribunen*; libretto by the composer, based on Bulwer-Lytton's novel), produced in Dresden, 1842. Setting: Rome, about 1350. An early work, it reflects the styles of Italian and French opera.

**Rigaudon, rigadoon.** A Provençal dance of the 17th century [see Dance music III] used in the operatic ballets of Lully, Campra, and Rameau, and also introduced in the optional group of the suite (Pachelbel, Bach). Among the earliest extant examples is a Rigadoon by Purcell (c. 1659–

95; see Ex.). The *rigaudon* also occurs in the suites of modern composers (Grieg, *From Holberg's Time*; Ravel, *Le Tombeau de Couperin*). See V. Alford, in *MQ* xxx, no. 3.

**Rigo** [It.]. Staff.

**Rigoletto.** Opera in three acts by Verdi (libretto by F. M. Piave, after Victor Hugo's drama *Le Roi s'amuse*), produced in Venice, 1851. Setting: Mantua and environs, 16th century. Its gruesome plot places *Rigoletto* in the category of the "horror opera," which had a great vogue around 1850. However, the action is full of moments of genuine dramatic tension, and the music elevates the opera far beyond the level of, e.g., Meyerbeer's *Robert-le-Diable*. Together with *Il Trovatore* (1853) and *La Traviata* (1853), *Rigoletto* represents the high point of Italian opera with melodramatic plots, popular melodies, and emphasis on "effective" vocal numbers.

**Rilasciando** [It.]. Slowing down.

**Rinforzando**, abbr. *rf*, *rfz*, *rinf.* [It.]. A sudden accent on a single note or chord, practically synonymous with *\*sforzando*. In early orchestral music (J. W. A. Stamitz) the term is used for a short but strong crescendo.

**Ring des Nibelungen, Der** [G., The Ring of the Nibelung]. Tetralogy by Richard Wagner, consisting of four operas: *Das Rheingold* (The Rhine Gold, 1853–54; designated by Wagner as *Vorspiel*, i.e., prologue); *Die Walküre* (The Valkyrie, 1854–56); *Siegfried* (1856–71); and *Götterdämmerung* (The Twilight of the Gods, 1873–74). The libretto is by Wagner, based on legends from the Scandinavian Edda and the Nibelungenlied. The first performance of the entire *Ring* took place in Bayreuth, 1876, for the dedication of the Bayreuth Festspielhaus. Setting: Germanic mythology.

In order to forge together his large, complicated plot, Wagner here more than in any of his other operas relies on *\*leitmotivs* as a means of unification. Not only has each of the characters his own specific motif, but basic ideas, such as "the curse," "the ring," and "the sword," are also represented in this way. Moreover, in contrast to such earlier operas as *Tannhäuser* and *Lohengrin*, Wagner here completely discards the last remnants of the aria or lied as an ingredient of operatic structure, replacing it with an "unending melody" that, intentionally avoiding definite cadences and sectional construction, continues almost from the beginning to the end of each act in an uninterrupted flow [see Opera X; Recitative; Leitmotiv].

**Ripieno** [It.]. In the 17th- and 18th-century orchestral music, particularly in the *\*concerto grosso*, the "reinforcing section" of the orchestra, comparable to the "rear section" of the violins, etc., in the modern orchestra. Therefore, *ripieni* indicates the full orchestra (*tutti, concerto grosso*) as distinguished from the soloists (*concertino*). However, *senza ripieni* (without *ripieni*) does not mean "orchestra silent" but calls for the leading orchestra players only, i.e., a smaller ensemble used for the accompaniment of the soloists (*concertino*). A *ripienista* is an orchestral player.

**Riposato** [It.]. With a feeling of repose.

**Riprendere** [It.]. To take up (the original tempo).

**Ripresa** [It.]. (1) Repeat or repetition (also of a performance, opera, etc.). (2) Recapitulation (in sonata form). (3) In the 14th-century *\*ballata*

(and its descendant, the *\*frottola*), the refrain. (4) In 16th- and 17th-century music, a varied repeat of a dance [see T. Norlind, in *SIM* vii, 172], or a closing section of a dance or a tune [see *HAM*, no. 154, Ammerbach; no. 192, Frescobaldi]; see under *Ritornello* (1).

**Riservata** [It.]. Variant spelling of *reservata*. See *Musica reservata*.

**RISM**. Abbr. for *Répertoire International des sources musicales*, an exhaustive inventory of musical sources intended to replace R. Eitner's *Biographisch-Bibliographisches Quellen-lexikon* (1900–04). The project was initiated in 1952 by F. Blume (chairman) and other musicologists. It consists (or will consist) of two main sections: A. an alphabetical catalog of authors (composers, writers, theorists, etc.); B. a number of catalogs arranged chronologically or systematically, each dealing with a specific subject, e.g., "Printed Collections of the 16th–17th Centuries," "Manuscripts of Tropes and Sequences," etc. The following volumes (all for section B) have appeared: F. Lesure, *Recueils imprimés, XVIe–XVIIe siècles: I. Liste chronologique* [1960]; *id.*, *Recueils imprimés, XVIIIe siècle* [1964]; J. S. van Waesberghe, P. Fischer, and C. Maas, *The Theory of Music from the Carolingian Era up to 1400*, vol. i. [1961]; H. Husmann, *Tropen- und Sequenzenhandschriften* [1964]; G. Reaney, *Manuscripts of Polyphonic Music, 11th–Early 14th Century* [1966]. See F. Blume, in *JAMS* xvii, 415ff.

**Rispetto** [It.]. A form of early Italian poetry, usually in eight lines with the rhyme scheme a b a b c c d d. Several 14th-century madrigals have texts in *rispetto* form [see W. T. Marrocco, *The Music of Jacopo da Bologna* (1954), p. 16].

**Risposta** [It.]. Fugal answer.

**Risqolo**. See under Syrian chant; Melody type.

**Ritardando**, abbr. *rit.*, *ritard.* [It.]. Gradually slackening in speed, also indicated by *rallentando*. *Ritenuto* properly calls for immediate reduction of speed.

**Ritenuto** [It.]. See under *Ritardando*.

**Rite of Spring, The**. See *Sacre du printemps, Le*.

**Ritmo** [It.]. *\*Rhythm*. For Beethoven's indication "ritmo di tre [quattro] battute," see *Battuta*.

**Ritornello** [It.]. (1) In the 14th-century *\*caccia* and *\*madrigal*, the couplet at the end of the

poem, which usually expresses the "thought" derived from the preceding "description." In musical composition, it is treated as a separate section, usually involving a change of meter. The *ritornello* is not a refrain. The name ("little return") may indicate that the *ritornello* restates the content of the main stanza in modified form. Cf. the terms *\*repetitio*, *\*reprise*, and *ripresa* [see *Ripresa* (3) and (4)], all of which mean "conclusion."

(2) In 17th-century Italian operas and cantatas, the term has essentially the same meaning but is applied to short instrumental conclusions added to an aria or a song [see *HAM*, no. 183, Cavalieri; no. 209, Landi; no. 221, Cesti]. Sometimes the *ritornello* also occurs at the beginning of the song, an example being the famous *ritornello* for Orfeo's song "Vi ricorda," in Monteverdi's *Orfeo* (1607) [for another example, by Stradella, see *HAM*, no. 241]. Aside from the *\*sinfonias*, which serve a different purpose, the *ritornelli* are the only instrumental pieces in early operas. The *ritornello* instrumental refrain is a standard feature of German 17th-century strophic songs (arias). See the arias of Johann Erasmus Kindermann in *DTB* 32 and Adam Krieger in *DdT* 19.

(3) See *Ritornello* form. See also *Ritournelle*.

**Ritornello form**. A term often used for the typical form of the first and frequently also the last movement of the baroque concerto, particularly the *\*concerto grosso*. Such movements consist of an alternation of tutti and solo sections, the tutti sections being based on identical material while the solo sections vary. The tutti sections therefore form the *ritornello*.

**Ritournelle** [F.]. A 17th-century dance in quick triple time, by far the most common dance type in the ballets of Lully. Like the *\*ritornello*, it serves as the conclusion of a song.

**Riverso, rivolto** [It.]. Terms that mean *\*inversion* (of intervals, chords, or parts) but also are used to denote *\*retrograde* motion. See *Rovescio*.

**Rococo**. In painting, architecture, and other visual and decorative arts, designation for an 18th-century style in which light, ornate decoration (especially in the form of scrolls, shells, etc.), and emphasis on frivolous elegance and luxury replace the massive structures of the baroque. Its counterpart in 18th-century music is the so-called *\*gallant* style, which, with its emphasis on pleasantness and prettiness, is in marked contrast to the impressive grandeur of the *\*baroque*.

style. The main flowering of rococo was from 1725 to 1775. However, the movement began considerably earlier in France, where François Couperin (1668–1733) represents the musical counterpart of the first major rococo painter, Watteau (1684–1721). From France it spread to Germany (Telemann, 1681–1767; Mattheson, 1681–1764) and Italy (D. Scarlatti, 1685–1757). The wholehearted adoption of the rococo style led to a deterioration of artistic standards under musicians such as Balbastre, Daquin, C. Nichelmann, G. B. I. Grazioli, Sacchini, and many others who fill volumes euphemistically called "The Old Masters of the Pianoforte." Although as early as 1740 Johann W. A. Stamitz, founder of the \*Mannheim school, established a novel style of a more vigorous nature, rococo elements are still present in the works of K. P. E. Bach, Haydn, and Mozart. See Gallant style; *Empfindsamer Stil*. See P. H. Lang, *Music in Western Civilization* (1941), pp. 530ff; *GrHWM*, pp. 416–26.

**Rogue's March.** A tune of English origin that was used when a soldier was expelled from the army. See *GD* iv, 416, and iii, 316; *GDB* vii, 207.

**Rohrblatt** [G.]. The \*reed of the clarinet, oboe, etc., instruments called *Rohrblattinstrumente*.

**Rohrstimmen, Rohrwerk** [G.]. The reeds of the organ.

**Roi David, Le** [F., King David]. Opera (Dramatic psalm) in two parts by Honegger (libretto by R. Morax), produced in Mézières, Switzerland, 1921, and produced as an oratorio in New York, 1925. In the latter form, the orchestra is considerably enlarged, and a narrator relates the dramatic events between musical selections. Comprising 27 pieces, it describes the life of David from his youth as a shepherd boy until his death.

**Rolle** [G.]. An 18th-century term (used by D. G. Türk) for the \*turn.

**Rollschweller** [G.]. The crescendo pedal of the organ.

**Roman Carnival, The.** See *Carnaval romain, Le.*

**Romance** [F., Sp.], **Romanze** [G.], **romanza** [It.]. (1) The Spanish *romances* are long poems in four-line stanzas dealing primarily with historical or legendary subjects. Their origin can be traced back to the 14th century. The *Cancionero musical de palacio* [\*Editions XXXII, 5] contains polyphonic settings of several *romances*, e.g.,

"En memoria d'Alixandre" (Anchieta) and "Pésame de vos, el Conde" (J. del Encina). Settings to lute (vihuela) accompaniment are found in the lute (vihuela) books of Narvaez [\*Editions XXXII, 3; e.g., "Paseábase el rey moro"], Luis Milán [\*Editions XLVI, 2; e.g., "Durandarte"], and Mudarra [\*Editions XXXII, 7; e.g., "Triste estaua el rey David"]. A large number of 17th- and 18th-century *romances* are preserved in various Cancioneros and other sources [\*Editions XXXII, 18]. Among the numerous composers of *romances* were M. Romero, G. Díaz, J. Pujol, and the brothers Francisco and José Ruiz Samaniego. To the present day, the *romance* is extensively cultivated in Spanish folk music.

(2) The French *romance* is a short strophic song of lyrical character, usually dealing with love but also with historical events. An early publication is the *Recueil des romances historiques, tendres et burlesques* by M. Delusse (1767). Well-known composers of *romances* were H. Duparc, G. Fauré (instrumental), and others.

(3) The German *Romanze* is primarily an instrumental composition of a lyrical character (Haydn's symphony, *La Reine*; Mozart, Piano Concerto in D minor, K. 466; Beethoven, *Romanze*, op. 40, 50; Schumann, *Albumblätter*, no. 11). In Schumann's *Drei Romanzen* op. 28, only the second is in an idyllic style, the other two being highly dramatic. Vocal *Romanzen* occur mostly in operas, a famous example being Pedrillo's "Romanza" in Mozart's *Die Entführung aus dem Serail*.

**Roman chant** [L. *cantus Romanus*, *cantilena Romana*]. The liturgical chant of the Roman Catholic Church, i.e., \*Gregorian chant. Although this chant developed in Rome, it probably received its final form—the only one known today—in the Frankish empire during the 8th and 9th centuries. More properly “Roman” is a different repertory known as \*Old Roman chant.

**Roman de Fauvel.** See Sources, no. 8.

**Romanesca.** A harmonic bass, widely used for the composition of *arie per cantar* and dance

variations from the middle of the 16th through the early 17th centuries [see Ex. 1]. Its provenance is uncertain; extant sources indicate that

musicians in both Italy and Spain played a significant role in its early history. Because, in *arie per cantar*, singers improvised discant tunes to the bass pattern, many different discant melodies are found in extant versions of the *romanesca*.

The isometric pattern cited above developed over a long period. Many late 15th- and early 16th-century sources in both Italy and Spain include adumbrated examples that are more complicated rhythmically than the isometric pattern. Indeed, numerous variants existed side by side with the isometric pattern, under such titles as *Favorita*, *El poverin*, *La desperata*, *La comadrina*, *L'Herba fresca* [see Ex. 2], *La pigna*, *La meza notte*, *La canella*, *Todeschin*, etc. [see Ex. 2, *L'Herba fresca* bass].

2

Among the earliest examples of pieces written on the isometric bass pattern are a "Gaillarde" in Attaingnant's *Dixhuit basses dances* (1529; f.24), a set of variations on "O guárdame las vacas" in Narvaez's *Los Seys Libros del Delphin* (1538; vi, f.82v), "Ein gutter venetianer Tantz" in H. Newsidler's lute tablature (1540; f.E4), and a "Pass'e mezo alla villana" in Rotta's lute tablature (1546; no. 20). The earliest extant appearances of the title *Romanesca* with the bass pattern are in Mudarra's *Tres libros de música* (1546; ff.17, 24, "Romanesca o guardáme las vacas") and in Phalèse's *Carminum quae chely vel testudine* (1546; f.164, "Romanescha"). Settings also appear in 16th-century collections by Valderrábano (1547; see *HAM*, no. 124), F. Bianchini (1546), Pisador (1552), Ortiz (1553), Balletti (1554), Becchi (1568), Le Roy (1568), Phalèse (1568, '74), Valente (1576), Cabezón (1578), Caroso (1583), and many others.

In the 17th century, keyboard variations were written by Trabaci (1603), Mayone (1609), and Frescobaldi [see *HAM*, no. 192]; strophic bass arias [see *Aria III*] by Caccini (*Le Nuove Musiche*; see *BüHM*, *Barock*, p. 45), Monteverdi (*Madrigali*, bk. vii), Landi (*RiHM*, ii.2, 91f), and Kaspar Kittel (*ibid.*, p. 353); and violin variations by Marini (*HAM*, no. 199) and Salomone Rossi (*RiHM*, ii.2, 88f). The pattern was also used for countless compositions in collections for the guitar. See O. Gombosi, in *LRM* vii, 14-25; J. Ward, in *MGG* xi, 778-79. L.H.M.

**Romanian letters.** See Romanus letters.

**Roman school.** A term used with reference to the *a cappella* church music established in Rome by Palestrina (c. 1525-94; see Palestrina style) and continued, with incorporation of the polychoral elements of the \*Venetian style, by a long line of strongly conservative musicians, mostly in Rome, among them G. M. Nanino (c. 1545-1607), F. Suriano (1549-after 1621), R. Giovannelli (1560-1625), F. Anerio (c. 1560-1614), G. Allegri (c. 1582-1652), D. Mazzocchi (1592-1665), V. Massocchi (1597-1646), F. Foggia (c. 1604-88), O. Benevoli (1605-72), E. Bernabei (c. 1620-87), T. Bai (c. 1660-1714), G. Pitoni (1657-1743), and Caldara (1670-1736). In general, these musicians rejected the current styles and forms of baroque music (aria, recitative, oratorio, cantata, opera, sonata, toccata, etc.) and devoted themselves to the composition of strictly liturgical music (Masses, motets, Requiems, psalms, etc.). Based on the principles of vocal style of the Palestrina period, their technique tended toward scholarly treatment (canonic contrivances) as well as pompous display; thus Masses for 16, 24, and more voice-parts are no rarity in what has aptly been called the "colossal baroque," and some composers used up to eight choruses, which were placed throughout St. Peter's [see the 54-voice Mass by Benevoli in *DTO* 20]. For the later development of this style, which continued throughout the 18th century, see K. G. Fellerer, *Der Palestrinastil . . . des achtzehnten Jahrhunderts* [1929]; also O. Ursprung, in *ZMW* vii. See *A cappella*; Palestrina style.

**Romanticism** [F. *romantisme*; G. *Romantik*; It., Sp. *romanticismo*]. An important movement of the 19th century, continuing until c. 1910. Fore-shadowed in the late works—particularly the piano sonatas—of Beethoven (1770-1827), it found its first champions in Weber (1786-1826) and Schubert (1797-1828) and its fullest realization in the works of six composers, all born within a single decade: Berlioz (1803-69), Mendelssohn (1809-47), Schumann (1810-56), Chopin (1810-49), Liszt (1811-86), and Wagner (1813-83). Berlioz, Mendelssohn, Schumann, and Chopin worked principally from 1820 to 1850, a period often designated as early romanticism. Liszt and Wagner, who lived much longer, produced their most important works after 1850, as did Franck (1822-90), Bruckner (1824-96), Smetana (1824-84), Brahms (1833-97), Mussorgsky (1839-81), Tchaikovsky (1840-93), Dvořák (1841-1904), and Grieg (1843-1907).

They represent the middle period of romanticism, from about 1850 to 1890. The last phase of the movement, known as late (or neo-) romanticism, from c. 1890 to 1910, is represented by a large number of composers born between 1850 and 1880, among them Elgar (1857–1934), Puccini (1858–1924), Mahler (1860–1911), R. Strauss (1864–1949), Sibelius (1865–1957), and Reger (1873–1916). Other late romantic composers, like Grieg, Dvořák, and Albéniz, are identified especially with \*nationalism in music.

The romantic movement in the arts began in literature during the second half of the 18th century. Jean-Jacques Rousseau (1712–78) and others, reacting against the intellectual, formalistic classical tradition, demanded a return to simplicity and naturalism, with a greater emphasis on man's instincts and feelings than on his intellect. In music, romanticism was characterized by emphasis on subjective, emotional qualities and greater freedom of form. These traits need not imply that nonromantic music lacks emotional appeal. Nor does it mean that the romanticists were not form-conscious; if anything, they were more so, sometimes to the point of becoming formalistic (Chopin's later mazurkas, Schumann's Symphony in D minor, Liszt's Sonata in B minor). The greatest works of the romantic era, like those of all periods, are those that derive substance and balance from traditional principles of form and structure. Shortly after 1900 there began a reaction against romanticism that gained such impetus that anti-romanticism became the most tangible element of the early modern era. Whereas Debussy's \*impressionism, directed largely against German romantic music (especially Wagner), did not introduce any radical innovations, other \*twentieth-century music was a violent negation of romanticism in all its aspects, technical as well as philosophic.

In spite of its limitations, romanticism has supplied a large portion of the repertory of modern pianists and conductors. In the province of musical forms, romanticism's three outstanding contributions are the \*character piece for piano, the art song for voice and piano, and the \*symphonic poem for orchestra. Romantic composers have contributed much to the development of harmony and of orchestral colors. Finally, they have done much to break down some of the artificial barriers between the arts. For example, their combined use of literature and music is seen in such terms as "symphonic poem" or "tone poem," in the choice of literary subjects

for program pieces (*Mazeppa*, *Till Eulenspiegel*), and, most clearly, in Wagner's concept of the opera as a *Gesamtkunstwerk*. An important romantic device in such music is the \*leitmotiv.

Certain earlier periods of music history bear general resemblance to 19th-century romanticism and therefore might be termed "romantic," in contrast to others that might be considered "classical" periods [see under Classicism for a discussion of this idea].

**Romantic Symphony.** (1) Popular name for Bruckner's Symphony no. 4, in E-flat major, composed in 1874 (rev. 1878, 1880). (2) Name for Hanson's Symphony no. 2, composed 1928–30.

**Romanus letters, Romanian letters** [*G. Romanus-Buchstaben*]. A system of letters said to have been invented by a legendary 8th-century papal singer named Romanus. The system is explained by Notker (Balbulus; *GS* i, 95) and others, and is used in various neumatic MSS from St. Gall, Metz, and Chartres. The letters were to be used with the neumes in order to clarify details of pitch, rhythm, or performance not indicated by the neumes themselves. Of the numerous letters mentioned by Notker, only a few attained

practical significance, chiefly those concerning temporal values: *c* (*celeriter*, quick), *t* (*tenere*, slow), and *m* (*mediocriter*). They play a central part in present-day discussions of Gregorian rhythm [see Gregorian chant VI]. See *WoHN* i, 140; *ReMMA*, pp. 140ff; *ApGC*, p. 117; L. Kunz, "Die Romanusbuchstaben c und t" (*KJ* xxxiv).

**Romanze**, [G.]. See under *Romance*.

**Romanzen aus L. Tieck's Magelone** [G., Magelone Romances]. A cycle of fifteen songs by Brahms, op. 33 (1861–68), set to poems by L. Tieck.

**Rome**. For a full account of what little is known about the music of the ancient Romans, see *ReMMA*, pp. 51ff, and *GéHM*, pp. 114ff. See also *Hydraulos*; *Lituus* (1); *Tuba* (1); *Buccina*. See *NOH* i, 404; H. Antcliffe, in *ML* xxx, 337; P. R. Coleman-Norton, in *JAMS* i (Cicero); G. Wille, in *AMW* xi, 71.

**Romeo and Juliet**. Among the many compositions based on Shakespeare's play are: (1) Dramatic symphony by Berlioz, op. 17 (1839), for solo voices, chorus, and orchestra; (2) opera by Gounod (1867); (3) symphonic poem (Fantasy Overture) by Tchaikovsky (1869); (4) ballet by Prokofiev, op. 64 (1935).

**Rondador**. See under *Panpipes*.

**Ronde** [F.]. See under *Notes*. Also, a round dance.

**Rondeau**. (1) An important form of medieval French poetry and music. In its simplest, 13th-century form, it consists of eight short lines with a rather artificial repeat structure, line 1 being identical with lines 4 and 7, and line 2 with line 8. Lines 1 and 2 therefore form a refrain that recurs in part in the middle and complete at the end. Music is composed for the refrain only (line 1 = a, line 2 = b) and is repeated according to the scheme A B a A a b A B (capital letters indicate the refrain). In the 14th and 15th centuries the refrain (and correspondingly the entire poem) was expanded from two lines to three (2 plus 1, *rondeau tercet*), four (2 plus 2, *quatrain*), or five (3 plus 2, *cinquain*), but the musical structure remained the same. The accompanying example shows a 13th-century rondeau in the usual modern arrangement. The rondeau is one of the three *\*formes fixes*.

A considerable number of 13th-century rondeaux, all monophonic, exist. However, they are not found in the chansonniers of the trou-

vères, their texts occurring in purely literary sources such as the "Roman de la Rose" of c. 1200 or in large collections of poems such as *Bibl. nat. f. fr. 12786*. In a number of cases the music can be reconstructed because the refrains are preserved elsewhere with music, e.g., in 13th-century refrain motets. For example, the text of the accompanying example is in the above-

1.4.7. En ma dame ai mis mon coeur  
3. N'en par - ti - roi a nul fuer  
5. Si m'ont sor - pris si vair oeil

2.8. Et mon pen - ser.  
6. Ri - ant et clair

mentioned MS, and its refrain with music at the end of the motet "Trop souvent–Brunete–In seculum" [*HAM*, no. 32d]. Polyphonic settings, usually for voice and two instrumental parts, were composed by Adam de la Hale (c. 1240–87), Machaut (c. 1300–77) and his successors, and in the 15th century by Dufay, Binchois, Hayne van Ghizeghem, Busnois, Ockeghem, and many others. Of the *formes fixes*, the rondeau was the only one widely used after 1400. It figures prominently in the *\*Odhecaton* and its companion books, *Canti B* and *Canti C*. Examples in *HAM*, nos. 19d, 19e, 36b, 48, 68, 69, 71, 72, 79. For the origin of the rondeau, see *Rondellus* (2).

The literary form of the rondeau survives in modern poetry as the *triolet*.

Lit.: F. Gennrich, *Rondeaux, Virelais und Balladen*, 2 vols. (1921, '27); P. Aubry, "Refrains et rondeaux du XIIIe siècle" (*CP Riemann*); W. Apel, "Rondeaux, Virelais, and Ballades" (*JAMS* vii); G. Reaney, "The Poetic Form of Machaut's Musical Works" (*MD* xiii).

(2) An instrumental form of the 17th century, consisting of a reiterated *\*refrain* and different "couplets": A B A C A D . . . A. Whether this form is an outgrowth of the medieval rondeau is, to say the least, doubtful; no connection between the two is known. The rondeau is the form used most by the French clavecinists (Chambonnières, L. Couperin, D'Anglebert, F. Couperin, Rameau), as well as in contemporary orchestral and operatic music (Lully). The refrain as well as each couplet is a well-marked strain of 8 or 16 measures. Each couplet

usually emphasizes a different key, e.g., the first, tonic; the second, dominant; the third, relative minor; etc. [ex. in *HAM*, no. 277]. In the late 18th century, the 17th-century rondeau developed into the \*rondo form of the sonata.

**Rondellus** [L.]. (1) Medieval name (used by W. Odington, c. 1300) for a triple or duple \*voice exchange. (2) Modern (or medieval?) name for a type of Latin song that is structurally similar to the medieval rondeau [see *Rondeau* (1)]. Such songs, which date from the 12th century, are interesting as the forerunners of the French rondeau. They are found occasionally in the MSS of St. Martial, but the most important source is a collection of 60 *rondelli* in the last fascicle of the Notre Dame MS Florence, Bibl. Laur., *plut.* 29.i (F) [see "Magnus liber organi"; Sources, no. 3]. They are written in various repeat forms, the most common being that of the French rondeau without the initial refrain: a A a b A B. Actually, this is a simple binary form:  $\parallel : a : \parallel : a b : \parallel$ . For an example, see *HAM*, no. 17b. See H. Spanke, "Das lateinische Rondeau" (*Zeitschrift für französische Sprache und Literatur* liii, 27); P. Aubry, "Iter hispanicum" (*SIM* ix, 41); *id.*, in *CP Riemann*.

**Rondeña.** See Fandango.

**Rondo, rondo form, rondo-sonata form.** A form frequently used in classical sonatas, symphonies, and concertos for the final movement. It was developed from the \*rondeau of the French clavecinists by reducing the number of "couplets" to three, by using the same material for the first and third couplets, and by elaborating the middle couplet in the style of a development section, so that the following scheme results: R A R B R A' R. In this form the rondeau is similar to sonata form, inasmuch as A and A' correspond to the exposition and recapitulation, and B to the development. The recurrent section is usually called "rondo," and the intermediate sections "episode" or "diversion." The rondo form has often been used for the last movements of sonatas and concertos as a joyful or playful conclusion. Numerous examples are found in the final movements of Beethoven's earlier piano sonatas (op. 2, no. 3; op. 13; etc.) and in practically all the concertos of the Viennese classics. Earlier, less developed examples occur in the sonatas of Johann Christian Bach (e.g., no. 6 of the new ed. by L. Landshoff), the independent rondos of K. P. E. Bach (e.g., *Clavier-Sonaten nebst einigen Rondos fürs Pianoforte*, 1780), and

the early works of Haydn (e.g., Sonata no. 24, op. 17, no. 3). See Sonata B III (b).

The term "rondo form" is also used, particularly by English writers, for two alternation schemes shorter than the true rondo, the ternary form A B A and the five-part form A B A B A (or A B A C A). These are called respectively "first" and "second" rondo form, in distinction to the "third" rondo form discussed above. This terminology is objectionable from the historical standpoint, since only the "third" rondo form developed from the rondeau. The "first" rondo form is the ternary form [see Binary and ternary form], while the "second" rondo form represents an expanded ternary form. See Forms, musical.

Lit.: F. Piersig, *Das Rondo* [n.d.]; W. Chrzanowski, "Das instrumentale Rondo und die Rondo-formen des 18 Jahrhunderts" (diss. Leipzig, 1911); C. F. Abdy Williams, in *PMA* xvii; S. Clercx, in *RDM* 1935, p. 148 (K. P. E. Bach).

**Room acoustics.** See Architectural acoustics.

**Root.** The generating note of a triad or any of its inversions and modifications (seventh chord). For example, in the following chords the root is always C:

A triad, seventh chord, etc. is said to be in root position if the root is the lowest note; otherwise, it is in \*inversion. See Harmonic analysis IV.

**Rorantists.** A chapel choir (of nine singers and a cleric, *Collegium Rorantistarum*) founded in 1543 at Cracow by King Sigismund I of Poland (1467-1548) for the cultivation of a *cappella* music. Its name was derived from the Czech *Rorate* chants, a repertory of 16th-century songs for Advent that are named for the Introit for Advent, *Rorate coeli*. The Rorantist chapel existed until the 18th century.

**Rosalia.** A pejorative term for a schematic, unimaginative sequential treatment, such as was frequently used by second-rate composers of the period 1750-1850. It applies in particular to sequences that, owing to the exact repetition of the intervals, involve modulation of the key to the higher second, e.g., G-C-A-D-B-E, etc. The

inferiority of such passages lies in their facile symmetry of melody, harmony, and phrasing. The name comes from an Italian popular song, "Rosalia, mia cara," in which this device occurs. The German equivalent is *Schusterfleck* (cobler's patch).

**Rosamunde.** Incidental music by Schubert for a play by Helmina von Chézy, produced in Vienna, 1823. It contains, in addition to some choral numbers, an overture (originally written for a melodrama, *Die Zauberharfe*), three entr'actes, and two ballets that are often played in concert form.

**Rose.** Ornamental decoration in the circular sound hole of instruments such as lutes, guitars, and early harpsichords, often serving as the maker's trademark. See Sound hole.

**Rosenkavalier, Der** [G., The Knight of the Rose]. Opera in three acts by R. Strauss (libretto by H. von Hofmannsthal), produced in Dresden, 1911. Setting: Vienna, mid-18th century. The music is well known through numerous orchestral excerpts, particularly the waltzes.

**Rosin, resin.** A preparation made from gum of turpentine that is applied to the hair of the violin bow in order to give it the necessary grip on the strings.

**Rota** [L.]. (1) Medieval name for a round, particularly \*"*Sumer is icumen in*," probably with reference to the "turnover" of the melody in the different parts [see also Round]. See F. L. Harrison, in *PMA* lxxxvi; J. Handschin, in *MD* iii, 82ff. (2) See Rotta (1).

**Rote.** See Rotta (1).

**Rotrouenge, rotruenge.** A form of French 13th-century poetry that has been the subject of various philologic as well as musicologic studies. Seven poems, consisting of three to seven stanzas, can be definitely identified as *rotrouenges* on the basis of textual references such as "*Ma rotruenge finira . . .*" Only one of them, "*Chanter m'estuet*" (Raynaud, no. 636), is preserved with music; it has the structure a a a B c, B being an internal refrain, "*Oiés pour quoi*." From this evidence it has been hypothesized (by Gennrich)

that the musical form of the *rotrouenge* was characterized by repetition of the same melody for all the lines of the stanza except the last two or the last one, e.g.: a a a B [see *AdHM*, p. 195]. However, this assumption is unwarranted. A musical form "*rotrouenge*" does not exist. See F. Gennrich, *Die altfranzösische Rotrouenge* (1925); *id.*, in *Deutsche Vierteljahrsschrift für Literaturgeschichte* ix, 306; W. Apel, in *JAMS* vii, 129f; R. H. Perrin, in *JAMS* viii, 77.

**Rotta, rotte, rota.** (1) A medieval instrument mentioned in numerous literary sources (8th to 14th cent.). Most likely it was a psaltery. Possibly the name is a variant of cruit. For ill. see under Lyra. See H. Steger, *Die Rotte* (1961); *MaMI*, p. 133f; *SaHMI*, p. 262 (where it is said to be a harp). (2) In 14th-century Italian dances, the *rotta* is an after-dance that is a rhythmic variant of the main dance [see *HAM*, no. 59a; *SchGMB*, no. 28]. Mario Fabrizio Caroso's *La Nobiltà di dame* (1581, 1605) contains a *rotta* for lute (Balletto-Gagliarda-La Rotta-Canario; see \*Editions V, 1, p. 35) in triple meter, similar to the \**padovana*. Here the name may refer to Antonio Rotta, whose publication of 1546 contains the earliest *padovanae*.

**Rotulus** [L.]. Name for medieval MSS in the form of a long sheet of parchment that was rolled from top to bottom (like the Jewish Torah, which is rolled from left to right). Two or three *rotuli* with music exist, containing mostly early 14th-century motets (Brussels, Bibl. Royale, 19606; Paris, Bibl. nat., *Coll. de Pic.* 67). An illustration found in one of the Machaut MSS shows a group of singers reading from a *rotulus* [see *ReMMA*, opp. p. 364]. See R. Hoppin, in *RBM* ix, 131 (MS Brussels).

**Roulade** [F.]. A vocal melisma or a highly ornamented melody. In German, the term has a pejorative implication, being used for meaningless coloraturas in operatic arias. Originally, *roulade* meant an ornament consisting of rapid passing notes inserted between two principal melodic notes.

**Round.** Common name for a circle canon, i.e., a canon in which each singer returns from the conclusion of the melody to its beginning, repeating it *ad libitum*. The scheme of a three-voice round is:

I	a	b	c		a	b	c	
II		a	b		c	a	b	
III			a		b	c	a	

The melody of a round always consists of sections of equal length that are designed to make good harmony with each other. Accompanying is an example (by M. Praetorius, 1571–1621) together with the resulting harmony. The earliest and most famous round is \**“Sumer is icumen in,”* which, however, is not designed to

Vi-va vi-va la Mu-si-ca

be repeated *ad libitum*. Rounds were very popular in England, particularly the variety known as catch. For bibl. see under Catch.

**Rounded chanson.** Same as G. *Rundkanzone*. See *Bar* form II.

**Roundelay.** A 14th-century anglicization of the French term *rondelet*, i.e., \**rondeau* (1).

**Round O.** A 17th-century anglicization of *rondeau* (rondo), used by Matthew Locke (*Melothesia*, 1673), G. B. Draghi (*Six Select Suites of Lessons*, c. 1700), and others.

**Rovescio** [It.]. Retrograde motion or inversion. For example, “Menuet(to) al rovescio” in Haydn’s Sonata no. 4 for piano and violin (identical to his Symphony no. 47, 3rd movt. [“al roverso”], and also Piano Sonata no. 26, B. & H. edition) is to be played backward, in retrograde motion [see *Retrograde*], whereas that in Mozart’s Serenade K. 388 uses imitation in the inversion.

**Row.** Same as tone row. See *Serial music*.

**Roxelane, La.** Popular name for Haydn’s Symphony no. 63, in C, composed in 1777. The second movement is a set of variations on the French tune “La Roxelane.”

**Royal counterpoint.** See under *Diaphonia*.

**Rubab.** See *Rabab*.

**Rubato** [It.]. (1) An elastic, flexible tempo involving slight *accelerandos* and *ritardandos* that alternate according to the requirements of musical expression. There has been a great deal of discussion about tempo rubato, and some

writers maintain that it is the most difficult of musical terms to define. Actually, these difficulties disappear if a clear distinction is made between two types of rubato, one that affects the melody only and another that affects the whole musical texture.

The first type has become well known through its use in jazz. However, it also was used during the second half of the 18th century. Tosi (1723), Quantz (1752), K. P. E. Bach (1753), Leopold Mozart (1756), and D. G. Türk (1789) maintain that rubato applies only to the melody and should not affect the accompaniment. Chopin is reported to have taught this type of rubato, which may extend over several measures, after which the melodic and harmonic accents should again coincide.

The second type of rubato, which affects the whole musical fabric, would need no further explanation were it not for the fact that several writers, having studied the above-mentioned books, have applied the “give-and-take” principle of the 18th- (and 20th-) century type to the “full” rubato of Liszt or Chopin. They maintain that here, too, the *accelerandos* and *ritardandos* must complement one another, so that, after six or seven measures in free tempo, the player arrives at exactly the same moment in time that he would have reached had he played in rigid tempo. This interpretation has led to heated controversy.

The preface to Frescobaldi’s *Fiori musicali* (1630) contains interesting remarks about the rubato performance of his toccatas [see *TaAM* iv, p. xi].

(2) About 1800 the term “rubato” was used to indicate modifications of dynamics rather than tempo, e.g., accents on normally weak beats, such as the second and fourth in a 4/4 measure (Türk, 1789; H. C. Koch, 1808; see Lit., Bruck). It is possible that Chopin meant this manner of performance when he prescribed “rubato” in his compositions, since he used the term almost exclusively in mazurkas or melodies in mazurka style (e.g., F-minor Concerto, last movement). The strict rhythm of the mazurka would seem to exclude modifications of tempo yet readily admits unexpected accents on the second or third beat.

Lit.: Henry T. Finck, *Musical Progress* [1923], ch. vi; John B. McEwen, *Tempo Rubato; or, Time-variation in Musical Performance* (1928); J. A. Johnstone, *Rubato* [1925]; B. Bruck, *Wandlungen des Begriffes Tempo rubato* [n.d., c. 1928]; L. Kamiński, “Zum Tempo rubato” (*AMW* i).

**Rubeba, rubible.** See Rabab.

**Rückpositif** [G.]. A division of an organ separated from the main portion of the instrument and usually located on the gallery railing at the organist's back. It was almost always played from the lowest keyboard of the main console, although in some organs of the 16th century it had its own keyboard, requiring the organist to turn completely around in order to play it. Other names for it are *positiv* [F.], *Rugwerk* [Neth.], and *chaire* or *chair* [Eng.]. It was very common in German, Dutch, French, and English organs up to the early 19th century, and is now being revived in England and America. Also see *Positif*; Organ II, VII, XII. B.J.O.

**Rücksichtslos** [G.]. Inconsiderate. *Rücksichtsloser Kontrapunkt*, the modern "reckless" counterpoint, without regard for harmonic considerations.

**Rueda.** A Spanish (Castilian) round dance in fast quintuple time. See *Zortziko*. See H. Collet, "La Musique espagnole moderne" (*BSIM* iv).

**Rugby.** "Symphonic movement" by Honegger (1928), suggested by the English sport.

**Ruggiero.** A harmonic bass of Italian provenance, popular from the mid-16th through the early 17th centuries [see Ex.]. A. Einstein has suggested that the title comes from the first word of a verse from L. Ariosto's *Orlando furioso*: "Ruggier, qual sempre fui, tal' esser voglio" [see *SIM* xiii; the word *Fedele* is sometimes substituted for *Ruggiero* and the piece labeled *Aria sopra Fedele*]. The practice of chanting epic poetry to a skeletal bass is an old one; examples of its most developed form are found in Italian collections under the title "Aria per cantar ottave." A singer usually improvised a discant tune to the harmonic pattern represented by the bass, a fact that accounts for the many different discant melodies found in extant versions.

All these reforms were rejected, however, by the *raskolniki* (Old Believers), who still use the old chant and *kriuki* notation. Most Russian chant is based on a system of eight *echoi* [see *Echos*], each of which has stock melodic figures (*popievki*) that are used only for chants written in that particular *echos* [see *Melody type*].

Peter the Great helped introduce Western opera. Under Catherine II (reigned 1762–96) music in St. Petersburg was dominated by Italian composers, such as F. Manfredini, B. Galuppi, T. Traetta, and G. Paisiello, who controlled the Imperial Opera from 1776 to 1784. The earliest Russian composers, such as Maximus Beresovsky (1745–77), Dimitri Bortniansky (1751–1825), and E. I. Fomin (1761–1800), studied with Italians and wrote operas in the Italian style, while Alexey Titov (1769–1827) imitated Mozart. His son, Nikolay Titov (1800–75), and Alexander Varlamov (1801–48) wrote many very popular songs, e.g., Varlamov's "The Red Sarafan." Alexey Verstovsky (1799–1862) was a forerunner of the first great Russian composer, Glinka.

II. The spirit of Russian folk music dominated the evolution of both vocal and instrumental art music. The earliest collection of folk-songs was published by V. Trutovsky (4 vols., 1776–95), and soon after, I. Pratch, a Czech residing in Russia, published a collection of songs (2 vols., 1790, 1806). The first composer to use the unusual melodic and rhythmic inflections of Russian folksong was Mikhail Glinka (1804–57), popularly known as "the father of Russian music." He wrote the first national opera, *A Life for the Czar* (1836), also called *Ivan Sussanin*, the name of its patriot hero. In his second opera, *Ruslan and Ludmilla* (1842), Glinka introduced Oriental elements and other colorful devices. Glinka's tradition of Russian nationalism was continued by Alexander Dargomyzhsky (1813–69), whose operas *Rusalka* (1856) and *The Stone Guest* (first perf. 1872) contain early examples of realism in recitative. Alexander Serov (1820–71), on the other hand, represented Western trends. His Biblical opera *Judith* (1863) is in German oratorio style, although his later operas, *Rogneda* (1865) and *Evil Power* (1871), are nationalist. Anton Rubinstein (1829–94), known primarily as a virtuoso pianist, also composed operas, among them *Demon* (1875), which is still popular in Russia. The first great Russian symphonist was Peter Tchaikovsky (1840–93), of whose six symphonies the last (*Pathétique*, 1893) is the

most profound and best known. Also part of the standard repertory are his symphonic fantasies *Romeo and Juliet* (final version, 1880) and *Francesca da Rimini* (1876); his Piano Concerto no. 1 (1875); his Violin Concerto (1879); and his ballets *Swan Lake* (1877) and *The Nutcracker* (1892). His two operas, *Eugen Onegin* (1879) and *The Queen of Spades* (1890), are favorites in Russia but are not often performed abroad. Tchaikovsky's tradition was continued by the piano virtuoso Sergey Rachmaninoff (1873–1943), whose Piano Concerto no. 2 is widely performed. Minor followers of Tchaikovsky's include Anton Arensky (1861–1906) and Vassili Kalinnikov (1866–1901).

The melancholy tone of Tchaikovsky's music, reflected in his wide use of minor keys, found a sharp contrast in the vigorous national style of the so-called \*Five: Alexander Borodin (1833–87), César Cui (1835–1918), Mily Balakirev (1837–1910), Modest Mussorgsky (1839–81), and Nicolay Rimsky-Korsakov (1844–1908). Mussorgsky's opera *Boris Godunov* (1874) influenced not only Russian composition but music everywhere, while his unfinished opera *Marriage* (written 1868, 1st stage perf. 1909) anticipates the modern comic opera. Balakirev is noted for his skillful use of Oriental melodic materials, especially in his symphonic poem *Tamara* and the brilliant piano fantasia *Islamey*. Borodin composed two symphonies and the historical opera *Prince Igor* (posthumously perf. 1890). Rimsky-Korsakov, the most prolific of the Five, wrote nine operas, of which *The Snow Maiden* (1882), *Sadko* (1898), and *The Tale of Czar Saltan* (1900) are the most frequently performed in Russia. His last three operas, *Kashchey the Immortal* (1902), *The Invisible City of Kitezh* (1907), and *The Golden Cockerel* (1909), represent a transition from traditional to modern Russian music, while his symphonic poem *Scheherazade* (comp. 1888) is an outstanding example of coloristic use of the orchestra. César Cui, of French ancestry, was a romantic composer whose association with the Russian national school was a historical accident. Other important composers in the Russian national tradition were Alexander Glazunov (1865–1936; eight symphonies, concertos, chamber music, ballets) and Anatol Liadov (1855–1914), whose symphonic fairy tales are miniature masterpieces. Mikhail Ippolitov-Ivanov (1859–1935), Alexander Gretchaninov (1864–1956), Sergey Vasilenko (1872–1956), Nicolas Tcherepnin (1873–1945), and Reinhold Glière (1875–

1956) also composed in the Russian national style.

The early modern school is represented by Alexander Scriabin (1872–1915) and Nicolai Medtner (1880–1951). Scriabin, a mystic, is an isolated phenomenon in Russian music. His symphonic style stems from Wagner and Liszt, while his sonatas, preludes, and piano etudes owe their inspiration to Chopin. However, his harmonic idiom is far more advanced than his models, and his melodic writing approaches atonality. His symphonic poem *Prometheus* (1910) is built on a six-note \*mystic chord.

Igor Stravinsky (b. 1882) lived in Paris from 1910 and in the United States from 1939. One of the great figures in 20th-century music, he had more influence on European and American composers than on his compatriots. In Paris he was associated with the ballet impresario Sergei Diaghilev, for whom he wrote his greatest scores, *L'Oiseau de feu* (1911) and *Le Sacre du printemps* (1913). The former work shows the influence of Rimsky-Korsakov, but *Le Sacre du printemps* breaks with all tradition, although it retains elements of Russian folk melos (it is subtitled *Tableaux de la Russie païenne*). Stravinsky returned to Russian subjects in several later works, but in the 1920's he abandoned his national style in favor of neoclassicism, and in the 1950's he adopted serial techniques.

Sergey Prokofiev (1891–1953) lived in Paris and America from 1918 to 1932 and then returned to Russia. His early works are aggressively modernistic, full of vitality, wit, and irony. A brilliant pianist, he initiated a new percussive genre of piano composition. His works include piano concertos, sonatas, and suites; the operas *Love for Three Oranges* (1921) and *War and Peace* (concert perf., 1944); the ballets *Romeo and Juliet* (1938) and *Cinderella* (1945); the cantata *Alexander Nevsky* (1939); seven symphonies, of which the first, named *Classical Symphony* (1918), is the most famous; *Lieutenant Kijé*, and numerous other instrumental compositions. His symphonic fairy tale, *Peter and the Wolf* (1936), is a perennial favorite.

Prokofiev's contemporaries included Nicolai Miaskovsky (1881–1950), who wrote twenty-seven symphonies in a neoromantic style; Mikhail Gnessin (1883–1957), who used Jewish subjects; and the brothers Alekandr A. Krein (1883–1951) and Grigory A. Krein (1880–1955), who also contributed compositions inspired by Jewish music.

Among composers of the Soviet generation,

the most renowned is Dmitri Shostakovich (b. 1906). His first symphony, written while a student at the Leningrad Conservatory, established him as a highly gifted composer and became his most frequently performed composition. His Symphony no. 7, written during the siege of Leningrad (1941), was acclaimed as a great patriotic work. In addition to thirteen symphonies, Shostakovich has written ten string quartets, two piano concertos, a violin concerto, and many piano compositions. His operas *The Nose* (1930) and *Lady Macbeth of Mtsensk* (1934), criticized by Soviets for their use of dissonance, have rarely been performed.

Other significant Soviet composers are Aram Khatchaturian (b. 1903; ballet *Gayane*, with the famous *Saber Dance*, piano concerto, violin concerto); Dmitri Kabalevsky (b. 1904; operas, instrumental concertos, piano music); Ivan Dzerzhinsky (b. 1909; known mostly for his operas); Tikhon Khrennikov (b. 1913; operas, instrumental music); Vissarion Shebalin (1902–63; five symphonies, nine string quartets, etc.); and Georgy Sviridov (b. 1915; oratorios and other choral works).

Soviet philosophy dictates that art must serve society, but the attempts of the Russian Association of Proletarian Musicians to govern composers failed, and the government disbanded it in 1932. The slogan "Socialist Realism," launched in the 1930's, promulgated a national style in an accessible idiom. In a famous assault on Shostakovich, a *Pravda* editorial of 1936 denounced modernism in Soviet music and condemned the vaguely defined formalism of Western music. A 1949 decree of the Central Committee of the Communist Party of the U.S.S.R. renewed this attack, specifically accusing Prokofiev and Shostakovich. The decree was rescinded in 1958 but at the same time reasserted "Socialist Realism" as the governing principle of Soviet music.

With the relaxation of stylistic strictures in the 1960's, a group of young Soviet composers began to write music using serial techniques, and some even applied \*aleatory methods of the Western avant-garde. Among these composers was Andrey Volkonsky (b. 1933), born in Geneva and living in Russia since 1950. His unrestrained modernism was sharply criticized, but his music was admitted for performance in 1965. Other members of the Soviet avant-garde are Edison Denisov (b. 1929), Sergey Slonimsky (b. 1932), Leonid Grabovsky (b. 1935), and Valentin Silvestrov (b. 1937).

I rev. K.L.; II by N.S.

**Russian bassoon.** A 19th-century upright serpent, now obsolete. It was made of wood in three or four detachable sections, ending in a brass bell. It also had six finger holes and three or four keys. See Brass instruments V (b).

**Russian horn.** A Russian hunting horn, straight or slightly bent, used from c. 1750 to c. 1826 in bands of 30 to 60, each horn playing a single note only, i.e., without making use of the overblown tones. The first of these bands, which have been compared to a live organ, was established by a Czech horn player, J. A. Maresch, in 1751, and attained a high degree of perfection, as appears from the rather complicated pieces it played. Two examples are reproduced in *LavE* i.5, 2499. See J. C. Hinrichs, *Entstehung, Fortgang und jetzige Beschaffenheit der russischen Jagdmusik* (Petersburg, 1796).

**Russian Quartets.** Beethoven's string quartets, op. 59, nos. 1–3, composed in 1805–1806, also known as "Razumovsky Quartets" because they were commissioned by the Russian Count Razumovsky. In nos. 1 and 2 Beethoven used a "Thème Russe" that he took from a collection of 150 songs published by Iwan Pratsch in 1790. The name is also used for Haydn's quartets nos. 37–42, op. 33, which follow the *Sonnenquartette*, nos. 31–36. See *Scherzi, Gli*.

**Ruslan and Ludmilla** [Rus. *Ruslan i Lyudmila*]. Opera in five acts by Glinka (libretto by V. F. Shirkov and V. A. Bakhturin, based on a poem by Pushkin), produced in St. Petersburg, 1842. Setting: Russia, legendary times.

**Rute** [G.]. A kind of birch brush called for by R. Strauss and others to obtain a special effect on the bass drum.

**Rybebe.** See Rabab.

**S.** (1) Abbr. for *\*segno*, *\*sinistra*, *subito*. (2) In liturgical books, abbr. for *\*schola*, i.e., choir. (3) In H. Riemann's system of harmonic analysis [see Functional harmony], abbr. for subdominant. (4) In 16th-century *\*partbooks*, abbr. for *superius*, i.e., soprano. (5) Abbr. for W. Schmieder's catalog of Bach's works; see *BWV*.

**Saccadé** [F.]. Abrupt, jerky.

**Sackbut**, **sagbut**, **saqueboute**, **sacabuche**. Names for the medieval trombone. See Trombone II.

**Sackgeige** [G.]. *\*Kit*.

**Sackpfeife** [G.]. Bagpipe.

**Sacramentary** [L. *sacramentarium*]. See under Liturgical books I, 9.

**Sacre du printemps, Le** [F. The Rite of Spring]. Ballet by Stravinsky (choreography by Nijinsky), produced in Paris, 1913. It represents an ancient pagan rite. The two parts (I. *L'Adoration de la terre*; II. *Le Sacrifice*), now often performed as a concert piece, are divided into several scenes. The work is one of the major landmarks in 20th-century music, establishing Stravinsky's revolutionary dynamism. Its harsh sounds and wild rhythms, willingly accepted and admired today, caused a riot of indignation at the first performance.

**Saeta** [Sp.]. An Andalusian folksong sung during Lent or the Feast of the Nativity to accompany street processions and other outdoor devotional or penitential activities. *Saetas* vary greatly in form and style, ranging from simple syllabic melodies to highly ornamented ones. See A. de Larrea, in *AnM* iv; A. Salazar, in *Nuestra música* vi, 29ff (Mexico); ex. in F. Pedrell, *†Cancionero musical popular español*, 4 vols. (1918–22), i, 119ff; also M. Schneider, in *AnM* i, 80ff.

**Sagbut**. *\*Sackbut*. See Trombone II.

**Sainete** [Sp.]. A Spanish type of comic opera of the late 18th century, portraying scenes from everyday life and often approaching low comedy. Among the composers of *sainetes* were Antonio Soler (1729–83) and Blas Laserna (1751–1816).

**St. Anne's Fugue**. Popular name for Bach's great organ fugue in E-flat, from the *\*Clavier-Übung*

iii (1739), so called because its theme is similar to the beginning of an English hymn tune called "St. Anne" (usually sung to the verses beginning "O God, our help in ages past"). Bach, of course, did not know the hymn, nor Sperindio Bertoldo's *Ricercar* on the sixth tone (1591), which employs Bach's theme (in C).

**St. John Passion**. See under Passion music.

**St. Martial, school of**. An important school of the 10th to 12th centuries located at the Abbey of St. Martial in Limoges (also known as the school of Limoges). Aside from composing many *\*sequences* and *\*tropes* (chiefly 10th and 11th centuries), it is important mainly for its contribution to the development of *\*organum*, in which the polyphonic school of St. Martial (c. 1100–50) immediately preceded *\*Notre Dame*. Ex. in *HAM*, no. 27a.

Lit.: J. Chailley, *L'École musicale de Saint Martial de Limoges* [1960]; J. Handschin, in *ZMW* vi; R. L. Crocker, in *JAMS* xi (proses); P. Hooreman, "Saint-Martial de Limoges au temps de l'abbé Odolric" (*RBM* iii); L. Treitler, in *JAMS* xvii (polyphony); J. M. Marshall, in *JAMS* xv (hidden polyphony); G. Schmidt, in *MF* xv (structural problems); W. Apel, "From St. Martial to Notre Dame" (*JAMS* ii); *id.*, in *CP Anglès* (organa); H. Spanke, in *Zeitschrift für französische Sprache und Literatur* liv, lvi; *id.*, in *Butlletí de la Biblioteca de Catalunya* viii, 280ff (London MS); H. Anglès, *ibid.*, pp. 301ff (London MS); *id.*, in *CP Besseler* (polyphony); B. Stäblein, in *CP Blume* (modal rhythm); J. Handschin, in *CP* 1924 (motets).

**St. Matthew Passion**. Bach's last and greatest Passion, based on the Gospel according to St. Matthew, with free poetic insertions by Picander, first performed at St. Thomas' Church, Leipzig, on Good Friday, 1729. The first performance after Bach's death, produced in Berlin by Mendelssohn in 1829, was the decisive step toward the "rediscovery" of Bach. See Passion music.

**St. Paul**. Oratorio by Mendelssohn, op. 36, produced in Düsseldorf, 1836.

**Saite** [G.]. String. *Saitenchor*, *\*course of strings*. *Saiteninstrument*, stringed instrument.

**Salicus**. See under Neumes I.

**Salmo** [It.]. Psalm, psalm composition.

**Salome.** Opera in one act by R. Strauss (libretto by H. Lachmann, translated from Oscar Wilde's play), produced in Dresden, 1905. Setting: Terrace of Herod's palace, Galilee, about A.D. 30. Except for the passages associated with Jochanaan (John the Baptist), the music is some of the most intensely emotional ever written.

**Salomon Symphonies.** Haydn's last twelve symphonies, nos. 93 to 104, written 1791–95 in London for the concerts managed by Johann Peter Salomon. They are also known as \*London Symphonies, although the name London Symphony specifically applies to no. 104 (also sometimes called the Salomon Symphony). Others in this group are the \*Surprise (no. 94), \*Military (no. 100), \*Clock (no. 101), and \*Drum-Roll (no. 103). It should be noted that the numbering of the complete series of Haydn's symphonies is not in agreement with the numbering within this group; nos. 94 and 104 of the complete series are nos. 3 and 7 (rather than 2 and 12) of the Salomon Symphonies.

**Salón México, El.** Descriptive piece for orchestra by Copland, composed 1933–36, inspired by the composer's visit to Mexico in 1932. It uses several popular Mexican melodies such as might be heard in a dance hall (*El Salón México*).

**Salpinx.** See under Brass instruments V (a).

**Saltarello.** A gay, sprightly dance of Italian provenance.

(1) *14th century.* The music of four saltarelli without choreographies is preserved in Brit. Mus. MS Add. 29987. In varying meters (6/8, 3/4, 6/8, 4/4), all are monophonic pieces cast in the four-repeated-phrase form of the \*estampie.

(2) *15th century* [F. *pas de breban* (Brabant); Sp. *alta danza*]. One of the faster measures (*misura*) or step units of the *bassa danza* (\**basse danse*). The term was sometimes applied to the *quaternaria*, another step unit of the *basse danse* family that, because of its popularity in Germany, was known to the Italians as the *saltarello tedesco*.

(3) *16th century* [F. *sauterelle*, *tordion*, *tourdion*; G. *Hupfauf*, \**Proportz*, *Sprung*, \**Nachtanz*]. The music of the *saltarello* is indistinguishable from that of the \*galliard. The difference between the two is in the style of dancing as suggested by the respective titles: *saltarello*, a small leap; galliard, vigorous. The galliard is simply a more vigorous version of the *saltarello*. A galliard or a *saltarello*

is usually coupled either to a \*pavane or a \*passamezzo, and the coupled dances all are composed on the same musical material (harmonic patterns, melodies, etc.).

The *saltarello* continued in vogue until late in the 19th century. Indeed, its basic steps are still used in present-day folk dances. However, by the 17th century any function it had as an elegant court dance waned in favor of a dance of the common people. As a folk dance, its movements were executed more rapidly and with greater violence. The *saltarelli* in the last movement of Mendelssohn's Italian Symphony are stylized apotheoses of the dance, but they do suggest its hopping and jumping movement. For detailed descriptions and bibl. see L. H. Moe in *MGG* xi, 1315–18.

L.H.M.

**Saltato, saltando** [It.]. Same as *sautillé* [see Bowing (d)].

**Saltbox.** A popular noise-producing instrument in the form of a box with a revolving mechanism. It was used by clowns in 18th-century England.

**Salterio** [It., Sp.]. \*Psaltery, \*dulcimer.

**Salve Regina** [L.]. One of the four antiphons B.V.M. [see Antiphon (2)], probably written and composed by Hermannus Contractus (1013–54). The chant, actually a hymn with a free poetic text sung to a first-mode melody of great beauty [*LU*, p. 276], soon became famous, particularly among the religious societies of the 14th to 16th centuries whose main object was the worship of the Virgin (Salve Societies). Polyphonic compositions of the text, with or without use of the plainsong melody, are fairly numerous (e.g., Dunstable, see Editions XXXIV, 8, p. 152; Ockeghem, see *BeMMR*, p. 238; Obrecht; Josquin). Of particular interest are the compositions for organ (Buxheim Organ Book, Hofhaimer, Kotter, Schlick; see H. J. Moser, *Frühmeister des deutschen Orgelkunst*, 1930), which usually include only the odd-numbered verses (*Salve Regina; Ad te clamamus; Eia ergo; O clemens; O dulcis*), the others (*Vita dulcedo; Ad te suspiramus; Et Jesum; O pia*) being sung *alternatim* in plainsong. Later settings for organ are by John Bull [\*Editions XXXIV, 14], Pieter Cornet [\*Editions I, 10], and numerous 17th-century Spanish composers, e.g., Aguilera de Heredia, Jimenez, and Bruna. See *HAM*, nos. 100, 139.

Lit.: J. Maier, *Studien zur Geschichte der Marienantiphon Salve Regina* (1939); K. Dèzes,

in *ZMW* x; P. Runge, in *CP Liliencron*; A. Orel, in *StM* vii, 48–101.

**Samba** [Port.]. A Brazilian style of folk dance characterized by the use of syncopated rhythmic patterns within a 2/4 meter. Two types of samba are performed today, a rural type, which is more violent and somewhat faster, similar to the *\*batuque*, and an urban variety, derived from the *\*maxixe*, which is more moderate in tempo and less strongly syncopated. In Rio de Janeiro the samba is the most characteristic carnival music, and at these festivities it is generally performed in groups forming a circle. Otherwise, it is danced by couples. J.O-S.

**Sambuca** [Gr. *sambykē*]. A name used for a variety of old instruments, among them a harp or psaltery of ancient Rome, a medieval chordophone commonly known as the *\*crwth*, and also a woodwind made from the elder tree [L. *sambucus*]. In the Middle Ages the *\*hurdy-gurdy* was sometimes called *sambuca rotata*. In the early 17th century, Fabio Colonna, also known as Linceo (c. 1567–1650), invented an enharmonic harpsichord called *sambuca lincea*. It had 17 notes to the octave and a total of 50 strings (hence its other name, *pentecontachordon*). Colonna described it in his *La Sambuca lincea* (Naples, 1618).

**Samisen**. Same as shamisen. See Japan; Lute.

**Sampogna**. Same as *\*zampogna*.

**Samson et Dalila** [F., Samson and Delilah]. Opera in three acts by Saint-Saëns (libretto by F. Lemaire, based on the Bible), produced in Weimar, 1877. Setting: Gaza, Palestine, 1150 B.C.

**Sanctorale** [L.]. In the Roman rite, generic name for the feasts of Saints, as opposed to the *\*Temporale*, the feasts of the Lord. It is subdivided into the *Proprium sanctorum* and *Commune sanctorum*; see Gregorian chant I.

**Sanctus**. [L.]. The fourth item of the Ordinary of the *\*Mass*. The text consists of three sections, *Sanctus . . .*, *Pleni sunt caeli . . .*, and *Benedictus qui venit . . .*. Polyphonic compositions usually fall into three corresponding sections, or at least two, Sanctus and Benedictus. In later Mass compositions (17th, 18th centuries) the Benedictus is usually written in a lyrical style. See P. J. Thannabaur, *Das einstimmige Sanctus* (1962), which includes Sanctus melodies.

**Sanft** [G.]. Soft, gentle.

**Sanglot**. [F.]. An 18th-century name for an appoggiatura or passing tone sung to plaintive words such as “Oh” or “Hélas.”

**Sangsaitte**. [G.]. See Cantino.

**Saqueboute** [F.]. *\*Sackbut*. See Trombone II.

**Saraband** [F. *sarabande*; Sp. *zarabanda*]. A 17th- and 18th-century dance [see Dance music III] in slow triple meter and dignified style, usually without upbeat, frequently with an accent or prolonged tone on the second beat and with feminine endings of the phrases.

The saraband probably came from Mexico (not Persia, as was formerly believed) and appeared in Spain in the early 16th century. Originally it was probably a wild and even lascivious love dance, for it is described and severely attacked as such by various writers, among them Cervantes. Particularly characteristic is the following passage from a *Tratado contra los juegos públicos* (Treatise against public amusements) of Juan de Mariana (1536–1624): “A dance and song, so lascivious in its words, so ugly in its movements, that it is enough to inflame even very honest people.” The dance was officially suppressed in Spain (c. 1590) by Philip II but continued to exist under the name *zarabanda* throughout the 17th and 18th centuries as a quick dance with a characteristic alternation of 3/4 and 3/8 meter. [See *LavE* i.4, 2098, 2247.] As late as 1676, Thomas Mace, in his *Musick's Monument*, wrote “Serabands, are of the shortest triple-time; but are more toyish and light, than corantes; and commonly of Two Strains.”

About 1600 the saraband appeared in France and England. An early example is a “Sarabrand” by Orlando Gibbons that, being faster and gayer than the classical type, may represent the transition from the original dance to its later dignified

form (similar examples appear in Michael Praetorius, *C. Terpsichore*, 1612). Examples of the slower type occur in Chambonnières (Bauyn MS, c. 1650). At the same time (Froberger) it became a standard dance of the \*suite. The accompanying example (from Handel's Suite no. 7) illustrates the normal type of saraband, whereas the saraband from Bach's Partita no. 6 shows it in its final stage of artistic idealization. See R. Stevenson, "The First Dated Mention of the Sarabande" (*JAMS* v); D. Devoto, "La folle Sarabande" (*RdM* 1960, p. 3; 1961, p. 145).

**Sarambo** [Sp.]. A traditional dance form, very popular in the Dominican Republic, that evolved from the Andalusian *zapateado* and is also known as *zapateo*. It is essentially a fast 6/8 tap dance in which solo and group dancing alternate. Three instruments are always used, the *acordeon*, *guiro* [see *Reco-reco*], and \**tambora* (played without sticks). In the group episodes, called *callao* (lit., silent), the melodic instruments cease playing and only percussion continues. Rhythmically the *sarambo* is built on a one-measure pattern with strong accents on the weak beats.

J.O.S.

**Sārangi**. See under Violin II.

**Sardana**. The national dance of Catalonia, usually in quick 6/8 meter and danced in a circle to the accompaniment of the \*pipe and tabor. See *LavE* i.4, 2379.

**Saron**. See *Gambang*. For ill. see under Percussion instruments.

**Sarrusophone**. See under Oboe family II, F.

**Sarum use**. (1) The ritual used in the Cathedral of Salisbury, England, which differed in certain details from the Roman liturgy. It prevailed during the later Middle Ages throughout much of England, until it was abolished by decree in 1547. Two plainsong MSS dating from the 13th century have been published in facsimile by W. H. Frere under the titles *Graduale Saris-buriense* (1894) and *Antiphonale Sarisburiense* (1901-25). See his *The Sarum Gradual* and the *Gregorian Antiphonale Missarum* (1895).

French composers of the 15th century repeatedly based their compositions on the Sarum use rather than the Gregorian version of chants. Examples are the three *Caput Masses*, and some motets by Binchois and Josquin [see *ReMR*, pp. 68, 90, 114, 255].

(2) When compared to the older Gregorian

form, the final form of the Sarum melodies (c. 1500) included many new or rewritten compositions showing economy of range, balance of cadence, a more advanced sense of musical form, and some transposition for effect or contrast. Much of the Gradual remained closer to the Gregorian form of the melodies than the Antiphonal did. Alleluia verses and hymns varied the most, with new melodies being written continuously until the suppression of the English monasteries. The hymns varied in transmission as do folksongs. The modern revival of plainsong in Anglican churches has used the Sarum more than the Gregorian form of the melodies. See F. L. Harrison, "Music for the Sarum Rite" (*AnnM* vi).

(2) by L.E.

**Sassofone** [It.]. Saxophone.

**Satire**. Satire, irony, and caricature are by no means foreign to music. Although 19th-century philosophers and aestheticians "proved" that such distortions have no place in musical expression, the 20th century brought forth abundant evidence to the contrary. In fact no account of the revolutionary movement of the early 20th century would be complete without pointing to the important role that satire, irony, and caricature played in the effort to overthrow the tradition of the 19th century. French composers in particular used ridicule as a weapon, notably Erik Satie in numerous pieces bearing such satirical titles as "Embryons desséchés." The new harmonic style with its unlimited exploitation of discord naturally offered unprecedented opportunities for caricaturing effects. Examples are Debussy's "Golliwogg's Cake-walk" (from *Children's Corner*), with its allusion to the Tristan theme; Stravinsky's *Petrouchka*, with the caricaturing *Valse*; A. Casella's *Pupazzetti*; E. Goossens' *Kaleidoscope*; and Shostakovich's *Polka* (from *The Golden Age*), which satirizes the Geneva disarmament conference.

Satire is usually effected by deliberate violation of the rules or by stylistic distortion. Such an effect is probably intended in Lorenzo Masini's madrigal "Dolgomi a voi" of c. 1350, in which he uses a strikingly dissonant and awkward style (involving parallel fifths) as the text complains about "qui che guastan tutte nostre note" (those who make a mess of all our notes). A rondeau by Solage, "Fumeux fume" (written c. 1380), exceptional for its low range and tonal vagaries, appears to ridicule the *fumeurs*, a group of late 14th-century Bohemians in Paris [see W. Apel, *French Secular Music of the Late 14th*

*Century*, no. 40; also Commentary]. An especially effective example of musical caricature is Hans Newsidler's "Der Judentanz" of 1544 [see *HAM*, no. 105b]. In the late 16th century parallel fifths were deliberately used in the \*villanella in order to enhance the textual parody. Aside from innumerable examples in opera, in which the satire usually lies mainly in the text and action, other examples of essentially musical satire are Mozart's charming *Ein musikalischer Spass* (1787; K. 522), with its good-natured mockery of provincial music; the Beckmesser Scene of Wagner's *Meistersinger*, which is an acid satire on the untalented musician; and Berlioz' *Symphonie fantastique*, in which the distorted presentation of the \*Dies irae portrays hellish despair and fiendish laughter. One of the first modern composers to write satirical music for its own sake was Enrico Bossi (*Pezzi satirici*).

Lit.: H. F. Gilbert, "Humor in Music" (*MQ* xii); R. D. Chennevière, "Erik Satie and the Music of Irony" (*MQ* v); A. Einstein, "Die Parodie in der Villanella" (*ZMW* ii); Z. Lissa, "Die Kategorie des Komischen in der Musik" (*CP* 1958).

**Satz** [G.]. (1) Movement (of a sonata, symphony, etc.); e.g., *erster Satz*, first movement. However, *Hauptsatz*, and *Seitensatz* (*Nebensatz*) denote the first and second theme within a movement. (2) Style, manner of writing; e.g., *strenger* (*freier*) *Satz*, strict (free) style.

**Saul**. Oratorio by Handel, produced in London, 1739.

**Sausage bassoon** [G. *Wurstfagott*]. See under Oboe family III (end).

**Sauterelle** [F.]. See *Saltarello* (3).

**Sautillé** [F.]. See under Bowing (d).

**Savart**. Unit of a system of logarithmic pitch determination introduced by Félix Savart (1791–1841) of France. It is based on the fact that the logarithm of 2 (ratio of frequencies of two tones an octave apart) is 0.30103, so that the logarithmic intervals of all tones lie between 0 and 0.30103. For convenience all figures are multiplied by 1,000, so that the octave measures 301 savarts. The system is very useful, particularly since for all practical purposes the figure 301 can be replaced by 300, so that each semitone equals 25 savarts. It was later supplanted by A. J. Ellis' system of \*cents, in which all the figures are approximately four times as large

(1 savart = 3.99 cents). See Intervals, calculation of, VI.

**Saxhorn**. See under Brass instruments III (f).

**Saxophone** [G. *Saxophon*; It. *sassofone*; Sp. *saxófono*]. A family of hybrid instruments invented by Adolphe Sax of Brussels c. 1840 (patented 1846). They are played with a single beating reed, as are the clarinets, but are conical in bore, as are the oboes. Their key arrangement also resembles that of the oboes, but their mouthpiece is like that of the clarinets. The body of the instrument is of metal, as in the brass instruments. [For ill. see under Clarinet family.] The saxophones are especially valuable in bands, in which they blend well with either the woodwinds or the brasses. The complete family numbers eight instruments, alternately in E-flat and B-flat, as follows: (1) sopranino in E-flat; (2) soprano in B-flat; (3) alto in E-flat; (4) tenor in B-flat; (5) baritone in E-flat; (6) bass in B-flat; (7) contrabass in E-flat; (8) subcontrabass in B-flat. All are treated as transposing instruments, written in the treble clef and with the written chromatic compass shown [see Ex.]. The sopranino sounds a minor third higher than written, the soprano a major second lower than

written, etc. Nos. 3 to 5 are the most popular of the group.

The sound of the saxophone is extremely variable. Its timbre being intermediate between those of wood and brass, it passes from the softness of the flute over the broad, mellow tone of the cello to the metallic strength of the cornet. These properties, together with its great flexibility, have given it a prominent place in jazz bands. The principal member of the family is the alto saxophone (also made in F), which has been employed for solos by many French composers, first by J. G. Kastner in *Le dernier Roi de Juda* (1844) and subsequently by Delibes, Thomas, Saint-Saëns, Bizet, and D'Indy. Richard Strauss introduced a quartet of saxophones in his *Sinfonia Domestica*, and Hindemith used the saxophone in his opera *Cardillac*. Compositions for saxophone include Debussy's *Rapsodie pour Saxophone et piano* (1903–05), Ibert's *Concertino da camera* for saxophone and orchestra (1935), Milhaud's *Scaramouche* for saxophone and

piano (1942), and Villa-Lobos' *Fantasia* for saxophone and orchestra (1948). See J. Kool, *Das Saxophon* [1931]. W.D.D.

**Sax(o)tromba.** A group of valved brass instruments devised by Adolphe Sax (patented 1845) with a bore intermediate between that of the trombone and saxhorn. They are seldom used today.

**Saxtuba.** A circular valved brass instrument invented by Adolphe Sax (1852).

**Saynète** [F.]. \**Sainete*.

**Scala** [It.]. \*Scale.

**Scala, La.** See under Opera houses VII.

**Scala enigmatica.** An arbitrary scale, c-d<sup>b</sup>-e-f<sup>#</sup>-g<sup>#</sup>-a<sup>#</sup>-b-c', used by Verdi in his "Ave Maria" (1898).

**Scale** [F. *gamme*; G. *Skala*, *Tonleiter*; It. *scala*; Sp. *escala*, *gama*]. I. The tonal material of music arranged in an order of rising pitches. Since the tonal material varies greatly in different periods as well as different countries (e.g., China) there are a large number of scales. The basic scale of European music is the *diatonic scale*. It consists of five whole tones (t) and two semitones (s) in the following arrangement: t t s t t t s (e.g., c, d, e, f, g, a, b, c'). This scale is usually referred to as a *major scale* (properly C-major scale; see III) as distinguished from the *minor scale*, in which the arrangement of intervals is t s t t t t s (e.g., c d e<sup>b</sup> f g a b c'). For more details, see Major, minor. Both major and minor scales may be transposed, starting on any one of the twelve notes in an octave, e.g., d e f<sup>#</sup> g a b c' d', or d e f g a b c' d'. Thus there are twelve major scales and twelve minor scales, one in each \*key. All the tones found in any of the scales above can be combined in one scale, the *chromatic scale*, which consists of twelve semitones. This all-inclusive scale, also known as the \**dodecuple scale*, is the tonal foundation of modern music, the other scales now being considered selections thereof [see Gapped scale]. Naturally, numerous other selections are possible and occasionally have been employed, particularly the \**whole-tone scale*, the so-called *gypsy scale*, and the \**pentatonic scale*. The accompanying table shows how they are set up.

Chromatic	c c <sup>#</sup> d d <sup>#</sup> e f f <sup>#</sup> g g <sup>#</sup> a a <sup>#</sup> b c'
Major	c d e f g a b c'
Minor, melodic	
ascending	c d e <sup>b</sup> f g a b c'
descending	c d e <sup>b</sup> f g a <sup>b</sup> b <sup>b</sup> c'
Minor, harmonic	c d e <sup>b</sup> f g a <sup>b</sup> b c'
Whole tone	c d f <sup>#</sup> g <sup>#</sup> a <sup>#</sup> c'
Gypsy	c d e <sup>b</sup> f <sup>#</sup> g a <sup>b</sup> b c'
Pentatonic	c d f g a c'

In the 20th century attempts have been made to broaden the tonal material of music by the introduction of \*quarter tones, resulting in a quarter-tone scale of twenty-four tones to the octave [see also Microtone].

II. All the scales described above can be derived from the diatonic scale, which was already used by the ancient Greeks. Upon closer examination, however, it appears that this scale underwent minute changes owing to the different systems of intonation (tuning) used in the various periods from about 500 B.C. to A.D. 1750. Thus, the Greek diatonic scale was based on the \*Pythagorean system, while in the Middle Ages certain intervals of \*just intonation crept in (particularly, the \*third), a fact that in turn necessitated the adoption of various systems of \*temperament. The last of these was that of equal temperament, established in the time of Bach. (For tables showing the differences among these scales, see Temperament; also Intervals, calculation of.) Still greater deviations are found in the numerous non-Western scales, such as the *sléndro* and *pélog* of \*Java, the *SA-grāma* of \*India, etc.

III. Still another consideration in the concept of "scale" is the center tone (tonic, home tone), whereby the various tones of the scale are not considered equally important but are related and subordinated to one of them. Thus, the diatonic scale is usually interpreted as a "C-major scale," because C is its initial tone (for an ingenious method of constructing the diatonic scale without preference given to one tone, see Hexachord). Actually, any of the tones of the diatonic scale (as well as of other scales) can be designated as the center tone, as in the medieval \*church modes. For the sake of clarity, the term "scale" should be avoided for these centralized scales, which are better termed modes. Thus, the C-major scale would be called the "C-mode of the major (or diatonic) scale," the Lydian scale the "F-mode of the major scale," etc. Each mode of any scale may also begin on various pitch levels. This leads to what is generally called

transposed scales but might better be termed keys. Thus, the F-sharp minor scale would be the "F-sharp key of the C-mode of the minor scale." The same terminology can be applied to other scales, e.g., "D-mode of the pentatonic scale," etc.

The medieval modes (as well as the Greek "scales") included yet another element of limitation, i.e., \*ambitus. Thus, the medieval Hypolydian might be considered the c-c' segment of the F-mode of the diatonic scale.

Lit.: A. Daniélou, *Introduction to the Study of Musical Scales* [1943]; A. Auda, *Les Gammes musicales* [1947]; H. Pfrogner, *Die Zwölfordnung der Töne* [1953]; A. H. Fox Strangways, in *ML* vii; L. S. Lloyd, in *MQ* xxviii; *id.*, in *ML* xxvii; V. de Rubertis, in *RMI* xxix and xxx.

**Scale degrees.** Special names and signs used in \*harmonic analysis to denote the various tones of the scale when they occur as the roots of triads, seventh chords, etc. These names are: tonic (I), supertonic (II), mediant (III), subdominant (IV), dominant (V), submediant or superdominant (VI), and subtonic or leading tone (VII). The most important are the \*tonic, \*dominant, and \*subdominant.

**Scaling, scale** [G. *Mensur*]. The proportion of diameter to length in an \*organ pipe or, more generally, in a rank of pipes. In the modern German system of scaling, all pipe diameters are compared to a single standard scale known as *Normalmensur*, in which the diameters for the c pipes are: C (8-foot c) =  $6\frac{1}{2}$  in., c =  $3\frac{3}{4}$  in., c' =  $2\frac{1}{2}$  in., c'' =  $1\frac{1}{4}$  in., c''' =  $\frac{3}{4}$  in., c'''' =  $\frac{1}{16}$  in. In practice the foregoing represents a usable scale for a diapason (or principal) 8-foot. Wider scaling (i.e., pipe diameters larger than *Normalmensur*) tends to produce flute tone (characterized by few audible harmonics), while narrower scaling tends to produce string tone (more audible harmonics). Reed pipes are scaled by a different method. Also see Organ VIII.

**Scampata** [It.]. Same as \*charivari.

**Scandicus.** See under Neumes I (table).

**Scandinavia.** See Denmark; Finland; Iceland; Norway; Sweden. See J. Horton, *Scandinavian Music* [1963]; B. Wallner, "Scandinavian Music after the Second World War" (*LBCM*; also *MQ* li).

**Scat singing.** In jazz, the interpolation of non-sense syllables and other peculiar vocal effects, introduced in the 1920's by Cab Calloway

(b. 1907) and Louis Armstrong (b. 1900). See Jazz III.

**Scenario.** A skeleton libretto of a play or an opera that indicates the characters, number, and general nature of the scenes. The German term *Scenarium*, however, means a full libretto with detailed directions for the scenery.

**Schachtbrett** [G.]. Old term for \*echiquier.

**Schalkhaft** [G.]. Roguish.

**Schall** [G.]. Sound, chiefly acoustical. *Schallbecken*, cymbals. *Schalloch*, sound hole. *Schallplatte*, record. *Schallwellen*, acoustical waves.

**Schalmei** [G.]. See under Oboe family III.

**Scheherazade.** Symphonic suite by Rimsky-Korsakov, op. 35 (1888), based on some tales from the *Arabian Nights* and named for the woman who tells the stories. In 1910 it was presented in Paris as a ballet by the Russian Ballet under Fokine. See also *Shéhérazade* (Ravel).

**Schellen** [G.]. Tambourine. *Schellenbaum*, \*Turkish crescent. *Schellentrommel*, tambourine.

**Schenker system.** A system of musical analysis and interpretation developed by Heinrich Schenker (1868–1935). It represents an attempt to reveal the organic structure of music by showing that every composition is the elaboration of some simple tone structure that guarantees its continuity and coherence.

Schenker's point of departure is "nature," i.e., the overtone series through the fifth partial, from which man derives not only the major triad but all intervals, scales, and basic structures of music. The overtones (1, 2, 3, 5; i.e., unison, octave, fifth, major third) constitute the *Klang* (sound, sonority) or natural triad, which may appear in its vertical or horizontal position. The horizontal projection of the *Klang* determines the melody as well as the bass. In the latter it appears as *Grundbrechung* or *Bassbrechung* (broken ground), mainly as a succession of I and V; in the former as *Umlinie* (primordial, fundamental line), in which the basic tones, I, III, V, are filled in with others. *Umlinie* and *Grundbrechung* together constitute the *Ursatz* (fundamental setting), which is the basic structure, the "background" of the composition.

Schenker's approach to musical analysis is a process of stepwise reduction, leading from the actual composition (foreground) over an intermediate stage (middle ground) to the *Ursatz* (background). The middle ground is a simplified

version of the foreground, including the essential elements or the raw materials of the composition. In Ex. 1, the theme from the last movement

of Beethoven's Ninth Symphony, the melody itself is the foreground. Ex. 1a shows the middle ground, which represents the first phase of the reduction of the actual music to its basic structure (the Arabic numerals refer to the measures of the original melody). The reduction leads from this stage to the background shown in Ex. 1b; this is the *Ursatz*. Important elements of this (and every) structural pattern are the "motions" (*Züge*) of the upper part or parts (here a "motion of a third [*Terz-Zug*]; the numerals  $\hat{3}$ ,  $\hat{2}$ ,  $\hat{1}$ , signify scale degrees) and the "breaking up" of an otherwise continuous tonic by a  $\hat{1}-\hat{5}-\hat{1}$  movement of the bass (*Bassbrechung*).

The purpose of this kind of analysis is not to show that all compositions can be reduced to a few types of "fundamental structure," but to demonstrate how a few basic patterns unfold into the infinite variety, the broad and rich life of the actual compositions. Accordingly, its main interest is not in the background itself but in *how* background and foreground are connected, i.e., the middle ground. For instance, an analysis of the second song from Schumann's "Dichterliebe" leads to the same *Ursatz* as Beethoven's melody. The difference lies in the middle ground, which appears more complex here—so complex, indeed, that two successive reductions become necessary, resulting in two levels of middle ground. It is in the middle ground that genius is distinguished from lesser talent. Only a great master can produce such interesting middle-ground pictures as that in Ex. 2 (Bach, 12 Little Preludes, no. 3). Schenker applied his analysis mostly to compositions of the period from Bach through Brahms (excluding Wagner). His pupils have shown that his principles can also be applied to medieval and 20th-century music.

Forte, in *Journal of Music Theory* iii. v.z.

**Scherzando** [It.], **Scherzhaft** [G.]. Playful.

**Scherzi**, Gli. Popular name for Haydn's six string quartets, op. 33, so called because the minuets bear the inscription "Scherzo" or "Scherzando" and accordingly are faster than the usual minuets of the period [see under Scherzo]. They are also known as the Russian Quartets (because they were dedicated to the Grand Duke Pavel Petrowitsch, who visited Vienna in 1781) and as Maiden Quartets [G. *Jungfern-Quartette*] because the title page of the 1782 edition shows a female figure [G. *Jungfer*].

**Scherzo** [It.]. (1) A movement, usually the third, of sonatas, symphonies, and quartets (rarely concertos), which was introduced by Beethoven to replace the \*minuet. Like it, the scherzo is followed by a \*trio after which the scherzo is repeated. Occasionally (e.g., Beethoven, Symphony no. 7) the scheme of alternation is extended to S T S T S. The distinguishing features of the scherzo are rapid tempo in 3/4 meter, vigorous rhythm, a certain abruptness of thought involving elements of surprise and whim, and a kind of bustling humor that ranges from the playful to the sinister (e.g., Beethoven's Symphony no. 5). The demarcation between minuet and scherzo is by no means always clear. Some late minuets of Haydn's approximate the scherzo, as do minuets by Beethoven, e.g., in his first piano sonata; on the other hand, Haydn

used the term "scherzo" in some of his earlier works (*Gli \*Scherzi*) for pieces scarcely different from his minuets. The great masters of the scherzo were Beethoven, Schubert, and Bruckner. Nationalist composers have frequently used it as a vehicle for the introduction of national dances, with the result that many composers have produced a moderately good scherzo in an otherwise mediocre symphony. For the internal structure of the scherzo, see Binary and ternary form II.

(2) Chopin and Brahms (op. 4) employed the term "scherzo" for independent pieces in which highly dramatic, somewhat gloomy sections (scherzo) alternate with more lyrical ones (trio).

(3) In the baroque period "scherzo" was used for vocal pieces in a lighter vein (C. Monteverdi, *Scherzi musicali*, 1607; A. Cifra, *Scherzi sacri*, 1616; B. Marini, *Scherzi e canzonette a una, e due voci*, 1622), as well as for instrumental pieces of a somewhat fanciful character similar to the \*capriccio. (A. Troilo, *Sinfonie, scherzi*, 1608; Jean [Johann] Schenk, *Scherzi musicali*, c. 1700, for viola da gamba and bass [\*Editions LII, 28]; J. S. Bach, in Partita no. 3). See G. Becking, *Studien zu Beethovens Personalstil: Das Scherzothema* (1921).

**Schicksalslied** [G., Song of Destiny]. Setting by Brahms for chorus and orchestra, op. 54 (1871), of a poem from Hölderlin's *Hyperion*.

**Schiettamente** [It.]. Openly, simply.

**Schillinger system**. A system of composition introduced by J. Schillinger (1895–1943) and published posthumously (*The Schillinger System of Musical Composition*, 2 vols., 1946). It amounts to an exhaustive presentation of all possible tonal and rhythmic combinations, conceived in arithmetic terms and described in confusing, pseudomathematical language. It has become a manual for trade musicians who have found in it novel combinations, mostly rhythmic.

**Schisma**. See Comma, schisma.

**Schlag** [G.]. Beat. *Schlaginstrumente*, *Schlagzeug*, percussion instruments.

**Schlagzither** [G.]. The modern plucked \*zither (not the dulcimer), as opposed to earlier bowed zithers (*Streichzither*).

**Schlegel** [G.]. Drumstick.

**Schleifer** [G.]. See under Appoggiatura, double II.

**Schleppend** [G.]. Dragging, heavy.

**Schlummerlied** [G.]. Slumber song.

**Schluss** [G.]. Conclusion, cadence. *Schluss-satz*, final movement.

**Schlüssel** [G.]. Clef.

**Schnabel** [G.]. The mouthpiece of the clarinet and recorder; see Mouthpiece (b), (d).

**Schnabelflöte** [G.]. Old name for \*recorder.

**Schnadahupfl** [G.]. A Bavarian-Austrian folksong, frequently with improvised humorous texts between an iterated refrain. See K. Rotter, *Der Schnadahupfl-Rhythmus* (1912).

**Schnarre** [G.]. Rattle. *Schnarrtrommel*, snare drum. *Schnarrwerk*, old term for reed section of the organ.

**Schnell** [G.]. Fast.

**Schneller** [G.]. See Inverted mordent.

**Schola (cantorum)** [L.]. Originally, the papal choir and singing school, possibly organized (or reorganized) by St. Gregory (590–605) but first mentioned in 780 by Paul Diaconus (Paulus Diaconus). It became the central body for the propagation of Roman chant, as the singers were sent to other churches and monasteries [see Sistine choir]. In the papal bull *\*Motu proprio* (1903) of Pius X, new impetus was given to the establishment of *scholae cantorum* in even the smallest churches. The name has also been adopted by certain institutions outside the Church, of which that founded in Paris in 1894 by Vincent d'Indy, Bordes, and Guilmant is the most important. Originally planned as an institution for church music, it developed c. 1900 into a general music school with an intensive training program based on Gregorian chant and counterpoint. The name *schola* has come to imply the conservative and academic trends in French music, represented by César Franck and his spiritual successors.

**Scholarships, fellowships, and prizes**. I. *United States*. Scholarships and fellowships are awards of money granted by institutions or corporations to applicants of unusual ability for further study, research, or composition. A fellowship usually has higher monetary value and represents a greater honor than a scholarship. In awarding scholarships, the applicant's financial need is generally taken into consideration, whereas it usually has no bearing on fellowships.

Scholarships and fellowships fall roughly into two classes: those maintained by funds from a specific bequest (usually bearing the donor's name) and those supplied from a general fund and administered according to prevailing policy or circumstances. The former sometimes contain definite stipulations as to the applicant's qualifications and the use to which the scholarship or fellowship is to be put.

1. Scholarships and student aid. These terms are often used synonymously to designate grants of money for study in the institution granting the awards. A common way of administering such funds is through "tuition scholarships," which take the form of a remission of part or all of the tuition. Unfortunately such a practice has led to abuse in some instances; the granting of tuition scholarships has been only a means of reducing prices to compete with other schools. The fairest method of awarding scholarships is by competition, and this method is used, especially in musical performance, by some of the larger schools.

2. Fellowships. These are granted principally by universities or corporations. Generally they bear a name, have a fixed value, and specify in what field the holder shall work. Most fellowships carry a large enough stipend to enable the holder to live modestly. They are awarded for advanced work in various fields of music—musicology, composition, performance, education, etc. Resident fellowships are given for work in a specific institution, traveling fellowships for work abroad. Most fellowships are granted primarily to enable an advanced student to continue his education.

Full information on scholarships, fellowships, and other grants-in-aid can be secured by writing to the Music Scholarship Chairman of the various colleges and conservatories. Information on fellowships for music study abroad can be secured by writing to the Institute of International Education, New York City. Information on special scholarships not identified with particular institutions is carried regularly in such magazines as *The Music Journal*, the *American Musician*, *Etude*, and others. The Guggenheim Foundation grants fellowships in composition or in musical research, usually to persons who have passed the student age and have proved their ability. The Fulbright scholarships are given for work outside the United States. There are two categories, one for students to do research, the other for professors to give lectures. The American Academy in Rome

offers several fellowships in music, usually granted to young composers of special promise. They require that the candidate reside at the Academy in Rome.

II. *Other countries*. 1. *Prix de Rome*. Awarded annually (since 1803) by the Académie des Beaux-Arts of Paris after difficult competitive examination, including the composition of a cantata or one-act opera. The first prize consists of a four-year stay in the Villa Medici in Rome; the second is a gold medal. Winners of the "Grand Prix de Rome" have included Halévy (1819), Berlioz (1830), Bizet (1857), Debussy (1884), G. Charpentier (1887), and Florent Schmitt (1900). Ravel was among those who failed to win it. Belgium also has a *Prix de Rome*, awarded biennially.

2. The most important English prize is the *Mendelssohn Scholarship*, founded in 1847 and awarded annually for composition. It is a cash award. Except for A. S. Sullivan (1856–60) and Eugène d'Albert (1881–82), no outstanding composer appears on the list of the holders [see *GD*; also *Sup. Vol.*; *GDB*].

3. For the German prizes s.v. "Preise" in Moser's *Musiklexikon*. E.B.H.

**Scholia enchiriadis**. See *Musica enchiriadis*; Theory II, 3.

**Schöne Müllerin, Die** [G., The Fair Maid of the Mill]. Cycle of twenty songs by Schubert, op. 25, composed in 1823 to poems by Wilhelm Müller.

**Schools of music**. See Music education in the United States.

**Schöpfung, Die** [G.]. German title of Haydn's oratorio *The \*Creation*.

**Schöpfungsmesse** [G.]. Haydn's Mass in B-flat (1801), so called on account of the similarity of a theme in the "Qui tollis" with one in his oratorio, *The Creation* [G. *Die Schöpfung*].

**Schottische** [G.]. A mid-19th-century round dance similar to a slow polka, not to be confused with the much faster *\*écossaise*. It was also known in England as the "German polka."

**Schrammelquartet** [G.]. A type of instrumental ensemble, inaugurated in 1877 by the Viennese violinist Johann Schrammel, which became very popular in Vienna and elsewhere for the performance of light music (waltzes, etc.). The original quartet consisted of two violins, clarinet, and guitar; the clarinet was later replaced by

the accordion. A Schrammel orchestra is an enlarged ensemble of a similar type.

**Schrittmässig** [G.]. Measured.

**Schübler Chorales.** Collection of six chorale preludes by Bach, published about 1747 by Schübler. Four of them are based on arias from cantatas arranged for the organ.

**Schuhplattler** [G.]. A Bavarian dance in which the dancers slap their knees and soles with their hands. The music is that of the \**Ländler* or similar dances.

**Schusterfleck** [G.]. See under Rosalia.

**Schwanda the Bagpiper** [Cz. *Švanda Dudák*]. Folk opera in two acts by Jaromir Weinberger (libretto by M. Karesch), produced in Prague, 1927. Setting: fairy tale. The opera, although translated into more than ten languages, is little known in America except for two excerpts, the Polka and the Fugue, which are frequently played in orchestral concerts.

**Schwanendreher, Der.** Concerto by Hindemith for viola and small orchestra (the only strings used are cellos and basses), composed 1935. The music is a skillful elaboration of four old German songs, in three movements: I. A setting of "Zwischen Berg und tiefem Tal" (c. 1500); II. an introduction on "Nun laube, Lindlein, laube" (16th cent.) and a fugato on "Der Gutzgauch auf dem Zaune sass" (by Lemlin, c. 1520); III. a set of variations on "Seid Ihr nicht der Schwanendreher?" The name, literally "swan turner," may refer to an organ grinder who had a swan turning on the top of his instrument.

**Schwanengesang** [G., Swan song]. Schubert's last songs (composed 1828), to seven poems by Rellstab, six by Heine, and one by Seidl, published posthumously by T. Haslinger (Vienna), who chose the title. They are often performed as a song cycle, although they do not properly belong to that category.

**Schwärmer** [G.]. See under Tremolo I.

**Schwebelpfeif** [G.]. See under Schwegel.

**Schwebungen** [G.]. \*Beats.

**Schwegel, Schwegelpfeife** [G.]. Obsolete name for a flute, either transverse or vertical [see also Flute III]. In Poglietti's *Aria allemanda con alcune variazioni* (c. 1680; see *TaAM* viii) it appears as *Schwebelpfeif*, meaning a variation in which the quick and high passages of the fife are imitated.

**Schweller** [G.]. \*Swell.

**Schwellkasten.** Swell box. *Schwellwerk*, swell organ.

**Schwingung** [G.]. Vibration.

**Schwungvoll** [G.]. Animated, spirited.

**Scialumo** [It.]. See Chalumeau (2).

**Sciolto** [It.]. Easy, unconstrained.

**Scordatura** [It.]. Abnormal tuning of a stringed instrument in order to obtain unusual chords, facilitate difficult passages, or change the tone color. Scordatura was frequently used in the lute music of the 16th and 17th centuries, the most common procedure being to lower the lowest string from A to G [G. *Laute im Abzug*; It. *bordone discordato*; see *WoHN* ii, 63]. The *Intabulatura de lauto, libro quarto* by J. A. Dalza (Petrucci, 1508) includes two "Pavana alla ferrarese in scordatura," the first in G-c-g-b-e'-a', the second in G-d-g-b-e'-a' (normal tuning: A-d-g-b-e'-a'). A very unusual scordatura, A-e-e-b-e'-g#', is used for the "Judentantz" in Hans Newsidler's *Ein new künstlich Lautten Buch* (1544; *HAM*, no. 105b; see also *ApNPM*, p. 78). In the early part of the 17th century there virtually was no "normal" tuning for the lute, consequently making it difficult to consider any tuning of this period a scordatura. Often, the particular tuning to be used with a given piece, called \*accord [It. *accordatura*], was indicated at the beginning.

Scordatura was also much used in the violin music of the 17th century, particularly by Heinrich von Biber [see *DTO* 11 and 25; the transcriptions are not always correct (see Lit., Schneider)]. His violin sonata, "Surrexit Christus hodie" [*HAM*, no. 238], requires the tuning g-g'-d'-d'' (instead of g-d'-a'-e'), whereas a<sup>b</sup>-e<sup>b</sup>-g'-d'' is required for "Christi Gebet" (*SchGMB*, no. 238). The accompanying example

(beginning of Bach's Suite no. 5 for cello solo) illustrates the notation. The "accord" at the beginning shows that the A-string is to be lowered one tone. The notes indicate not the actual sound but the position of the fingers in the usual manner, and the natural in the signature directs

the player always to play  $g-a-b^b$  on the highest string, which actually sounds  $f-g-a^b$ . In later music for strings (from Mozart on) the most common instance of scordatura is tuning the lowest string a semitone or whole tone lower in order to increase the range, or a tone higher in order to increase the brilliance of the sound. In Bartók's *Contrasts*, last movement, the violin has sections tuned  $g\sharp-d'-a'-e^{b''}$ , so that the two tritones can be played on open strings.

Lit.: T. Russel, in *MQ* xxiv; A. Moser, in *AMW* i; M. Schneider, in *ZIM* viii; G. Adler, in *ZIM* ix; E. Lesser, in *AM* iv, nos. 3 and 4; G. Reader, *Thesaurus of Orchestral Devices* [1953], pp. 573ff.

**Score** [F. *partition*; G. *Partitur*; It., Sp. *partitura*].

I. A notation showing all the parts of an ensemble (orchestra or chamber music) arranged one underneath the other on different staves (full score, orchestral score). A vocal score is the score of a choral work (opera, oratorio) that shows the vocal parts on separate staves but the instrumental parts in a piano reduction. A piano score is the reduction of an orchestral score to a version for piano, on two staves.

Since about the mid-19th century it has been the practice to lay out an orchestral score in the following order, starting at the top of the page: woodwind, brass, percussion, strings. If a harp is used, it is placed immediately above the strings, but should voices and organ also be included, they are written between the harp and strings. In general, the instruments of each group are arranged in order of descending pitch. Following is the arrangement in Brahms' Symphony no. 2:

2 flutes	}	Woodwinds
2 oboes		
2 clarinets in A		
2 bassoons		
2 horns in D	}	Brass
2 horns in E		
2 trumpets in D		
3 trombones and		
bass tuba		
Kettledrums in D and A		Percussion
Violin I	}	Strings
Violin II		
Viola		
Cello		
Double bass		

II. Before c. 1225, score arrangement was used exclusively for writing down polyphonic

music. All the organa, conductus, and clausulae, i.e., the entire repertory of the schools of St. Martial and Notre Dame, were notated in this fashion. With the development of the motet (c. 1225) this arrangement was discarded for part arrangement, in which the parts are notated separately on one or, usually, two facing pages of the book [see *ApNPM*, p. 283]. This method saved space, since there was a great difference in length between the texted upper parts of the

motet and the textless tenor with its few and long notes written in ligatures. The accompanying drawing shows an arrangement of music in four parts as used in the \*choirbooks of the 15th and 16th centuries. The choirbook arrangement persisted until the mid-16th century but was gradually superseded by arrangement in \*partbooks [G. *Stimmbücher*], i.e., separate books for soprano, alto, etc. The earliest MS partbooks date from c. 1480 (Glogauer \*Liederbuch). This method was particularly advantageous for printing and, in fact, was almost exclusively employed in the printed books of 16th-century ensemble music, both vocal and instrumental. Solo music (organ, lute), on the other hand, was always written or printed in a scorelike arrangement [see *ApNPM*, p. xx].

Because the large repertory of 13th- to 16th-century vocal music—motets, Masses, secular songs—has survived only in the form of individual parts, one might wonder how musicians could compose such strictly polyphonic and highly complex works (often involving riddle canons and intricate notational devices) without making a score. Obviously they must have used some makeshift scoring, probably writing out sections on a wax tablet, slate, or some other material. Even when parchment or paper was used, the scoring was considered only a sketch without permanent value and therefore was destroyed. The earliest surviving scores date from c. 1560.

About 1600 the development of orchestral

music and the acceptance of the thoroughbass led to the general adoption of the score with bar lines (earliest example in Cipriano de Rore's *Madrigali*, 1577). Indeed, one of the largest scores ever written is that of a 54-voice Mass by Benevoli, composed in 1628 for the opening of the new cathedral at Salzburg [DFO 20; see Roman school]. Partbook scoring still survives, e.g., in the four volumes containing the parts of Beethoven's string quartets. See R. Schwartz, "Zur Partitur im 16. Jahrhundert" (*AMW* ii); E. Lowinsky, in *JAMS* i, xiii (early scores; cf. *ibid.* ii, 130ff; S. Clercx, in *CP Masson* i).

**Score reading.** The ability to grasp from a chamber, vocal, or orchestral score the essential features of melodic and harmonic structure and, sometimes, to reproduce these on the piano. This is fairly easy in the case of, e.g., a string quartet of the classical period, where it will often suffice to read the melody part (usually Violin I) and the bass, and to supplement these with the traditional harmonies. Reading a 20th-century string quartet, however, requires much more skill and versatility. Reading an orchestral score becomes even more difficult owing to the use of the old alto and tenor clefs and the transposed notation for numerous wind instruments [see Transposing instruments]. Although precise score reading can be mastered only after long study, the amateur who merely wishes to "follow" a performance with a score can content himself with acquiring facility in glancing quickly over the page and picking out the momentarily leading melody from its general melodic contour and rhythm. See H. Gal, *Directions for Score-Reading* (1924); M. Bernstein, *Score Reading* (1932); H. Creuzburg, *Partiturspiel*, 4 vols. (1956–60).

**Scorrendo, scorrevole** [It.]. Flowing, gliding.

**Scotch snap.** See under Dotted notes III.

**Scotch (Scottish) Symphony.** Mendelssohn's Symphony no. 3, in A minor, op. 56, inspired by a visit to Scotland in 1829. It was begun in Italy in 1830 and finished in Berlin in 1842.

**Scotland.** The earliest information about music in Scotland is supplied by Giraldus Cambrensis, who in his *Topographia Hibernica* (c. 1190) says that "in the opinion of many, Scotland has not only equalled Ireland, her teacher in music, but has . . . surpassed her." The MS Wolfenbüttel 677 (c. 1250), the earliest source for the repertory of the school of \*Notre Dame [see also "Magnus liber organi"], originally belonged to the mon-

astery of St. Andrews and may have been written for that monastery, since it includes a responsory for its patron saint (f. 18v: "Vir perfecte . . . nos Andrea fac consortes. . ."). Not until the 16th century are sources of Scottish music encountered, among them a MS known as the "Scone Antiphoner," presently in the Advocates' Library of the National Library of Scotland (Edinburgh), and a MS set of four partbooks known as the St. Andrews Psalter (or Wood's partbooks), now scattered in Edinburgh, Dublin, and London. The former contains Masses, motets, and Magnificats, several of these by Robert Carver, Canon of Carver (1487–after 1546); the latter, dated 1566, contains psalm tunes, Latin motets, and canticles, by Robert Johnson (c. 1583–1633), David Peebles (d. 1579), and others. Other composers of this period were Patrick Douglas, of whom a few motets remain in a MS at Christ Church, Oxford, and John Fetny (c. 1480–1550). A considerable number of songs, many of them with lute or harpsichord accompaniment, as well as instrumental pieces, mostly pavaues and galliards, survive in various sources [see Editions XXXIV, 15].

The accession of James VI of Scotland to the English throne (James I, 1603) seems to have brought a considerable decline of musical activity in Scotland. Among the few publications of the 17th century are Edward Millar's *Psalter* of 1635 (Edinburgh) and J. Forbes' *Songs and Fancies* 3–5 v. *Apt for Voices and Viols* (Aberdeen, 1662, '66, '82). During the 18th century, English ballad operas were introduced in Scotland. An important event was the foundation of the Edinburgh Musical Society, which, from 1725 on, gave regular concerts. Few Scottish composers became famous until the end of the 19th century, when A. C. MacKenzie (1847–1935), J. B. McEwen (1868–1948), and William Wallace (1860–1940) participated in the current revival of music in Britain. Important Scottish composers who, unlike these three, actually worked in Scotland, include David Stephen (1869–1946), Ian Whyte (b. 1901), Cedric Thorpe Davie (b. 1913), and Erik Chisholm (1904–65, settled in South Africa). See Strathspey; Lament (1); Pibroch.

Lit.: H. G. Farmer, *A History of Music in Scotland* (1947); M. Patrick, *Four Centuries of Scottish Psalmody* (1949); D. Baptie, *Musical Scotland: Dictionary of Scottish Musicians from about 1400* (1894); J. Love, *Scottish Church Music* (1891); J. Glen, *Early Scottish Melodies*

(1900); F. Harrison, *Music in Medieval Britain* [1958]; H. G. Farmer, *Music in Mediaeval Scotland* (1930; also in *PMA* 56); \*Editions XXXIV, 15; N. Diem, "Beiträge zur Geschichte der schottischen Musik im XVII. Jahrhundert" (diss. Leipzig, 1919); A. Carmichael, *Carmina gadelica*, 5 vols. (1900–54); [H. G. Farmer], "Some Early Scottish Composers" (*MA* ii); J. Beveridge, "Two Scottish 13th-century Songs" (*ML* xx, 352ff); G. Abraham, "Burns and the Scottish Folksong" (*ML* iv, 71ff).

**Scriptores** [L.]. Abbr. for two important publications of medieval treatises on music: (a) *Scriptores ecclesiastici de musica sacra potissimum*, 3 vols., ed. M. Gerbert (1784; fac. ed. 1931); and (b) *Scriptorum de musica medii aevi nova series*, 4 vols., ed. E. Coussemaker (1864–76; fac. ed. 1963). The collections are usually designated *Gerbert Scriptores* (GS, G.S., or G.Scr.) and *Coussemaker Scriptores* (CS, C.S., or C.Scr.). Both are indispensable sources for medieval musicological research. The *Gerbert Scriptores* contain chiefly the earliest treatises (9th–11th cent.) and the *Coussemaker Scriptores* those of the 13th and 14th centuries [for partial contents, see Theory]. The contents are given in full in *GD* and *GDB*, together with those of *Musici scriptores graeci*, ed. K. von Jan (1895; sup. vol. 1899), a collection of writings on Greek music.

**Scrittura** [It.]. Commission to write an opera for the next season, usually granted by an opera company.

**Scucito** [It.]. Unconnected, *non legato*.

**Seashore tests.** See under Tests and measurements in music.

**Seasons, The.** (1) Oratorio by Haydn, composed 1798–1801, with a German libretto (original title: *Die Jahreszeiten*) by G. van Swieten, based on an English poem by J. Thomson. Its four parts portray spring, summer, fall, and winter. (2) Collective title (original, "Le quattro Stagioni") of the first four concertos of Antonio Vivaldi's *Il Cimento dell' Armonia e dell' Invenzione*, op. 8, for violin, strings, and continuo. Each concerto is based on a descriptive sonnet.

**Sea Symphony.** Vaughan Williams' Symphony no. 1 (1910), for solo voices, chorus, and orchestra, based on texts from Walt Whitman's *Leaves of Grass*.

**Sea trumpet.** Erroneous translation of \*tromba marina.

**Sebell.** Rare spelling for \*cibell.

**Secco recitative.** See under Recitative.

**Sechzehntel** [G.]. See under Notes.

**Second** [F. *seconde*; G. *Sekunde*]. See under Interval.

**Seconda prattica** [It.]. Term used c. 1600 for the then novel style of monody (recitative, aria, opera; see *Nuove musiche*), as opposed to the *prima prattica*, the polyphonic style of the 16th century. Monteverdi, in the preface to Book V of his Madrigals (1605), said that he adopted "seconda prattica, overo perfetione della moderna musica." See also *SSR*, pp. 405ff.

**Secondary dominants.** See under Dominant (1).

**Seconda volta** [It.]. See under *Prima volta*.

**Seconde rhétorique** [F.]. In the 14th and 15th centuries, designation for poetry, as opposed to *première rhétorique*, i.e., prose. All the texts of Machaut's *ballades*, for example, fall under *seconde rhétorique*. See M. Bukofzer, in *MQ* xxviii, p. 33f.

**Seelenamt** [G.]. \*Requiem Mass.

**Seelenvoll** [G.]. Soulful.

**Segno** [It.]. A sign in the form of :S: used to indicate the beginning or end of a section to be repeated. In the former case, the indication *dal segno*, *dal S.*, or *D.S.* appears at the end of the section; in the latter case, *al segno* (to the sign), *sin' al segno* (until the sign), or *fin' al segno* (end at the sign) is stated. See also under *Da capo*.

**Segreto di Susanna, Il** [It., The Secret of Susanne]. Opera in one act by E. Wolf-Ferrari (libretto by E. Golisciani), produced (in German) in Munich, 1909. Setting: Piedmont, c. 1910.

**Segue** [It.]. Instruction to the performer to play the following movement without break (*segue l'aria segue la coda*). It may also mean to continue in the same manner, e.g., with a certain pattern of broken chords that is written out in full only at the beginning [see Ex. i under Abbreviations].

**Seguidilla.** A dance of southern Spain (Madrid, Murcia, Seville, etc.), with a text based on four-line poems (usually 7.5.7.5), whose lines are freely repeated or broken up in actual performance, as well as interspersed with passages played on the guitar. The music is in moderately fast

triple meter. In Act I of Bizet's *Carmen* there is a *seguidilla*, which, however, is not typical.

**Seikilos Song.** One of the few remnants of ancient Greek music, a short song from the 2nd or 1st century B.C. that begins with the words "Hoson zes" (While you live). It is engraved on a tombstone (discovered in 1883), as an epitaph by Seikilos for his wife. Because of the similarity of its melody (perhaps also its first word) to the Gregorian antiphon "Hosanna David" [LU, p. 578], it has been cited as evidence that Gregorian chant is derived from ancient Greek music. However, this theory has been almost completely discredited today [see Gregorian chant VII]. The Seikilos Song is shown in *SchGMB*, no. 1; *HAM*, no. 7c; and, together with "Hosanna David," *ReMMA*, p. 115.

**Seis** [Sp.]. Traditional dance-song of Spanish origin, popular in the Dominican Republic. It uses 6/8 and 3/4 meter alternately, in animated tempo. The text consists of ten-line stanzas [Sp. *décimas*] in eight-syllable verse. It is always sung by a solo singer, either man or woman, to the accompaniment of guitars, but is danced by groups of couples. Yodeling and the use of meaningless syllables is quite common, and the \*Phrygian cadence is often used. J.O.S.

**Seises** [Sp.]. A group of six (or more) choir boys who perform dances with singing and clapping of castanets before the high altar of the Cathedral of Seville (formerly also in other churches of Spain) on great festival days. The *seises* were established in the 15th century. Victoria, Guerrero, Morales, and others have written music for them, but the music now used is more recent and mediocre in quality. See J. Moraleda y Esteban, *Los Seises de la catedral de Toledo* (1911); J. B. Trend, in *ML* ii, 10; R. H. Stein, "Die Kirchentänze in Sevilla" (*DM* xv, no. 1).

**Seiten-** [G.]. Side. *Seitenbewegung*, oblique motion. *Seitenthema*, *Seitensatz*, the second theme of a movement in sonata form, or of other forms.

**Sekunde** [G.]. Second. *Sekundakkord* [see under Seventh chord].

**Semi-** [L.]. Half. *Semibiscroma*, *semibreve* (*semibrevis*), *semicroma*, *semifusa*, *semiminima*, *semi-quaver*, see Notes; also Mensural notation. *Semichorus*, half-chorus. *Semidiapente*, diminished fifth. *Semiditonus*, the minor third. *Semiditas*, in mensural notation (\*proportions), same as *proportio dupla*.

**Semiramide.** (1) *Semiramide riconosciuta*, opera in three acts by Gluck (libretto by Metastasio), produced in Vienna, 1748. (2) Opera in two acts by Rossini (libretto by G. Rossi, based on Voltaire), produced in Venice, 1823. Setting (for both): Babylon, legendary times.

**Semiseria** [It.]. An 18th-century term for an *opera seria* that contained a number of comic scenes.

**Semitone.** One-half of a whole tone, the smallest interval in traditional Western music. (Smaller intervals are called \*microtones.) The octave consists of twelve semitones and the diatonic scale includes two semitones (between e and f, and b and c'). The exact measurement of a semitone varies slightly according to the system of tuning. In equal temperament [see Temperament] each semitone equals exactly 100 \*cents, whereas in other systems there are semitones of different sizes. For instance, in the \*Pythagorean system the "diatonic" semitone (e-f, b-c'; Gr. *diesis* or *limma*, medieval *semitonus minor*) is equivalent to 90 cents, and the "chromatic" semitone (b<sup>b</sup>-b; Gr. *apotome*, medieval *semitonus maior*) to 114 cents. In \*just intonation these values are almost reversed, e-f being 112 cents and b<sup>b</sup>-b 92 cents.

**Semplice** [It.]. Simple, unaffected.

**Sempre** [It.]. Always; e.g., *sempre legato*, always legato.

**Senario** [It.]. Zarlino's designation for the first six numbers and the ratios between them, 1:2:3:4:5:6. From these he derives all the consonances: octave (2:1), fifth (3:2), fourth (4:3), major third (5:4), minor third (6:5), and major sixth (5:3). See R. W. Wienpahl, "Zarlino, the Senario, and Tonality" (*JAMS* xii).

**Senhal** [Prov.]. In Provençal poetry, a wordplay whereby a name, usually that of a woman, is concealed in the text. This device was also used in the Italian madrigals of the 14th century, e.g., Landini's *Non a Nnarcisso* (*Anna*).

**Senkung** [G.]. See under *Arsis* and *thesis*.

**Sennet** (also written *Sennate*, *Synnet*, *Cynet*, etc.). In the stage directions of Elizabethan plays, a term meaning that music is to be played. The indication "Trumpets sound a flourish, and then a sennate" (Thomas Dekker, *Satiromastix*) calls for a flourish (fanfare) followed by a somewhat longer piece played on brass instruments.

The term is probably derived from sonata [see Sonata B, I]. For a similar term, see Tucket.

**Sensible** [F.]. The leading tone.

**Sentito** [It.]. Expressive.

**Senza** [It.]. Without. *Senza tempo, senza misura*, without strict measure. For *senza sordini*, see Mute.

**Sepolcro** [It.]. See Sepulchrum play.

**Septet**. Chamber music for seven players, usually strings and wind mixed. Besides Beethoven's well-known Septet op. 20, there are others by Spohr, Hummel, Saint-Saëns, and Ravel.

**Septième** [F.], **Septime** [G.]. The interval of the seventh. See Interval.

**Septimenakkord** [G.]. \*Seventh chord.

**Septuor** [F.]. \*Septet.

**Septuplet** [G. *Septole*]. A group of seven notes played in the time of four or six. Examples occur under proportional designations such as *dupla sesquitercia* (7/3), *trippla hemiola* (7/2), or *proportio septupla* (7/1), the first two in the late 14th-century Codex Torino, Bibl. Naz. J. II. 9 [see *WoHN* i, 373ff] and the last in Correa de Araujo's *Libro de Tientos* of 1626 [\*Editions XXXII. no. 6, ii, 149].

**Sepulchrum play**. A medieval play portraying the burial of Jesus. See Liturgical drama. It was revived in the 17th-century *sepolcro*, a special oratorio performed, particularly in Vienna, during Holy Week before a representation of the Holy Sepulchre in the church. See A. Schering, *Geschichte des Oratoriums*, pp. 131ff.

**Sequela**. Term sometimes used for the pre-existing melodies of sequences [see Sequence II C], the term "sequence" being reserved for the combination of these melodies with the text. See Dom A. Hughes, ed., *Anglo-French Sequelae* (1934).

**Sequence** [G. *Sequenz*]. I. In composition, the repetition in a single part of a short musical phrase at another pitch, usually at the second above or below, more rarely at the third [see Repetition]. A sequence is called *melodic* (or *monophonic*) when the repetition occurs in the melody only (as in monophonic music or when the lower parts are not involved in the procedure); it is called *harmonic* (or *polyphonic*) if similar repetitions occur in all the parts. If the repetitions are made without accidentals (change

of key) the sequence is *tonal* or *diatonic* [Ex. 1a]. This procedure necessarily implies that some of the intervals become larger or smaller by a semitone (minor instead of major third, diminished instead of pure fifth, etc.). If, on the other hand, the intervals of the model are preserved exactly, the sequence is *real* [Ex. 1b; see Tonal and real]. In practice most sequences are of a mixed type called *modulatory* or *chromatic* [Ex. 1c].

In spite of its stereotyped construction, the sequence is highly important as an element of logical continuation. This is particularly true of the tonal sequence (in its exact or slightly modified form), which combines unity of key with variety of intervallic repetition. From the point of view of harmonic analysis, the sequence is interesting because it often produces chordal combinations otherwise not admitted in strict style (diminished fifths, secondary seventh chords, etc.).

Short sequential passages occasionally are found in Gregorian chant, e.g., in a standard cadence of the responsories of mode 8 [Ex. 2a; see "Verbum caro," *LU*, p. 390f], which, like all sequential formations of plainsong, is slightly irregular (note the grouping of the neumes). Very rigid polyphonic sequences are a characteristic trait of the 12th-century organa of St. Martial and of Santiago de Compostela. Usually one part is the inversion of the other [Ex. 2b, from the St. Martial organum *Omnis curat*; cf. a similar passage in *HAM*, no. 27a]. The long coloraturas frequently found in 14th-century madrigals or *caccie* often include sequential passages [see, e.g., *ReMMA*, p. 365]. Imitative sequences appear in the works of Paolo Tenorista [Ex. 2c, from *Tra verdi frondi*] and Johannes Ciconia. In the 15th century, Obrecht

stands out for his masterly handling of the sequence in a large variety of ways. Ex. 2d shows an instance occurring in the Gloria of his *Missa Je ne demande*. The harmonic sequence became an important means of formal development and continuation in many compositions of the 17th to 19th centuries, frequently used in the episodes of the fugue and the development section of the sonata. In the late 18th century mediocre composers made abundant use of an inferior type of sequence known as \*rosalia.

II. *Gregorian chant*. A. *Origin*. The origin of the sequence has been the subject of much study and dispute. [For its relationship to the trope, see under Trope (3).] There is good reason to assume that the sequences originally were long melismas (*melodiae longissimae*) sung without text after the word Alleluia, and that the term *prosa ad sequentia* refers to these purely musical additions. Later these melismas were underlaid with a text, which was called \**prosa*; hence the designation *sequentia cum prosa*, i.e., melody with text. An idea of how the sequence originated can be inferred from the report (often misrepresented or, without justification, considered untrustworthy) of Notker (Balbulus), a German monk of St. Gall (c. 840–912), who

said that as a young man he had to sing *longissimae melodiae*, which he found difficult to remember. A monk from the monastery of Jumièges (near Rouen) came to St. Gall with a book in which some verses were adapted to the sequences. However, Notker did not find these satisfactory and began to write some of his own. Finally, his teacher, Iso, advised him that it would be best to have only one tone to each syllable of the text. From this it appears that: (1) the sequences were originally without text; (2) the addition of a text (*prosa*) was practiced in northern France c. 900; (3) Notker perfected the French method by providing a syllable for each tone of the melisma, so that the *sequentia cum prosa* acquired the fully syllabic style it long retained.

The remainder of this discussion deals separately with the textual and musical aspects of the sequence (hereafter the term will mean sequence *with* text), although in the actual development they are closely interlocked.

B. *Text*. The sequence texts are long poems in a free style, usually in the form a, bb, cc, dd, . . . jj, k; that is, they begin and end with a single line (a, k) between which are a number (four to ten or more) of double-line stanzas. The two lines of each stanza are identical in the number and accentuation of syllables, but usually there is a marked variation from one stanza to the next. For instance, Notker's sequence "Psallat ecclesia" has the following syllabic scheme: 28; 14, 14; 20, 20 [21]; 8, 8; 19, 19; 13, 13; 9, 9; 17 [see *ApGC*, p. 445]. The irregular length of the stanzas and the absence of strict poetic meter suggest Byzantine origin. In fact, a few of the Byzantine *kontakia*, particularly the famous \*Akathistos hymn, contain stanzas with similar verse structures. However, the sequence as a species is not derived from the *kontakion*, which has an entirely different form [see Byzantine chant II]. The French sequences, for which the name \**prosa* was customary, also include a sort of rhyme. In most of them, each line ends on a (or at, am, etc.), in assonance with the final vowel of "Alleluia." They also often begin with the word "Alleluia," which is rarely true of the German sequences.

C. *Music*. The music is parallel to the textual structure, there being a single line at the beginning and the end, and repeated lines for each of the double stanzas: a bb cc dd . . . jj k. This form is particularly evident in several MSS containing the melodies without text [see *Sequela*]. In these, the first and last section are

marked *x* (= *semel*, once), and the others are marked *d* (= *duplex*, double). The sequences (and sequelae) often have strange names, such as "Puella turbata" (Disturbed girl), "Cignea" (Swanlike), or "Cithara." In some cases the title refers to the parent Alleluia [see II A above], e.g., "Laetatus sum" (Alleluia Laetatus sum, for the second Sunday of Advent) or "Adorabo" (Alleluia Adorabo, for the dedication of a church). However, the relationship between the sequence melody and the Alleluia melody is by no means wholly clear. In most cases the sequence begins with the phrase for the word "Alleluia" but thereafter it continues freely, without using the melody of the Jubilus and the verse [ex. in *HAM*, no. 16a]. Reconstructions designed to show that the entire sequence is borrowed from the Alleluia are of doubtful validity [see, e.g., *BeMMR*, pp. 84ff].

An interesting trait of many sequences is the use of different ranges and tonal realms in the various sections. Another novelty is the extensive, and often exclusive, use of a rising cadence (f-g) instead of the falling cadence (a-g) that prevails in Gregorian chant.

D. Later development. The development of the sequence is usually divided into three phases. The early sequence, described above, was followed about a hundred years later by the "intermediate" sequence. It is characterized by more regular versification, the lines becoming more nearly equal in length, often showing strictly poetic meter (iambic, dactylic) and occasionally employing actual rhyme. The most famous example of this type is the Easter sequence "Victimae paschali laudes," by Wipo of Burgundy (c. 1000-50; see *HAM*, no. 16b; *LU*, p. 665f). The third, final stage is the rhymed sequence [G. *Reimsequenz*; F. *proses*], represented mainly by the numerous sequences of Adam de St. Victor (d. 1177 or 1192). Textually, his sequences are indistinguishable from strictly versified hymns of ten, twelve, or more stanzas, and only the musical treatment makes them sequences. Whereas in a hymn all the stanzas are sung to the same melody, Adam gave the first half of each stanza a new melody, the second half being sung to the same melody [see *HAM*, no. 16c]. His sequences thus are in the double-versicle form aa bb cc . . . jj, without single lines at the beginning and end. Although Adam's Latin is admirably elegant, his music is inferior to that of the older sequences. His procedure led to an enormous output of rhymed sequences, which in ensuing centuries threatened to over-

shadow the traditional Gregorian repertory. A drastic step was taken at the \*Council of Trent (1545-63), which abolished all but four of these sequences: Wipo of Burgundy's Easter sequence "Victimae paschali laudes" (the only remnant of the older type); the sequence for Whitsunday, "Veni sancte spiritus" (Golden Sequence, attributed to Innocent III, late 12th cent.); Thomas Aquinas' sequence for Corpus Christi, "Lauda Sion" (c. 1261); and Thomas of Celano's sequence for the \*Requiem Mass, "Dies irae" (c. 1200). In 1727 a fifth sequence was adopted for liturgical use, Jacopone da Todi's celebrated \**"Stabat Mater."* The Christmas sequence "Laetabundus" [see *ZMW* xi, 274ff] is still used in the service of the Dominican monks. Derivatives of the sequence are the \**estampie* and the \**lai*.

E. Sequence composition. Sequences appear to have played a considerable role in the earliest days of polyphony. The longest example of organum in the "Musica enchiridiadis" of c. 900, "Rex coeli Domine" [*HAM*, no. 25b, 2], is a fragment of a sequence [see J. Handschin, in *ZMW* xiii, pp. 113ff], and what may be called the earliest polyphonic composition is based on the sequence "Benedicta sit" [see W. Apel, in *RBM* x, p. 134; melody in A. Hughes, *Anglo-French Sequelae*, p. 28]. The 11th-century Winchester Troper contains several two-voice sequences. In subsequent centuries the sequence was used less frequently until Dufay, who composed "Victimae paschali," "Laetabundus," and "Veni Sancte Spiritus" in alternatim form [see under Alternation], one of the double stanzas being in plainsong. From the same period come two settings of "Veni Sancte Spiritus" by Dunstable. A considerable number of sequences are included in the Mass Propers of Isaac's \**Choralis Constantinus*. While most of these are in alternatim form, Josquin and other 16th-century composers employed the entire text as the basis for motets [see *HAM*, no. 113, for Willaert's *Victimae*, Pars I; see also *HAM*, no. 299, for a setting of a portion by Jommelli].

**Sequentia** [L.]. Term for sequence, properly one without text; see Sequence II A. For another meaning, see Lesson (1).

**Séraphine**. See under Harmonium II.

**Serenade**. Evening music, vocal or instrumental. The former (song of a lover beneath his lady's window) is common in opera (Mozart, Don Giovanni's aria "Deh, vieni alla finestra") and in the song repertory. The opposite is \**aubade*, i.e., morning music.

More important is the instrumental serenade, which, losing its "utilitarian" function, developed c. 1770 into a purely musical type similar to the \**cassation*, \**divertimento*, and \**notturmo*. As a form, the serenade is characterized by a mixture of elements taken from the suite, particularly marches and minuets, and from the sonata. The style likewise is about midway between that of the suite and the symphony. Serenades usually are written for a small ensemble consisting of a limited number of strings and a few wind instruments, as would be suitable for an open-air performance. The most famous examples are Mozart's \**"Haffner"* Serenade (K. 250) and *Eine kleine Nachtmusik* (K. 525). Others are

by Haydn, Beethoven (op. 8, 25; also op. 41, 42, which are arrangements of the earlier ones), Brahms (op. 16), Dvořák (op. 22, 44), and Elgar (op. 20).

**Serenata** [It.]. (1) \*Serenade. (2) Name for 18th-century short operatic works written to celebrate the birthdays of royal persons (particularly at the Viennese court) and performed (in the evening?) in a reception room with costumes and modest scenery. They might best be described as dramatic cantatas. Well-known examples are Handel's *Acis and Galatea* (1720) and his earlier *Acis, Galatea e Polifemo* (Naples, 1708). A *serenata* by Stradella is reprinted in the Handel Edition, sup. vol. iii.

**Serial music**. General term describing 20th-century compositions in which the traditional rules and conventions governing all aspects of music—tonality, melody, harmony, rhythm, etc.—are discarded, to be replaced by various new rules and principles. The most general such principle, which radically distinguishes serial music from traditional tonality, is the distribution of structural importance over many (possibly all) elements of musical development, and, as a result, the multiplication of structural characters through their reciprocal "relativization" (and, at the same time, limitation and illumination). The first important attempt to effect such a distribution is represented by generalized asymmetry and nonperiodicity [see section IV].

1. *Origins*. About 1910, numerous composers were experimenting with many different innovations, which nonetheless had one feature in common: they all questioned certain fundamental aspects of the musical language of the West. The works of Arnold Schoenberg in particular attacked the very heart of this language, the tonal structure of harmony. His conclusions have their immediate origin in: (1) the steady increase, in postromantic music, of dissonances, ever less justifiable in the traditional framework, and the more and more frequent use of several successive dissonances chromatically related to one another; (2) a revival of contrapuntal writing, in which the thematic figures, constantly undergoing variation, produce and control the totality of sonorous textures, including elements that had previously been considered only secondary. From these trends sprung new hypotheses that were in flagrant contradiction to the conventions of cadence. In those of his

works that are called \*atonal (from op. 10 to op. 22), Schoenberg explicitly suspends the traditional harmonic functions. Not content with simply failing to take them into account, he systematically strives to avoid them. This led him to a style based on the most strained dissonances (for his time) and on a generalized chromaticism, which involves the elimination of consonant chords, octaves, and all figures that have a potential for tonal polarization. In his most radical works, such as the op. 16 orchestral pieces and the monodrama *Erwartung*, he succeeds to a large extent in eliminating prolonged rhythmic periodicities, structures with a constant polyphonic density, and motifs with a strong coefficient of repetition—all these being phenomena that confirm tonal organization. One of the most important theoretical concepts Schoenberg formulated at this time was that of generalized nonrepetition. At its extreme, his style produces “sound events,” i.e., materials that (for their time) are as discontinuous, as nonformalized, as “concrete” as possible.

II. *Schoenberg's twelve-tone system.* Schoenberg, however, was seeking an organizing principle that could put order into the “chaos” he believed he had created. The result was the *dodecaphonic* or *twelve-tone* system, whose roots lie in his atonal works but which he applied in practice only after a silence of almost ten years (c. 1913–23).

The twelve-tone system consists of using a series of intervals (or tone row; G. *Reihe*, *Grundgestalt*) involving in turn all twelve tones of the chromatic scale in any order chosen by the composer. No tone may be repeated until the other eleven have appeared. The order of the series remains unchanged throughout the composition except for the following permissible modifications: (1) the octave position of any tone of the series can be changed; (2) in addition to its original form (S) the series is available also in inverted form ( $S^i$ ), in retrograde form ( $S^r$ ), and in retrograde inversion ( $S^{ri}$ ); (3) all four forms of the series can be used in transposition to any step of the chromatic scale, thus making available 48 ( $12 \times 4$ ) modifications. The total development of a composition thus is based on the variations (in rhythm, octave, etc.) of one of these figures, which assumes the role of a “supertheme.” The beginning of the Trio from Schoenberg's Suite op. 25 [Ex. a] shows the series of this piece, together with its three basic modifications. The composition begins with four full statements of the series, the third

The image displays musical notation for Schoenberg's twelve-tone system. It shows the original series (S) and its three basic modifications: inverted (Si), retrograde (Sr), and retrograde inversion (Sri). The notation includes treble and bass staves with notes and rests, and labels for each form and its transpositions. The series is shown in its original form (S) and its three basic modifications (Si, Sr, Sri) across four measures. The notation includes treble and bass staves with notes and rests, and labels for each form and its transpositions.

and fourth in transposition. The continuation is based on three four-tone sections of the series, marked 1, 2, 3. In the series shown here, section 3 is identical (aside from transposition) to its retrograde inversion,  $3^{ri}$ . In the *Klavierstück* op. 33a [Ex. b] measure 1 presents the entire series in three chords of four tones each, and measure 2 uses the same treatment for the retrograde inversion of the series, transposed a semitone down. In the next three measures the *ri*-form of the series appears in the right hand, again divided into three sections, each of which is simultaneously stated by the left hand in its normal form.

The twelve-tone technique was adopted by Alban Berg, who used it intermittently, frequently combining it with methods that are

founded in tonality. In his Violin Concerto (1935) the series is constructed so as to include major and minor triads [Ex. c]. The "vertical" aspect (chord structure) may be just as directly inferred from a series as the "horizontal" aspect (linear structure), but the coordination of these two dimensions poses both theoretical and practical problems.

The twelve-tone method reveals two apparently antithetical tendencies. On the one hand, perpetual utilization of the chromatic total (all twelve tones) manifests the rupture of tonal coherence. In the foreground are those intervals or groups of intervals that are least compatible with tonality. Further, nonrepetition is applied in a very basic way: a note cannot be heard again until the eleven others have appeared (even if only theoretically). On the other hand, the processes used to organize and control the resulting asymmetry, i.e., the variation techniques, necessarily stem from tonal music. Moreover, there is indeed repetition, since the variations are always based on the same source; thus identity takes pre-eminence over difference.

Schoenberg's language has its roots in the music of the 18th and 19th centuries, to which other aspects of his work—e.g., rhythm, phrasing, rhetoric—are more closely related. However, through the very dissonance in his harmony, enhanced by the seemingly contradictory presence of more consonant formations, Schoenberg's music expresses a state of distortion and disintegration that is a remarkable (and typically \*expressionist) testimonial to an era of violent crisis.

Other composers who have used the twelve-tone technique are E. Krenek, L. Dallapiccola, W. Fortner, M. Babbitt, and N. Skalkottas.

III. *Webern and serial music.* Well before he adopted the twelve-tone technique, Anton Webern, who with Berg was Schoenberg's principal disciple, carried his master's conclusion even further. Having developed as far as possible the principle of generalized asymmetry, Webern soon defined in his works the principles and requisites for a new harmony, based on the equal harmonic value of all the notes, and, to accomplish this, the pre-eminence of a new kind of chromaticism. Unlike Schoenberg, Webern neither denied nor ignored the polarizing power of the intervals. Instead, he used it in a new, diverging way, giving each sound a maximum presence, specific and irreducible. The nature of the intervals (abundance of major sevenths, etc.) and their arrangement in different octaves thus fulfill a "spreading" function, for it is with these that Webern organizes all other aspects of musical articulation: (a) the variable density and interrupted structure of polyphony; (b) the importance of oblique relations (e.g., interlocking structures); (c) numerous dynamic steps, emphasized by the use of intermittent instrumentation; and (d) rhythmic irregularity, applied to both small and large temporal units, the former emphasized in his earlier works (especially op. 7 to op. 13) and the latter in his later ones.

Having carried the search for an absolute asymmetry as far as possible, Webern found symmetry and asymmetry to be not opposites but complementary (a fact classicism recognized when it subordinated one to another, e.g., dissonance to consonance). With this background, Webern turned to twelve-tone serial music. With Schoenberg, the series retains the appearance of a theme, at first always strongly realized and with all else necessarily subordinate to it. With Webern, the series, still the basis for all elements of the composition, is not actual (i.e., not ex-

plicit) and so is truly general and generative. No *Ur* or *Grundform*, no version any more "original" than another, no structure is regarded as the model series. It is not reducible to a given sequence of twelve notes. Rather, it represents the idea of multiple possible sequences, or better, multiple fields of distribution, at once successive and simultaneous. See Ex. d, showing different forms (in the orthodox sense: retrograde, inversion, transposition) from the series of Webern's Concerto op. 24.

- 5 (retrograde of 4): b a d c  
← ← ← ←

← ← ← ←

1. "Original" series (hypothetically) contains four similar groups of three notes: (a) original; (b) retrograde inversion; (c) retrograde; (d) inversion. 2. Retrograde inversion of (1), but also retrograde motion of each group of three notes. 3. Retrograde of (1) transposed a tritone, and also the groups exchanged two by two. 4. Same as (2) but transposed a tritone; also, halves of row exchanged two by two. 5. Retrograde of (4); also inversion of (1); combines operations (2) and (3), i.e., retaining the retrograde of the groups of three notes (2) and the exchange of the groups two by two (3). 6. Retrograde of (3); also transposition at the tritone of (1); combines operations (2) and (4), i.e., retrograde of notes, exchange of halves. 7. Retrograde of (2); the other inversion of (1) a tritone from (5); combines operations (3) and (4), i.e., exchange of groups and of halves. 8. Retrograde of (1); combines operations (2), (3), and (4).

IV. *Post-Webern serial music*. In 1945, a war-time accident put an end to Webern's quest, which he had pursued in almost total isolation. At the same time, young musicians from various countries began to discover, thanks to the post-war resumption of communication, the importance and originality of Webern's contribution. Affected by the atmosphere of the war years, they were still oriented toward relentless criticism of the traditional idioms. Pierre Boulez (b. 1925) was the first composer to take a bold initiative, combining the rhythmic innovations of his master. Olivier Messiaen, with the fruit of the Viennese examples. At a very early stage he took as his principal model the serial techniques of Webern—only to tear them to pieces. Boulez' aesthetic (shared by others of his generation, such as Stockhausen, Berio, and Pousseur, in their own interpretations) is an aesthetic of unpredictability, of irreversible movement, of the pre-eminence of discontinuity, or, musically, of *generalized nonperiodicity* [see Period]. It is as a true generator of asymmetry that the series will function. The stress will be on perpetual variation, whose control, theoretically, is rendered possible by the presence of the row. Applying this to all aspects (pitch, rhythm, dynamics, timbre, etc.) and levels of musical discourse (up to the over-all form), composers will at first attempt to create music in which asymmetry is as general as possible.

Boulez has described the first attempts at generalizing the series, a sort of "zero degree" of musical articulation. The principle of perpetual renewal is at first applied note by note, engendering a music in which each note is distinguished from its neighbors in numerous respects, the lowest notes continually followed by the highest, the shortest by the longest, etc. As all the extremes are rapidly exhausted, the next transformation can only be produced within a more limited field, and so it becomes less and less striking, less and less novel. At the lowest level, the potential for variation is almost entirely exhausted. As it diminishes (e.g., simply in the course of a work's growing longer), there results the danger of monotony and of a static quality. This represents the exact opposite of the sought-after asymmetry and perpetual renewal and is all the more flagrant in that the serial permutations, which are difficult to identify owing to their intricacy, become definable only in terms of chance and probability.

Serial composers aware of these results strive to overcome such problems. Boulez' first book

of *Structures* for two pianos (1951–52) already offers the first example of what will later be called a “technique of groups,” which consists of treating serially not just isolated notes but entire sections of sonorous material—an entire group of sounds, more or less compact, being opposed to another by this or that *total* character. This naturally presupposes that all the elements making up a group have a particular character in common and present anew a certain degree of relative similarity, recognizability, and symmetry, over and over again.

Thus the present-day—and, no doubt, future—serial composer is concerned with the progressive development of a new synthesis of elements traditionally considered antithetical, a tendency shown in a series of remarkable landmarks, e.g., Boulez’ *Le Marteau sans Maître* (1955) and *Pli selon Pli* (1960); Stockhausen’s *Zeitmasse* (1956), *Gruppen* (1958), and *Kontakte* (1960); Berio’s *Alleluja* I and II (1956; 1956–8) and *Tempi concertati* (1959). This new stage in the history of serial music will manifest itself in the increasing overthrow of taboos (e.g., prohibition of octaves) that serial composers originally felt obliged to establish. All kinds of material—both traditional and wholly new—will come to be used integrally. A number of branches, momentarily diverging, in which musicians of many nationalities are collaborating, have come to enrich the common current. Among them are K. Stockhausen (Germany), H. Pousseur (Belgium), M. Kagel (Argentina), L. Berio, B. Maderna, and L. Nono (Italy), and recently also Stravinsky.

Certain of the serial composers have taken part in investigating highly unusual areas (which the early serialists had initiated), notably that of noise (the accumulation of dissonances), and that of chance, in which some young Americans grouped around John Cage have been working. Noise, which lends itself to extreme differentiation, rich in innumerable “colors,” had already been used in instrumental music (e.g., the orchestral masses of Stravinsky’s *Le Sacre du printemps*, the giant percussions of Varèse, the chromatic frictions of Webern’s op. 9, no. 5). But it is electronic music, governed by serial methods (although *\*musique concrete* has undeniably pointed out to it certain paths) that will have the task of fully utilizing noise. [See Aleatory music; Electronic music.] These important lines of research directly affect the techniques of interpretation, conferring on the performer a share of creative responsibility (“open” or “mobile”

forms), a trend whose first signs are implied in Webern’s serial treatment.

Research in these fields presumes a solid theoretical background, and serial composers have often relied on modern information and communications theories [see Computer], acoustics and structural linguistics, probability and games theory, the psychology of form, etc. It would seem that a vast system is now beginning to emerge, able to assimilate all the earlier systems that have contributed to its development (including, e.g., the tonal system). If this is true, the theoretical basis for a new and truly collective language will have been found.

**Serinette** [F.]. A miniature barrel organ formerly used to teach canaries (*serin*) to sing, through frequent repetition of a tune.

**Serpent.** See under Cornett; also Brass instruments V (b).

**Serse.** See *Xerxes*.

**Serva padrona, La** [It., The Maid as Mistress]. Opera in two acts by Pergolesi (libretto by G. A. Federico), produced in Naples, 1733, as an \*intermezzo between the three acts of his serious opera, *Il Prigionier superbo* (The Haughty Prisoner). Setting: Naples, 1733. A delightful miniature employing only three characters, *La Serva padrona* is an important landmark not only in the field of opera [see Comic opera; War of the Buffoons] but in the general development of musical style, anticipating some practices of the later 18th century.

**Service.** The group of musical settings of the \*canticles and other items (Kyrie, Creed, etc.) from the Book of Common Prayer of the Church of England. A morning service consists of "Venite exultemus," \*"Te Deum," and "Benedictus," or the alternatives "Benedictus es" [see under "Benedictus Dominus Deus Israel"], "Benedicite," and "Jubilate." The evening service includes the "Magnificat" and "Nunc dimittis," or the alternatives "Cantate Domino" and "Deus misereatur." The Communion service begins with the \*Decalogue (or Responses after the Commandments) and/or the \*Kyrie, and continues with settings of the Creed, Sanctus, \*Benedictus qui venit, \*Agnus Dei, and \*Gloria in excelsis. Each canticle is traditionally referred to by the original Latin incipit, although all are sung in English. A complete service includes most of the items listed above, usually composed in the same key and therefore commonly referred to by simply the name of the composer and the key, e.g., Ouseley in B minor. In the 20th century, particularly in the United States, many of the canticles have been composed singly rather than as complete or partial services. The terms "short service" and "great service," used chiefly in the 16th and early 17th centuries, refer to the shorter, syllabic style of the former and the richer, contrapuntal style of the latter, with its repetition of textual phrases.

The history of the service proper begins with Christopher Tye (c. 1500–c. 1572) and Thomas Tallis (c. 1505–85). Tye's *Evening Service* and Tallis' *Short Service* are both in the simple homophonic style recommended by Archbishop Cranmer. William Byrd (1543–1623) used the older, polyphonic style in his *Great Service*; in his *Second Short Service with Verses to the Organs* he introduced "verse" or solo passages with organ accompaniment to contrast with the "full" choral passages. Other composers of services before the Commonwealth government were Thomas Morley (1557–1602), Thomas Tomkins (1572–1656), Thomas Weelkes (c. 1575–1623), and Orlando Gibbons (1583–1625). It should be noted that the Communion service quickly lost the importance that its model, the \*Mass, has always maintained in the Roman Catholic Church, and that interest concentrated on the morning and evening services until the late 19th century.

During the Commonwealth (1642–60) under Oliver Cromwell, the cathedrals were closed, choirs disbanded, organs mutilated, and music books destroyed. During the Restoration, services by men such as William Child (1606–97), Benjamin Rodgers (1614–98), Jeremiah Clarke (c. 1673–1707), and John Blow (1648/9–1708) remained conservative. Those by Henry Purcell (c. 1659–95) are more progressive but are inferior to his anthems. His *Te Deum* and *Jubilate in D*, for St. Cecilia's Day, 1694, like those of Handel, were written for special festive occasions rather than for the daily services. Such 18th-century composers as William Croft (1678–1727), Maurice Greene (1695–1775), William Boyce (1710–79), John Travers (c. 1703–58), Jonathan Batisthill (1738–1801), Thomas Attwood (1765–1838), and John Clarke (1770–1836) continued to write better \*anthems than services.

Victorian composers, partly influenced by the Oxford movement, which restored the use of the Communion service in parish churches, gave new life to the form by writing independent organ parts. "Venite exultemus" was no longer set for choir but was sung to Anglican chant. Samuel Sebastian Wesley (1810–76), T. A. Walmisley (1814–56), F. A. G. Ouseley (1825–89), and George M. Garrett (1834–97) led the way. The otherwise inferior work of John Stainer (1840–1901) is distinguished by its aptness for the acoustics of St. Paul's Cathedral, London, where he served from 1872 to 1888. Charles Villiers Stanford (1852–1924) made by far the most important contributions of this time. His serv-

ices, symphonic in conception, are very effectively laid out for choir and organ.

Significant composers of service music in the 20th century include Charles Wood (1866–1926), Edward Bairstow (1874–1946), Harold Darke (b. 1888), Basil Harwood (1859–1949), Henry Walford Davies (1869–1941), John Ireland (1879–1962), Herbert Howells (b. 1892), and Ralph Vaughan Williams (1872–1958), as well as the Canadian, Healey Willan (b. 1880), followed by Edmund Rubbra (b. 1901), Michael Tippett (b. 1905), and Benjamin Britten (b. 1913). Britten's *Te Deum* in C is built in a most striking manner, using only the C-major triad until it reaches a climax at the words "Holy, Holy, Holy."

Lit.: Dom A. Hughes, "Sixteenth Century Service Music" (*ML* v, 145ff); W. G. Whittaker, "Byrd's Great Service" (*MQ* xxvii, 474ff). See also under Anglican church music; Anthem.

L.E.

**Sesqui-** [L.]. Prefix used to denote fractions whose numerator is larger by one than the denominator, e.g., *sesquialtera*: 3/2 (one plus one half); *sesquitercia*: 4/3; *sesquiquarta*: 5/4; *sesquioctava*: 9/8; etc. In early music theory these terms were used for either ratios of vibrations (i.e., intervals) or ratios of time values (i.e., \*proportions). For instance, in discussions of the intervals, *sesquialtera* means the fifth [see Acoustics III], whereas in treatises dealing with proportions it means temporal values corresponding to modern triplet notes (three triplet notes equal two normal notes). The former meaning occurs also in the organ stop "*sesquialtera*," originally a mixture stop combining the octave with the fifth but usually also including other harmonics, such as the third in various octaves. Another term for *sesquialtera* is \**hemiola*.

**Sestetto** [It.]. \*Sextet.

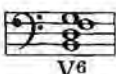

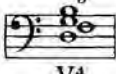

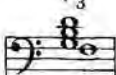

**Setzart** [G.]. Style of composition.

**Seven (Last) Words, The.** The seven last words of Christ (compiled from the four Gospels) have occasionally been used as a text for \*Passion music, e.g., by Heinrich Schütz (*Die Sieben Worte*, c. 1645), Haydn (1785), and Gounod (*Les Sept Paroles du Christ sur la Croix*, 1855). Haydn's composition, commissioned by the Bishop of Cadiz, is not a choral setting of the text but a series of seven instrumental "sonatas," each to be played after the recitation of one of the "words." It appeared in three versions: first

for orchestra (op. 47), then for string quartet (op. 48, nos. 51–57), and finally for piano (op. 49). See A. Sandberger, in *JMP* x, 45ff. There also is a choral version in the form of a cantata, possibly by Haydn's brother Michael.

**Seventh.** See under Interval.

**Seventh chord.** A chord consisting of the third, fifth, and seventh above the fundamental. In a given key there are seven such chords, one on each degree of the scale, e.g., in C major: c–e–g–b (I<sup>7</sup>), d–f–a–c' (II<sup>7</sup>), e–g–b–d' (III<sup>7</sup>), etc. By far the most important of these is that on the fifth degree, the so-called dominant seventh: g–b–d'–f' (V<sup>7</sup>). Each seventh chord is capable of three inversions, according to whether its lowest tone is the third, fifth, or seventh. Shown here are the dominant seventh chord and its three inversions, together with the designations in \*harmonic analysis and corresponding German terms.

Root position g–b–d'–f'		Septimenakkord
First inversion b–d'–f'–g'		Quintsextakkord
Second inversion d'–f'–g'–b'		Terzquartakkord
Third inversion f'–g'–b'–d''		Sekundakkord

Note that the dominant seventh chord is enharmonically identical with the so-called "German" augmented sixth chord [see Sixth chord], e.g.: g–b–d'–f' = g–b–d'–e#. The natural resolution of the former chord is into the triad on C, and that of the latter into the triad on F-sharp.

While each of the seven "diatonic" seventh chords contains major as well as minor thirds (in various arrangements), there also is an important seventh chord consisting of minor thirds only, the *diminished seventh chord*. It usually appears on the seventh degree of the scale, e.g., b–d'–f'–a<sup>b</sup> in C (major or minor). The normal resolution of this chord is into the tonic triad (c'–e'–g'). On account of its dominant character, it is frequently called a dominant ninth chord (g–b–d'–f'–a<sup>b</sup>) with the root (g) omitted. Owing to its equidistant construction, any of its tones can be considered the home tone, so that a single chord may serve as a dominant to four different keys. In each case the chord must, of course,

be written differently, as shown in Ex. 1. Still other resolutions result from the fact that the chord can also be interpreted as the seventh chord of the raised supertonic, as in Ex. 2. Owing

to its protean nature the diminished seventh chord is frequently used for quick modulation into far-distant keys, e.g., from G into C-sharp [Ex. 3]. See Harmonic analysis III; Ninth chord.

**Sext.** (1) The fifth canonical hour; see Office. (2) German term (also *Sexte*) for the interval of the \*sixth. *Sextakkord*, see under Triad.

**Sextet** [F. *sextette*, *sextuor*; G. *Sextett*; It. *sestetto*; Sp. *sexteto*]. Chamber music for six performers, in various combinations, e.g., two violins, two violas, and two cellos (Brahms, op. 18, op. 36; Dvořák, op. 48), string quartet and two horns (Beethoven, op. 81b), two clarinets, two horns, two bassoons (Beethoven, op. 71), etc. A vocal sextet is a composition for six singers with or without instrumental accompaniment.

**Sextolet** [F.; G. *Sextole*; It. *sestina*; Sp. *seisillo*]. A group of six notes played in the time of four ordinary notes. There should be a clear indica-

tion in writing as to whether the six notes are meant to form three groups of two each, or two groups of three each.

**Sfoggiando** [It.]. Ostentatiously.

**Sforzando**, **sforzato**, abbr. *sf*, *sfz*. [It.]. Forcing, i.e., with a sudden strong accent on a single note or chord. *Sfp*, *sforzando* followed immediately by *piano*.

**Shake**. Older name for the trill. For closed and open shake, see under Grace. A shaken beat is a repeated lower appoggiatura; a shaken cadent is a repeated \*Nachschlag. P.A.

**Shakers, music of the**. See E. D. Andrews, *The Gift to Be Simple* [1962].

**Shakuhachi** [Jap.]. See under Japan; for ill. see under Flute.

**Shamisen** [Jap.]. See under Japan; Lute.

**Shank**. See under Wind instruments IV (b).

**Shanty, chanty, chantey**. Names for work songs of English and American sailors, sung while pulling ropes or performing other work requiring concerted effort. Well-known shanties are "The Wide Missouri," "The Banks of Sacramento," and "The Rio Grande."

Lit.: F. Rickaby, *Ballads and Songs of the Shanty-Boy* (1926); J. C. Colcord, *Songs of American Sailormen* (1938); R. R. Terry, *The Shanty Book*, 2 vols. (1921, '26); W. M. Doerflinger, ed., *Shantymen and Shantyboys* (1951); F. P. Harlow, *Chanteying Aboard American Ships* (1962); S. Hugill, *Shanties from the Seven Seas* (1961); R. R. Terry, in *ML* i, 35ff, 256ff; *id.*, in *PMA* xli; H. Whates, in *ML* xviii, no. 3.

**Shape-note**. See Fasola.

**Sharp** [F. *dièse*; G. *Kreuz*; It. *diesis*; Sp. *sostenido*]. A musical note or tone one-half step higher than the tone named, indicated by the sign #. For its origin and use in early music, see Accidentals II. In the notation of the 16th to 18th centuries the sharp frequently occurs in a diagonal position [see Accidentals II]. The term "sharp" also was used to mean the "sharped," i.e., the major third of a key. For instance, Burney used the term "key E-sharp" in the meaning of "key E major," and Beethoven inscribed his Leonore Overture no. 1, op. 138 (in C major) "Ouverture in C#." Foreign terms for C-sharp, etc., are given under Pitch names.

**Shawm** [F. *chalemie*; G. *Schalmei*; It. *piffaro*]. See under Oboe family III.

**Shéhérazade**. Song cycle by Ravel (to poems by T. Klingsor, inspired by the *Arabian Nights*), composed in 1903 and containing three songs: "Asie," "La Flûte enchantée," and "L'Indifférente." See also *Scheherazade* (Rimsky-Korsakov).

**Sheng**. A Chinese mouth organ that consists of a bowl-shaped wind chest (originally a gourd or calabash, today made of wood) into which a number of bamboo pipes (12-17) are inserted, arranged in the form of a circle. The pipes are fitted with free reeds made of metal, set in motion by inhalation or, less often, exhalation through a mouthpiece fitted to the wind chest. Not all of the pipes speak, i.e., have reeds; typi-

cally, 13 of a set of 17 speak. Each pipe has a small hole, just above the edge of the wind chest, that the player must cover for the pipe to sound. The player holds the instrument cupped in both hands, enabling him to cover several holes at the same time. The music, consisting of chords, usually moves in parallel fifths or triads. [Ex. in R. Lachmann, *Musik des Orients* (1929), p. 108.] The sheng is thought to be the oldest free-reed instrument. See ill. under Wind instruments.

**Shift.** Movement in violin playing; see Position (2).

**Shimmy.** A type of dance music popular in America after World War I. It was like a fast fox trot, danced with shaking movements of the shoulders or entire body. Hindemith was one of several German composers who used the dance in art music, in his *Suite 1922*, op. 26, for piano.

**Shivaree.** U.S. corruption of \*charivari.

**Sho.** Japanese name for \*sheng. See E. Harich-Schneider, in *MQ* xxxix.

**Shofar.** An ancient Jewish instrument made from a ram's horn and used to the present day in Jewish rites for the celebration of the New Year. It has no separate mouthpiece and produces only two crude and awe-inspiring sounds, roughly corresponding to the second and third harmonic. See H. Avenary, "Magic . . . of the Old-Hebrew Sound-Instruments" (*Collectanea Historiae Musicae* ii [1956], 21ff).

**Short octave.** A special arrangement of the keys in the lowest octave of early organs, harpsichords, etc. The fact that the lowest chromatic tones (C#, D#, F#, G#) were almost never needed in keyboard music prior to c. 1700 naturally led to the omission of the corresponding pipes or strings, a procedure that was particularly desirable in view of the great cost of the large organ pipes. On the keyboard, instead of omitting the four corresponding black keys, the keys for the remaining eight tones were arranged in a "shortened" octave that extended only to the key normally occupied by E. The keys for the tones F, G, A, B<sup>b</sup>, and B were usually left in their normal position, and the three remaining keys (normally E, F#, G#) were allotted to the tones C, D, and E in arrangements such as

	(a)	(b)
Black	C D B <sup>b</sup>	D E B <sup>b</sup>
White	E F G A B	C F G A B

An additional advantage of this arrangement was that it enabled playing certain widely spaced chords, e.g., E-B-e-g#, with the left hand alone [see Fitzwilliam Virginal Book, i, xviif and 287]. As a matter of fact, in arrangement (b) this chord is produced by the keys G# B e g#, which are within easy reach. The often discussed tenth E-g at the end of J. S. Bach's Toccata in E minor for harpsichord does not support Spitta's and Schweitzer's contention that this toccata is an organ piece (the theory being that the low E calls for the organ pedal), since it can easily be played with the left hand on the short octave (b). Similar widely spaced chords occur in the works of Froberger and other early keyboard composers. A later (19th-century) arrangement on pianos was the *broken octave*. Here the lowest octave was complete with twelve keys, except that C# was replaced by the more useful note A<sub>1</sub> from below. See also Pedal piano. See *GD* v, 92ff (spinet); *GDB* vi, 296 (organ); G. Kinsky, in *ZMW* ii.

**Short service.** See under Service.

**Si.** See under Pitch names; Solmization.

**Siam.** See Thailand.

**Siciliana, siciliano.** A 17th- and 18th-century dance of Sicilian origin, in very moderate 6/8 or 12/8 meter, usually with a flowing broken-chord accompaniment and a soft, lyrical melody with dotted rhythms—very similar if not identical to the \*pastorale. A characteristic trait is the Neapolitan sixth (flattened supertonic) at cadences. The *siciliana* occurs as a slow movement in early sonatas (Corelli, Bach, Padre Martini) as well as in vocal music (operas, cantatas) whenever gentle pastoral scenes are to be represented musically.

**Side drum.** Same as snare drum; see Percussion instruments B, 1.

**Siegfried.** See *Ring des Nibelungen*, *Der. \*Siegfried Idyll* is the scene (Act II) frequently played in symphonic concerts.

**Siegfried Idyll.** A composition for small orchestra by Wagner, composed in 1870 and first performed in his home at Triebtschen (hence also called *Triebtschen Idyll*) on the birthday of his wife, Cosima. The title refers to their son, Siegfried, then just over one year old. It is based on themes from Wagner's opera *Siegfried* but also includes the cradle song "Schlaf, Kindchen, schlaf" (Sleep, baby, sleep).

**Sight.** In English 15th-century treatises, a term indicating the ranges and permissible intervals of the voice-parts added above a plainsong, primarily in connection with improvised counterpoint. There are "three degrees of discant: meane, treble, quatreble," beginning respectively a fifth, eighth, and twelfth above the tenor. The meane comprises the consonant intervals (third, fourth, fifth, sixth, octave) between 3 and 8, the treble those between 5 and 13, and the quatreble those between 8 and 15. A secondary meaning of the term involves transposition. Some writers give examples in which the added voice (meane) is written a fifth lower than it

should sound [see Ex.; tenor in black notes]. This method may have been used for instruction and also because the sights, particularly the higher ones (treble, quatreble), could be conveniently written on the same staff as the tenor. Alternate names are *discantus visibilis*, *fictus visus*, and *perfectio ocularis*. See M. F. Bukofzer, *Geschichte des englischen Diskants* (1936), pp. 22ff and *passim*; S. W. Kenney, in *MQ* xlv, 36ff.

**Sight-reading, -singing** [F. *à livre ouvert*; G. *vom-Blatt-Spiel*; It. *prima vista*]. I. The ability to read and perform music at first sight, i.e., without preparatory study of the piece. This type of playing makes entirely different demands on the performer from those of ordinary finished playing. In fact, from the technical as well as the psychological point of view, it is its very opposite, so that accomplished pianists and virtuosos are frequently very poor at sight-reading. Unfortunately, this may be true not only of concert pianists, who can, perhaps, afford to neglect sight-reading, but also of numerous students and amateurs, who would benefit greatly from facile sight-reading. This is no doubt a serious fault of their present musical education; indeed, many music teachers do not realize the importance of sight-reading.

The problems of sight-reading differ somewhat in various areas of musical activity. Sight-singing, for example, involves elements of association, habit, memory, theoretical understanding, and imagery, which must be learned over a period of time. In recent years this basic study has been emphasized in a number of music schools where it is taught under the name *\*sol-fège*. An important means of obtaining facility

in sight-singing is ensemble participation. There has been a considerable movement to facilitate sight-singing by the use of *\*solmization* systems in place of ordinary musical notation. Methods such as the English *\*Tonic sol-fa* avoid many of the complications inherent in traditional musical notation (clefs, signatures, accidentals, etc.), but they restrict the student to a limited field of music, whereas familiarity with ordinary notation opens to the student the entire field of music, choral as well as instrumental and orchestral.

II. The situation of the violinist is similar to the singer's since his music is likewise largely restricted to melodic progression in one line. As in singing, the facility of grasping immediately the significance of intervals and of rhythmic figures is prerequisite for playing at sight. As in singing, ensemble performance is very important.

III. The pianist's sight-reading problems are considerably greater, owing to the greater complexity of piano music. The greatest enemy of sight-playing is playing from memory, which, although today considered indispensable for any "finished performance"—with dubious justification, incidentally—causes the player to rely on memory and on looking at his fingers. In sight-reading, however, the player is expected to rely not on his memory but on his faculty of rapid perception; moreover, his eyes must be fixed not on his hands but on the music. Proficiency of sight-reading therefore depends on a student's ability to guide his fingers by the sense of touch. Simple exercises, such as playing an octave, a fifth, a triad, or a seventh chord without looking at the keys will gradually give the feeling of tactile security that is both the basis of sight-playing on the piano and an important factor in piano playing in general [see Piano playing IV].

Still greater are the intellectual demands of playing chamber or orchestral music from a score. See Score reading.

Kraft, *A New Approach to Sight Singing* [1960]; A. Fish and N. Lloyd, *Fundamentals of Sight Singing and Ear Training* (1964); W. G. McNaught, "The Psychology of Sight-Singing" (*PMA* xxvi); H. Lowery, "Recent Researches in Score-reading" (*Hinrichsen's Year Book*, 1947-48); M. Vidor, "Musical Notation in the Light of Psychology" (*MR* i, no. 3); F. Clark, L. Goss, and D. Kraehenbuehl,

"Reference Book for Piano Teachers," pp. 80–86 (The New School for Music Study, 1963).

rev. K.N.

**Signal.** See Fanfare; Military music.

**Signature.** Signs placed at the beginning of a composition, indicating the key [see Key signature] or meter [see Time signatures].

**Signet.** \*Sennet.

**Silence** [F.]. Rest.

**Sillet** [F.]. Nut (of the violin).

**Similar motion.** See Motion.

**Simile, simili** [It.]. Indication to continue "in the same way," e.g., with the same kind of bowing, or with the same type of broken-chord figure, etc.

**Simon Boccanegra.** Opera in three acts and a prologue by Verdi (libretto by F. M. Piave, rev. by A. Boito, based on a play by A. Gutiérrez), produced in Venice, 1857; rev. version in Milan, 1881. Setting: Genoa and environs, mid-14th century.

**Sin al fine (segno)** [It.]. Until the end (sign). See *Segno*.

**Sincopa** [It.]. \*Syncopation.

**Sincopas.** See *Cinque-pace*.

**Sinfonia.** (1) [It.]. Symphony. (2) A name chosen by Bach for his three-part \*inventions.

(3) In the baroque period (1600–1750), name for orchestral pieces of Italian origin, designed to serve as an introduction to: (a) an opera or operatic scene (Monteverdi, *Orfeo*, 1607, and *L'Incoronazione di Poppea*, 1642; S. Landi, *Il Sant' Alessio*, 1634 [see *HAM*, no. 208; *RiHM* ii.2, 255, 263]; M. A. Rossi, *Erminia sul Giordano*, 1633); (b) an orchestral suite (S. Rossi, *Sinfonie e gagliarde*, 1607, '08; J. J. Löwe von Eisenach, *Synfonien, Gagliarden, Arien*, 1658; J. Rosenmüller, *Sonate da camera cioè Sinfonie Alemande, Correnti*, 1670; J. J. Fux, *Concentus* [see *DTO* 47]); or (c) a cantata (e.g., two cantatas by Provenzale [see *RiHM* ii.2, 385f]; Bach, *Christ lag in Todesbanden*). Bach also wrote a sinfonia for harpsichord, in his Partita no. 2.

No fixed form or style attaches to these pieces. In this period, "sinfonia" is simply one of various names used for an introductory instrumental piece [see Overture], others being sonata, toccata, etc. On the other hand, independent canzonas and sonatas were also designated "sinfonia." Possibly the term had the connota-

tion of orchestral performance, not necessarily implied by the others. Not until c. 1690 did the operatic sinfonia become standardized (by A. Scarlatti; for later ex., see *HAM*, no. 259, *La Griselda*, 1721) into what is usually called "Italian overture" [see Overture], one of the ancestors of the modern symphony. Examples of 17th-century sinfonias are in *SchGMB*, nos. 151, 191, 211, 220, 223, 224, 229. The last of these shows the merging of the sinfonia with the trio sonata. For an unusually early example of "symphonia" (15th cent.), strikingly similar in style and form to the Toccata in Monteverdi's *Orfeo*, see *RiHM* ii.1, 42 and 207ff.

**Sinfonia concertante** [It.]. Term used by Mozart and others for a symphony with one or more solo instruments.

**Sinfonie pastorale.** See Pastoral Symphony.

**Sinfonietta** [It.]. A small symphony, usually also for a smaller orchestra.

**Sinfonische Dichtung** [G.]. \*Symphonic poem.

**Singakademie** [G.]. A society for concert-giving founded at Berlin in 1791 by C. F. C. Fasch. Today it is mainly known through its concert hall.

**Singing.** I. Singing is no doubt the most widespread kind of music-making, being the only one (besides whistling) that does not depend on an instrument. The human vocal apparatus can be used in very different ways, depending in part on anatomic differences among various peoples (European, Asian, African) and, even more important, on differences in training and taste. Even in Western music history the "timbre" of the voice has not remained the same. There is reason to believe that the singers of ancient Gregorian chant preferred a somewhat nasal timbre (still frequently heard in churches). The strikingly high range of much 14th- and 15th-century music is accounted for by the extensive use of \*falsetto. The celebrated \*castrati of the 17th and 18th centuries probably possessed a vocal timbre that few today would consider ideal. About 1800 the purity and brilliance of \*bel canto were abandoned in favor of the expressive, dramatic voice generally favored today. However, the deliberately unexpressive \*Sprechstimme and the special manners of singing used in modern jazz once more demonstrate the variability of vocal timbre.

II. An infinitely greater variety exists in details of style and performance. Particularly

noteworthy is the ample use made, from pre-Christian times through the 17th century and later, of \*vocalization. The singing of Gregorian chant involved numerous ornaments, such as \*vibrato, \*tremolo, and \*portamento, some of which were indicated by special neumatic signs [see Neumes]. In the 13th century, Magister Lambert (probably the same as Pseudo-Aristotle) tells us that the \**plica*, a derivative of "liquescent" neumes, is to be performed "by the partial closing of the epiglottis combined with a subtle repercussion of the throat" [CS i, 273a]. Similarly, some writers hold that the Jewish word "alleluia" originated as a phonetic formation derived from trilling the tongue against the roof of the mouth (l-l-l), a vocal technique still widely used in Asia. Among the most striking features of early vocal music, Gregorian as well as polyphonic, is the seeming indifference to correct underlaying of the text, frequently leading to wrong accentuation. In many cases, however, this procedure was not the result of indifference but of principles contrary to those of modern singing but nonetheless aesthetically valid [see Text and music].

III. Vocal ranges also have varied greatly. Although there presumably always have been voices of high, medium, or low range, in early music they were not exploited to nearly the extent they are today. The average range (ambitus) of Gregorian chant is from c to e', i.e., the range of the tenor voice. Nearly all 13th-century polyphonic music is within this range in all parts (usually three), while in many compositions of the 14th century (Machaut, Landini) the vocal part goes up to c'' and in the early 15th century (Dufay) to f'', calling for the use of falsetto, even though the actual pitches were about a third below the written ones, because of the lower standard of pitch then in use. A noteworthy contrast to the generally high pitch employed in this period is provided by a few exceptionally low-pitched compositions, e.g., Solage's "Fumeux fume," with an over-all range from E to d, and Binchois' "Beata nobis," with an over-all range from G to f. About 1450, with the rise of the \*Flemish school, an important change took place, the texture of polyphonic music being separated into four distinct ranges, corresponding to bass, tenor, contralto, and mezzo-soprano. Since practically all music surviving from this period is sacred, it was performed by men exclusively, perhaps occasionally with boys singing the highest part. Even in the secular repertory of the Middle Ages and

Renaissance there is nothing to indicate performance by women, aside from rare pieces like the liturgical drama of the Resurrection (c. 1100), which includes a dialogue between the Angel and the women watching Christ's tomb [see SchGMB, no. 8]. The rise of opera in the 17th century brought about a decisive change, the various roles now being given to voices of appropriate range. The leading hero (*primo uomo*) was a castrato, the leading heroine (*prima donna*) a high soprano, the *secondo uomo* a bass, and the *seconda donna* a contralto—a scheme that, of course, was sometimes modified [see *Prima donna*].

IV. In the 19th century began the "scientific" study of the vocal apparatus and of singing. Manuel Garcia (1805–1906) laid the foundation for this study in his *Mémoire sur la voix humaine*, which he presented to the French Academy of Sciences in 1840 and which was followed in 1847 by his *Traité complet de l'art du chant*. Among his pupils were Jenny Lind, Mathilde Marchesi de Castrone, Julius Stockhausen, and others, who in turn taught later generations of celebrated singers. Garcia's scientific studies were continued by Lilli Lehmann and Mathilde Marchesi. In the last analysis, however, such studies have benefited the physiologist more than the singer. Most singing teachers prefer to depend on practical experience and personal influence.

For more details about the technical aspects of voice production, see Voice. Related articles: Voices, range of; Register (2); *Bel canto*; *Castrato*; Falsetto; Vocalization; Solfège; Song; Tremolo; Vibrato; Text and music; Vocal music; Word painting.

**Singing saw.** An ordinary handsaw, held between the knees and set in vibration by either a violin bow or drumsticks. Its special effect is a gradual modification of pitch (similar to the *\*portamento* of the violin) obtained by bending the free end of the blade with the left hand. The instrument has been used in jazz and other popular music.

**Singing school.** See under United States.

**Singspiel** [G.]. About 1700, the German equivalent for *dramma per musica* (drama with music), i.e., opera, applied alike to serious and comic operas (e.g., Keiser's *Croesus*, 1710). Later (c. 1750) the term was restricted to comic operas with spoken dialogue, written on the models of the English *\*ballad opera* or the French *opéra comique*. Charles Coffey's ballad operas, *The Devil to Pay* (1728) and *The Merry Cobbler* (1735), were translated by C. F. Weisse (*Der Teufel ist los* and *Der lustige Schuster*) and then set to new music by J. C. Standfuss (c. 1750). J. A. Hiller (1728–1804) wrote operas to the same two librettos and many others (*Lisuart und Dariolette*, 1766; *Die Jagd*, 1770), representing the high point of the Leipzig Singspiel. From Leipzig the movement spread elsewhere, chiefly to Berlin and Vienna. Most of the members of the *\*Berlin school* wrote Singspiele, notably Georg Benda (*Der Jahrmarkt*, 1775; see DdT 64). In Vienna, where as early as 1751 the young

Haydn wrote *Der krumme Teufel* (lost; see DTO 64), the Singspiel reached its artistic peak in Mozart's *Die Entführung aus dem Serail* (1782). Other important examples are Ignaz Umlauf's *Die Bergknappen* (1778; DTO 36), Dittersdorf's *Doktor und Apotheker* (1786), Johann Schenk's *Der Dorfbarbier* (1796; DTO 66), and Schubert's *Die Zwillingsbrüder* (1819). As a distinctive national type of popular opera, the Singspiel played somewhat the same social role in Germany as the *opéra comique* in France and the ballad opera in England. Also, the romantic character of many of the librettos, especially in North Germany, made the Singspiel one of the principal ancestors of German romantic opera.

Operatic works with spoken dialogue were written as early as the 17th century, e.g., S. T. Staden's *Seelewig* (1644; see MfM xiii, nos. 4, 5, 6) and J. W. Franck's *Die drey Töchter Cecrops* (1679; see AMF iv). Also see Opera VII; Comic opera II E.

Calmus, *Die ersten deutschen Singspiele von Standfuss und Hiller* (1908); O. Beer, *Mozart und das Wiener Singspiel* (1932); R. Krott, *Die Singspiele Schuberts* (1921); R. Eitner, in MfM xiii (*Seelewig*); G. Schmidt, in AMF iv (*Cecrops*); W. Stauder, in AMF i (J. André); P. Nettel, in ZMW vi (*Singballett*); V. Helfert, in ZMW v (*Viennese Singspiel*); F. Brückner, in SIM v (Benda). D.J.G.

**Sinistra** [It.]. Left (hand).

**Sink-a-pace, sinqua-pace.** *\*Cinque-pace*.

**Sirvente(s)** [Prov.]. A type of troubadour poetry dealing not with love but with political events, questions of morals, etc. According to the *Doctrina de compondre dictatz*, they borrowed their verse structure and melody from some chanson. The only example preserved with music is Peire Cardenal's "Un Sirventes novel."

**Sistine choir (chapel).** The present name of the papal choir of thirty-two singers who provide the music for services in which the Pope officiates in person. It developed from the ancient *\*schola cantorum* and received its present name from the *Cappella Sixtina*, the chapel built by Pope Sixtus IV in 1471–84. Since 1480 another choir has existed, the *Cappella Giulia* (richly endowed by Pope Julian II), which performs at St. Peter's and has often been mistakenly called Sistine choir. Both bodies have been greatly admired

for the excellence of their vocal technique, involving long crescendos and decrescendos and numerous refinements. However, their performances of Palestrina, etc., are historically incorrect, laden with romantic sentimentality and much inferior to those of other bodies, such as the *Schola Cantorum* of Paris.

Lit.: F. X. Haberl, *Die römische "Schola Cantorum"* (1887; also in *VMW* iii); R. R. Terry, in *MA* iii; E. Celani, in *RMI* xiv; K. Weinmann, in *AMW* ii; R. Casimiri, "I Diarii Sistini" (*Note d'Archivio* i, iii, iv, ix-xvii).

**Sistre.** Same as cistre. See under Guitar family.

**Sistrum.** An ancient Egyptian rattle used in the worship of Isis. It consisted of a handle and a horseshoe-shaped metal frame with loose cross-bars that rattled when the instrument was shaken. Often, the rattling noise was augmented by loose metal disks strung along the cross-bars. Similar instruments, in the shape of a U, were used in Sumeria, perhaps as early as the third millennium B.C. [For ill. see under Percussion instruments.]

**Sitar.** See under India VIII.

**Sitole.** Same as cistre, etc. See under Guitar family.

**Six, Les** [F.]. A name applied in 1920 to a group of six French composers—Louis Durey, Arthur Honegger, Darius Milhaud, Germaine Tailleferre, Georges Auric, and Francis Poulenc—who c. 1916 formed a loose association based on their acceptance of the aesthetic ideals of Erik Satie. Although their individual styles differed considerably, they all opposed the vagueness of impressionism and endorsed the simplicity, clarity, and other characteristics of the then dawning \*neoclassic movement. They found an eloquent advocate in Jean Cocteau. An earlier group, called *Les Nouveaux Jeunes*, included A. Roland-Manuel but not Durey and Milhaud [see N. Slonimsky, *Music Since 1900*, rev. ed. (1949), pp. 181, 201]. A later group of a similar kind was the \*École d'Arcueil. See S. M. Trickey, "Les Six" (diss. North Texas State College, 1955); E. Vuillermoz, in *MM* i; R. Manuel, in *MM* ii; V. Rašín, "'Les Six' and Jean Cocteau" (*ML* xxxviii, 164ff); also D. Milhaud, *Notes Without Music*, ed. R. H. Myers, trans. D. Evans (1953).

**Six-four chord.** The second inversion of the triad, e.g., g-c'-e', indicated  $I_4^6$ ,  $II_4^6$ , etc., in modern harmonic analysis, and  $\frac{6}{4}$  in figured-bass parts. It normally occurs in strong position followed by

the dominant (V), as shown in measure 4 of the accompanying example, but may also occur in weak position, as in measure 2. One of the first composers to make deliberate use of the six-four chord was Willaert. See G. Haydon, *The Evolution of the Six-Four Chord* (1933); L. Matossi, in *DM* x, 356ff.

**Sixteen-foot.** See Foot (2).

**Sixth** [F. *sixième*; G. *Sexte*; It. *sesta*; Sp. *sexta*]. See Interval. In early music the sixth was regarded as the least perfect consonance, and often even as a dissonance. Thus, Anon. IV (c. 1280) speaks of "that vile and loathsome discord which is the sixth" [CS i, 359a].

**Sixth chord.** The first inversion of the triad, e.g., e-g-c', indicated  $I_6^6$ ,  $II_6^6$ , etc., and in modern harmonic analysis, 6 or  $\frac{6}{3}$  in figured-bass parts. In four-part harmony, doubling of the fundamental is generally avoided (e-c'-g'-c'', not e-e'-g'-c'') because the e can only be resolved upward to the f, so that, with doubled e, parallel octaves (e-f, e'-f') would result. The sixth chord is used on every degree of the scale and often occurs in parallel progressions [see Sixth-chord style]. An especially interesting chord is the \*Neapolitan sixth, f-a<sup>b</sup>-d<sup>b</sup> in C major, which is usually described as the first inversion of the triad on the lowered supertonic, d<sup>b</sup>-f-a<sup>b</sup> [see, however, Functional harmony]. Among the numerous chromatic variations on the chord of the sixth, those containing an augmented sixth, e.g., a<sup>b</sup>-f<sup>#</sup>, deserve special mention. There are four common ones: the augmented sixth, the augmented six-five-three, the augmented six-four-three, and the doubly augmented six-four-three. The first three are sometimes called

(rather pointlessly) "Italian," "German," and "French" sixth respectively. Their derivations and common resolutions are shown in the example (+ and ++ indicate augmented and doubly augmented intervals). See P. Miller, "The Augmented Sixth Chord" (*Journal of Musicology* i). See also Added sixth.

**Sixth-chord style.** Designation for passages formed of consecutive sixth chords. Such passages are often called "fauxbourdon," but this term should be restricted to one particular manifestation of sixth-chord style, described under \*fauxbourdon. Rapid sixth-chord progressions occur in the works of Bach [see Ex. 1, from the cantata *Ach wie flüchtig*], Mozart, Beethoven (Piano Sonata op. 2, no. 3, last movement), Brahms, and others. However, sixth-chord style plays a much more important role in the music

of the late Middle Ages (c. 1300–1450). It probably originated in England. In fact, the earliest instances are found in English MSS of c. 1300, when French music was still based on perfect consonances and the principle of contrary motion. For examples, see *ReMMA*, p. 399; *HAM*, no. 57b; see also Discant. Short progressions in sixth chords are quite common in the works of Landini, especially in cadences [see *HAM*, no. 53]. The sixth-chord style reached its culmination in the compositions of Dunstable, Dufay, and Binchois, which often included long passages and even entire sections in sixth chords [Ex. 2]. An extreme case is Binchois' *In exitu Israel* [J. Marix, *Les Musiciens de la cour de Bourgogne* (1937), pp. 196ff], which, from beginning to end, is written in sixth chords. In this period there also developed two special methods of singing in 3 harmonies, both involving some sort of improvisation, namely, Dufay's \*fauxbourdon and what Guilelmus Monachus called *Anglorum modus fauxbourdon* [see *Discantus supra librum*]. In the former, the lowest and

highest parts are notated and the middle part "improvised," whereas in the latter only the lowest part is notated.

**Sixth tone.** An interval equal to one-third semitone, there being thirty-six sixth tones to the octave. See Microtone.

**Skala** [G.]. \*Scale.

**Skolie** [G.]. Name used by Schubert and others for a drinking song.

**Slancio, con** [It.]. With dash.

**Slargando** [It.]. Slowing down.

**Slavic music.** See Bulgaria, Czechoslovakia, Poland, Russia, Yugoslavia, etc.

**Sleeping Beauty, The.** Ballet by Tchaikovsky (choreography by M. Petipa), produced in St. Petersburg (now Leningrad), 1890. It is based on the familiar fairy tale.

**Sléndro.** See under Java.

**Slentando** [It.]. Slackening, slowing down.

**Slide.** (1) In violin playing, a slight \*portamento used to pass quickly from one note to another, usually at the distance of a third or a fourth. It produces a matchless legato as well as a special effect of expressiveness. Paganini introduced a virtuoso type of slide by executing chromatic passages, singly or in thirds, entirely with the same finger. (2) The movable portion of the \*trombone. See also Wind instruments IV (a); Slide trumpet. (3) An ornament consisting of two or more notes approaching the main note by conjunct motion; see Appoggiatura, double II.

**Slider.** See under Organ II.

**Slide trumpet.** See under Trumpet II.

**Slur.** (1) A curved line placed above or below a group of notes to indicate that they are to be played legato, e.g., with one stroke of the violin bow, or with one breath in singing. If the notes to be found under the slur have staccato dots, the meaning of the combined signs is \*portato. A slur connecting two notes of equal pitch is properly called \*tie or bind. (2) An ornament resembling the French *tierce coulée* [see Appoggiatura, double II].

**Sly Vixen, The.** See *Cunning Vixen, The*.

**Sminuendo** [It.]. Same as diminuendo.

**Smith College Music Archives.** See Editions XLVIII.

**Smorzando** [It.]. Fading away.

**Snare drum.** See under Percussion instruments B, 1.

**Snello** [It.]. Nimble, agile.

**Soave** [It.]. Gentle, sweet.

**Société française de musicologie, Publications.** See Editions XLIX.

**Societies, musical.** I. *United States.* Some of the more important musical organizations of national scope are the following:

1. A.G.O. (American Guild of Organists). A national association of church organists, founded in 1896, having as its purposes: (1) improvement of music in churches; (2) maintenance of high standards among organists; and (3) exchange of views and information among members through periodic meetings. The *American Guild of Organists Quarterly* has been published since 1956, and its monthly journal, *The Diapason*, since 1909.

2. A.M.S. (American Musicological Society). An organization, founded in 1934, for "the advancement of research in the various fields of music as a branch of learning" (from its constitution). The society is divided into regional chapters that hold regular meetings where papers of musicologic interest are read. A national convention is traditionally held each year, formerly in connection with the M.T.N.A. convention [see 6] and now with the C.M.S. [see 9]. Two yearly publications, *Papers of the A.M.S. (PAMS)* and *Bulletin of the A.M.S. (BAMS)*, issued from 1936, were superseded by the *Journal of the American Musicological Society (JAMS, 1948—)*.

3. I.S.C.M. (International Society for Contemporary Music). The society was begun in Europe in 1922; the United States section was founded in 1923. Its purpose is to discover and encourage talent in composition and to provide opportunities for performance of contemporary works. To this end, it holds annual Festivals of Contemporary Music, where works selected by an international jury are performed. See below, under III.

4. League of Composers. An organization, founded in 1923, for promoting modern music through the performance and commissioning of new works, and through its official organ, *Modern Music*. The League was for a number of years primarily a New York organization, but sub-

sequently chapters were founded in various sections of the country.

5. M.E.N.C. (Music Educators National Conference). This organization began in 1907 as the Music Supervisors National Conference. The present name was adopted in 1936. Its purpose is to foster cooperation among public-school teachers, especially supervisors, with a view to raising standards of music in the schools and securing a better place for music in the curriculum of the schools.

6. M.T.N.A. (Music Teachers' National Association). An organization, founded in 1876, interested primarily in the practical problems of musical education. The chief activity of the M.T.N.A. is its annual convention, where papers are read and discussions carried on by educators from all sections of the country and all branches of music education. *Papers and Proceedings of the M.T.N.A.*, published annually from 1906 to 1950, contains reprints of the papers read at the conventions.

7. N.A.S.M. (National Association of Schools of Music). An organization of professional music schools whose aim is to unify curriculum, maintain standards, and serve as an accrediting organization for music schools. Annual meetings are held in conjunction with the M.T.N.A. [see 6]. Much of the credit for the N.A.S.M.'s development belongs to Howard Hanson.

8. Society for Ethnomusicology. Formally founded in 1956, this society publishes the journal *Ethnomusicology*.

9. C.M.S. (College Music Society). Formed in 1958, this society publishes *College Music Symposium*, which first appeared in 1961.

II. *Europe.* 1. Allgemeiner Deutscher Musikverein. Founded in 1861 by Franz Liszt and Karl Franz Brendel, for the purpose of: (1) furthering in a progressive sense the musical life of Germany; (2) looking after the interests of professional musicians and composers; (3) supporting needy composers and their families. The society has given more than sixty festivals (*Tonkünstlerfeste*) in various cities of Germany.

2. Bach-Gesellschaft. A German society founded in 1850 (centenary of Bach's death) with the object of publishing a complete critical edition of Bach's works. This edition, which includes forty-six volumes, is referred to by the abbreviation *BG*. The society was dissolved in 1900 after the last volume had been issued. Simultaneously, a "Neue Bach-Gesellschaft" was founded to carry on the work of completing the original edition by publishing revisions and

practical scores. Since 1904 this society has issued an annual *Bach-Jahrbuch* (*BJ*) containing articles on Bach and related subjects.

3. British Music Society. Founded in 1918 by Dr. A. Eaglefield-Hull, reorganized in 1921. Its object was furthering of the interests of musicians throughout Great Britain. It was disbanded in 1933 but a few local branches survive, notably the Contemporary Music Centre, which acts as the British section of the International Society for Contemporary Music [see III, 3].

4. Gesellschaft der Musikfreunde. The oldest and most important musical society of Austria (Vienna), founded in 1812, largely through the efforts of J. F. Sonnleithner. It has been active in various directions: (a) conservatory, founded 1817, first director Antonio Salieri; (b) *Singverein*, an amateur choral society of outstanding rank, founded 1858; (c) *Gesellschaftsorchester* (today *Orchester Verein*), an orchestral society, first amateur, later professional, founded in 1859; (d) music library, founded 1819 [see Libraries, Austria, Vienna]; (e) museum, containing autographs, letters, pictures, musical instruments (Haydn's piano), and musical curios (Beethoven's ear trumpets).

5. Incorporated Society of Musicians. An English society founded in 1882 by James Dawber and Henry Hiles for furthering the following aims: (1) uniting the musical profession in a representative society; (2) providing opportunities for discussion; (3) improving musical education; (4) organizing musicians; and (5) obtaining legal recognition for qualified teachers of music.

6. Maatschappij tot Bevordering der Toonkunst. The largest musical society in Holland, founded in 1829 and located in Amsterdam. It is active mainly in choral singing. The society has also been active in editing old music [see Editions LII].

7. Société des Concerts du Conservatoire. Founded by F.-A. Habeneck in Paris, probably c. 1828, for the purpose of giving concerts [see Concert II]. It has continued to the present day, giving concerts with conservative programs.

8. Société Nationale de Musique. Founded in Paris, 1871, by Romain Busine and C. Saint-Saëns, for the purpose of performing works by living French composers.

III. *International*. 1. Internationale Gesellschaft für Musikwissenschaft (International Musicological Society; Société Internationale de Musicologie). A society founded in 1927 to further musicologic activities, in place of the former

Internationale Musikgesellschaft [see III, 2]. The headquarters are at Basel. Congresses are arranged every few years [see *CP* 1930, etc., in Abbreviations listed at the front of this book] and a periodical, *Acta Musicologica* (*AM*), has been published since 1928.

2. Internationale Musikgesellschaft (International Musical Society). A society founded in 1899 by O. Fleischer, whose aim was a federation of musicians and musical connoisseurs of all countries and which has been instrumental mainly in furthering musicological research. It issued: *Zeitschrift der Internationalen Musikgesellschaft* (*ZIM*), a monthly periodical; *Sammelbände der Internationalen Musikgesellschaft* (*SIM*), a quarterly, for longer articles; and books under the collective title *Publikationen der Internationalen Musikgesellschaft*. Congresses were held in 1904 (Leipzig), 1906 (Basel), 1909 (Vienna), 1911 (London), and 1914 (Paris), and reports were published under titles such as *Kongress der Internationalen Musikgesellschaft* [see *CP* 1904, etc., in Abbreviations listed at front of this book]. The society was disbanded in September, 1914.

3. International Society for Contemporary Music, founded at Salzburg in 1922, with headquarters in London since 1923. Its object is furthering contemporary music. See under Festivals III. National societies were formed in various countries; see above, I, 3, and II, 3.

See also Academy; Apollo Club; *Männergesangverein*; \**Orphéon*; *Singakademie*. For more complete and detailed information about the American societies, see Pierre Key's *International Music Year Book*, rev. ed. (1928); regarding the others, see A. Einstein, *Das neue Musiklexikon* (1926), s.v. "Vereine," and H. Riemann, *Musiklexikon* (11th ed., 1929), pp. 1920ff. E.B.H.

**Sociology of music.** A discipline concerned with the relationship between music and society. The systematic aspect of this relationship, which is implied by the term "sociology," is as yet undeveloped with respect to both general principles and the analysis of contemporary problems. Thus the field consists essentially of the social history of music, which presumably is viewed in the light of sociologic concepts and larger trends. Studies of Oriental and primitive music are considered in the province of \*ethnomusicology, even when their interest is sociological.

A social point of view is particularly valuable in the case of music because of its intimate and highly ramified connections with society. Per-

haps more than any other art, music is able to unite and sway masses of people, especially if they are active participants rather than listeners. An operatic production today can hardly be financed without public support. Audiences vary in social composition, size, and diversity, extending from private gatherings of connoisseurs to the huge groups of people that can be reached by electronic media. Style is surprisingly responsive to audience, and extends correspondingly from subtleties of chromaticism, polyphony, and dynamics to monophonic and homophonic textures *al fresco*. Even in the case of modern technologic means of dissemination like television, each style of music has its own audience; the idea of mass culture is largely an illusion. Musical types and forms also are greatly influenced by social forces, generated by and flourishing in response to particular social conditions and functional demands.

Characteristic sociologic subjects of investigation include the social and economic position of the musician, the dissemination of music (including the role of technology), musical organizations and institutions, public musical life, taste and criticism, the social determination of style, the music of specifically social purpose and of lower social strata (types often neglected by a stylistic orientation), the musical interaction of the various strata of society, and particular genres of music (ballet, opera, church music, choral music, convivial music, military music) that are shaped considerably by social forces. The influence of music upon society is as much a part of the field as is the influence of society upon music.

In ancient \*Greece, as in all ancient civilizations, the educative and social influence of music was thought to be immense; only in the totalitarian governments of the 20th century did music again become a political instrument of comparable power. The pedagogic ceremonial, military, and religious functions of specific genres were explicitly defined: the communal choral dance, the military music of Sparta, the dithyramb, the *skolion*. Roman music was even more clearly bound to various social contexts: amphitheater games, the pantomime, the theater, the dinner party, military life, funerals.

The styles and forms of \*Gregorian chant were molded by their subservience to religious function. Tonal and musical attractiveness were restricted and regarded with suspicion. The chant was an important factor, however, in creating a community of spiritual devotion, even

when it was largely performed by professional singers. Its unifying power was particularly evident in cloister life; and it served as the focal point of the curriculum and of educational ideals in both monastic and cathedral schools. Except during the political ascendancy of the Church, when secular elements were admitted to liturgical music, the official attitude towards instruments and popular melody was one of hostility. The free employment of secular features was characteristic of the Renaissance and still more so of the \*baroque [see History of music V]. In Lutheranism this stylistic tolerance was a persistent trait; the communal force of congregational song was strengthened by a folklike quality, and a complex art of \*chorale variation was developed for the organ and enlisted in the same cause of enhancing devotion [see Chorale].

The 13th-century \*motet, on the other hand, reflects the sophistication of a society of clerics. The \*polyphonic music of the *trecento* belongs to a thoroughly secular courtly society, while the lower classes, like the old aristocracy, undoubtedly expressed their musical predilections in \*monody. Courtly love is also the basic motivation for the refined art of Machaut, with its retrospective tendencies. In the \*Renaissance, although the composer remains a performer, his work gradually takes on the value of personal distinctiveness, and the musical composition correspondingly becomes a *res facta* destined for preservation and looked to for its special aesthetic properties and workmanship. In spite of more popular predecessors and parodies, the \*madrigal, like the Flemish \*chanson, was music for a closed group of discriminating performers. The Parisian chanson, by contrast, was cast in a more popular mold, and took full advantage of the wide dissemination afforded by music \*printing.

The rise of Italian \*opera was the most striking social manifestation of baroque music. It combined with foreign forms such as the *ballet de cour* and slowly became diversified in accordance with the variety of social settings in which it found its place. Outside France, the audience changed from a purely aristocratic to a stratified one through the addition of the commercial and lower classes, especially in Venice and Hamburg; yet in the 18th century, as part of a generalized critical reaction, national operatic types arose in specific response to the demands of a wider and less cultivated public. Alongside Italian opera in Germany, the international influence

of aristocratic art can also be seen in the imitation of the dance \*suites of Lully, which, by way of contrast, are made up to a considerable extent of the courtly stylization of French provincial dances. [Also see Dance music.]

In the 18th century, the major social development apart from \*comic opera was the formation of a public musical life, manifested most clearly in concert societies and \*music criticism. These activities expanded during the 19th century and were joined by other phases of musical life appealing to still larger masses of people, such as the institution of choral societies, the composition of a large quantity of four-hand \*piano music for convivial purposes, and the even more widespread publication of superficial salon music for piano, including facile etudes and variations and arrangements of operatic airs. The diversification of musical life during the 20th century is still more remarkable. Concerts increasingly became presentations of an established repertory attended by a very diverse audience rather than contemporary production involving a conversant and interested group, although a number of special kinds of concert appeared around mid-century, each with its specific audience. At the same time, there was a marked increase in the number of functional and social types of music, which now included commercial music, \*jazz, \*folk music, and many other varieties.

During the latter part of the 19th century, performers gradually became members of trade unions, the modern descendants of guilds (\*Meistersinger), and secured the benefits of steadier employment and adequate income. Composers had ceased to find regular positions in the service of church or nobility during the earlier 19th century; their defined place in society had given way to freedom as well as specialization, and even to the isolation and prophetic mission described in German romantic literature. Rather belatedly, however, it was only in the 20th century that the value of originality was finally recognized in terms of legal protection against plagiarism, as well as by royalties on the sale and performance of music [see Copyright]. It would seem, nevertheless, that the communal constituents of a personal style will always remain considerable; they not only are conspicuous in older music, but can also be discerned without much difficulty in the 19th and 20th centuries.

The modern availability and ubiquity of music of all kinds has undoubtedly had important

effects on the role of amateur performance, on the nature of the listening experience, on musicianship, and even on musical scholarship. Technology would seem to have impersonalized and generalized musical response, placing more emphasis on mass reactions.

**Soggetto** [It.]. Subject or theme [Ex. 1]. In 18th-century theory the term is used in a more special sense, for a fugal theme of a traditional character, similar to the subjects of the 16th-century \*ricercar. It is thus distinguished from the *andamento* [Ex. 2], a longer theme, usually falling

into two phrases, and from the *attacco*, a short motif such as used in motets or in the episodic sections of fugues. The subjects of the fugues in C-sharp minor and G major from *The Well-Tempered Clavier*, vol. i, illustrate the difference between a *soggetto* and *andamento*. See Tonal and real.

**Soggetto cavato** [It., carved subject]. In 16th-century theory (G. Zarlino, *Le Istitutioni harmoniche*, 1558), a musical subject derived by "carving out" vowels [*cavato delli vocali*] from a sentence and transforming them into a melody by means of the solmization syllables of the Guidonian hexachord. An example is Josquin's Mass, *Hercules Dux Ferrarie* (dedicated to Hercules, Duke of Ferrara), whose main subject is *e u e u e a i e*; or, in corresponding solmization syllables, *re ut re ut re fa mi re*; or, in modern notes, *d c d c d f e d*. Another example is the motto "Vive le roi" (*V = u*, i.e., *ut*), whose musical realization (*ut mi ut re re sol mi*, i.e., *c e c d d g e*) is the tenor of an instrumental piece that Josquin wrote for a festive occasion, possibly for the accession of Louis XII to the throne of France (1498; see *SchGMB*, no. 62a). Two Masses by C. de Rore are based on longer "Hercules" mottoes [see *ReMR*, p. 375]. See A. Thürlings, in *CP* 1906.

An early realization of the same principle is implied in a method recommended by Guido d'Arezzo in his "Micrologus," ch. xvii, entitled "Quod ad cantum redigitur omne quod dicitur" (How anything spoken can be turned into music). Without having recourse to his own solmization syllables, he assigns the vowels *a e i o u* to five successive notes of the scale, e.g., *c d e f g*, so that the text "Sancte Johannes meritorum tuorum" receives, through the syllables *a e o a e e i o u u o u*, the melody *c d f c d d e f g g f g*. The method is refined by the optional assignment of some of the five vowels to a neighboring pentachord.

**Sogitha**. See under Syrian chant.

**Soir, Le**. See under *Matin, Le*.

**Sol**. See under Pitch names; Solmization.

**Soldier's Tale, The**. See *Histoire du soldat, L'*.

**Soleá**. An Andalusian folksong, with stanzas of three eight-syllable lines, the first and third in rhyme. It is plaintive in character and is basically a form of *cante jondo* [see Flamenco]. For an example, see *LavE* i.4, 2394.

**Solemn Mass**. See *Missa*.

**Solesmes**. The Benedictine monks of Solesmes (a village near Le Mans, France) have become famous through their work of restoring Gregorian chant. They have produced an edition of a reasonably correct text of Gregorian chant at the high point of its development (9th, 10th cent.), an edition that was officially adopted in 1904 under the name "Editio Vaticana" to replace the corrupt versions of the "Editio Medicea" (17th cent.) and the similar "Ratisbon edition" of the late 19th century [see Liturgical books II]. Another important achievement was their attempt to solve the problem of the chant's rhythm. The Solesmes interpretation of Gregorian rhythm has won wide acclaim, as well as official Church recognition. However, it has also met with serious criticism from various musicologists [see Gregorian chant VI]. The leading personalities of Solesmes were Dom Guéranger (1805–75), Dom Pothier (1835–1923), and Dom Mocquereau (1849–1930). The last-named inaugurated the publication of early neumatic MSS, called *Paléographie musicale* [see Editions XLII], and was also the chief champion of the Solesmes theory of Gregorian rhythm (*Le Nombre musical grégorien ou rythmique grégorienne*, 1908). The present leader is Dom Joseph Gajard (b. 1885). A periodical, *Revue grégorienne*, is published bimonthly; also, since 1954, *Etudes grégoriennes* at irregular intervals. See N. Rousseau, *L'École grégorienne de Solesmes: 1833–1910* (1910); J. Gajard, *The Solesmes Method* [1960].

**Sol-fa**. See Tonic sol-fa.

**Solfège** [F.], **solfeggio** [It.]. (1) Vocal exercises sung to a vowel (*a, o, u*) or to the syllables of \*solmization (*ut* [*do*], *re*, *mi*, etc.), which are used instead of a text. The latter method, which was the earlier, combines the purpose of acquiring vocal technique with one of elementary instruction [see (2)] since the student is supposed to recognize the notes and intervals, a requirement of basic importance for \*sight-reading. Vocal exercises sung to a vowel are properly called *vocalises* [F.], *vocalizzi* [It.], but the name

*solfeggio* also has come into common use for this procedure, which includes highly difficult virtuosic exercises and frequently involves passages too rapid to be "sol-fa-ed."

Vocal exercises without text from the 17th century survive in great number under the name "ricercari" [see *Ricercar* II (d)]. In 1786 a book called *Solfèges d'Italie* was published in Paris. It contained exercises by Scarlatti, J. A. Hasse, L. Leo, Porpora, Carfaro, and others, to be treated as either *solfeggi* or *vocalizzi*. A famous collection is the *Solfèges du Conservatoire*, which contains contributions by Cherubini and other professors of the Paris Conservatory. An outstanding collection of recent date is the *Répertoire moderne de vocalises-études*, which includes contributions by Fauré, D'Indy, Ravel, and others. Perhaps the most widely used collection is A. Danhauser, L. Lemoine, and A. Lavignac, *Solfège des Solfèges*, 3 vols. [1910-51].

(2) The term also has come to mean instruction in the rudiments of music, i.e., the study of intervals, rhythm, clefs, signatures, etc., usually employing solmization and having as its goal the ability to translate symbols (notation) into an aural image immediately and accurately. Extensive courses in solfège, sometimes covering four years of study, were first introduced in France and Belgium and have been adopted recently by some American institutions. See R. Longy-Miquelle, *Principles of Musical Theory* (1925); P. Hindemith, *Elementary Training for Musicians* (1946); A. Fisk and N. Lloyd, *Fundamentals of Sight Singing and Ear Training* (1964); A. Danhauser, *Théorie de la musique* (1872 and many later editions); H. Villa-Lobos, *Solféjos* (1940); W. Earhart, *Music to the Listening Ear* (1932); O. Ortmann, *Problems in the Elements of Ear-Dictation* (1934); G. A. Wedge, *Advanced Ear-Training and Sight-Singing* (1922).

**Solfeggietto** [It.]. Title used by some composers in the meaning of "little study." The best known example, by K. P. E. Bach, is a work in C minor originally entitled "Solfeggio" (in *Musikalisches Vielerley* [1770], p. 19).

**Solmization.** I. General term for systems of designating the degrees of the scale by syllables instead of letters. The syllables mostly used today are: *do* (or *doh*), *re*, *mi*, *fa*, *sol*, *la*, *si* (*ti*). There are two current methods of applying these syllables to the scale degrees, known as "fixed do" and "movable do." In the former, the syllables are applied to "fixed" notes, i.e., those of the C major scale (*do* = C; *re* = D; etc.). In the

latter, they are applicable to any major scale, so that *do*, *re*, *mi*, etc., denote tonic, supertonic, mediant, etc. (e.g., in D major: D, E, F#, etc.). The former system is essentially identical with the current system of tone letters, since there is an exact and unchangeable correspondence between the letters (C, D, E . . .) and the syllables (*do*, *re*, *mi* . . .). The syllables have certain advantages, however, chiefly in that they lend themselves better to singing [see *Solfège*] and that they have more "individuality." They are used mainly in France and Italy. The movable syllables can be used to great advantage in elementary studies, such as scales, clefs, intervals, simple modulations, etc. A modern system of "movable do" is the \*tonic sol-fa, which is widely used in England. See *Sight-reading*.

II. The use of syllables for designating tones is very old. The Chinese had such a system, and tone syllables are still used in Indian music. The ancient Greeks employed the syllables *tah*, *tā*, *toh*, *teh* (τα, τη, τω, τε) for the tones of the descending tetrachord (e.g., a, g, f, e). It is probably from similar syllables (va, vη, vω, ve) that the Byzantine *enechemata* [see *Echos*] and the \**noeane* of Western medieval theory were derived. The modern system of solmization originated with Guido d'Arezzo (c. 990-1050), who introduced the syllables *ut re mi fa sol la* as names for the tones c to a. Later they were also used for the two other hexachords [see *Hexachord*]. The name "solmization" [L. *solmisatio*] is derived from the combination *sol-mi*, which, however, denotes not g-e but g-a, the syllable *mi* being understood as belonging to the hexachord on f. Thus, it denotes not only the Guidonian syllables as such, but the principle of mutation (change from one hexachord into another). The Guidonian syllables were also used as the basis of a "fixed do" terminology, i.e., in the compound terms *C-fa-ut*, *D-sol-re*, etc. [see *Hexachord* III].

III. The medieval system remained unaltered until the end of the 16th century, when increasingly wider use of chromatic tones and transposed keys rendered it less and less suitable. About 1600, French musicians began to use the Guidonian syllables in a fixed position, *ut* for C, etc. In order to complete the octave, the syllable *si* (probably derived from the last words *S-ancte I-oannes* of Guido's hymn) was introduced, and c. 1650 the rather unsingable syllable *ut* was replaced by *do* [Otto Gibelius, *Seminarium modulatoriae vocalis* (1645)]. Simultaneously, various attempts were made to introduce new systems designed for the heptachord, e.g., the

"voces belgicae" of Hubert Waelrant (c. 1517–95): *bo ce di ga lo ma ni* (known as "Bocedization"), or Daniel Hitzler's (1575–1635) "Bebization" *la be ce de me fe ge*, or Karl Heinrich Graun's (1704–59) "Damenization" *da me ni po tu la be*—all fleeting attempts occasionally classified as "Bobizations." In the United States a simplified system of solmization known as \*fasola was widely used during the 18th century. More recently, attempts at reform have been made in England and Germany, with the idea of making the solmization syllables more useful in elementary instruction and sight-singing [see Tonic sol-fa; Tonika]. Karl A. Eitz (1848–1924) invented a *Tonwort* system for Bosanquet's 53-tone scale, which was simplified in the *Jale* system of R. Münnich [see his *Jale* (1930)].

Müller, "Solmisations-siben in der Medicäischen Choralausgabe" (*AMW* i); C.-A. Moberg, "Die Musik in Guido von Arezzos Solmisationshymne" (*AMW* xvi); *RiHM* i.2, 167ff.

**Solo.** (1) A piece executed by one performer, either alone (piano solo; violin solo; e.g., Bach's Sonatas for violin solo), or with accompaniment by piano, organ, orchestra, etc. (2) In orchestral scores, a passage intended to stand out. (3) In concertos, designation for the soloist, in distinction from the orchestra (*tutti*). (4) In the early concerto (Bach, Handel), the orchestral part for passages to be played *senza ripieni* [see *Ripieno*]. See also Ensemble (3).

**Solo organ.** See under Organ III.

**Solo pitch.** A pitch slightly higher than normal; it is used occasionally to obtain a more brilliant tone.

**Sombrero de tres picos, El** [Sp., The Three-Cornered Hat]. Comedy-ballet by De Falla, produced in London, 1919, based on a novel by Alarcón. The music, largely from Andalusian sources, has a strong Spanish flavor, and some of the dances (particularly the Miller's Dance) have become popular concert pieces.

**Son** (1) [F.]. Sound. *Son bouché*, stopped note (of a horn; see Horn I); *son ouvert*, open (natural) note of a wind instrument.

(2) [Sp.]. A folk dance that originated in Cuba's Oriente Province and reflects strong Afro-Cuban traditions. Its tempo is moderate

and its form consists of an exposition, usually sung by a solo voice, followed by two statements of a contrasting melody based on motifs sung by the chorus. The most common accompanying rhythmic patterns used are:

A sort of hybrid form known as *bolero-son*, combining elements of both dances [see Bolero], has recently been developed. (2) by J.O.-S.

**Sonata.** A. General. The sonata is a composition for piano (piano sonata), or for violin, cello, flute, etc., usually with piano accompaniment (violin sonata, cello sonata, etc.), which consists of three or four separate sections called movements. Almost all features of the sonata are also found in other types of instrumental music, i.e., the symphony, chamber music (quartet, trio, quintet, etc.), and, with some modifications, the concerto. The main difference lies in the performing bodies: the symphony is a "sonata" for orchestra, the quartet a "sonata" for four strings, the concerto a "sonata" for a soloist with orchestra, etc. The sonata principle has dominated instrumental music since the late 18th century, including the great majority of works in the present-day concert repertory, from Haydn and Mozart to Brahms, Bruckner, and many 20th-century composers.

The normal scheme for the movements of a sonata (symphony, etc.) is Allegro–Adagio–Scherzo (or Minuet)–Allegro. A slow introduction sometimes precedes the opening Allegro. While Allegro (Allegro molto, Presto) and Adagio (Largo, Lento) merely mean "quick" and "slow," the Scherzo or Minuet has a dance-like character. This movement is sometimes missing, particularly in Mozart's sonatas as well as in most concertos. Notable exceptions to the normal scheme are Beethoven's *Moonlight Sonata* op. 27, no. 2 (designated by Beethoven as *Sonata quasi una fantasia*), consisting of Adagio, Allegretto (a scherzo movement), and Presto; his op. 111, consisting of Maestoso (an introduction), Allegro, and Arietta (an Adagio in variation form); and Liszt's Sonata in B minor, in which the several sections of a single movement function as contrasting sections.

Both the sonata as a whole and its individual

movements are subject to certain principles of formal structure, which are adhered to with varying strictness by different composers. The first movement (Allegro) is almost always in the so-called \*sonata form; the second (Adagio) is often in sonata form or ternary form but may be in \*binary or variation form; the third movement is normally in ternary form, Minuet (\*Scherzo)–Trio–Minuet (Scherzo); the last movement (Allegro, Presto) is in sonata form or \*rondo form (occasionally in variation form). See Forms, musical.

B. *History*. I. Until 1650. The history of the sonata as a form is not identical with the history of the name "sonata." Originally, the term simply meant "sound-piece" and was used for various types of instrumental music. In literary sources, variants of the term *sonnade* occur at least as early as the 12th century [see Lit., Newman, *Sonata in the Baroque Era*]. Luis Milán, in his vihuela book *El Maestro* (1535), mentions "villancicos y sonadas," the latter being dances (pavanes) or fantasias. G. Gorzanis used the title "sonata" for a *passamezzo* and *padovana* for lute (*Intabolatura di liuto . . . libro primo*, 1561). Giovanni Gabrieli's well-known *Sonata pian'e forte* [HAM, no. 173] and *Sonata octavi toni* (1597; \*Editions XXIII, 2) are likewise compositions that have a solely nominal connection with the sonata in its present-day meaning. The former, scored for violin, cornett, and 6 trombones, may be related to the "sonatas" of the military trumpeters, the German \**Turmsonaten* or the English \**sennets*. A. Banchieri's *L'Organo suonarino* (1605) contains eight pieces called "Sonata," mostly short imitative pieces in two parts, whereas the fourteen "Sonate di cimbalo" in Gianpietro Del Buono's *Canoni oblighi et sonate* (1641) are different elaborations of the same *cantus firmus* (*Ave maris stella*). As late as 1702, Bernardo Pasquini used the title "Sonate per Gravicembalo" for an autograph containing *ricercars*, *suites*, *toccatas*, etc., but not a single sonata.

The most fundamental aspect of the present-day sonata—i.e., the contrast provided by its different movements—can be traced to instrumental compositions of the late 16th century that fall into a number of short sections in contrasting styles. Among the earliest examples are a "Ricercare del 12° tono" for four instruments by Andrea Gabrieli (c. 1520–86; see HAM, no. 136); a "Canzon Primi toni" for eight instruments by Giovanni Gabrieli [see Editions XXIII, 2]; and organ canzonas by Vincenzo

Pellegrini (in *Canzoni de intavolatura d'organo*, 1599). During the first half of the 17th century a large number of compositions for instrumental ensemble called "canzone da sonar" or, occasionally, "sonate" (e.g., S. Rossi, *Il quarto libro de varie sonate*, 1622), were published. These pieces fall into five or more short sections in contrasting styles, frequently alternating fairly long sections in imitative style with shorter ones in homophonic texture and slower tempo. For more details, see Canzona (5).

Beginning about 1635, the sections tended to decrease in number and increase in length, thus acquiring the character of "movements." An early example is Tarquinio Merula's canzona "La Gallina" (1637), which has three distinct movements, the first and last based on the same theme [see H. Riemann, *Old Chamber Music*, vol. iii]. Other composers who contributed to this development were Salomone Rossi, B. Marini, G. B. Fontana, M. Neri, and G. B. Buonamente, all of whom published before 1655 [ex. in *RiMB*, nos. 98, 99; J. W. Wasielewski, *Instrumentalsätze*; \*Editions III, 7].

II. 1650–1750. After 1650 a fairly standard structure developed, mainly in Venice under Legrenzi (1626–90). It consisted of an initial Allegro movement in fugal style, a homophonic second movement in dancelike triple meter, and a final movement similar to the first and often based on identical or related material. Often this three-part scheme was enlarged to four or five movements by the addition of short "Adagios" before and/or after the middle movement. The four-movement scheme is seen in Legrenzi's "La Torriana" (1655; see *RiMB*, no. 102), and the five-movement form in his "La Buscha" (1677; see HAM, no. 220). The "symmetrical" structure Allegro–Adagio–Dance–Adagio–Allegro was used also by G. B. Vitali (c. 1644–92; see his sonata of 1667 in H. Riemann, *Old Chamber Music*, iv, 146). Arcangelo Corelli (1653–1713) used, in his *Sonate a trè*, op. 1, op. 3 (1681, '89), a new four-movement plan, Adagio (or Grave)–Allegro–Adagio–Allegro, which was generally adopted as the standard form of the *sonata da chiesa* [see under *Sonata da camera*]. In op. 5 (1700) Corelli returned to the earlier six-movement form, retaining an Adagio at the beginning. Numerous pieces of the *sonata da chiesa* structure (i.e., with a scheme of four movements, slow–fast–slow–fast) were written by non-Italian composers, such as Bach, Handel, Jean Marie Leclair (1697–1764; see Editions XLVII, 27), while the Italians of this period frequently

preferred longer or shorter schemes. Thus, Veracini's (1690–c. 1750) violin sonatas have five to eight movements [see Editions IX, 34]; Tartini's (1692–1770) usually have three: slow–fast–very fast [see Editions IX, 32]; and Locatelli's (1695–1764) almost always have three: Andante–Allegro–Minuet (or Aria con variazioni).

According to medium of performance, the baroque sonata may be divided into four categories: those written in one part, in two parts (*a due*), in three parts (*a tre*), and in four or more parts. The most famous examples in one part are Bach's unaccompanied sonatas for violin or for cello [for earlier compositions of this type, see Violin music; Cello]. The "sonatas a due" usually call for three performers, one for the melody (most commonly violin) and two for the realization of the thoroughbass. This type (often called "violin sonata" or even "solo violin sonata") was cultivated as early as 1617 by Marini (*Affetti musicali*) in a strikingly virtuoso style, employing trills, rapid runs, double-stops, etc. [see *SchGMB*, nos. 182, 183]. The virtuoso element is even more prominent in the sonatas of J. H. Schmelzer (c. 1623–80) and H. I. F. von Biber (1644–1704; see *SchGMB*, no. 238). The "sonata a tre" or trio sonata, the most important type of all, was performed by one, two, or four players, practically never by three [see Trio sonata], while the "sonata a quattro" and "a cinque" probably were for small orchestral ensembles [see Sinfonia (3)]. The earliest known keyboard compositions written in distinct movements are three *Canzone francese* by Giovanni Salvatore published in 1641 [see Editions XI, 3]. A publication by Gregorio Strozzi of 1687 [\*Editions XI, 11] contains three pieces called "Sonata" in three or four movements, the first of which bears the remark, "detta da altri impropriamente Canzona francese" (improperly called by others canzona francese). Five years later, Johann Kuhnau (1660–1722) published, with his *Neüer Clavier-Übung*, pt. ii [1692], a "Sonata aus dem B" that earned him the somewhat undeserved title of "inventor of the piano sonata." Seven other sonatas followed in his *Frische Clavier Früchte* (1696). Bernardo Pasquini (1637–1710) used the term "sonata" as a generic designation for a variety of keyboard compositions [see above], but also for twelve "sonatas" in three or four movements written in the form of two thoroughbass parts to be performed on two harpsichords.

III. 1750–90. The emergence of the "Viennese classical sonata" of Haydn, Mozart, and Beethoven marks one of the most striking devel-

opments in music history. The change from the baroque sonata to the classical sonata is not simply a change from a four-movement scheme, Adagio–Allegro–Adagio–Allegro, to a three-movement scheme, Allegro–Adagio–Allegro, or another four-movement scheme, Allegro–Adagio–Scherzo–Allegro. Fundamental changes of style and structure within the movements are involved as well. Further, the repertory now divided into the solo sonata (piano, violin, flute, etc., sonata), chamber sonata (quartet, quintet), and orchestral sonata (symphony), each of which follows a separate line of development. The following discussion deals mainly with the first category from three aspects: (a) over-all form; (b) single-movement form; (c) style. [For the others, see String quartet; Symphony.]

(a) Over-all form. The three-movement plan Allegro–Adagio–Allegro was standardized in the Italian overture of Alessandro Scarlatti [see Overture I]. Bach employed this form in all but the first of his \*Brandenburg Concertos, in the "Italian Concerto," and in the six organ sonatas, which are among the first sonatas written in this form. The Italian composers of harpsichord sonatas (G. B. Sammartini, 1701–75; B. Galuppi, 1706–85; P. D. Paradies, 1707–92; G. M. Rutini, 1723–97; see Editions IX, 22, 27, 28) wrote some sonatas in two movements, e.g., Allegro–Andante, or vice versa (Paradies) or Allegro–Minuet (Sammartini). Domenico Scarlatti wrote more than 550 one-movement sonatas, which, in his first publication, *Essercizi per Gravicembalo* (1738), were called "essercizio." Some, if not all, of these pieces were intended to be combined in two- or three-movement sonatas. G. Platti's sonatas (pub. between 1742 and c. 1746) are mostly in four movements but frequently include dances, e.g., Larghetto–Allegro–Siciliana–Presto, or Adagio–Allegretto–Grave–Minuet. In the \*Haffner collections (1755–66) the sonatas have various plans: Andantino–Allegro–Presto; Larghetto–Allegro–Minuetto; Allegro–Minuetto, etc. The "classical" scheme Allegro–Adagio–Allegro was used consistently in the piano sonatas of K. P. E. Bach (Prussian Sonatas, 1742; Württemberg Sonatas, 1744), Haydn (except some of the earliest), and Mozart. The four-movement scheme Allegro–Adagio–Minuet–Allegro was already used by Johann W. A. Stamitz (1717–57) of the \*Mannheim school. Although Haydn and Mozart generally adopted it for their string quartets and symphonies, Beethoven was the first to use it in his sonatas, replacing the Minuet with a Scherzo.

(b) Single-movement form. In the mid-18th-century rococo sonata (Sammartini, G. M. Rutini) practically all the movements are in binary form, A B, with both sections repeated. For the relationship of this form to the first-movement sonata form, see Sonata form II. Forms other than binary were very rare. The Haffner collections contain one example of ternary form for a slow movement (Aria from Sonata 8 by Paradies) and one example of \*rondo form (Sonata 16 by G. B. Serini). The slow movements in the sonatas of K. P. E. Bach are usually in free form. Haydn seems to have been the first to make extensive use of the rondo form for the final movement.

(c) Style. The change from the contrapuntal baroque style to a homophonic texture already appears in the final movements of Corelli's sonatas. Vivaldi's style is highly rhythmic, and Tartini's is brilliant, while the rococo composers used a somewhat facile melodic style [see Gallant style], derived from opera. The change to more dramatic expression is usually credited to the Mannheim school and their Viennese contemporaries (Wagenseil), although Italian composers (particularly Sammartini) worked in the same direction. K. P. E. Bach wrote in a highly expressive style [see *Empfindsamer Stil*] that considerably influenced the young Haydn, while the Italianate style of Johann Christian Bach became a model for Mozart. Muzio Clementi's sonatas anticipate the virtuosity and dramatic elements of the Beethoven sonatas.

IV. 1790—. This period, the greatest in the development of the sonata, opens with Beethoven's sonatas for piano, violin, and cello. In his last piano sonatas (op. 81, 90, 101, 106, 109, 110, 111) he expanded the traditional form in various ways and often replaced the intensely dramatic style of his earlier works with a transcendent lyricism. In op. 106, 110, and the cello sonata op. 102, no. 2, the last movement is a fugue. Franz Schubert's piano sonatas, in a lyric, often songlike style, have only recently won the recognition due them. Schumann's sonatas, while not as tightly constructed as those of other composers, show skillful use of counterpoint and rhythm. Chopin's two sonatas in B-flat minor and in B minor, together with Liszt's B-minor Sonata, are outstanding examples of the romantic sonata. Brahms' three piano sonatas (op. 1, 2, 5) and violin sonatas (op. 78, 100, 108) are among the few important works in this genre written in the second half of the 19th century. The early 20th-century composers sometimes

avoided the sonata because it was so representative of 19th-century tradition. Some composers, such as Busoni and Ravel, turned to the \*sonatina as a less pretentious type. The emergence of \*neoclassicism (c. 1920) led to a revival of the sonata, with Stravinsky, Bartók, and Hindemith the most outstanding contributors. Other 20th-century composers of sonatas are C. Ives, Milhaud, Prokofiev, and E. Carter.

**Sonata da camera, sonata da chiesa** [It.]. Baroque terms meaning chamber or court sonata and church sonata respectively. Originally, these terms indicated place of performance, not a specific type or form. They first appear in Tarquinio Merula's *Canzoni, overo sonate concertate per chiesa, e camera*, op. 12 (1637), which contains canzonas and dancelike pieces (*Ballo, Chiacona, Ruggiero*). The former are probably *da chiesa* and the latter *da camera*. Later publications entitled *da chiesa e da camera* are: M. Uccellini, *Sonate correnti Et Arie*, Book 4 (1645; sonatas, *corrente*, arias); G. A. Pandolfi Mealli, *Sonate* (1660; sonatas); M. Cazzati, *Varii e diversi capricci* (1669; capriccios, dances). Between 1670 and 1690 the two terms gradually became associated with larger forms rather than with single pieces. Arcangelo Corelli standardized the *sonata da chiesa* as a piece consisting of four movements, slow-fast-slow-fast (op. 1, op. 3), and the *sonata da camera* as a suite consisting of an introduction and three or four dances, e.g., Allemande, Sarabande, Gigue (op. 2, op. 4). It may be noted that the designation *Sonate da chiesa* appears only in some reprints of his op. 1 (1683, '95). The original editions of both op. 1 (1681) and op. 3 (1689) are entitled *Sonate a trè*. Also noteworthy is the fact that Veracini's *Sonate da camera*, op. 3 (1696) actually contain "church sonatas," e.g., Grave-Vivace-Largo-Vivace.

**Sonata form.** A term that designates not the over-all form of the sonata [see Sonata A] but a form frequently used for single movements of sonatas (symphonies; quartets; overtures, e.g., Mozart, *Don Giovanni*, *Zauberflöte*; etc.). Since it is the form most used for first movements of sonatas, it is also known as *first-movement form* or *sonata-allegro form*. These terms, too, are misleading, since the form is often used for the slow or the final movements of sonatas. The form has been used continuously since the time of Haydn and Mozart, although since 1900 it has been so freely treated that sometimes it is scarcely recognizable.

I. A movement written in sonata form consists of three sections—exposition, development, and recapitulation (also called statement, fantasia section, and restatement), the last usually followed by a coda. In the exposition the com-

poser introduces the musical ideas, consisting of a number of themes; in the development section he "develops" this material [see Development]; and in the recapitulation he repeats the exposition with certain modifications. In practically all early sonatas the exposition is repeated, indicated by a repeat sign. The structure, therefore, of sonata form can be indicated by the scheme A A B A. There is no doubt that composers wanted the exposition to be repeated since they frequently wrote two different endings (*prima* and *seconda volta*) for this purpose. This repetition is also aesthetically important, since it helps the listener remember the themes on which the whole movement is based. Beethoven occasionally omitted the repeat (e.g., in the *Appassionata*, 1st movt.) and about 1870 it was generally discarded, mainly on account of the larger dimensions of each section (in the music of Bruckner, Franck, Mahler, *et al.*).

The exposition contains a first and second theme connected by a bridge (modulating) passage. Other melodies in the exposition are considered continuations of the two main themes. Usually there is a difference between the first and second themes, the former being, e.g., dramatic, the latter lyrical. The second theme is in a different key from the first, normally the key of the dominant if the tonic is major, or the relative key if the tonic is minor. After the second theme there is often a more or less distinct "closing theme." In later sonatas or symphonies (Brahms and Bruckner, in particular) this theme becomes as important as the two main themes. Some movements contain many themes (Beethoven's Symphony no. 3, first movt.) while others often concentrate on one main theme (Haydn's later works; e.g., Symphony no. 104, first movt.; F-major Quartet op. 77, no. 2, finale). Occasionally the most vivid contrasts are found within a single theme (Mozart's Jupiter Symphony, K. 551, first movt.). Thematic material was built in a number of ways: as a tune (Mozart, B<sup>b</sup>-major Quartet, K. 458, first movt., opening theme); as a group of motifs (Haydn, D-major Quartet op. 76, no. 5, finale); as patterned figuration (Beethoven, *Appassionata*, finale).

The development is the central section of the movement, in position as well as emotional impact. In style and treatment it differs radically from the exposition. Many devices and procedures are used to produce the special character of "development," "dynamic tension," "increased temperature," "fighting forces," etc., one or both of the themes from the exposition

being used as the point of departure [see Development]. Two important techniques are melodic fragmentation and rapid harmonic modulation. Other devices are imitation of melodic motifs (fugal style), contrapuntal combination of different motifs, use of themes or motifs in \*inversion or \*diminution. There are, of course, no set rules for this procedure. In the development section more than anywhere else, the composer is free to use his ingenuity and imagination. Occasionally new themes and material are used in the development (Mozart, B<sup>b</sup>-major Quartet, K. 458, first movt.; Beethoven, Piano Sonata op. 2, no. 1, last movt.; Symphonies nos. 3 and 4, first movts.), but this is an exceptional procedure.

The recapitulation normally contains all the material of the exposition, though usually with certain modifications in the bridge passages. One modification is obligatory, namely, that the second theme appear in the tonic (not, as before, in the dominant). Thus the whole movement closes in the tonic. In some symphonies (Sibelius) the recapitulation is shortened, e.g., to a restatement of the first theme only.

The coda, usually a closing statement of moderate length, sometimes assumes considerable proportions and even becomes another development section (e.g., in Beethoven's *Eroica*, first movt.).

The fully developed sonata form may be diagrammed thus:

Exp.			Dev.			Recap.			Coda
I	II	(III)				I	II	(III)	
T	D					T	T		

[For a clear example, see Beethoven's C-minor Quartet op. 18, no. 4, first movt.]

Each phase of action tends to be longer than the preceding one. Many sonata forms have a rather brief first key area, establishing the home key. The remainder of the exposition requires more time, both for the second key to overcome the impression of the tonic and for confirming the second key. Similarly, the development must erase the effect of the second key, reach the tonic, and establish it.

Naturally, the standard sonata form described above is sometimes modified. Some modifications and variants are: (1) substitution of an episode for the development (Mozart, Overture to *Die Entführung aus dem Serail*; Beethoven, F-minor Sonata op. 2, no. 1, finale); (2) delay in the establishment of an important key (Beethoven, F-major Quartet op. 59, no. 1, first movt., first key established at measure 43; F-major

Quartet op. 18, no. 1, first movt., second key delayed; Schubert, Symphony no. 7, finale, recapitulation begins in E<sup>b</sup> instead of C); (3) reversal of the order of events, i.e., return to opening theme before the development (Brahms, Symphonies nos. 1 and 3, finales); (4) combination of single-movement sonata form with elements of multimovement layout (Liszt, B-minor Sonata; Beethoven, *Grosse Fuge*).

II. *Early development.* Unlike the baroque sonata (*sonata da chiesa*), the rococo sonata (mostly for harpsichord) begins with an allegro movement. With few exceptions, these movements are in "rounded binary form,"  $\text{||: A :||: BA :||}$ , which by 1720 was well established in suite movements [see Binary and ternary form]. Alternations between tutti and solo, forte and piano, vigorous and lyric passages (common features of baroque and rococo styles) were the origin of thematic contrast in the sonata form. The first-movement allegros in binary form were often in styles derived from the baroque concerto (Vivaldi), the *opera buffa* (Pergolesi), the so-called Neapolitan opera, the French overture, and many other forms. In time allegros became longer and more complex in thematic (or motivic) substance. Principles of tonal structure that stemmed from the binary dance movements were still essential characteristics of sonata form as late as 1800. Various writers of the 1780's and 1790's (G. J. Vogler, J. G. Portmann, H. C. Koch, A. F. C. Kollmann; see Lit., Ratner) describe sonata form in terms of harmony—*section I* (later the exposition): (1) tonic key with transition to dominant; (2) dominant key (or relative major key) with close on dominant (or relative major); *section II* (later the development and recapitulation): (3) harmonic digressions leading back to first key; (4) restatement of I and 2 (or only 2) in tonic key. Note that in this definition the writers are not actually describing the fully developed sonata form of their own time. The use of themes and a thematic development, so important in the fully developed sonata form, is not mentioned and, in fact, is of relatively little significance in preclassical examples. Many early pieces begin with a more or less well-defined theme but continue with motivic rather than thematic material. The harmonic digressions in subsection (3) are usually sequential restatements of a phrase. Often section II begins with the initial theme (in a different key), in which case this material may be omitted from subsection (4). Some binary movements treat the second half of the form as a mirror image of the first:

	Section I	Section II
Key	I V	V I
Thematic material	A B	B A

B in Section II generally incorporates some development procedures (J. C. Bach, E-major Sonata). The practice of starting section II with a full statement of the initial theme was still used by K. P. E. Bach and in Haydn's earlier works. The repeat of both sections, instead of just the first, is indicated in many works by Haydn, Mozart (regularly in his string quartets), and even in Beethoven's Piano Sonata in F-sharp (op. 78). Although some early 18th-century movements fully restate two themes in the tonic (F. B. Conti, *Overture to Pallade Trionfante*, 1722; Bach, *Well-Tempered Clavier* ii, Prelude in D major), the complete recapitulation did not become standard until after 1750. (Note, e.g., the change in Mozart's symphonies.)

Thus, the emergence of sonata form was a gradual development, not the achievement of any single "inventor," as has been proposed by H. Riemann (J. W. A. Stamitz); G. Adler (G. M. Monn); V. Helffert (Czech composers); F. Torrefranca (G. Platti). Stamitz, for instance, instead of developing motifs, uses a mosaic-like alternation of recurring fragments similar to the structure of Domenico Scarlatti's sonatas. A symphony of 1740 by the Viennese composer G. M. Monn [DFO 31, p. 37] uses, in a rudimentary manner, the basic sonata form—exposition, development, and recapitulation, as well as two distinct themes in the exposition. A better example is the first movement of a Trio attributed (wrongly) to Pergolesi (1710–36), reprinted in H. Riemann's *Collegium musicum*, no. 30.

It is interesting to note that the basic structure of sonata form occurs, on a much smaller scale, in the scherzos and minuets of sonatas, as well as in many folksongs [see Binary and ternary form II].

Possibly the first theorist to use the term "sonata form" in musical analysis was A. B. Marx in his *Die Lehre von der musikalischen Komposition* (1837–47). Marx and his contemporaries (Riemann, Jadassohn, Prout, Lobe, et al.) established the present concept of sonata form as a characteristic order and treatment of themes.

III. *Later development.* The best-known classical examples of sonata form are found in the works of Haydn and Mozart. Beethoven, Schubert, and Brahms expanded the form. The works of Beethoven's middle period (particu-

larly Symphony no. 3, first movt.) have lengthy expositions and recapitulations as well as a wide harmonic range. For example, in Symphony no. 3, Beethoven arrives at E minor, the furthest removed point, and introduces a new theme to emphasize this harmonic region. As a result of this digression, the development section is twice as long as the exposition or recapitulation. The recapitulation alone was no longer sufficient to establish the home key. Therefore the lengthy coda has a section in the home key that counterbalances the E-minor episode in the development.

The 19th-century sonata generally has fewer movements, often very long (Schubert, Bruckner, Mahler). Here sonata form reflects the influence of romanticism. The two key areas for the exposition are more colorful (the use of third-related key shifts: Beethoven, *Waldstein* sonata, first movt.; Brahms, Symphony no. 3, first movt.; Schubert, C-major Quintet, first movt.). Thematic groups and principal themes are more sharply delineated (Tchaikovsky, Symphony no. 6, first movt.). Separation of the exposition into contrasting sections is especially noticeable in movements that have three distinct themes, each in a different key (Beethoven, Sonata *Appassionata*, first movt., F minor, A<sup>b</sup>, A<sup>b</sup> minor; Schubert, C-major Quintet, first movt., C, E<sup>b</sup>, G; Brahms, Symphony no. 3, first movt., F, A, A minor).

In the 19th century, development techniques were more freely used than in the classical period. Material might be developed following its initial presentation in the exposition, and the development section itself is usually much more complex than those of Haydn and Mozart (e.g., Beethoven's *Eroica*). However, the influence of the 18th-century sonata form is evident, e.g., in Mendelssohn's Symphony no. 3, 2nd movt., and Smetana's *Overture to The Bartered Bride*. The rise to the dominant is unbroken, with only limited melodic contrast.

In the 20th century various aspects of sonata form have been adapted to new techniques of composition. Schoenberg, in his Quartet no. 4, 1st movt., builds two large thematic groups, clearly contrasted in style, using the twelve-tone series. Bartók, in his *Music for String Instruments, Percussion, and Celesta*, 2nd movt., organizes the sonata form around the tonal center C, with G as a contrasting key area. Other 20th-century composers who have used sonata form include Stravinsky, Copland, Richard Strauss, Piston, Sessions, Hindemith, and Bloch.

Newman, *The Sonata in the Classic Era* (1963; extensive bibl.); R. von Tobel, *Die Formenwelt der klassischen Instrumentalmusik* (1935); F. Tutenberg, *Die Sinfonik Johann Christian Bachs* (1928); W. S. Newman, "The Recognition of Sonata Form by Theorists of the Eighteenth and Nineteenth Centuries" (*PAMS* 1941, pp. 21-9); L. Ratner, "Harmonic Aspects of Classic Form" (*JAMS* ii); *id.*, "Eighteenth-Century Theories of Musical Period Structure" (*MQ* xlii); J. P. Larsen, "Sonatenform-Probleme" (*CP Blume*); W. Fischer, "Zur Entwicklungsgeschichte des Wiener klassischen Stils" (*StM* iii [1915]). See also under Sonata, Lit. for III.

**Sonatina.** A diminutive sonata, with fewer and shorter movements than the normal type and also usually simpler, designed for instruction (Clementi, Kuhlau). However, such composers as Busoni, Ravel, Bartók, Chávez, and Milhaud have written sonatinas of considerable technical difficulty and artistic merit. Although usually associated with the piano, sonatinas are also written for other instruments, both solo and in combinations. See under Sonata B IV.

**Son Chapin.** The most popular dance of Guatemala. Also known as *son guatemalteco*, it is in binary form and is basically in 3/4 meter with occasional interpolations of 6/8. Derived from European ballroom dances brought to the New World during the 19th century, it differs radically from the Cuban *\*son*, whose syncopated patterns, reflecting Negro influences, are nonexistent in the Guatemalan model. J.O.-S.

**Song.** A song is a short composition for solo voice, usually but not necessarily accompanied, and written in a fairly simple style. Based on a poetic text, it is designed so as to enhance rather than overshadow the text.

The song is the oldest musical form and is found in all periods and places. The rest of this article is concerned with the Western secular art song, excluding *\*folksong*, the songs of Africa, China, etc., as well as religious and liturgical songs (chants, chorales, hymns, etc.).

I. *To 1600.* Among the few remnants of Greek vocal music is a charming lyrical song, the *\*Seikilos Song*. A few examples of medieval Latin lyrical songs have been preserved, notably the 10th-century lovesong "O admirabile Veneris idolum" [see *BeMMR*, p. 72], whose melody is

interesting on account of its clear G-major tonality. The "Planctus Karoli," a lament for the death of Charlemagne (814), is written in neumes that cannot be deciphered [see fac. and attempt at transcription in *GD* v, 1f]. The most notable body of Latin songs is the 12th- and early 13th-century *Carmina burana* [see Goliard songs]. About 1100 a great flowering of song started with the French *\*troubadours* and *\*trouvères*, and continued with the German *\*minnesingers* and *\*Meistersinger*. The devotional songs of Italy and Spain, known as *laude* and *\*cantigas*, may also be mentioned. All the songs previously mentioned are unaccompanied, but songs with instrumental accompaniment figure prominently in the music of 14th-century France and Italy [see *Ars nova*; *Ballata*; Madrigal I; Rondeau; Virelai]. This development reached a climax in the numerous chansons of the *\*Burgundian* masters Dufay and Binchois (both born c. 1400). In the second half of the 15th century the song with instrumental accompaniment was gradually replaced by the *\*part song*, for three or four voices. Notable composers were Ockeghem, Obrecht (some with Dutch texts), Isaac (French, Italian, German texts), and Josquin. In the 16th century innumerable French chansons were written by Sermisy, Janequin [see Program chanson], Certon, Crécquillon, and a long line of other composers, closing with Orlando di Lasso. The German part song was cultivated by Hofhaimer, Finck, Senfl, and others. The Spanish *\*villancicos* and Italian *\*frottole* of the early 16th century may well be regarded as songs, but the madrigals are too elaborate to be so considered. An interesting repertory is made up of the lute songs by Arnolt Schlick (*Tabulaturen etlicher Lobgesang*, 1512) and vihuela songs by Luis Milán (*El Maestro*, 1535), Enríquez de Valderrabano (*Silva de Sirenas*, 1547; *\*Editions XXXII*, 22/23), and other Spaniards [see *Villancico*]. A large number of beautiful lute songs (*\*ayres*) were written in England c. 1600 by John Dowland, Thomas Morley, and many others [see *Editions XVII*]. At the same time the *\*air de cour* was developed in France, to be supplanted, during the 17th and 18th centuries, by the more popular types known as *\*vaudevilles*, *\*pastourelles*, *\*bergerettes*, and *\*brunettes*.

II. *Baroque.* The rise of *\*monody*, c. 1600, brought with it fresh impetus for song composition, with its declamatory style and its reduction of the accompaniment to bare essentials. In Italy, where this movement originated, monody produced no lasting tradition of songwriting

because the chief focus was on opera, which required a more elaborate type of vocal music, the \*aria. In Germany, however, the new trends brought about an early flowering that led almost without interruption to the songs of Schubert, Schumann, and Brahms [see Lied].

III. *Modern song.* Long after the German lied had reached its peak (Schubert), interest in song composition was renewed elsewhere, particularly in France, where composers of rank, inspired by the poetry of Verlaine and Baudelaire, inaugurated a typically French tradition of song (\**mélodie*). Among the earliest and most impressive examples are the sixteen songs by Duparc (1848–1933), composed 1868–77. About the same time Fauré (1845–1924) began to write songs, mostly in cycles [see Song cycle] such as *La Bonne Chanson* (1892–93), *La Chanson d'Eve* (1907), *Le Jardin clos* (1915–18), and *L'Horizon chimérique* (1921). In the meantime Debussy (1862–1918) had composed his sensational *Chansons de Bilitis* (1897), which decisively turned away from German models toward a typically French (impressionist) style. The songs of Ravel and Albert Roussel follow the same general trend. Later 20th-century French vocal writing shifted from impressionism toward neoclassicism or toward a sophisticated type of pseudo-popular chanson. However, the *mélodies* of Poulenc indicate a return to the expressive and meaningful treatment of Debussy and Fauré.

The Russians, beginning with Glinka, evolved a highly effective type of romance, usually in symmetrical (ternary) song form. The songs of Tchaikovsky, Rachmaninoff, Gretchaninov, and Glière are mostly lyrical and somewhat sentimental, with texts taken from mediocre contemporary poets. Mussorgsky created a vigorous and unacademic type of song, often employing an expressive and realistic recitative, a style that influenced not only Russian but also French and Spanish songwriters. Rimsky-Korsakov, Balakirev, and Borodin wrote numerous songs in a strongly nationalist idiom, with emphasis on elaborate accompaniment. The Soviet school largely followed the Mussorgsky-Borodin tradition, but Tchaikovsky's influence is also apparent.

The Italian song literature of the 19th century consists of a large number of popular and sentimental songs, for the most part of low quality. The preoccupation with opera apparently proved fatal for the song until about 1910. While the songs of Ottorino Respighi are written in the sensuous style of late romanticism, there

followed a trend toward simplification and even archaism, based on the study of Italian song types of the 16th century (Casella, Malipiero, Petrassi).

In England, too, scarcely any songs of importance were written during the 19th century. Among modern English composers who have been active in this genre are Vaughan Williams, Holst, Bax, Goossens, John Ireland, Philip Heseltine (known as Peter Warlock), Benjamin Britten, and Roger Quilter.

In the United States, Stephen Foster was the creator of a national type of song, and many of his songs have become folksongs. In the development of art song Henry F. Gilbert and Horatio W. Parker were pioneers. The romantic song is represented by MacDowell, Hadley, Carpenter, Cadman, and others; the impressionist by Loeffler and Griffes; the modern song has found an impressive representative in Charles E. Ives.

Greene, "Stanford's Songs" (*ML* ii, 96ff); *id.*, "The Future of the English Song" (*ML* i, 19ff, 123ff); M. Cooper, "Liszt as a Song Writer" (*ML* xix, 171ff); E. Walker, "The Songs of Schumann and Brahms" (*ML* iii, 9ff); H. Bedford, "Un-accompanied Song" (*ML* iii, 262ff); E. H. C. Oliphant, "A Survey of Russian Song" (*MQ* xii). See also Ayre; Ballad; Folk music; Lied; Shanty; Text and music.

**Song cycle** [*G. Liederkreis*]. A group of related songs designed to form a musical entity. Examples include Beethoven's *An die ferne Geliebte*, op. 98 (composed 1816 to words by A. Jeitteles); Schubert's *Die schöne Müllerin* (1823; words by W. Müller) and *Winterreise* (1827; also by Müller); Schumann's *Frauenliebe und -leben* (1840; poems by Chamisso) and *Dichterliebe* (1840; poems by Heine); Brahms' *Magelone* (1861–68; poems by Tieck); Fauré's *La Bonne Chanson* (1892–93; poems by Verlaine); Debussy's *Chansons de Bilitis* (1897; poems by Pierre Louÿs). Among the numerous song cycles of the 20th century, Hindemith's *Das Marienleben* (1922–23, rev. 1948; poems by Rilke) is outstanding.

The idea of the song cycle is present in 16th-century cycles of madrigals and canzonas, such as G. de Wert's settings of twelve stanzas from Tasso's *Gerusalemme liberata* (1581) or C. de Rore's set of madrigals based on Petrarch's *Vergine bella* and *A la dolce ombra*. There are several English song cycles from the 17th and 18th centuries. See D. L. Earl, "The Solo Song Cycle in Germany, 1800–1850" (diss. Indiana Univ., 1952); J. Mark, "The Song Cycle in England" (*Musical Times* lxi, 325ff).

**Song form** [G. *Liedform*]. The simple ternary form A B A, a form that actually is much more common in instrumental (particularly piano) music than songs. The term was used first (by B. Marx; *GD* iii, 195; *GDB* vii, 962) to designate the M T M form of the minuet with trio, a species for which the term "ternary form" is preferable in view of the wide discrepancy in style between these dancelike pieces and a song. The term "song form" sometimes is also used for \*binary form, a distinction being made between ternary song form and binary song form; in this usage the word "song" might just as well be omitted.

**Song-motet.** See under Motet B I.

**Song of Destiny.** See *Schicksalslied*.

**Song of the Earth.** See *Lied von der Erde*, Das.

**Songs of a Wayfarer.** See *Lieder eines fahrenden Gesellen*.

**Songs without Words.** See *Lieder ohne Worte*.

**Sonido trece** [Sp.]. Name given by the Mexican composer and theorist Julián Carrillo (1875–1965) to his method of using microtone intervals. In most of the compositions he wrote after 1922, Carrillo employs  $\frac{1}{2}$ ,  $\frac{1}{4}$ ,  $\frac{1}{8}$ , or  $\frac{1}{16}$  of whole tones. Special pianos and a harp tuned to these intervals were manufactured by him and used to play his works. J.O-S.

**Sonnambula, La** [It., The Sleepwalker]. Opera in two acts by Bellini (libretto by F. Romani), produced in Milan, 1831. Setting: a Swiss village, early 19th century.

**Sonnenquartette.** See Sun Quartets.

**Sonneries** [F.]. Signals given by trumpets or by church bells.

**Sonus.** In the \*Gallican and \*Mozarabic Mass, an item corresponding to the Roman Offertory.

**Sopra** [It.]. Above. *Come sopra*, as above. *M.d.* (or *M.s.*) *sopra*, right (or left) hand above the other (in piano playing). See *Sotto*.

**Soprano.** The highest female voice; see Voices, range of. Soprano soloists are classified as dramatic, lyric, or coloratura. Voices of similar range are the unchanged boy's voice ("boy soprano") and the "male soprano," i.e., either a \*falsetto or, formerly, a \*castrato. The term is also used for certain instruments to denote the highest member of a family, e.g., soprano recorder.

**Soprano clef.** See under Clef.

**Sorcerer's Apprentice, The.** See *Apprenti sorcier*, L'.

**Sordino** [It.]. (1) See Mute. (2) Old name for the \*kit or \*clavichord.

**Sordune.** See under Oboe family III.

**Sorochinskaya Yarmarka, Sorotchintsy Fair.** See *Fair of Sorochinsk*.

**Sortisatio** [L.]. A 16th-century term for improvised counterpoint, as opposed to *compositio*, written out counterpoint. The earliest known mention occurs in the "Opus aureum" (1501) by Nicolaus Wollick, who says that *sortisare* is "cantum diversis melodiis improvise ordinare." Similar definitions are given by A. Ornithoparchus ("Musice active micrologus," 1517) and H. Faber ("Compendium musicae," 1548), while in later writings (e.g., J. Thuringus, *Opusculum bipartium*, 1625) the term has the connotation of popular music (\**Bergreyen*, \**villanella*). Two examples given by Faber are in note-against-note style with occasional progressions in unison and in parallel fifths. See A. Hammerich, in *SIM* i, 352; W. Gurlitt, in *TV* xvi, 194ff; E. T. Ferand, in *CP* 1949, pp. 103ff, and *MQ* xxxvii.

**Sospirando** [It.]. Sighing, plaintive.

**Sostenente (sostinente) piano.** Generic name for a keyboard instrument that produces a sustained sound like that of the violin or organ. A great many such instruments, all more or less ephemeral, have been invented. There are four principal means of obtaining such an effect: (1) by currents of air directed against the strings; (2) by repeating hammers; (3) by a bowing mechanism; (4) by means of electricity. The first method was used in Jean Schnell's *Anémocorde* [see under Aeolian harp]. The second, in

which rapidly striking hammers produce a tremolo, was invented by Hawkins in 1800, improved in the *Melopiano* of c. 1873 (Caldara and Brossi), and patented in a new form by E. Moor in 1931 and by Cloetens in 1932. The third is realized in a large number of instruments generically called *piano-violin* [G. *Bogenklavier*, *Streichklavier*, *Geigenwerk*], all descendants of the \*hurdy-gurdy. Usually, the "bow" consists of one or more wheels bearing rosined strings and set in rotation by a pedal mechanism, while the strings are pressed against the wheel by a key mechanism. The first successful instrument of this type was Hans Heyden's *Geigenwerk* (c. 1575; described in Praetorius' *De Organographia* [1619; vol. ii, *Syntagma musicum*] and its supplement, *Teatrum Instrumentorum* [1620]). Later constructions frequently used complete violins, violas, etc., which were placed inside a big circular bow and pressed against it, in different positions, by a mechanism connected with the keyboard. In 1817 H. R. Mott of England patented a "Sostinente Piano Forte" in which rollers acting on silk threads transmitted vibrations to the strings. For the fourth category, see Electronic instruments. See G. Kinsky, "Hans Haiden" (ZMW vi); also SaRM; MaMI.

**Sostenuto, sostenendo** [It.]. Sustaining the tone to or beyond nominal value, i.e., slackening the tempo. *Andante sostenuto* calls for a slow andante.

**Sostenuto pedal.** See under Piano I.

**Sotto** [It.]. Under. *Sotto voce* (under the voice) means performance, vocal or instrumental, "in an undertone," i.e., with subdued sound. *M.d.* (*M.s.*) *sotto* means right (left) hand underneath the other (in piano playing); see *Sopra*.

**Soubrette** [F.]. A light operatic soprano, often playing a somewhat comical role, e.g., Zerlina in Mozart's *Don Giovanni*. The corresponding French term is *dugazon*, after a famous singer, Louise Dugazon (1755–1821), who excelled in such roles.

**Soundboard** [F. *table d'harmonie*; G. *Resonanzboden*; It. *piano armonico*, *tavola armonica*; Sp. *caja armónica*]. In pianos, the wooden surface over which the strings are stretched, which serves as a resonator (also called \*belly). Most defects in sound, which often develop in pianos after a number of years, are due to cracking or bending of the soundboard.

**Sound hole** [F. *ouïe*; G. *Schalloch*; It. *occhi*; Sp. *abertura acústica*]. An opening of various shapes cut in the table of violins and other stringed instruments. Such an opening permits freer movement of the central part of the table, thus helping it reinforce the tones produced by the strings. F. Savart's (1791–1841) experiments showed that in violins, violas, etc., the traditional F-shape of the holes (F-holes) is superior to any other shape. In earlier stringed instruments (viols) the holes were in the shape of a sickle or half-moon (C-holes), whereas the apertures of lutes and guitars are in the shape of a circle in the center of the table [see Rose]. In the latter, the shape and position of the holes result in prolongation of the sound, whereas the F-holes of the violins have the opposite effect.

**Sound ideal.** [G. *Klangideal*] A term used by musicologists for the characteristic "sonorities" of various periods of music, particularly the earlier ones. For instance, the sound ideal of the \*Burgundian school (early 15th cent.) is a light, multicolored combination of vocal sound with many instrumental timbres of a somewhat nasal character, extremely rich in overtones and rather harsh and piercing. See *Spaltklang*. This sonority is in striking contrast to that of the early \*Flemish school (late 15th cent.), which is darker in color, lower in range, relatively uniform in timbre, and preferably vocal. See A. Schering, in *JMP* xxxiv; G. Pietzsch, in *AM* iv, nos. 2 and 3; K. G. Fellerer, in *JMP* xlv; H. Brunner, *Das Klavierklangideal Mozarts* (1933).

**Sound post** [F. *âme*; G. *Seele*, *Stimmstock*; It. *anima*; Sp. *alma*]. In violins, etc., a small pillar of pine set between the table and back. It serves both to counter the heavy pressure of the bridge on the table (its original purpose) and, chiefly, to convey the vibrations of the table to the back of the instrument and to bring the various vibrating sections into conformity with each other. The correct position of the sound post is slightly behind the right foot of the bridge. Attempts to change the material or shape of the sound post have proved unsuccessful. See W. Huggins, *On the Function of the Sound-post* (1883).

**Soupir** [F.]. See under Notes.

**Soupirant** [F.]. Sighing, plaintive.

**Sources, musical (pre-1450).** There are four categories: Gregorian chant; secular monophony; organ music; polyphonic music. For the first

category, see Editions XLII. For the second, see under Chansonier; Minnesinger; *Lauda; Cantiga*. For the third, see under Organ music I. The most important sources of polyphonic music prior to 1450 are listed below.

*Before 1100.* \**"Musica enchiriadis"* and other treatises dealing with \*organum [see also Theory, nos. 3 to 7]. Winchester Troper [see Troper].

*12th century.* 1. MSS of \*St. Martial, c. 1150: Paris, Bibl. Nat. lat. 1139, 3719, 3549; London, Brit. Mus. Add. 36881. Contents: 2-voice organa. See H. Spanke and H. Anglés, *Die Londoner St. Martial-Conductushandschrift* (1935); H. Spanke, in *Zeitschrift für französische Sprache und Literatur* liv, 282ff, 385ff; J. M. Marshall, "The Repertory of the St. Martial Manuscript" (diss. Yale Univ., 1961).

2. Codex Calixtinus, also called Liber Sancti Jacobi, Compostela, Spain. Contents: 2-voice organa (also conductus) of the school of \*Compostela. New ed., 2 vols., by W. M. Whitehill and G. Prado (1944); the music section in P. Wagner, *Die Gesänge der Jakobusliturgie zu Santiago de Compostela aus dem sogenannten Codex Calixtinus* (1931); W. Krüger, in *MF* xvii (also *MF* xix, 180).

*13th century.* 3. Various MSS containing the repertory of the school of \*Notre Dame: organa, clausulae, conductus, motets, \**"Magnus liber organi."* The four most important are (1) Wolfenbüttel 677 (formerly Helmstedt 628) W<sub>1</sub>; fac. ed. in J. H. Baxter, *An Old St. Andrews Music Book* (1931); the organa in W. Waite, *The Rhythm of Twelfth-Century Polyphony* (1954). (2) Florence, Bibl. Laur. plut. 29.1 (F). (3) Wolfenbüttel 1206 (formerly Helmstedt 1099) W<sub>2</sub>; fac. ed. by L. Dittmer [1960]; also see E. Thurston, "The Conductus Compositions in Manuscript Wolfenbüttel 1206," 2 vols. (diss. New York Univ., 1954); J. Knapp, "The Conductus of the Notre Dame School," 4 vols. (diss. Yale Univ., 1961). (4) Madrid, Bibl. Nac. 20486 (formerly Hh 167; Ma); fac. ed. by L. Dittmer [1957]. For other sources, see F. Ludwig, *Repertorium organorum*, rev. ed. (1964).

4. Codex \*Montpellier, Montpellier, Faculté de médecine H 196 (Mo). Contents: motets. New ed. in Y. Rokseth, *Polyphonies du XIIIe siècle*, 4 vols. (1935–39; facsimiles, transcriptions, commentary).

5. Codex Bamberg, Bamberg, Staatsbibl. Ed. IV.6 (Ba). Contents: motets, \**In seculum* compositions. New ed. in P. Aubry, *Cent motets du XIIIe siècle*, 3 vols. (1908; facsimiles, transcriptions, commentary).

6. Codex Huelgas or Burgos, Monastery of Las Huelgas near Burgos (Hu). Contents: motets and monophonic hymns. New ed. in H. Anglés, *El Códex musical de Las Huelgas*, 3 vols. (1931; facsimiles, transcriptions, commentary).

7. Torino, Bibl. Reale man. var. N. 42 (c. 1300). Contents: motets. New ed. in A. Auda, *Les "Motets Wallons" du manuscrit de Turin: vari 42*, 2 vols. [1953].

*Note:* The motet repertory in nos. 3–7 (and some pieces in no. 8, below) may be found in F. Gennrich, *Bibliographie der ältesten französischen und lateinischen Motetten* (1957), and the conductus repertory of the Notre Dame MSS is indexed in E. Gröninger, *Repertoire-Untersuchungen zum mehrstimmigen Notre Dame-Conductus* (1939).

*14th century.* 8. Roman de Fauvel, Paris, Bibl. Nat. fr. 146 (c. 1315). Contents: motets and monophonic songs inserted in a continuous narrative. Fac. ed. in P. Aubry, *Le Roman de Fauvel* (1907); transcriptions in L. Schrade, *Polyphonic Music of the 14th Century*, vol. i [1956]. See G. A. Harrison, "The Monophonic Music in the Roman de Fauvel" (diss. Stanford Univ., 1963).

9. Codex Ivrea (Italy), Library of the Chapter. Contents: motets and \**chaces*. See M. J. Johnson, "The Motets of the Codex Ivrea," 2 vols. (diss. Indiana Univ., 1955; commentary and transcriptions).

10. Machaut MSS of the Bibl. Nat., Paris. Contents: complete works of G. de Machaut (c. 1300–77). New ed. in F. Ludwig, *G. de Machaut, musikalische Werke*, 4 vols. (1926–29; vol. iv ed. by H. Bessler [1954]); also in L. Schrade, *Polyphonic Music of the 14th Century*, vols. ii, iii [1956]. Also see R. Hoppin, in *Notes* xv and in *MD* xii, xiv.

11. Florence, Bibl. Naz. Panciatichi 26. Contents: madrigals, *caccie*, *ballate*, by early Italian composers. See *WoGM* i, 244 (for correction of the various lists of contents given in *WoGM*, see F. Ludwig, in *SIM* iv).

*Note:* Collation of nos. 11–15 in K. von Fischer, *Studien zur italienischen Musik des Trecento und frühen Quattrocento* (1956). For complete Italian 14th-century corpus, see Editions XII, 8.

12. London, Brit. Mus. Add. 29987. Contents: Italian compositions of the 14th century; also instrumental \**estampies*. See *WoGM* i, 268.

13. Codex Squarcialupi, Florence, Bibl. Laur. Pal. 87. Contents: works of Francesco Landini and numerous other 14th-century Italian com-

posers (madrigals, *ballate*, *caccie*). See *WoGM* i, 228; new ed. in J. Wolf, *Der Squarcialupi-Codex* (1955).

14. Paris, Bibl. Nat. *ital.* 568. Contents: Italian compositions of the 14th century. See *WoGM* i, 250; G. Reany, in *MD* xiv.

15. Codex Reina, Paris, Bibl. Nat. *fonds fr. nouv. acq.* 6771. Contents: Italian 14th-century pieces; French 14th-century pieces; compositions of the period of Dufay. See *WoGM* i, 260; K. von Fischer, in *MD* xi, xvii; N. Williams, in *MD* xvii.

16. Modena, Bibl. Estense *L.* 568. Contents: French and Italian compositions of the late 14th century. See *WoGM* i, 335.

17. Chantilly, Musée Condé 1047. Contents: French compositions of the late 14th century. See *WoGM* i, 328; G. Reany, in *MD* viii.

18. Torino, Bibl. Naz. *J II* 9. Contents: Mass items, motets, French secular compositions, all unique and anonymous. See H. Besseler, in *AMW* vii, 210; R. Hoppin, in *MD* xi. New ed. in \*Editions XII, 21.

19. Codex Apt, Apt (France), Library of the Chapter, c. 1400. Contents: chiefly Mass items. See H. Besseler, in *AMW* vii, 201. New ed. in \*Editions XLIX, Ser. I, 10. See the review by G. de Van, in *AM* xii, 64; also A. Elling, "Die Messen, Hymnen und Motetten der Handschrift von Apt" (diss. Göttingen, 1924).

15th century. 20. Bologna, Lic. Mus. *Q 15* (formerly 37; *BL*). Contents: compositions by Ciconia, Dunstable, Dufay, J. de Limburgia, et al. See G. de Van, in *MD* ii, 231ff.

21. Modena, Bibl. Estense *lat.* 471 (*ModB*). Contents: similar to no. 20. See H. Besseler, in *AMW* vii, 236.

22. Bologna, Bibl. Univ. 2216 (*BU*). Contents: similar to no. 20. See H. Besseler, in *MD* vi.

23. Codex Aosta, Aosta (Italy), Seminary Library (*AO*). Contents: similar to no. 20. See G. de Van, in *MD* ii, 5ff.

24. Canonici MS, Oxford, Bodl. Libr. *MS. Can. misc.* 213 (c. 1450). Contents: Mass items, motets, chansons. New ed. of secular pieces in J. Stainer, *Dufay and His Contemporaries* (1898), and in \*Editions XII, 11; of sacred pieces, in C. van den Borren, *Polyphonia sacra* (1932). See S. W. Spurbeck, "A Study of the Canonici Manuscript" (diss. Univ. of Rochester, 1943); G. Reany, in *MD* ix; E. Dannemann, *Die Spätgothische Musiktradition* (1936).

25. Old Hall MS, Catholic College of St. Edmunds, Old Hall, England (c. 1425). Contents: Mass compositions, motets, hymns. New ed.

by A. Ramsbotham and H. B. Collins, 3 vols. (1935–38). See M. Bukofzer, in *MQ* xxxiv, xxxv; *id.*, *Studies in Medieval and Renaissance Music* [1950].

26. Trent Codices. See separate entry.

27. Cancionero musical, Madrid, Bibl. del Palacio, *MS* 2, 1–5 (c. 1500). Contents: 463 Spanish accompanied songs, mostly \**villancicos*. New ed. in \*Editions XXXII, 5, 10.

See also Chansonier; Liederbuch. For more complete lists see *ApNPM*, pp. 201ff (12th–14th cent.); *WoHN* i, 351ff and 444ff (14th–16th cent.); *AMW* vii, 245 (14th–15th cent.).

**Sourd** [F.]. Muffled, muted.

**Sourdine** [F.]. (1) \*Mute (*sordine*). (2) An obsolete wind instrument [It. *sordone*] of the late Renaissance, similar to an early form of bassoon, with a soft, muffled sound; see Oboe family III.

**Sousaphone**. See under Brass instruments III (e).

**Souterliedekens** [Dutch]. A 16th-century Netherlands collection of 159 monophonic psalm tunes, published in 1540 (by Symon Cock at Antwerp) and reprinted in more than thirty editions. The publication is the earliest complete translation (rhymed) of the psalms into the vernacular [see Psalter]. The melodies are not newly composed but were taken from popular or folk melodies of the period, mostly Dutch, and the editor has indicated with each melody the beginning of the original secular text, thus preserving numerous early folk melodies. There also is a MS collection from 1537. Tielman Susato of Amsterdam published, in his *Musyck Boexken*, iv–vii (1556–57), 62 three-voice settings of the same melodies by Clemens non Papa [ex. in *ReMR*, p. 358]. Clemens' pupil, Gerardus Mes, composed them in four parts (1561).

Lit.: E. Mincoff-Marriage, ed., ‡*Souterliedekens . . . van 1540* (1922); D. F. Scheurleer, ‡*Die Souterliedekens* (1898); H. F. Commer, ed., ‡*Collectio operum musicorum Batavorum*, 12 vols., xi (c. 1850; Clemens non Papa; F. van Duyse, ‡*Oude nederlandse liederen: melodieën uit de Souterliedekens* (1889); H. A. Bruinsma, "The Souterliedekens and Its Relation to Psalmody in the Netherlands" (diss. Univ. of Michigan, 1949); K. P. Bernet Kempers, "Die 'Souterliedekens' des Jacobus Clemens non Papa" (*TV* xii, xiii, xv); E. Mincoff-Marriage, "Unveröffentlichtes aus der Weimarer Liederhandschrift v. J. 1537" (*Tijdschrift voor nederlandse taal- en letterkunde* xxxviii, new ser. xxx); W. Wiora,

"Die Melodien der 'Souterliedekens' und ihre deutschen Parallelen" (CP 1952).

**South America.** See under Latin America and individual countries.

**South American Indian music.** See under American Indian music.

**Soviet Union.** See Russia.

**Sp.** [G.]. Abbr. for *Spitze* (point), indicating, in violin music, the point of the bow, and in organ music, the toe of the foot.

**Spacing.** Arrangement of the notes of a chord according to the demands of the single voices. When the three upper voices are as close together as possible, the spacing is described as "close position" or "close harmony" [Ex. 1, 2]; sometimes the term is reserved for positions not ex-

ceeding a twelfth [Ex. 3, 4]. The other arrangements, common in vocal music, are called open position or open harmony [Ex. 5, 6].

**Spagna** [It.]. A famous *\*basse danse* melody, entitled "Il Re di Spagna" (The King of Spain), preserved as a monophonic melody in the *basse danse* MSS of the 15th century and used very frequently as the basis of polyphonic compositions. According to a recent study (O. Gombosi) there are nearly 250 settings for instruments, keyboard, or lute, under such names as "Basa Castiglia," "La Spagna," "Spanyol" [HAM, no. 102], etc. After 1550 C. Festa transformed the tune into a *cantus firmus* for contrapuntal exercises [see Lit., Gombosi]. H. Isaac composed a *Missa La Spagna* (Petrucci, 1506). The melody is also used in the "Alta" by F. de la Torre [HAM, no. 102a]. See O. Gombosi, ed., *Composizioni di Meser Vincenzo Capirola: Lute-Book* (1955), pp. xxxvi-lxiii; O. Kinkeldey, "Dance Tunes of the Fifteenth Century," in *Instrumental Music*, ed. D. C. Hughes (1959); M. F. Bukofzer, *Studies in Medieval and Renaissance Music* [1950], pp. 190ff; W. Apel, in *MD* i.

**Spain.** From earliest times to the present, Spanish music has mingled popular and artistic elements. The establishment of several separate cultural centers within Spain led to a regionalism

that, over a period of time, combined with many outside influences to create a unique musical heritage.

I. *Before 1500.* The Christianization of Spain, which took place during the 4th century, led to the introduction of so-called Visigothic chant, the Spanish counterpart of Gregorian (Roman) chant, which persisted until it was superseded by Gregorian chant in the latter part of the 11th century. Because it remained in use during the Arab domination (711-1085) it is usually known as *\*Mozarabic chant* [see also Chant]. Before the Arab conquest, Seville, Toledo, and Saragossa were centers of musical culture, particularly under the bishops St. Leander (d. 599) and St. Isidore (c. 560-636). The latter's writings contain valuable information concerning contemporary performance of church music [see *ReMMA*, p. 110]. There also are a number of secular songs, unfortunately notated in neumes that cannot be deciphered, although the melodic outline of one nonliturgical Latin song, the "Song of the Sibyl," is known [see *ReMMA*, p. 199]. Probably the earliest known version appears in a Spanish MS of the mid-10th century. The earliest decipherable examples of Iberian secular monody in the vernacular are Galician songs, *Siete canciones de amor*, attributed to the early 13th-century troubadour or *jongleur* Martim Codex. One of the most disputed features of early Spanish music is the *\*Arab element*, which according to some scholars (Farmer, Ribera) exercised a basic influence not only on Spanish music but on all European music. However, such sweeping claims can scarcely be supported. A very important source of more than four hundred monodic devotional songs is the collection known as *Cantigas de Santa Maria*, written for (and partly by) Alfonso X (the Wise), King of Castile and León (1252-84). The MSS of the *cantigas* contain rich illuminations showing musicians in Arab dress playing on instruments of Arab origin [see *Cantiga*].

In the 12th century the monastery of Santiago de Compostela in the Pyrenees was a leading center of polyphonic music, side by side with the school of St. Martial. The remarkable Codex Calixtinus of Santiago (c. 1140) shows strong evidence of French origin and contains what is apparently the oldest three-part composition known [see Compostela; Sources no. 2; *ReMMA*, p. 267f; *AdHM*, p. 181f; *ApNPM*, pp. 212ff]. One of the sources of the Notre Dame repertory, the MS Madrid (or Toledo Codex), Bibl. Nac. 20486 [see Sources, no. 3], was probably written

in Spain. The influence of French polyphonic music is also apparent in the Codex musical de las Huelgas (or Codex Burgos; see Sources, no. 6), which contains original Spanish pieces, monophonic as well as polyphonic. Johannes Roderici (Rodríguez) is repeatedly mentioned as a composer or editor in this MS, which, though inscribed during the early part of the 14th century, also contains 13th-century works. Evidence of musical activity in 14th-century Catalonia includes a list of some six hundred musicians who served at the court of Catalonia-Aragon at the time and a 14th-century MS at Montserrat, the *\*Llibre Vermell* (Red Book), containing dances, "pilgrim songs" (folk tunes with sacred texts), and other short polyphonic and monodic pieces. John I of Aragon (1350–96) not only composed music himself but also sought the best European musicians, musical instruments, and books for his court.

Probably the earliest Spanish composer whose compositions survive is Johannes Cornago (fl. 1455–after 1466), known for his *Missa signor de la mapa mundi* and about a dozen shorter pieces. Juan de Anchieta (1462–1523) and Francisco de Peñalosa (c. 1470–1535) wrote Masses, motets, hymns, and secular songs. A vast repertory of Spanish songs, mostly in three parts, is preserved in a number of late 15th- and early 16th-century *\*cancioneros*, of which the *Cancionero musical de Palacio* [see Sources, no. 27], containing 463 compositions (mostly *\*villancicos*), is the most important. The composers represented in this collection include Cornago, Anchieta, Peñalosa, Francisco de la Torre, Juan Urreda (Johannes Wreede, a Fleming), and Juan del Encina (1468–1529; also famous as a poet and writer). An important theorist of the same period was B. Ramos de Pareja (c. 1440–after 1491).

II. 1500–1800. The 16th century was the golden age of Spanish music. In sacred vocal polyphony, organ music, and vihuela music Spain produced masters of the first rank. Outstanding in the first field were Cristóbal de Morales (c. 1500–53), his pupil Francisco Guerrero (1527–99), and the "Spanish Palestrina," Tomás Luis de Victoria (c. 1549–1611). Each wrote about twenty Masses in addition to Magnificats, hymns, and motets. Guerrero composed more than one hundred motets, Morales about ninety, and Victoria forty-six. Guerrero also wrote more than a dozen secular songs and some sixty popular religious polyphonic pieces with vernacular lyrics. Besides these three major composers,

more than forty composers were active in local centers throughout Spain under Philip II, producing an extremely rich repertory.

The *Libro de Cifra Nueva para tecla, harpa, y vihuela* (1557), compiled by Venegas de Henestrosa, is particularly noteworthy as an anthology of mid-16th-century Spanish and Italian instrumental music. Among the organists represented in this collection are Francisco Perez Palero, Pedro Vila, Pedro de Soto, and the great master Antonio de Cabezón. The main source for Cabezón's organ music (hymns, Magnificats, *\*tientos*, *\*fabordones*, *\*diferencias*) is the *Obras de música* of 1578 [*\*Editions XX*, 3, 4, 7, 8], published posthumously by his son, Hernando.

In 16th-century Spain the vihuela de mano, a six-course guitar tuned like the lute, was widely used, but no Spanish music calling specifically for lute has been preserved. Outstanding vihuela composers include Luis Milán, Luis de Narváez, Enriquez de Valderrábano, Miguel de Fuenllana, Diego Pisador, and Esteban Daza, who published tablature books between 1536 and 1576 [see Vihuela]. In addition, a number of musicians were known chiefly as theorists: Juan Bermudo (*Declaración de instrumentos musicales*, 1555), Tomás de Santa María [see O. Kinkeldey, *Orgel und Klavier* (1910)], Diego Ortiz (*Tratado de glosas*, 1553, new ed. by M. Schneider [1913]), and Francisco de Salinas (*De música libri septem*, 1577, fac. ed. by Kastner [1958]). See also Madrigal IV; *Ensalada*.

During the 17th century Spanish church composers continued the polyphonic tradition, largely in the conservative *stile antico* that persisted well into the 18th century. Representative composers include Juan Pujol (c. 1573–1626; some sacred works ed. by H. Anglés [1926–32]), Juan Comes (1568–1643), Mateo Romero (d. 1647), and Carlos Patiño (d. 1683). The school of Montserrat is known largely through the publication of the works (Masses, motets, *villancicos*) of Joan Cererols [in D. Pujol, *Mestres de l'Escolania de Montserrat*, 3 vols. of vocal music (1931–32)]. The *Cancionero de Sablonara* (78 songs) is a 17th-century collection of *villancicos*, chiefly by Romero and Jean de Castro (c. 1540–c. 1610). Numerous 17th-century Spanish composers wrote for the theater [see Lit., Cotarelo]. Organ music of this time is represented by S. Aguilera de Heredia (c. 1565–after 1620), Correa de Araujo (c. 1576–after 1663), José Jiménez (17th cent.), Pablo Bruna (17th cent.), Juan Cabanilles (1644–1712), and his pupil José Elías (c. 1680–c. 1749), of whom more than three hundred

compositions are preserved in Spanish libraries [see Organ music E].

The middle of the 17th century saw the rise of the *zarzuela*, a unique type of opera. After 1750 it was replaced by more popular types of lyric theater, the *tonadilla* and *sainete*. During the 18th century Italian influence became more and more prominent, owing much to the unlimited power given the Italian castrato Farinelli, favorite of King Philip V. Operas by Neapolitan composers were performed at the royal theater, and, at the same time, two Spanish musicians became famous abroad as composers of Italian opera—Domingo Terradellas (Italianized name Domenico Terradellas, 1713–51), who went to Naples as a boy, and V. Martín y Soler (1754–1806; frequently confused with Antonio Soler), who from 1780 on lived in Florence, Vienna, and St. Petersburg. The latter is remembered mainly for his opera *Una Cosa rara* (1786), from which Mozart quoted in the final scene of *Don Giovanni*, a remarkable circumstance in view of the fact that Soler's opera had for a time completely eclipsed Mozart's *Figaro*.

Naples-born Domenico Scarlatti, who lived in Madrid under royal patronage from 1729 until his death (1757), was the chief harpsichord composer in Spain at this time. His style was adopted by his pupil, Padre Antonio Soler (1729–83), who wrote many kinds of music, carrying on the tradition of Cabanilles and Elías in his organ works. Other notable composers of this period include Mateo Albéniz (d. 1831), Manuel Blasco Nebra (1750–84; see *HAM*, no. 308), and Mateo Ferrer (1788–1864). Chamber works were written by such men as Tomás de Iriarte (1750–91), Manuel Canales, José Herrando (pupil of Corelli), and Luis Misón (d. 1766), who also wrote *tonadillas*.

III. 1800—. Ramón Carnicer (1789–1855), Baltasar Saldoni (1807–89), and Miguel Hilarión Eslava y Elizondo (1807–78) were active during the first half of the 19th century. However, Bellini, Donizetti, and Rossini reigned supreme on the operatic stage, until the popular *zarzuela*, in the form of short comic operas with spoken dialogue, was revived by Basilio Basili (1803–95) and F. A. Barbieri (1823–94). Felipe Pedrell (1841–1922), Tomás Bretón y Hernández (1850–1923), and Ruperto Chapí y Lorente (1851–1909) gradually worked toward a more artistic and nationalist Spanish opera.

The founders of modern Spanish music were Pedrell and Isaac Albéniz (1860–1909). Albéniz is famous mainly for his *Iberia* (1906–09), a

collection of twelve piano pieces using Spanish dance rhythms with great imagination and a virtuoso piano technique. Enrique Granados (1867–1916) wrote the piano suite *Goyescas* (after scenes from Goya, 1911–14), which was expanded into an opera and first produced at the New York Metropolitan Opera in 1916. Although lacking the exuberant spirit of Albéniz' music, Granados' more introspective works are typically Spanish in their graceful elegance. Manuel de Falla (1876–1946) is probably the most representative Spanish composer since Spain's golden age. Such works as his *Noches en los Jardines de España* and the ballet *El Sombrero de tres picos* (1919) are both impressionist and nationalist. His *El Retablo de Maese Pedro* (1923) and harpsichord concerto in particular greatly influenced younger Spanish composers. Less important is the mannered descriptive music of Joaquín Turina (1882–1949). The impressionist Federico Mompou (b. 1893) is known for his short poetic piano pieces. Composers who are little known outside Spain include José María Usandizaga (1887–1915), Jesús Guridi (b. 1886), and Conrado del Campo y Zabaleta (1879–1953). Ernesto Halffter (b. 1905), a pupil of De Falla, has used folk elements in his music, although neoclassical tendencies are apparent in his *Sinfonietta* (1923–27). His brother Rodolfo (b. 1900, later moved to Mexico) has a more cerebral approach; with fine craftsmanship he treats popular and traditional material in a highly original manner. Later he turned to serial techniques. Joaquín Rodrigo (b. 1902), highly prolific, has shown a many-sided nationalism, drawing sparingly on folk elements but endeavoring to embrace the whole tradition of Hispanic music. The Catalan composer Jaime Pahissa (b. 1880, later moved to Buenos Aires) developed a personal system of composition, based exclusively on unisons and multiple octaves that produce a polyphonic effect through contrary motion (*Suite intertonal*, 1926). Oscar Esplá (b. 1886) is distinguished as a theorist as well as a composer. Julian Bautista (b. 1901, moved to Buenos Aires) has composed modern pieces outside the national tradition, whereas Carlos Surinach (b. 1915) combines a nationalist approach with more progressive technique.

Present-day Spanish composers tend to avoid explicit nationalism in order to achieve the "universalization" of Spanish music. Folk elements have been strongly rejected by the leading group of young musicians, who have embraced

serial techniques. Among the most important of them are Cristóbal Halffter (b. 1930; nephew of Ernesto and Rodolfo), Luis de Pablo (b. 1930), Ramón Barce, Manuel Carra, Gerardo Gombau, and Enrique Franco.

More than any other country, Spain possesses a wealth of national dances that have inspired many composers. See *Alalá; Alborada; Auresku; Bolero; Canto de órgano; Fandango; Flamenco; Folia* (2); *Guajira; Habanera; Jaleo; Jota; Muineira; Murciana; Pavane; Polo; Rueda; Saeta; Saraband; Sardana; Seguidilla; Seises; Soledá; Zortziko*. Also *Auto; Sainete; Tonadilla; Zarzuela; Madrigal IV*.

rev. S.B.

**Spaltklang** [G.]. Name for a sonority resulting from simultaneous use of contrasting timbres. The term is used with reference to 14th- and 15th-century music (Machaut, Dufay), whose polyphonic character is emphasized by the simultaneous sound of, e.g., voice, shawm, and trombone. The Gothic organ also was based on the \*sound ideal of *Spaltklang*.

**Spanisches Liederbuch** [G., Spanish Song Book]. A collection of forty-four songs by Hugo Wolf, composed 1889–90, to German translations, by E. Geibel and Paul Heyse, of Spanish poetry of the 16th and 17th centuries. See F. Walker, in *ML* xxv, 194.

**Spanish Rhapsody**. See *Rapsodie Espagnole*.

**Spanish Song Book**. See *Spanisches Liederbuch*.

**Sparte** [G.]; **sparta, spartita** [It.]. Partition score. *Spartieren* [G.] means to write a full \*score or put into score. The term is used specifically with reference to early vocal music (prior to 1600), which was originally written in single parts. Therefore, it is synonymous with transcribing early music, a process requiring knowledge of \*mensural notation.

**Spatium** [L.]. The space between two lines of a staff.

**Speaker key**. In wind instruments, a key that facilitates the production of tones by overblowing. It opens a small hole that causes the air column to vibrate in one-half or one-third of its entire length. The oboe usually has two such keys, used to overblow different portions of the scale at the octave, while the clarinet has only one, producing the twelfth.

**Speaking stop**. In organs, any stop that produces sounds, as distinct from others that merely operate couplers, etc.

**Species.** A method of teaching counterpoint known mainly through J. J. Fux's *Gradus ad Parnassum* (1725). Fux distinguished five species, i.e., different ways of adding contrapuntal voice-parts above and below a given *cantus firmus* (c.f.); (1) note against note; (2) two notes against each note of the c.f.; (3) four notes against each note of the c.f.; (4) notes in syncopated position; and (5) florid counterpoint, consisting of a combination of the other species and progressions in eighth notes. [See Ex.] This method of teaching can be traced back as far as 1533 (G. M. Lanfranco, *Scintille de musica*; see Counterpoint

II). Fux's five species are found in L. Zacconi's *Prattica di musica* ii (1619), together with other "species," such as *contrappunto fugato*, *ostinato*, *doppio*. See K. Jeppesen, *Counterpoint* (1930; Eng. trans. 1939).

**Speech song.** See *Sprechstimme*.

**Sperdendosi** [It.]. Fading away.

**Spezzato** [It.]. Split, broken. *Coro spezzato*, divided chorus [see Polychoral style]; *registro spezzato*, divided register [see Divided stop]. M. Pesenti, in his *Il Secondo Libro delle correnti alla francese... con alcune correnti spezzate a tre* (1630) uses the indication "spezzata" for a style probably similar to the French *\*style brisé*.

**Spianato** [It.]. Smooth, even.

**Spiccato** [It.]. See Bowing (d).

**Spiegelfuge** [G.]. Same as mirror fugue [see Mirror composition].

**Spieldose** [G.]. Music box.

**Spielfigur** [G.]. A term used particularly in connection with the keyboard music of composers such as Bull, Sweelinck, and Scheide-mann, who often employed short, lively, playful motifs, such as shown in the accompanying example (Sweelinck, Toccata). Frequently these

figures alternate among the various voice-parts, in which case they are called *\*Komplementärfiguren*.

**Spieloper** [G.]. Name for the German 19th-century *\*comic opera* (Lortzing, Marschner).

**Spinnet** [F. *épinett*; G. *Spinett*; It. *spinetta*; Sp. *espineta*]. (1) A type of small harpsichord. Originally the Italian and French terms referred to any jack-action keyboard instrument [see Harpsichord], but later they were limited to any small, single-choired jack-action instrument in which the strings ran more or less transversely. The German term was used mainly to refer to the oblong instruments with transverse strings that in England were called virginals. In Dutch it was used to distinguish virginals with the keyboard displaced toward the left from those in which it was displaced toward the right (*muse-lar*). During the 18th century the term was applied in England to small instruments having a single transverse choir of strings and a short bent side to the right. In modern English, the spinet is distinguished from the oblong virginals. Generally speaking, any single-choired harpsichord-like instrument that is neither oblong nor of the characteristic harpsichord wing-shape may properly be called a spinet. Acoustically it differs from the virginal, in which both ends of the vibrating section of the strings are supported by bridges mounted on the soundboard, in that one end of each string of the spinet is supported by a bridge glued to the

solid wrestplank. In this it resembles the harpsichord. The resulting tone is less hollow than that of the virginal.

(2) A piano with strings perpendicular to the keyboard (as in an upright piano) but with an indirect action. See Piano III. (1) by F.H.

**Spingardo.** A dance of the early 16th century, known only from two examples in J. A. Dalza's *Intabolatura de lauto* (Petrucchi, 1508), where it occurs in two suites, *passamezzo-saltarello-spigardo*, instead of the normal suite, *passamezzo-saltarello-piva*. It would appear to be just another name for the *\*piva*.

**Spiritoso** [It.]. Spirited.

**Spirituals.** See Negro music I. See G. P. Jackson, "Pennsylvania Dutch Spirituals" (*MQ* xxxviii, 80ff).

**Sponsus play.** See under Liturgical drama.

**Sprechstimme, Sprechgesang** [G.]. A type of voice production halfway between song and speech. It consists of recitation on higher or lower pitches, which, however, are merely hinted at in a subdued manner. *Sprechstimme* is usually notated on a staff by means of crosslike symbols instead of notes. Both the method and notation of *Sprechstimme* [lit., speech song] were introduced by Humperdinck in his melodrama *Königskinder* (1897). Schoenberg used it in *Pierrot Lunaire* (1912) and *Die Glückliche Hand* (1913), and Alban Berg in *Wozzeck* and *Lulu*. See R. Stephan, "Zur jüngsten Geschichte des Melodrams" (*AMW* xvii); H. Keller, in *Tempo*, no. 75 [1965/66], pp. 12-17.

**Sprezzatura.** Term used by G. Caccini (*Le Nuove musiche*, 1601) for a "nonchalant" type of singing, very likely a rubato. See *RiHM* ii.2, 526; *BuMBE*, pp. 28, 371f; F. Torre Franca, in *CP* 1952, p. 412.

**Springbogen** [G.]. *Sautillé, saltando*; see Bowing (d).

**Springer.** An *agrément* used in 17th-century English lute and viol music and belonging to the category of *\*Nachschlag*.

**Sprung(k)** [G.]. A 16th-century designation for a *\*Nach Tanz* (after-dance).

**Spurious compositions.** Their number being legion, the reader is referred to C. L. Cudworth, "Ye Olde Spuriousity Shoppe" (*Notes* xii, 25ff, 533ff), as well as the following literature. Considerable emphasis is placed on Haydn and

Mozart simply because so much research has been done concerning these two composers.

Lit.: H. C. Robbins Landon, *The Symphonies of Joseph Haydn* [1955]; *id.*, *Supplement to "The Symphonies of Joseph Haydn"* [1961]; *id.*, "Two Orchestral Works Wrongly Attributed to Mozart" (*MR* xvii); *id.*, "The Jena Symphony" (*MR* xviii); *id.*, "Doubtful and Spurious Quartets and Quintets Attributed to Haydn" (*MR* xviii); A. Main, "Maximilian's Second-Hand Funeral Motet" (*MQ* xlviii); J. La Rue, "Major and Minor Mysteries of Identification in the 18th-Century Symphony" (*JAMS* xiii); *id.*, "A New Figure in the Haydn Masquerade" (*ML* xl); C. Cudworth and F. B. Zimmerman, "The Trumpet Voluntary" (*ML* xli); D. E. Deutsch, "Unfortunately Not By Me" (*MR* xix; trans. M. J. E. Brown); H. T. David, "A Lesser Secret of J. S. Bach Uncovered" (*JAMS* xiv); W. Kirkendale, "More Slow Introductions by Mozart to Fugues of J. S. Bach?" (*JAMS* xvii); J. Reid, "The 'Gastein' Symphony Reconsidered" (*ML* xl); A. M. Owen, "The Authorship of Bach's Cantata No. 15" (*ML* xli); F. Hudson and A. Dürr, "An Investigation into the Authenticity of Bach's 'Kleine Magnificat'" (*ML* xxxvi); J. M. Barbour, "Pokorny Vindicated" (*MQ* xlix); A. Tyson, "Haydn and Two Stolen Trios" (*MR* xxii); H. C. Robbins Landon, "Problems of Authenticity in Eighteenth-Century Music," in *Instrumental Music*, ed. D. G. Hughes (1959).

**Squarcialupi, Codex.** See Sources, no. 13.

**Square neumes** [G. *Quadratneumen*]. A neumatic script of the 12th century, characterized by the use of small squares (rather than dots, dashes, etc.) to indicate pitches. It developed in northern France and was later universally adopted for the notation of Gregorian chant [see Neumes II] as well as secular monophony (*trouvères, laude*), except in Germany, where *\*Nagelschrift* remained in use up to 1500. See also Square notation.

**Square notation** [G. *Quadratnotation*]. Term introduced by F. Ludwig (*Repertorium organorum* [1910], i, pt. I) to designate the notation of the school of *\*Notre Dame* (c. 1175-1250), which was the first to use square shapes for the notes and ligatures (derived from the *\*square neumes*), instead of the less definitely drawn, neumelike symbols of earlier periods (school of *\*St. Martial*). The chief sources of square notation are the MSS containing the "Magnus liber organi" [see Sources, no. 3].

Some writers prefer the term \*modal notation. However, this term implies that the notational signs are to be interpreted in modal meter, i.e., in the scheme of the rhythmic \*modes, an implication that is not wholly valid. The pieces written in square notation belong to several categories, of which only one—the repertory of *organa*, *tripla*, *quadrupla*, and *clausulae*—deserves the name “modal.” With others, such as the earlier *organa dupla* (Leoninus), *conductus*, and monophonic songs, modal interpretation is at least doubtful. For an example of square (or modal) notation, see Notation, Ex. 2. See *ApNPM*, pp. 215–81; *WoHN* i, 198–250.

**St.** See under Saint.

**Stabat Mater** [L.] A 13th-century sequence (*Stabat mater dolorosa*), probably written by the Franciscan Jacopone da Todi (c. 1228–1306). It was officially added to the Roman Catholic liturgy in 1727 and is still sung today at the Feast of the Seven Dolors (Sept. 15; for the text and liturgical melody, see *LU*, p. 1634<sup>v</sup>). The poem has been set by Josquin, Palestrina, Lasso, Steffani, d'Astorga (ed. by R. Franz), A. Scarlatti, D. Scarlatti, Caldara, Pergolesi, Haydn, Rossini, Schubert, Verdi, Dvorák, Dohnányi, Stanford, Szymanowski, Poulenc, Thomson, Persichetti, and others.

Lit.: K. H. Bitter, *Studie zum Stabat Mater* (1883); *ApGC*, pp. 31, 424, 464; E. Schmitz, *Das Madonnen-Ideal in der Tonkunst* [1918]; C. B. Edgar, in *SIM* ii; P. Mies, in *KJ* 1932; W. Baeumker, in *KJ* 1883, p. 59.

**Stabreim** [G.]. \*Alliteration.

**Staccato.** A manner of performance indicated by a dot or the sign ▼ placed over the note, calling for a reduction of its written duration with a rest substituted for half or more of its value. Thus, a quarter note will be reduced to perhaps a sixteenth note, followed by three sixteenth rests. In piano and violin playing as well as in singing, there are various types of staccato, produced by different touch, bowing, attack, etc. [see *Bowing* (g)]. Earlier composers, such as K. P. E. Bach, Haydn, and Beethoven, normally indicated staccato with the wedge [see Schencker's ed. of Beethoven's piano sonatas], reserving the dot for a less rigid staccato (*portato*), preferably in slow movements. In *Die Bedeutung der Zeichen Keil, Strich und Punkt bei Mozart* (ed. H. Albrecht, 1957), five scholars (H. Keller, H. Unverricht, O. Jonas, A. Kreutz, E. Zimmermann) investigate the significance of

the wedge, vertical stroke, and dot in Mozart's autographs and first editions, with more or less differing results. See also P. Mies, in *MF* xi. Today the dot is used as the normal sign, and the dash for a more pronounced staccato. See A. Pochon, *Le Rôle du point en musique* (1947).

**Staff, stave** [F. *portée*; G. *Liniensystem*, *System*; It. *riga*; Sp. *pentagrama*, *pauta*]. A series of horizontal lines, today always five in number, on and between which musical notes are written, thereby indicating (in connection with a \*clef) their pitch. The positions of the notes on the staff give a satisfactory image of the pitches, although they fail to indicate the difference between whole tones and semitones, as well as the modifications of pitch produced by accidentals (e.g., C-double-sharp is actually higher in pitch but lower on the staff than D-flat).

The first use of horizontal lines for the representation of pitches appears in \**“Musica enchiriadis”* (c. 900). However, only the spaces between the lines are used, with the syllables of the text written in at their proper place [see *ApNPM*, fac. 42a, 42b]. The invention of the staff proper is ascribed to Guido d'Arezzo (c. 990–1050), who in *Regulae de ignoto cantu* [*GS* ii, 34ff] recommends the use of three or four lines, denoting *f a c'* or *d f a c'* (the use of one or two lines, red for *f* and yellow for *c'*, occurred in slightly earlier MSS). The four-line staff has been preserved to the present day for the notation of Gregorian chant. For notating polyphonic music the five-line staff was used as early as the 13th century [see *ApNPM*, fac. 46]. For compositions in simple note-against-note style (\**conductus*) the different staves were frequently written so close together that they give the impression of a single staff of ten or more lines [see *ApNPM*, fac. 47]; however, the fact that on such a staff the same clef letter (*c'*) is used simultaneously in different positions clearly shows that this is a juxtaposition of several staves rather than a single staff. Six-line staves were occasionally used in the 14th century (e.g., in the Italian Codex Rossi, c. 1340), in early 15th-century contratenors of wide range (Dufay, Binchois; see H. Besseler, *Bourdon und Fauxbourdon* [1950], pp. 45ff), and in numerous 16th-century scores of keyboard music [see *ApNPM*, fac. 1, 3, 4, 5].

Lute music and Spanish keyboard music of the 16th century are written on a series of lines that look exactly like the staff but have an entirely different meaning. In the former they

represent the strings of the lute and in the latter the voice-parts of a composition. See *Tablature II* and *III*. For modern reforms of the staff, see *WoHN* ii, 347ff.

**Staffless neumes.** See under *Neumes II*.

**Staffless notation.** General term for methods of notation in which the tones are indicated by letters or similar symbols rather than by notes on a staff. An old method of this type is the German organ and lute tablature [see *Tablature I* and *V*]; a newer one is the \*tonic sol-fa.

**Stahlspiel** [G.]. The military \*glockenspiel [see *Lyra* (4)].

**Stampita, stantipes.** See *Estampie*.

**Ständchen** [G.]. \*Serenade.

**Star-Spangled Banner, The.** The national anthem of the United States, officially adopted in a bill passed on March 3, 1931. The words were written by Francis Scott Key (1779–1843) in September, 1814, while he watched the British bombardment of Fort McHenry, near Baltimore. It is sung to a tune by John Stafford Smith (c. 1750–1836), an Englishman who originally composed the music for a poem beginning "To Anacreon in Heaven." It is not known whether Key had this tune in mind when he wrote the poem, or whether text and music were united later (possibly by Joseph Hopper Nicholson). See O. G. T. Sonneck, *The Star Spangled Banner* (1914); J. Muller, *The Star Spangled Banner* (1935).

**Steel band.** A type of instrumental ensemble that has developed since c. 1910 in the Caribbean. The instruments are old oil drums whose heads are embossed and indented in such a manner that each head will produce several different notes, depending on where it is struck. It is used extensively in \*calypso and \*merengue music.

**Steg** [G.]. Bridge of the violin, etc. See *Bowing* (k).

**Stegreif** [G.]. Improvisation, or performance without preparation. *Stegreifkomödien*, farcical plays with improvised dialogue, were extremely popular in Vienna toward the end of the 18th century. See *DTO* 64.

**Stendendo** [It.]. Slowing down.

**Steppes of Central Asia, In the** [Rus. *V Srednei Azii*]. Symphonic poem by Borodin, composed

in 1880. Its Russian title means simply *In Central Asia*.

**Steso** [It.]. Slow.

**Sticheron.** In Byzantine church music [see *Byzantine chant*] of the 8th century and later, poetic intercalations between the verses (*stichos*) of a psalm; in other words, psalm tropes. A collection of such hymns was called *sticherarion*.

**Stil** [G.], **stile** [It.], **stilus** [L.]. See *Style*.

**Stile concertante.** See under *Concerto III*.

**Stile concertato.** See *Concertato*.

**Stile concitato.** See under *Style*.

**Stile familiare.** See *Familiar style*.

**Stile rappresentativo** [It.]. Passages of melody in vocal or instrumental music characterized by freedom of rhythm, irregularity of phrasing, frequent pauses, and other traits of \*recitative [see also *Arioso*].  
D.J.G.

**Stimm-** [G.]. Voice. *Stimmbänder*, vocal cords; *Stimmbildung*, voice training; *Stimmbruch*, mutation; *Stimmbücher*, partbooks; *Stimmgabel*, tuning fork; *Stimmhorn*, a tool in the shape of a hollow cone used in tuning organ pipes; *Stimmführung*, \*voice-leading; *Stimmbrücke*, \*tuning wire; *Stimmkreuzung*, crossing of parts; *Stimpfeife*, \*pitch pipe; *Stimmritze*, glottis; *Stimmstock*, sound post; *Stimmtausch*, \*voice exchange; *Stimmumfang*, range; *Stimmwechsel*, mutation (of the voice); *Stimmzug*, slide (of trombones).

**Stimme** [G.]. (1) Voice. (2) Voice-part.

**Stimmen** [G.]. (1) Plural of \**Stimme*. (2) To tune.

**Stimmung** [G.]. (1) Mood; thus, *Stimmungsbild*, title for pieces meant to express some definite mood. (2) Tuning, intonation, e.g., *reine Stimmung*, just intonation.

**Sting.** See under *Vibrato* (1).

**Stingendo** [It.]. Fading away.

**Stiracchiando, stirato** [It.]. Drawing out, slowing down.

**Stockflöte** [G.]. See *Czakan*.

**Stockhorn.** \*Pibgorn.

**Stollen** [G.]. See under *Bar* form. Sometimes used as a term for exposition, which, in \*sonata form, corresponds to the *Stollen* of the medieval *Bar*.

**Stop.** (1) In the organ, the mechanical device by which the player can draw on or shut off the various registers. Depending on the style of organ console, this device may be in the form of either a stop knob (draw bar) or stop tab; also, the stop action may be mechanical (using draw knobs or levers) or electric (using tabs or knobs). See Organ II, III. The term is also used for the rank (ranks) of pipes controlled by the mechanism mentioned above. (2) In the harpsichord, stops are chromatic sets of strings that correspond to the keys of the keyboard. Stops have various tone colors and pitch levels. See Harpsichord. (3) A special device frequently used in 17th-century organs and harpsichords was the short stop (half-stop), with which the pipes or strings that it governs do not extend through the total compass of the keyboard. See Divided stop.

Lit.: W. L. Sumner, *The Organ*, rev. ed. (1958); S. Irwin, *Dictionary of Pipe Organ Stops* (1962); R. Russell, *The Harpsichord and Clavichord* (1959), pp. 14ff.

**Stopped notes.** See under Horn I.

**Stopped pipe.** Any pipe closed at one end. For stopped flute, see Organ IX; also Wind instruments III.

**Stopping.** (1) In stringed instruments (violins, lutes), placing the fingertips of the left hand so that they shorten the vibrating length of the string. See Double stop. (2) On the natural horn, see Horn.

**Storm and Stress.** See *Sturm und Drang*.

**Storta** [It.]. A 16th-century term [lit., twisted] for the cromorne or a very similar instrument. It is mentioned in the descriptions of instruments used for several 16th-century intermezzi.

**Strad.** Abbr. for Stradivarius violin; see Violin I.

**Straff** [G.]. Rigid, firm.

**Straight organ.** An organ having a separate and distinct row of pipes for every stop control at the keydesk. A straight organ has more pipes than a \*unit organ with the same number of stop controls. See Organ II (b). C.B.F.

**Strambotto.** A form of 15th-century Italian poetry, consisting of eight-line stanzas in iambic pentameter with the rhyme scheme ab ab ab ab, or, more frequently, ab ab ab cc (the latter is known as *ottava rima*; see, e.g., Byron's *Don Juan*). In Petrucci's *Frottole* (1504–14) *strambotti* are composed in strophic form, the music

of the first two lines being repeated four times [ex. in *RiHM* ii.1, 356]. Later examples are through-composed, in the manner of the madrigal. For bibl. see under *Frottola*.

**Strascicando, strascinando** [It.]. Dragging.

**Strathspey.** A slow Scottish dance in 4/4 meter, with many dotted notes, frequently in the inverted arrangement of the Scotch snap. The name, derived from the strath (valley) of the Spey, was originally synonymous with \*reel; later, "reel" was used for somewhat faster dances in more smoothly flowing rhythm, lacking dotted notes. Important early collections of strathspeys (reels) are: A. Cummings, *A Collection of Strathspeys or Old-Highland Reels* (Strathspey, 1780); Niel Gow, *Collection [A Second . . . Sixth] of Strathspey Reels* (Dunkeld, 1784–1822). Niel Gow (1727–1807) was the most famous performer of strathspeys and reels.

**Stravaganza** [It.]. General term for a piece in free style or involving some sort of fanciful treatment. As early as the end of the 16th century the name was used by G. Macque (c. 1550–1614) for compositions employing "extravagant" harmonies, modulations, dissonances, etc. See his *Consonanze stravaganti* in *HAM*, no. 174 [see also Editions XXVIII, 4, pp. 60, 69].

**Straw fiddle.** See under Xylophone.

**Straziante** [It.]. Anguished.

**Street cries.** As early as the late 13th century, street cries were incorporated into compositions, e.g., in the motet "On parole—A Paris—Frère nouvele," which describes the gay life of Paris and appropriately employs in the tenor a vendor's cry: "Frère nouvele! Muere france!" (Fresh strawberries! Wild blackberries!), repeating it four times as an ostinato [*HAM*, no. 33b]. Later, English composers were attracted by the street cries of London. About 1600, Weelkes, Gibbons, and Deering each wrote a composition in which the text (and probably also the music) consists exclusively of the cries of itinerant vendors, as, "New oysters, new walfleet oysters, New mus-sels . . . , New cockles . . . , Hott mutton pyes . . . ," etc. In Ravenscroft's *Pammelia* (1609) and *Melismata* (1611) a number of street cries are cleverly arranged as rounds. Handel used contemporary street cries in one of the movements of his opera *Xerxes* (1738). Numerous street cries are preserved in 18th-century prints or engravings, representing all sorts of vendors [see P. A.

Scholes, *The Oxford Companion to Music* (1955), facing p. 992].

**Street organ, hand organ.** A \*mechanical instrument based on the barrel-and-pin principle in which the pins operate reed pipes similar to those of the organ. A crank turns the barrel and also operates a bellows, which furnishes air to make the reeds vibrate. The instrument, which is associated with the Italian street musician and his monkey, is popularly but erroneously called \*hurdy-gurdy.

**Streich-** [G.]. Bow. *Streichinstrumente*, bowed instruments. *Streichquartett* (-quintett), string quartet (quintet). *Streichklavier*, piano-violin [see *Sostenente piano*].

**Streit zwischen Phöbus und Pan, Der** [G., The Struggle between Phoebus and Pan]. Secular cantata by J. S. Bach (1732), text by Picander, based on Ovid's account of the musical contest between Phoebus Apollo and Pan. The work is probably a satire directed against Bach's critic, Scheibe (represented by the character Midas).

**Strepitoso** [It.]. Noisy, boisterous.

**Stretta** [It.]. Same as \*stretto (2).

**Stretto** [It.]. (1) In a fugue, the imitation of the subject in close succession, with the answer entering before the subject is completed [G. *Engführung*]. The resulting dovetailing of the subject and its imitation produces an increased intensity that is particularly suitable for the close of the fugue [see Ex., from the Fugue in D

major, *Well-Tempered Clavier* ii]. Stretto, although used as early as 1400 [see, e.g., Dunstable's *O rosa bella*; *HAM*, no. 61, meas. 7-9], was used as a special device of theme presentation in the 16th-century *ricercar* by Girolamo Cavazzoni and, particularly, Andrea Gabrieli and the later *ricercar* composers. (2) In nonfugal compositions, stretto (stretta) is a concluding section in faster tempo, as, e.g., at the end of the last movement of Beethoven's Fifth Symphony.

**Strich** [G.]. Bow stroke.

**Stringed instruments.** Instruments in which the sound-producing agent is a stretched string. The scientific name for this category is chordophone [see under Instruments IV]. The most important members of this large group are the \*violin (and its family), \*harpsichord, \*harp, and \*piano. In each of these instruments the sound is produced by different means, i.e., bowing, plucking, and striking with a hammer. Ordinarily, the name "stringed instruments" ("strings") is reserved for members of the violin family. See H. Panum, *The Stringed Instruments of the Middle Ages* (1941); A. J. Rühlmann, *Geschichte der Bogeninstrumente* (1882); W. Bachmann, *Die Anfänge des Streichinstrumentenspiels* (1966).

**String quartet** [F. *quatuor à cordes*; G. *Streichquartett*; It. *quartetto di corde*; Sp. *cuarteto de cuerdas*]. Chamber music for four strings, practically always first and second violin, viola, and cello. The string quartet is the main type of \*chamber music and is frequently considered, by serious musicians as well as amateurs, the ideal type because it "always says what is necessary, and never too much." For its form, see under Sonata.

I. *The present repertory.* The present-day repertory of string quartets begins with the later quartets of Haydn, written between 1770 and 1790, and those written by Mozart in the same decades. In these works Haydn and Mozart established the string quartet not only as a definite ensemble but as the stylistic realization of the ideal of "four-fold companionship" that has remained—despite stylistic changes and some "side-stepping" in the late 19th century—the basic principle of quartet composition. Beethoven's earlier works (op. 18, nos. 1-6, 1801; op. 59, Russian Quartets, 1808) are what might be termed "Haydn quartets in Beethoven's language," but his late quartets (op. 127, op. 130-33, op. 135) transform a distinguished entertainment into music of far greater complexity and profundity. Beethoven's successor was Franz Schubert, whose late quartets (A minor, D minor) were seldom performed until relatively recently. While the quartets of the period immediately following (Cherubini, Schumann, Mendelssohn) are of secondary importance, a new peak was reached in the quartets of Brahms (op. 51, op. 67), which used the traditional form to express restrained romanticism. The romantic string quartet came to its conclusion with the

works of Dvořák (eight quartets, 1874–95), Franck (D minor, 1889), D'Indy (op. 35, 1891; op. 45, 1898; op. 96, 1930), and Max Reger (op. 54, op. 74, op. 109, op. 121).

French impressionism, with its emphasis on coloristic effects, and the turbulent decades of the early 20th century were not particularly favorable to the cultivation of so traditional a form as the quartet. Nonetheless, the quartets of this period are interesting documents, showing attempts to utilize the medium of strings as a vehicle for impressionist methods (Debussy, Ravel); atonality (Schoenberg, Berg, Webern); twelve-tone technique (Schoenberg, op. 30); motoric and percussive rhythms (Bartók, nos. 3 and 4); neoclassic idiom (Stravinsky, *Sessions*, Piston); quarter-tone technique (Bartók, no. 6, 3rd movt., *Burletta* section); etc.

**II. History.** The string quartet is a relatively recent type. To trace it to the 16th or early 17th century is a misguided effort. In the first place, the four-voice chamber music of this period (\*ricercars and similar pieces by Isaac, Hofhaimer, Senfl, Willaert, and A. Padovano; instrumental \*canzonas by Maschera and many others) is entirely different from the modern quartet in form and style. Moreover, it has no historical connection with the latter since the medium of four stringed instruments was largely abandoned in the baroque period except in England, where the \*fancy was cultivated until c. 1680. A composition by Gregorio Allegri (c. 1582–1652), which has been called “the first work for four stringed instruments,” owes this distinction merely to the fact that Athanasius Kircher, in his *Musurgia* of 1650, reproduced it with the designation “duoi violini, alto, e basso di viola” [see J. W. von Wasielewski, *Die Violine im 17. Jahrhundert, Instrumentalsätze*, Suppl., p. 26]. During the first half of the 17th century numerous four-voice instrumental pieces were written in Italy and Germany; these, however, seem to have been intended for small string orchestras rather than a quartet [see Sonata B II, close]. About 1675 the four-part ensemble was largely abandoned, and the \*trio sonata became the chief type of chamber music during the later baroque period.

Certain sonatas by Alessandro Scarlatti (1659–1725) bear the (authentic?) remark *per due violini, violetta, e violon-cello*, the earliest extant indication, after Kircher's, of the modern string quartet. Its actual history, however, does not begin much before 1750. The question of precedence is very difficult to settle since various

claimants lived at the same time (Tartini, 1692–1770; Sammartini, 1701–75; F. X. Richter, 1709–89; see *DTB* 27), while others (Starzer; see *DTO* 31; Pugnani; Boccherini; M. Canales; Karl Stamitz; Anton Stamitz; Gyrowetz) belong to the generation of Haydn (b. 1732). In general, the earliest string quartets (including those of the young Haydn) are orchestral rather than chamber music, since they were performed by several players to the part. Their form is frequently that of the \*divertimento. Haydn wrote 83 quartets, Boccherini 102, and Gyrowetz 60.

Aulich, *The Well-Tempered String Quartet* (1938); J. de Marliave, *Études Musicales* (1917), pp. 215ff; J. Kramarz, *Das Streichquartett* (1961); A. E. Hull, “The Earliest Known String-Quartet” (*MQ* xv); E. J. Dent, “The Earliest String Quartets” (*Monthly Musical Record* xxxiii [1903], 202–04); G. Roncaglia, in *LRM* vi, vii (Cambini); M. Pincherle, “On the Origins of the String Quartet” (*MQ* xv); M. Scott, “Haydn's '83'” (*ML* xi, 207ff); E. Goossens, “The String Quartet since Brahms” (*ML* iii, 335ff); G. Roncaglia, in *LRM* ii and vi. See also Chamber music.

**String quintet.** Chamber music for five strings. See Quintet.

**Strings.** Colloquial abbr. for the stringed instruments of the orchestra (string section) or the string quartet, quintet, etc.

**String trio.** Chamber music for three strings. See Trio (3).

**Strisciando** [It.]. The correct Italian term for what is usually called \*glissando.

**Stroboconn.** Trade name for an electronic-stroboscopic frequency meter used to measure acoustical frequencies. It can measure frequencies over the entire range of the piano keyboard (27.5 to 4,066 cycles per second), a range that can be extended to 50,000 cycles per second with the use of external frequency dividers. In musical-acoustical research, the Stroboconn is used for defining pitches, intervals, scales, etc., especially of ancient and non-Western music, as well as tunings, temperaments, and instrumental and vocal intonations. It is also useful in studies of the physiology and psychology of hearing, in tuning keyboard and other instruments, and in measuring the frequencies of harmonics, acoustical transients, and vibrato phenomena. The

instrument's main advantage is its high precision, being accurate within 1 cent (i.e., .05 per cent). The Strobocoenn does not, however, record (write or print out) its results, as some other, far less precise meters do.

Patented in 1942, the Strobocoenn became generally available in the late 1940's and is now produced in several models for industrial or musical applications. Measurements are read in \*cents as deviations from equal-temperament intonations [see Temperament]; the readings can then be converted from cents into cycles per second by using tables such as found in R. W. Young, *A Table Relating Frequency to Cents* (1939). See also F. A. Kuttner, in *MF* vi, 235ff. F.A.K.

**Strohfiedel** [G.]. Straw fiddle [see Xylophone].

**Stroh violin (cello)**. Instrument invented by Charles Stroh in 1901 for the purpose of recording, in which the usual body is replaced by an aluminum plate connected to an amplifying horn.

**Stromento** [It.]. Instrument. *Stromento*, instrumented, accompanied by instruments; see Recitative. *Stromenti a corde*, stringed instruments; *s. d'arco*, bowed instruments; *s. di legno*, woodwind instruments; *s. d'ottone* or *di metallo*, brass instruments; *s. a percossa*, percussion instruments; *s. a fiato*, *s. di vento*, wind instruments; *s. da tasto*, keyboard instruments.

**Strophenbass** [G.]. See Strophic bass.

**Strophenlied** [G.]. Strophic song.

**Strophic**. Designation for a song in which all stanzas of the text are sung to the same music, in contrast to a song with new music for each stanza [\*through-composed]. Generally the former method is preferred for simple lyrical texts and the latter for highly dramatic texts or more refined lyrics involving subtle shades of mood and expression.

**Strophic bass**. Designation for a technique, often found in early 17th-century monody, of using the same bass line for all the stanzas of a song, with varying melodies in the upper part. The strophic bass is distinguished from the \*ground (*basso ostinato*) by its greater length and its definite ending. Thus, *basso ostinato* and strophic bass are examples of continuous and sectional variation respectively [see Variations]. Among the earliest examples is the Prologue of Monteverdi's *Orfeo* (1609), whose five stanzas are sung to varied recitatives over the same bass.

Peri's *Varie musiche* (1610) contains three monodies (nos. 13–15) on the same bass, each consisting of recitative, aria, and ritornello. From c. 1620 to 1630, most cantatas are strophic-bass arias, e.g., those in Alessandro Grandi's *Cantade et Arie a voce sola* (1620). Grandi repeats the bass exactly [ex. in *RiHM* ii.2, 39f], whereas in the earlier examples it usually undergoes slight modifications. Frescobaldi's *Primo libro d'Arie musicali* of 1630 [new ed. by H. Spohr (1960), in *Musikalische Denkmäler* iv] contains several strophic-bass arias, e.g., "Dunque dovrò," entitled *Aria di romanesca* because its bass is derived from the \*romanesca. Kaspar Kittel's *Arien und Kantaten* of 1638 contain twelve strophic-bass arias, among them one on the \*ruggiero bass [see *RiHM* ii.2, 349ff]. See Cantata I; Aria III.

**Strophic song**. See under Through-composed.

**Strophicus**. See under Neumes I (table).

**Strumento d'acciaio**. Same as *strumento d'acciaio*. See under Glockenspiel.

**Stück** [G.]. Piece, composition.

**Stufe** [G.]. Degree (of the scale).

**Stundenofficium** [G.]. Hours of the \*Office.

**Sturm und Drang** [G.]. A movement in German literature [lit., storm and stress], c. 1770–85, represented by Reinhold Lenz (1751–92), F. M. Klinger (1752–1831), and others, and named after Klinger's play, *Sturm und Drang* (1776). It embodied the vehement attack of the younger generation on social and artistic conventions. In music, the term has been used with reference to the "forced" expressiveness that appears as early as 1753 in K. P. E. Bach's *Versuch über die wahre Art, das Clavier zu spielen*. Johann Gottfried Mützel (1718–88) and Johann Gottfried Eckard (1735–1809) represent the same tendencies. See H. H. Eggebrecht, in *Deutsche Vierteljahresschrift für Literaturwissenschaft und Geistesgeschichte* xxix (1955), pp. 323ff; L. Hoffmann-Erbrecht, in *MF* x.

**Stürze** [G.]. Bell of the horn. *Stürze hoch*, the bell turned upward.

**Stutzflügel** [G.]. Baby grand piano.

**Style** [F. *style*; G. *Stil*; It. *stile*; Sp. *estilo*]. In the arts, mode of expression or of performance. In a musical composition, "style" refers to the methods of treating all the elements—\*form,

\*melody, \*rhythm, etc. In practice, the term may be applied to single works (e.g., the style of *Tristan* compared to that of *Die Meistersinger*); to composers (the style of Wagner compared to that of Beethoven); to types of composition (operatic style, symphonic style, motet style, church style); to media (instrumental style, vocal style, keyboard style); to methods of composition (contrapuntal style, homophonic style, monodic style); to nations (French style, German style); to periods (baroque style, romantic style); etc. Also, such terms are sometimes used in combination, e.g., "Beethoven's symphonic style," "German romantic style," "instrumental style of the baroque," etc. The founder of modern \*style analysis is Guido Adler (1855–1941).

The study of musical style was introduced by Italian writers of the early 17th century, who invented a remarkable vocabulary for the various "languages" of the music of their time. The strict contrapuntal style of Palestrina, which predominated throughout the 17th century in Rome [see Roman school], was called *stile antico* (*obbligato, grave, osservato, romano*). The monodic style of the early 17th century [see *Nuove musiche*], in which the recitative served as the vehicle of expressive declamation, received designations such as *stile nuovo, moderno, espressivo, recitativo, rappresentativo* [see *Stile rappresentativo*]. Latin equivalents used by Christoph Bernhard (1627–92) are *stilus gravis* (or *antiquus*) and *stilus luxurians* (or *modernus*). *Stile concertante* is the style of concerto-like treatment, i.e., of rivaling instruments [see Concerto III], while *stile concitato* is the style of dramatic expression and excitement (Monteverdi, *Il Combattimento di Tancredi e Clorinda*, 1624; see W. Kreidler, *H. Schütz und der Stile concitato von Claudio Monteverdi* [1934]).

Parry, *Style in Musical Art* (1911); R. Crocker, *A History of Musical Style* [1966]; E. Closson, "Du Style" (*AM* iii, no. 3); K. Meyer, "Zum Stilproblem in der Musik" (*ZMW* v); A. Schering, "Historische und nationale Klangstile" (*JMP* xxxiv); L. Hibberd, "A Note on Musical Styles" (*MR* xix); H. Mersmann, "Zur Stilgeschichte der Musik" (*JMP* xxix); H. L. Clarke, "Toward a Musical Periodization of Music" (*JAMS* ix); E. A. Lippman, "Stil" (*MGG* xii). Also see under Style analysis.

**Style analysis.** The identification of characteristic features in the music of composers and schools by comprehensive analysis of harmony, rhythm, melody, and sound (all acoustical elements, such as timbre and texture), as well as form. Within these categories, style analysis considers all ramifications appropriate to the music examined, applying analytical procedures in all dimensions, from small details to comparisons of whole movements and cycles, and distinguishing significant from coincidental phenomena by systematic and consistent frames of reference. This approach, which deals concretely with the musical notes themselves, complements aesthetic and historical considerations of style.

LaRue, "On Style Analysis" (*JMT* vi, no. 1). J. LaR.

**Style brisé** [F.]. Term for the characteristic style of 17th-century French lute music (especially that of Denis Gaultier, c. 1600–72), in which melody and bass notes are sounded not simultaneously but one after the other, as e.g., f'–a–g–e' d'–f–e–c' [see *BuMBE*, p. 165f]. This style greatly influenced the harpsichord music of the French clavecinists and Froberger. Similar to the *style brisé* are certain formations in "contrapuntal" compositions written for a melody instrument, especially in Bach's compositions for unaccompanied violin and cello. See *Spezzato*.

**Style galant** [F.]. \*Gallant style.

**Subdiapente; subdiatessaron.** See *Diapente; Diatessaron*.

**Subdominant.** The fourth degree of the scale (f in C major or C minor), so called because this tone is a fifth below the tonic, just as the dominant is a fifth above it [see Scale degrees]. In harmonic analysis the triad of the subdominant is indicated IV or S. It occurs chiefly in the combination IV–V–I, i.e., as the antepenultimate chord in cadences. In early music it frequently occurs as the penultimate chord IV–I, a combination known as plagal cadence. More than any

other triad, the subdominant is capable of modifications that, in the current system of \*harmonic analysis, are regarded and labeled as different chords with different roots [see Ex.],

IV IV<sup>b</sup> II<sub>5</sub> II<sub>5</sub><sup>b</sup> II<sup>b</sup> V<sub>6</sub>/V V<sub>5</sub><sup>b</sup>/V V<sub>0</sub>/V V I

although from a functional point of view they are essentially identical [see Functional harmony].

**Subfinalis** [L.]. See under Church modes I.

**Subject** [F. *sujet, thème*; G. *Thema*; It. *tema, soggetto*; Sp. *tema*]. A melody that, by virtue of its characteristic design, prominent position, or special treatment, becomes a basic factor in the structure of the composition. The subject (or, if there is more than one, the main subject) is always stated at the outset of the composition. In \*sonata form there normally are two subjects or, in longer examples, two groups of subjects. A fugue usually has only one subject, except in special types such as the double or triple fugue.

In the course of music history the subject has become increasingly important, particularly as a unifying element. In early music (prior to 1500) there is no subject unless the borrowed *cantus firmi*, which form the basis of numerous compositions (Masses, motets), are regarded as such. During the second half of the 15th century (Ockeghem, Isaac) characteristic figures (motifs) were gradually adopted as material for short passages, in imitation, sequential treatment, or occasionally as \*ostinatos. The use of identical or similar motifs for the beginning of all the movements of a Mass also indicates a tendency toward unification [see Mass C, II]. The fully developed imitative style of the Josquin period use numerous subjects in succession, one for each \*point of imitation. The *ricercars* of this period usually reduce the number of such subjects and make more extensive use of each. In fact, they can already be considered "fugues in several sections," each fugue being based on one theme. An important step was taken in the variation canzonas of Frescobaldi, which use rhythmic modifications of a single subject for the different sections of the piece [see Canzona (5) I]. The fugues of the 17th century usually

employ themes lacking individuality or deficient in details of design. Bach's main contribution to the development of the fugue was the creation of themes of the highest artistic quality. The accompanying example shows two somewhat similar themes [Ex. a, Buxtehude, "Praeludium und Fuga" in F-sharp minor for organ; Ex. b, *Well-Tempered Clavier* ii, Fugue in A minor]

a

b

that illustrate this point. The sonata required a different type of subject, but the details of the development from the "continuous melody" of the *sonata da chiesa* (Bach, Handel) to the individualized subjects of the late works of Haydn and Mozart (c. 1780) and the highly dramatic themes of Beethoven are too complex for a brief summary. Suffice it to mention D. Scarlatti, Pergolesi, J. W. A. Stamitz, and Johann Christian Bach as some of the numerous composers who contributed to this development.

**Subito** [It.]. Suddenly.

**Subjugal** [L.]. Early designation for a plagal mode.

**Submediant**. See under Scale degrees.

**Subsemitonium**. See *Subtonium*.

**Subsidiary subject**. A subject of lesser importance, particularly one of those subjects that, in the fully developed examples of sonata form, follow after the "first subject" or the "second subject," thus forming the "first group" or the "second group."

**Subtonic**. See under Scale degrees.

**Subtonium** [L.]. The tone added below the normal range of a church mode (*subtonium modi*), hence, c in mode 1, G in mode 2, etc. [see Church modes I]. It is especially important in the authentic modes, in which it represents the tone below the final (*subfinalis*) and therefore is often used in cadences. Later *subtonium* came to mean the tone below the final in both the authentic and the plagal modes. In the 16th century, the term meant "whole tone below the final," as opposed to *subsemitonium*, half-tone below the final. All modes except the Lydian and Ionian have the *subtonium*. The replacement of the *subtonium* by the *subsemitonium* in any of

the other modes (e.g., the use of  $f\sharp$  in Mixolydian) was considered *\*musica ficta*.

**Succentor** [L.]. In 16th- and 17th-century German church music, the leader of Chorus II in antiphonal singing, deputy to the *\*precentor*.

**Successive counterpoint.** The writing of contrapuntal music in separate lines rather than in a simultaneous process of composition. From the beginning of polyphony through at least the end of the 13th century, music was always composed successively. For instance, in a 13th-century motet the process would start with the selection of a chant melody, which would be organized rhythmically by consistent application of some rhythmic pattern [see Modes, rhythmic]. This would be used as the tenor, to which was added the *duplum* (*motetus*) and, often by another composer, the *triplum*. The isorhythmic motets of the 14th century were written in the same manner, as were the *cantus firmus* Masses of the 15th century. In secular compositions of the 14th century, such as the *ballades* of Machaut, the process probably started with the *superius*, to which was added first the tenor and then the contratenor. Possibly *superius* and tenor were written more or less simultaneously, but the *contra* is always clearly recognizable as a later addition. In not a few cases the same composition survives with two different contratenors. In the 15th century successive counterpoint was gradually abandoned. Pietro Aaron, in his "De institutione harmonica" of 1516, after describing the successive mode of composition, *secundum veterum morem* (he gives the order *cantus*, tenor, bass, alto), says that modern composers conceive the four parts together, and that in this way the composition becomes more harmonious. See E. Lowinsky, in *PAMS* 1941, pp. 67f.

**Suffrages.** In the rites of the Anglican Communion, suffrage means an "intercessory prayer or petition" (Webster). There seems to be no clear distinction among the Western liturgies between the terms *\*preces* and suffrages. For example, *preces* as found in the Latin offices are called suffrages in the *Anglican Diurnal* and the *American Lutheran Service* books. In the Anglican Prayer Books the versicles and responses following the Creed in Morning and Evening Prayer are called the suffrages. A number of musical settings exist, among them two by Tallis. See *The Choral Service* (1929); *The Hymnal of the Protestant Episcopal Church in the United States* (1940), nos. 601, 602.

V.P.D.

**Suite.** An important instrumental form of baroque music, consisting of a number of movements, each in the character of a dance and all in the same key.

I. *Bach's suite.* The standard scheme of the suite used by Bach is A-C-S-O-G, with A standing for *\*allemande*, C for *\*courante*, S for *\*saraband*, G for *\*gigue*, and O for what is called optional dance or optional group, i.e., one or several dances of various types, chiefly the *\*minuet*, *\*bourrée*, *\*gavotte*, *\*passepied*, *\*polonaise*, *\*anglaise*, *\*loure*, and *\*air*. For the harpsichord, Bach wrote, besides some single suites, six "English Suites," six "French Suites," and six "Partitas." The terms "English" and "French" are both unauthentic and irrelevant; for the term "Partitas," see *Partita*. The English Suites and Partitas are preceded by an introductory piece (prelude), which, in the English Suites is (except for the first) similar to a *\*concerto grosso* movement. Those of the first three partitas are modeled after the *\*Inventions*, that of the fourth is a French overture [see Overture I], and the last two borrow their style from the *\*toccata*. The dance movements are invariably in binary form, either symmetrical (i.e., with both sections of about the same length) or asymmetrical, i.e., with the second section expanded in a manner foreshadowing sonata form [see Binary and ternary form; Sonata form]. Stylistically the dances of the optional group form a contrast to the others, being simpler in style and more clearly suggestive of dance types. The reason for this important difference is that the *allemande*, *courante*, *saraband*, and *gigue* are much older types, which originated in the 16th century and, by the time they were adopted into the suite (c. 1650), had lost their dance connotation and become idealized types, rhythmically weakened but elaborate in texture and style. The optional dances, on the other hand, originated in the French ballets of the late 17th century (Lully) and retained the character of actual dance music.

II. *The modern suite.* The suite became practically extinct after 1750, leaving only traces in the *\*divertimento* and *\*cassation* as well as in the minuet of the classical *\*sonata* (symphony). Franz Lachner (1803-90) tried to revive the form with his eight orchestral suites, written in a learned contrapuntal style. More important was the establishment of a modern suite in which the traditional dances were replaced by a free succession of movements of different character, frequently by national dances or ballet dances. This type of orchestral music gained favor in

the 1880's and 1890's. Particularly common are orchestral suites arranged from operas and ballets, e.g., Bizet's *L'Arlésienne* no. 1 (from the play with incidental music, 1872), Grieg's *Peer Gynt Suite* (from the incidental music to Ibsen's play, 1876), Tchaikovsky's *Suite from The Nutcracker* (from the ballet, 1892), Stravinsky's *Suite from Petrushka* (from the ballet, 1911). The neoclassical movement of the 20th century led to a deliberate revival of the abstract (non-operatic) suite, and Bach's example occasionally served as a pretext for introducing jazz dances into art music (Hindemith, *Suite* 1922; E. Krenek, E. Schulhoff, Conrad Beck).

III. *The suite before Bach.* The development culminating in Bach's suites represents an interesting example of international cooperation. Italy contributed the early development (16th century), England the gigue, Spain the saraband, France the great wealth of 17th-century dance types, and Germany the allemande as well as concept of the suite as a unified and definite musical form.

The origin of the suite is usually sought in the combinations of two dances, one in duple time, the other in triple time, that occur throughout the 16th century, e.g., pavane-galliard or *passamezzo-saltarello* [see *Nachtanz*]. Even more important than these pairings are the combinations, not uncommon in 16th-century lute books, of three or more dances played in succession. Examples are the combination *pavana-saltarello-piva* (or *spingardo*) in J. A. Dalza's lute book (1508), *basse danse-recoupe-tordion* in the lute books of P. Attaignant (1529), *passamezzo-gagliarda-padovana* in that of Antonio Rotta (1546), or *passamezzo-padovana-saltarello-ripresa* in that of M. Waisselius (1573). After 1600 this course was further pursued by such German composers as P. Peuerl, I. Posch (both in *DTO* 70), S. Scheidt (1587-1654), and J. H. Schein (1586-1630), each of whom established his own standard form, e.g., *Paduana-Intrada-Dantz-Gagliard* (Peuerl, 1611; see *EiBM*, no. 26), or *Pavana-Galliarde-Courante-Allemanda-Tripla* (Schein, *Banchetto musicale*, 1617; see *HAM*, no. 197). While the idea of the suite as a unified musical form is clearly present in these compositions, it is lacking in the works of French composers such as Jean-Baptiste Besard (b. 1567), Chambonnières (c. 1602-72), Louis Couperin (c. 1626-61) and D'Anglebert (c. 1628-91), who merely arranged the dances either according to types (Besard, *Thesaurus harmonicus*, 1603; one "Livre" of allemandes, another

of courantes, etc.) or, later, according to keys, but in such large numbers as to exclude the idea of a definite form. For example, a "suite" by Chambonnières in the Bauyn-MSS (c. 1760) includes five allemandes, eleven courantes, four sarabands, two giges, five courantes, one chaconne—all in C major. This loose aggregation still exists in the harpsichord works of François Couperin (pub. 1713-30) who, perhaps deliberately, avoids the name "suite" used as early as 1687 by Lebègue in his *Pièces de Clavecin*, ii) and instead uses the term "Ordre," which might well be also applied in the case of the earlier French composers. The important contribution of the French clavecinists was to transform the allemande, courante, gigue, and saraband from their 16th-century plainness to baroque refinement (the \*courante is particularly interesting in this respect), and to enlarge the repertory by those numerous dances that were adopted, c. 1700, into the optional group of the suite.

The creation of the classical suite is the work of J. J. Froberger (1616-67) who, born in Stuttgart, educated partly in Rome, and spending the last part of his life in France, was eminently suited for the task of imbuing the German "Renaissance" suite of Peuerl and Schein with the stylistic achievements of the French baroque. About 1650, the prevailing type of suite had only three movements: A-C-S. Many suites of Froberger have this scheme, as do all those by Kindermann (c. 1645; see *DTB* 32) and nearly all the instrumental suites of the Kassel MS (ed. by J. Écorcheville, *Vingt Suites d'Orchestre*, 1906). The gigue was introduced somewhat later as an "optional" dance, either before or after the courante, with the saraband retaining its position as the concluding movement: A-C-G-S or A-G-C-S. In Froberger's autograph MSS his four-movement suites invariably close with the saraband, as do, e.g., J. Rosenmüller's *Sonate da camera* of 1670 [*DdT* 18] and some of the suites in M. Locke's *Melothesia* (1673). Not until after Froberger's death were the positions of the saraband and gigue exchanged, as appears from the earliest printed edition of his suites (published posthumously in 1693), which bears the remark, "mis en meilleur ordre" (put in better order). Other examples of the A-C-S-G arrangement are in the suites of Georg Böhm (1661-1733).

The development of the suite was completed by the addition of the prelude and optional dances (minuet, gavotte, bourrée, etc.). Elabo-

rate preludes precede some of the lute suites of E. Reusner (*Delicie testudinis*, 1667; *Neue Lautenfrüchte*, 1676). Some of the suites in Locke's *Melothesia* include a prelude at the beginning and/or an optional dance at the end, e.g., P-A-C-S-Rant or A-C-S-Hornepipe. All the harpsichord suites by Purcell begin with a prelude but lack a gigue. Most of them are in the form P-A-C-S, but occasionally the saraband is replaced by a minuet. Some of Johann Krieger's suites (*Sechs musikalische Partien*, 1697; DTB 30; see *Partita*) also employ the optional dance as a closing movement (A-C-S-G-O) while suites ascribed to Pachelbel have it in the middle (A-C-O-S-G). Suites by G. B. Draghi (*Select Suites of Lessons*, 1700) are in the form P-A-C-S-O-G, with the optional dance (or dances) as the penultimate movement, an arrangement that is standard in the suites of Bach.

IV. *The sonata da camera*. Side by side with this central development were others of a somewhat freer character, chiefly in chamber and orchestral music. In Italy the suite was cultivated mainly as a form of chamber music. G. B. Buonamente's *Il quinto libro de varie Sonate, Sinfonie, Gagliarde, Corrente* (1629) contains two suites, *Sinfonia-Gagliarda-La sua Corrente*, and in his *Settimo libro* (1637) this structure is enlarged by the addition of a *Brando* after the *Sinfonia* [see P. Netti, in *ZMW* ix, 528ff]. Possibly the *Sinfonia* is not an abstract movement like the prelude but an idealized pavane. The usual designation for the Italian instrumental suite of the 17th century is *\*sonata da camera*. Originally, this term meant any kind of dance music, mostly single dances, but later it was applied to suitelike formations such as *Ballo-Corrente* (M. Cazzati, *Trattenimenti*, 1660), *Balletto-Corrente-Gigha-Sarabanda* (Bassani, 1677, '79, '80; in the last two publications the order is . . . *Sarabanda-Gigha*, corresponding to the simultaneous change from A-C-G-S to A-C-S-G in Germany), or *Balletto-Giga-Minuet-Borea* (G. B. Vitali, 1685). In most of these suites, *balletto* is probably just another name for the *allemande* [see *Balletto* (2)]. A. Corelli's *Sonate da camera*, op. 2 (1685) and op. 4 (1694), contain twelve suites each, mostly in four movements, such as *Preludio-Allemanda-Corrente* (or *Sarabanda*)-*Giga* (or *Gavotta*). G. Torelli's *Concerto da camera* (1686) contains twelve suites, each in three movements, e.g., *Alemanda-Corrente-Sarabanda*; *Balletto-Gigha-Sarabanda*; etc. Antonio Veracini's *Sonate da*

*camera*, op. 1 (1692) show a tendency toward amalgamation with the *sonata da chiesa* through the inclusion of free movements, e.g., *Fantasia-Allegro-Allemanda-Pastorale-Giga*. Thus in Italy the suite appears not to have been standardized, as it was in Germany.

V. *The French overture*. Still another type of suite, designed for orchestral performance, originated (presumably) in a practice similar to that exemplified in, e.g., Tchaikovsky's *Suite from the Nutcracker*, i.e., the performance of Lully's operas or stage ballets "in abstracto," as a succession of their most successful dance numbers preceded by the operatic overture (ballet suite). This idea was taken over by numerous German composers, who wrote orchestral suites consisting of a French overture [see *Overture* I] followed by a series of "modern" dances, such as *rigaudon*, *marche*, *chaconne*, *bourrée*, *traquenard*, and others. Such suites, briefly called "Overture," were written by Johann J. S. Kusser (*Composition . . . suivant la méthode françoise*, 1682), Georg Muffat (*Florilegium*, 1695/98; DTO 2, 4), J. K. F. Fischer (*Le Journal du Printemps*, 1695; DdT 10), J. A. Schmieder (*Zodiacus Musicus*, 1698; *ibid.*), J. J. Fux (*Concentus musico-instrumentalis*, 1701; DTO 47), G. P. Telemann (*Musique de table*, 1733; DdT 61/62), and J. S. Bach (4 Orchestral Suites). Bach also transferred this type to the keyboard in his *Französische Ouvertüre* (contained in the *\*Clavier-Ubung* ii, 1734), as Georg Böhm had done earlier [see his *Sämtliche Werke* i (1927), no. 2]. In its use of "modern" dances this suite comes much closer to the 19th-century type than the idealized "classical" suite.

Epstein, *Der französische Einfluss auf die deutsche Klaviersuite im 17. Jahrhundert* (1940); M. Reimann, *Untersuchungen zur Formgeschichte der französischen Klavier-Suite* (1940); G. Oberst, *Die englischen Orchester Suiten um 1600* (1929); AdHM i, 563ff; E. Noack, "Ein Beitrag zur Geschichte der älteren deutschen Suite" (AMW ii); T. Norlind, "Zur Geschichte der Suite" (SIM vii); G. Adler, in RMI iii (Muffat); B. Wójcikówna, in ZMW v (Fischer).

**Suite Bergamasque.** Piano composition by Debussy, consisting of *Prélude*, *Menuet*, *\*Clair de lune*, and *Passepied*. Its title is probably derived from a line in Verlaine's poem *Clair de lune*, "... masques et bergamasques."

**Sw.** Abbr. for *swell organ* [see under *Swell*].

**Swan Lake, The.** Ballet by Tchaikovsky (choreography by M. Petipa and L. Ivanov), composed in 1876. It tells the story of Prince Siegfried's fight against the Evil Power in his attempt to woo the Swan Queen, Odette. The ballet is one of the first to utilize the \*leitmotiv technique, with a specific melody representing the Queen.

**Swan of Tuonela.** Symphonic poem by Sibelius, op. 22 (1893), based on a legend from the \*Kalevala. Tuonela, the Finnish Hades, is surrounded by a river of black water on which a swan swims majestically and sings. In the music, sustained strings represent the dark waters and the gliding movements of the swan, while a solo English horn presents the swan's song.

**Swan Song.** See *Schwanengesang*.

**Sweden.** The tradition of Gregorian chant led, in the 13th century, to a national production of sequences and hymns [see Lit., Moberg]. Aside from this, very little is known about music in Sweden before 1600. The Reformation led to Olaus Petri's adaptation of Latin and German hymnody for Swedish use, but the Royal Chapel was maintained under Gustavus Vasa and his successors, Eric XIV (himself a composer of polyphonic settings) and John III. In the 14th century rhymed Offices for St. Birgitta were written by Archbishop Birger Gregersson (d. 1383) and Bishop Nils Hermansson (d. 1391), with music adapted from well-known melodies. In 1582, Theodoricus Petri published in Greifswald (Pomerania, then part of Sweden) *Piae cantiones* [\*Editions XLIII, 10], a collection of religious songs written in one to four parts, which, according to the introduction, were much used in the schools of Sweden and Finland. Some of them probably date as far back as the 13th century, while others are similar to Lutheran hymns. In the reigns of Gustavus Adolphus (1611–32) and his daughter Christina (1632–54) music was liberally encouraged at the court of Stockholm. During this period and until well into the 18th century, several members of the Düben family were active in Stockholm. Andreas Düben (c. 1590–1662) is known only for one composition (*Pugna triumphalis*) in Venetian polychoral style, composed for the burial of Gustavus Adolphus (1634), and a *Miserere*, composed for the burial of Karl X (1660). His son, Gustaf (1624–90), compiled a famous MS collection of music, including works by Buxtehude, now in the library of Uppsala.

Gustaf's son, Gustaf Düben (the younger), succeeded his father as a court conductor.

During the 18th century there was considerable musical activity at the University of Uppsala. Prominent figures were Olof Rudbeck (1630–1702), who held office as rector, and Harald Vallerius, professor of mathematics and *director musices*. An important composer was Johan Helmich Roman (1694–1758), who studied in London under Ariosti and Pepusch, and possibly also under Handel. He became director of court music in 1729 and wrote a considerable number of instrumental and vocal pieces in the style of Handel. Court opera houses were built during the 18th century (the one at Drottningholm is still in use), and under Gustaf III (1772–92) the growth of opera was much encouraged. The German Johann Gottlieb Naumann (1741–1801) wrote two successful operas, *Amphion* (1778) and *Gustaf Wasa* (1786), both produced in Stockholm. Other Germans who played a role in Swedish music were G. J. Vogler (Abbé Vogler, 1749–1814; opera *Gustaf Adolph och Ebba Brahe*, 1788) and his pupil J. Martin Kraus (1756–92; symphonies, operas). Particularly successful was the French-Swiss Jean-Baptiste-Edouard du Puy (c. 1770–1822) with his opera *Ungdom og Galskab* (1806), which was in the repertory of the Copenhagen and Stockholm operas throughout the 19th century. A unique personality in 18th-century Swedish society was C. M. Bellman (1740–95), who enjoyed the patronage of Gustavus III and frequented the taverns of Stockholm, where he sang his matchless lyrics to tunes he adapted or composed; collections of these songs were published under the titles *Fredmans epistlar* (1790) and *Fredmans Sångar* (1791).

Franz Berwald (1796–1868) deserves mention as a composer of symphonies, string quartets, and other chamber music. Ivar Hallström (1826–1901) gained a reputation as a composer of operas, some of which use clearly national idioms, earning him the title of "the Swedish Glinka." August Söderman (1832–76) encouraged the nationalist movement in his opera *Ett bondbröllop* (A Country Wedding). This movement was widely supported by the public and by music societies but never found a champion comparable in stature to Norway's Grieg. Andreas Hallén (1846–1925) wrote operas (*Harald Viking*, 1881) and symphonic poems in the styles of Wagner and Liszt, whereas Emil Sjögren (1853–1918) wrote songs and piano pieces in a late romantic style. W. Stenhammar

(1871–1927) wrote some distinguished string quartets and piano concertos, and H. Alfven (1872–1960) wrote symphonies and symphonic poems with strong nationalist-romantic coloring.

Late romantic and partly impressionist tendencies characterize the works of Adolf Wiklund (1879–1950), Edvin Kallstenius (b. 1881), Natanaël Berg (1879–1957), Ture Rangström (1884–1947), and Kurt Atterberg (b. 1887). The leaders of mid-20th-century Swedish music are Hilding Rosenberg (b. 1892), Gösta Nyström (b. 1890), Moses Pergament (b. 1893), Lars-Erik Larsson (b. 1908), Dag Wiren (b. 1905), Karl-Birger Blomdahl (b. 1916), Sven-Erik Bäck (b. 1919), Ingvar Lidholm (b. 1921), Bengt Hambraeus (b. 1928), and Bo Nilsson (b. 1937).

J.H.

**Swell.** In organs, mechanism for obtaining a gradation of sound, crescendo and diminuendo. It consists of a large room (swell box) built around one or more divisions of the pipes and provided with shutters similar to Venetian blinds, whence comes the name Venetian swell [*G. Jalousieschweller*]. The chief enclosed division is called *swell organ*, a name that also applies to the manual from which it is played. The swell box is opened and closed by a swell pedal, operated by the feet. The first practical swell mechanism, invented in 1769 by Shudi, was used in harpsichords before it was adopted for the organ.

**Swing.** See under Jazz III.

**Switzerland.** In the early Middle Ages the monastery of St. Gall was one of the chief centers of Gregorian chant. According to legend,

formal musical activity dates from c. 790, when Romanus, an emissary of Pope Hadrian I, fell ill at the monastery of St. Gall and, in gratitude for his recovery, taught the monks Gregorian chant. The MSS of the monastery, written in the so-called St. Gall neumes [see Neumes I], are among the most valuable sources of Gregorian chant [see Editions XLII A 1, B 1, 2]. In the 9th and 10th centuries St. Gall became prominent in the writing of \*sequences (Notker, Tuotilo), and Hermannus Contractus (1013–54) and Berno “Augiensis” (d. 1048), both monks of the Abbey of Reichenau, wrote important treatises [GS ii].

From the 11th century on, the monasteries of Einsiedeln, Rheinau, and St. Gall produced many liturgical plays, and by the 13th century the Passion and Easter plays were often given in the vernacular. By 1289 music was formally taught in convents, monasteries, and divinity schools, and in the 15th century daily music lessons were an accepted part of the public school curriculum. Organ building and organ playing soon flourished in Switzerland, which in the early 16th century had an important group of organ composers, Hans Kotter in Bern, Fridolin Sicher in St. Gall, and Hans Buchner in Basel [see Organ music I]. Outstanding were Henricus Glareanus (Heinrich Loris, 1488–1563), author of the \**Dodecachordon* (1547), and Ludwig Senfl (1490–1543), born in Zurich. Benedictus Appenzeller [see W. Barclay Squire, in *SIM* xiii], Sixtus Dietrich (c. 1492–1548), and Gregor Meyer (frequently mentioned and quoted in the *Dodecachordon*) were followers of Josquin, while Johannes Wannenmacher (d. 1551) is noted particularly for his *Biciniative duo germanica ad aequales* (1553). The 17th century produced Johann Melchior Gletle (1626–84), a prolific composer of Masses, psalms, motets, and also some pieces for \*tromba marina. Heinrich Weissenberg (fl. 1700), commonly known as Henricus Albicastro, wrote trio sonatas and concertos.

Strongly influenced by the educational philosophy of Heinrich Pestalozzi (1746–1827) and Jean-Jacques Rousseau (1712–78), Johann Georg Nägeli (1773–1836) gave new impetus to choral singing, which in turn inspired many outstanding compositions for male chorus, notably by Karl Attenhofer (1837–1914) and Friedrich Hegar (1841–1927). The end of the 19th century saw the development of a new music-education movement founded by Émile Jaques-Dalcroze (1865–1950). In 1892 he intro-

duced a solfège-rhythmic method at the Conservatory of Geneva that is still used throughout the world.

Most representative of the older generation of Swiss composers is the lieder composer Othmar Schoeck (1886–1957), who achieved a perfect union of music and poetry. Ernest Bloch (1880–1959), for many years active in the United States, was a champion of Jewish liturgical music. Frank Martin (b. 1890) was originally influenced by Ravel, later (c. 1930) by Schoenberg. His most important works are *Le Vin herbé* (1938–41), *In Terra Pax* (1944), and *Golgotha* (1945–48).

In the forefront of Swiss music stands Arthur Honegger (1892–1955). Although born in France (of Swiss parents), where he lived most of his life, he also studied and worked in Switzerland. His best-known compositions are *Le Roi David* (1921), *Pacific 231* (1923), *Jeanne d'Arc au Bûcher* (1935), his five symphonies (1930–50), and *Monopartita* (1951). [Also see under France IV; *Six, Les.*]

Wladimir Vogel (b. 1896), of German-Russian parentage but Swiss by choice, is the best-known Swiss serial composer. Albert Moeschinger (b. 1897) began as a champion of late romanticism but soon developed an independent style in such works as his violin concerto op. 40, *Fantasie* 1944 for strings, op. 64, and Symphony no. 3, op. 76. Willy Burkhard (1900–55) wrote more than ninety works, of which probably the best known are the oratorio *Das Gesicht Jesajahs* (The Vision of Isaiah; 1935) and the opera *Die schwarze Spinne* (The Black Spider), based on a story by Jeremias Gotthelf. The compositions of Conrad Beck (b. 1901), who studied in Paris, cover a wide field, including chamber and other instrumental music as well as choral works. Rolf Liebermann (b. 1910), a pupil of Wladimir Vogel's, developed a very personal kind of twelve-tone technique. His best-known works include a cantata for baritone, *Une des Fins du monde* (1945), and two operas, *Leonora 40/45* and *Penelope*. Among the younger generation of Swiss composers are Jacques Wildberger (b. 1922) and Rudolf Kelterborn (b. 1931).

**Syllabic style.** See under Gregorian chant III.

**Symbolum.** Name for the Credo in Ambrosian chant. *Symbolum Apostolicum* is the Apostles' Creed [see Creed (2)].

**Sympathetic string.** A string that is not played on but serves to reinforce the sound of the bowed or plucked strings by vibrating along with them [see Resonance]. Numerous instruments have such strings, e.g., the \*viola d'amore, \*viola bastarda, \*baryton, \*hardingfele, and \*tromba marina. They sometimes are added to the highest register of pianos, where they are called \*aliquot strings. See T. L. Southgate, in *PMA* xlii.

**Symphonia** [Gr.]. (1) Ancient Greek term for unison, as distinguished from *antiphonia*, the octave [see Antiphon] and \**paraphonia*, the fifth. (2) In the Middle Ages (possibly also in late Greek writings), *symphonia* means consonance as opposed to *diaphonia*, dissonance (Cassiodorus; *GS* i, 16b). Later the term was applied to various instruments such as the drum (Isidore of Seville, d. 636), \*hurdy-gurdy, also called *cinfonie* (J. de Muris, c. 1290–c. 1351), bagpipe (hence the modern name \*zampogna?), and a type of clavichord (16th cent.). (3) Beginning in the 17th century the name was used for various types of orchestral music that eventually led to the modern symphony. To avoid confusion, they are discussed under Sinfonia.

**Symphonia domestica.** A programmatic symphony [see Program symphony; Program music] by R. Strauss, op. 53, completed in 1903 and first heard in New York the following year. It is in one continuous movement divided into three sections.

**Symphonic band, concert band.** A term used in American secondary schools and colleges to distinguish the strictly musical functions of the typical school wind band from bands playing at pep rallies, half-time shows, athletic events, and so on. Such a distinction was prompted by the growing repertory of serious wind literature since the 1920's. The symphonic band consists of woodwind, brass, and percussion instruments. A typical example might be: 2 piccolos, 6 flutes, 2E<sup>b</sup> clarinets, 4 oboes, 1 English horn, 24 B<sup>b</sup> clarinets, 2 alto clarinets, 2 bass clarinets, 4 bassoons, 2 alto saxophones, 1 tenor saxophone, 1 baritone saxophone, 6 cornets, 4 trumpets, 8 horns, 2 baritone horns, 4 trombones, 5 tubas, and 6 percussion. In addition, cellos and contrabasses are sometimes used.

The origin of the symphonic band is inseparable from that of the \*military band. The town band of the 16th and 17th centuries had disappeared by the early 18th century, probably because no standard intonation or timbre had been developed by the instrument makers. About 1763 the instrumentation of the Prussian regimental bands was stabilized by Frederick the Great as 2 oboes, 2 clarinets, 2 horns, and 2 bassoons, and literature by Haydn, Mozart, K. P. E. Bach, and Beethoven exists for this "standard" band of the late 18 century. The reorganization of the French bands by Sax in 1854 and the German bands by Wieprecht in 1845 led to great versatility, owing not only to the adoption of valved brass instruments but also to variation in instrumentation. By the latter half of the 19th century, however, serious band literature was virtually nonexistent. Bands played marches, popular arias, and transcriptions. Notable exceptions are the *Grande Symphonie Funèbre et Triomphale* (1840) by Berlioz, *Trauermarsch zur Beisetzung C. M. von Webers* (1844) and *Huldigungsmarsch* (1864) by Wagner, and a *Military Overture*, op. 24 (1824) by Mendelssohn.

In the United States the symphonic band performed the same type of music as its European counterpart. The first mixed wind band of concert-giving stature was the Marine Band, founded in 1792. Notable civilian bands were the Allentown Band from Allentown, Pennsylvania, founded in 1828, Gilmore's Grand Boston Band, founded in 1859, and Sousa's famous band, founded in 1892. Gilmore, famous as an organizer of huge musical festivals, is regarded as the father of the symphonic band in America. His work with the 22nd Regiment Band of New York was known throughout Europe.

The recent revival of the symphonic band owes much to the compositions of Gustav Holst and Ralph Vaughan Williams. Holst's *First Suite for Band in E<sup>b</sup>* (1909), *Second Suite in F* (c. 1911), and *Hammersmith: Prelude and Scherzo* (1930), and Vaughan Williams' *English Folk Song Suite* (1924) and *Toccata Marziale* (1924) furthered the concept of a repertory specifically for band. Other composers of specifically band music include P. Hindemith, S. Prokofiev, E. Krenek, I. Stravinsky, D. Milhaud, and A. Schoenberg. Other 20th-century American composers who have written for band are S. Barber, M. Gould, N. Lockwood, and V. Persichetti.

**Symphonic Etudes.** See *Études symphoniques*.

**Symphonic poem.** I. A type of 19th- and 20th-century orchestral music based on an extra-musical idea, either poetic or realistic. The symphonic poem, also called tone poem, belongs to the general category of \*program music, representing its most recent and most sophisticated embodiment. Usually the term is reserved for compositions in one movement, in distinction to the \*program symphony. The German equivalent, *Symphonische Dichtung*, was first used in 1854, in connection with a performance of Liszt's *Tasso* in Weimar.

II. The symphonic poem proper was inaugurated by Liszt in his one-movement compositions *Ce qu'on entend sur la montagne* (1848, after a poem of Victor Hugo), *\*Tasso* (1849, after Byron), *Les Préludes* (1848, after Lamartine's *Méditations poétiques*), *\*Mazeppa* (1851, after Hugo), *Die Ideale* (1857, after Schiller), *\*Hunnenschlacht* (after a painting by Kaulbach, showing the slaughter of the Huns), *Hamlet* (1857), etc. Usually these compositions follow, somewhat freely, the form of the first movement of a symphony [see Sonata form]. A composition such as Beethoven's *\*Coriolan Overture* (1807) may be regarded as a predecessor of the symphonic poem. Liszt's innovation was eagerly seized upon by a large number of composers to whom literary, pictorial, and other ideas presented new sources of inspiration. Particularly favored were works descriptive of national life and scenery, for the symphonic poem came into being about the same time as musical \*nationalism. The first contributions in this

province were Smetana's six symphonic poems \**Má Vlast* (My Fatherland), composed 1874–79 (earlier symphonic poems of his were *Richard III*, 1858; *Wallenstein's Camp*, 1858; and *Hakon Jarl*, 1861). He had a host of successors, and there is scarcely a country that has not been described in music. Compositions such as Borodin's *In the Steppes of Central Asia* (1880), Saint-Saëns's *Africa* (1891), Sibelius' *Finlandia* (1899), Vaughan Williams' *A London Symphony* (1914), Respighi's *Fontane di Roma* (1917), F. Grofé's *Grand Canyon Suite* (1931), and E. Bloch's *America* (1928) illustrate the scope of the "musical atlas," which, however, includes few pictures of Germany and France, where nationalism never became a great force.

The poetic model of Liszt was followed by, among others, Tchaikovsky, with *Romeo and Juliet* (1869), *Francesca da Rimini* (1876), and *Hamlet* (1888); Saint-Saëns with *Omphale's Spinning Wheel* (1871) and *Phaeton* (1873); and Franck with *Les Éolides* (1876), *Le Chasseur maudit* (1882), *Les Djinns* (1885), and *Psyché* (1886, with chorus).

III. A new period of the symphonic poem began in 1895 when Richard Strauss, after some earlier works of less importance (*Aus Italien*, 1887; *Don Juan*, 1889; *Macbeth*, 1890), produced his outstanding *Tod und Verklärung* (Death and Transfiguration). His realistic approach and extremely bold, skillful handling of the orchestra made this work famous, although it first aroused violent criticism from professional writers and a large section of the public. In 1895 he wrote *Till Eulenspiegel* and there followed *Also sprach Zarathustra* (Thus Spake Zarathustra, after Nietzsche, 1896); *Don Quixote* (1897), a series of free variations that include such realistic effects as the bleating of sheep; wind machine to represent an imaginary flight through the air; and *Ein Heldenleben* (A Hero's Life, first perf. 1899), a musical autobiography. His *Sinfonia Domestica* (1903) describes, with realistic rather than musical success, a day in the composer's family life, and his *Alpensinfonie* (1915) is a detailed description of a day of climbing the Alps.

IV. Shortly before 1900 two important symphonic poems were written in France, Debussy's impressionist *Prélude à l'Après-midi d'un faune* (1894) and Paul Dukas' realistic *L'Apprenti sorcier* (1897). Sibelius wrote a number of tone poems, mostly based on the Kalevala, the Finnish national epic: *En Saga* (1892), *Kullervo* (1892), *The Swan of Tuonela* (1893), *Lemmin-*

*käinen and the Maidens of Saari* (1895), *Lemminkäinen in Tuonela* (1895). \**Lemminkäinen's Homecoming* (1895), \**Pohjola's Daughter* (1906), *Nightride and Sunrise* (1909), *The Bard* (1913), *Luonnotar* (1913), *The Oceanides* (1914), \**Tapiola* (1926). The 20th-century repertory includes Debussy's *La Mer* (1903–05); Stravinsky's *Feu d'artifice* (1908); C. Loeffler's *A Pagan Poem* (c. 1908), based on an Eclogue by Virgil; Elgar's *Falstaff* (1913), perhaps the most detailed musical description of a literary subject; Respighi's Roman trilogy *Fontane di Roma* (The Fountains of Rome, 1917), \**Pini di Roma* (The Pines of Rome, 1924), and *Feste Romane* (Roman Festivals, 1929); and G. Gershwin's *An American in Paris* (1928). A. Honegger's *Pacific 231* (1923) and *Rugby* (1928), realistic glorifications of the modern age, represent, both in subject and in their percussive and motoric idiom, an attempt to bring new life to the symphonic poem, which, sensuous and overrefined, had outlived its time. On the whole, this attempt did not prove successful. The neoclassical tendencies of the present day with their emphasis on purely musical forms and styles appear to have brought the symphonic poem to the end of its development. See J. Chantavoine, *Le Poème Symphonique* (1950); R. Mendl, "The Art of the Symphonic Poem" (*MQ* xviii).

**Symphonic Variations.** See *Variations symphoniques*.

**Symphonie fantastique.** Symphony by Hector Berlioz (1803–69), composed in 1831, which holds a prominent place in the symphonic literature of the 19th century owing to its outstanding artistic qualities as well as its historic importance in the field of program music [see also Symphonic poem] and in the development of the \*leitmotiv. The five sections of the symphony (subtitled *Episode de la vie d'un artiste*) are united by the use of a recurring theme, called *idée fixe*. In the fourth section the "Dies irae" melody appears in caricature.

**Symphonie pathétique.** See under *Pathétique*.

**Symphony.** In the broadest sense, a symphony is a sonata for orchestra. Its "modern" history may be said to begin with the first symphony of Haydn (1759), though similar works with the same title had become increasingly numerous during the period of coexistence of baroque and classical (c. 1725–1760), and symphonies are still being written today. Since the symphony represents a microcosm of the history and develop-

ment of musical style since 1760, and since the immense variety of works called "symphony" would lead one into nearly every aspect of musical history and aesthetics, this article is limited to a summary of the literature and a sketch of the main stylistic changes. [Also see such related articles as Sonata; Sonata form; Rondo; Minuet; Scherzo; Orchestra; Nationalism; Program music; Program symphony; etc.]

I. *Origins.* The symphony emerged from the style changes and cross-currents characterizing the waning \*baroque and the advancing \*classical. Its counterpart in chamber music and solo keyboard music is the \*sonata. The sources of the new form are the \*concerto grosso and \*trio sonata, as well as the Italian operatic \*overture or prelude, sometimes called *Sinfonia avanti l'opera*, which, c. 1700, had become standardized in three sections—fast, slow, fast. The baroque concerto contributed to the style of the symphonic slow movement and two-four finale, and the trio sonata is a direct forerunner of the symphony for strings in three parts. The operatic overture, more lyrical and less contrapuntal in texture, more closely approximates the later classical style, although Churgin [see Lit.] points out that Sammartini's early symphonies (1734–40) are much more contrapuntal than the typical operatic overture of that time. The overture melodies are in a conventional singing style; the symphonies are more "thematic." The overtures show very little \*sonata-form construction; the symphonies, especially those of Sammartini, contain real sonata-form movements.

During the 1740's a "symphonic style" became more clearly defined, and the four-movement design began to rival the three-movement sequence. The period of experimentation ended largely in the 1750's. The most important composers, many of whom lived about the same time as Haydn and Mozart, were: G. B. Sammartini (1700/1–75), whose first symphony (1734) antedates Haydn's no. 1 by twenty-five years; J. Stamitz (1717–57) and I. Holzbauer (1711–83), of the \*Mannheim school; J. C. Bach (1735–82); K. P. E. Bach (1714–88); and the Viennese composers G. M. Monn (1717–50), Wagenseil (1715–77), and Dittersdorf (1739–99). It is the Mannheim orchestra that is largely responsible both for standardizing the makeup of the orchestra and popularizing it. Appropriately, the first movement of Haydn's First Symphony opens with a striking "Mannheim crescendo."

II. *Classicism.* Haydn and Mozart were contemporaries, though Haydn (1732–1809) was

born earlier and died later than Mozart (1756–91). Haydn wrote 104 symphonies (1759–95), Mozart 41 (1764–88). The early symphonies of both men, in many respects preclassical, rival each other in variety and originality. In their later works, the results of long experimentation, the symphonic form is definitively established.

The classical symphony normally consists of four movements: an opening allegro, sometimes with a slow introduction; a lyrical slow movement; a minuet and trio, sometimes omitted; and a brisk and virtuosio finale. The instrumentation was built up gradually from a basic choir of two oboes, two bassoons, and strings, through the addition of (1) two horns, (2) two trumpets and drums, and (3) one or two flutes, and finally, (4) two clarinets. The horns served equally as members of the woodwind choir and the brass choir. The trumpets and drums were invariably associated, never one without the other. The double basses duplicated the cello part an octave lower. The orchestra for opera and church music of this period is often more irregular and varied, notably by the inclusion of trombones.

The grand plan of the first movement and sometimes the finale is \*sonata form. The slow movement took a variety of lyrical forms, though its key scheme is often that of sonata form; the third movement is a strict \*minuet and trio; and the finale might follow the principles—at least the key scheme—of sonata form, or might be more closely related to the \*rondo, or, often, represented some mixture of these two.

Other basic practices of the art of composition were perfected by Haydn and Mozart: the presentation of distinct opening ideas and closing material, the manipulation or development of motifs, and the standardization of techniques for transitions, harmonic motion, modulation, and orchestration. Above all, each movement of the symphony, slow as well as fast, was dynamic, "a succession of impulses that converge toward a definite point of repose" (Stravinsky).

Beethoven, whose first symphony (1800) was written roughly a decade after the last symphonies of Haydn and Mozart, stands at the end of the classical period and the beginning of romanticism. Beethoven expanded almost every aspect of symphonic composition. In form, he lengthened the coda, \*development, and introductions; he replaced the minuet with the scherzo; and he made far more use than Haydn or Mozart of the variations and the fugue. His manipulations and developments of musical material are more dramatic, as are the points

of articulation between themes. His melodic material, his rhythmic drive and cross-accents, and his dynamics all represent innovations. In harmonic and contrapuntal style the advances over his predecessors are fewer. In orchestration, however, the addition in the later symphonies of piccolo, double bassoon, three trombones, triangle, bass drum and cymbals, and finally, soloists and chorus, paved the way for the great orchestral advances of the 19th century.

III. *Romanticism*. There are two mainstreams in the 19th-century symphony—the German, particularly Viennese, and the more revolutionary romanticism of Berlioz and his followers. Aside from minor figures like M. Clementi, L. Cherubini, C. M. von Weber, and L. Spohr (9 sym.), the German tradition was carried on by F. Schubert (8 sym., 1813–28), F. Mendelssohn (4 sym., 1824–41, plus a symphonic cantata, *Lobgesang*, 1840), and R. Schumann (4 sym., 1841–51). Each in large measure adhered to the form and the traditions. Mendelssohn had by far the greatest gift for classical construction, dynamic propulsive movement, and the manipulation of ideas. Schubert had a similar feeling for rhythmic steadiness and perpetual motion at all speeds, fast and slow, whereas Schumann reveled in *tempo rubato*. Each in his own way manifested the first full flower of German romanticism.

Berlioz considered himself the natural successor of Beethoven in freeing the symphony from its classical straitjacket. The *\*Symphonie fantastique*, op. 14 (1830), has five movements with titles like those in Beethoven's *\*Pastoral Symphony*; *\*Harold en Italie*, op. 16 (1834), with viola solo, is based on literary scenes and the evocation of nature; *\*Romeo and Juliet*, op. 17 (1839), called *Symphonie dramatique*, makes use of solos and chorus, as in Beethoven's Ninth; and the *Symphonie funèbre et triomphale*, op. 15 (1840), is obviously concerned with those great confrontations of opposites that have always been a favorite of the romanticists. The legacy of Berlioz, which affected all composers of the 19th century with only a few notable exceptions (e.g., Brahms), consisted of: the musical delineation of romantic moods, and the relaxing of symphonic form to allow for such expression; a much expanded orchestra, not only through the use of new instruments (cornets, bells, antique cymbals, harps, etc.) but even more through the use of effects requiring a large number of players (e.g., four bassoons, cellos "at least fourteen," etc.). Berlioz opened the full

range of orchestral sound to later composers, and he brought to the symphony the whole technical apparatus of romanticism: rubato; frequent tempo changes; the *idée fixe*; chromatic melody and harmony; the transformation of theme; and the cyclic idea, leading directly to a one-movement form, the *\*symphonic poem*.

It is only a step from Berlioz to Liszt's *Eine Symphonie zu Dante's Divina commedia* (1855) and his *Eine \*Faust-Symphonie* (1854–57; dedicated to Berlioz), a symphony of three movements with titles (Faust, Gretchen, Mephistopheles), each a character sketch, actually a series of three symphonic poems linked by the transformation of themes. It is another small step to Liszt's symphonic poems and the large repertory of these works, truly poems and truly symphonic, in the latter 19th century.

After the *Faust-Symphonie* (1857) there is a curious fifteen-year hiatus. Minor composers such as Anton Rubinstein (6 sym.) and J. J. Raff (11 sym.) were popular in their day but have been dropped from the modern repertory. However, a promising series of first symphonies began to appear in the late 1860's: N. Rimsky-Korsakov and Dvořák in 1865, Bruckner in 1866, Borodin and Tchaikovsky in 1867, and finally Brahms' *Symphony no. 1* in 1876.

With four symphonies (1876–85) Brahms marks a return to the classical ideals of craftsmanship in structure and in the manipulation of musical ideas, and a basic interest in music alone rather than extramusical programs, character sketches, and literary allusions. Although strictly in the Beethoven-Viennese tradition, Brahms has a romantic warmth of melody and harmony and rhythmic specialties all his own. His melody and harmony and rhythm, i.e., the stuff of his music, are romantic; he is classic in his concern for grand plans (even baroque in the Passacaglia of the Fourth Symphony), and in the presentation and working out of his material.

Anton Dvořák (9 sym., 1865–93), was deeply devoted, personally and in musical style, to Brahms and the Viennese tradition. Yet the national music of Bohemia flowed through his veins and he was one of the first of the musical *\*nationalists* [also see Czechoslovakia]. Dvořák's use of folksong and folk dance, the pentatonic scale, and a peasant-like naïveté were combined with a superb mastery of the orchestra in the Schubert-Brahms tradition and virtuosity in creating effects—grandiose, sentimental, or bizarre—in the Berlioz tradition.

Tchaikovsky's six symphonies (1867–93), showing his mastery of solid structure, brilliant orchestration, and melancholy romanticism, make him the pre-eminent Russian symphonic composer of the century. Four streams of 19th-century art meet in him: the Beethoven tradition of clear and powerful form; the Berlioz love of the ultradramatic; a unique gift for orchestration, at once transparent and supremely brilliant; and a strain of Russian nationalism. The primarily nationalist Russian composers of symphonies were Borodin (3 sym., last incomp.), Rimsky-Korsakov (3), Balakirev (2), and Glazunov (8).

Three Americans, George Chadwick (3 sym.), John Knowles Paine (2 sym.), and Horatio Parker (1 sym.), exemplify the late 19th-century school in the United States, dominated largely by the German romanticists.

Anton Bruckner (10 sym., no. 9 incomp., 1866–96) and Gustav Mahler (10 sym., no. 10 incomp., 1884–1910) represent the twilight of German romanticism in radically different ways. Both followed the cult of the gigantic, and the works of both are pervaded with alternate simplicity and nostalgia on the one hand, and the grandiose or majestic on the other. Bruckner was strongly influenced by Wagner and, more remotely, by Schubert and Beethoven. His huge symphonies combine deep religious feeling and heartfelt pathos, yet they are static rather than dynamic. Though the skeleton of classic structure is often apparent, Bruckner's chief concerns were expression and delineation. A busy conductor all his life, Mahler barely found time to compose his nine gigantic symphonies. He commanded an endless variety of orchestral effects, and the instrumental parts are peppered with minute directions describing exactly how every note should be played. The frequently thin and linear texture foreshadows the neoclassicists' return to polyphonic style, but the "messages" of each symphony are spiritual, highly subjective experiences.

A nationalist but highly individual in his symphonies was Sibelius (7 sym., 1899–1925). Though related to Tchaikovsky in his first two symphonies, he struck out on his own with no. 3 (1907), and there followed five works, which (though currently neglected) are among the highest achievements in the literature. Sibelius clearly knew all about classical form, the apparatus of romantic expression, and the craft of orchestration, but his techniques remain intensely personal.

From the 1870's to the mid-1930's, there was hardly a composer who did not write at least one symphony. Notable exceptions are Wagner (if one disregards his youthful symphony of 1832), Debussy, Ravel, and the serial composers. Some of the symphonies written between 1870 and 1930 remain staples of the repertory; others have vanished, either because the composer's nonsymphonic works have assumed larger importance or because his star has, perhaps temporarily, set.

IV. *20th century.* For the sake of convenience, the composers of the modern era are grouped here by nationality.

*France.* French composers after Berlioz neglected the symphony. There are two examples by Bizet (1855, at the age of 17; 1860–68), one each by E. Chausson (c. 1890), P. Dukas (1896), and the Belgian-Parisian César Franck (1888), and three by V. d'Indy. Saint-Saëns wrote three symphonies, all with classical clarity and French elegance, the third (1886), a tour de force with organ and piano for four hands as well as orchestra. In the 1920's the genre was revived by A. Honegger, D. Milhaud, and A. Roussel. Of Roussel's symphonies, the first (1906) is a late romantic work akin to D'Indy's, whereas his last three symphonies are thoroughly postwar 20th-century works. Milhaud wrote five brief symphonies for very small chamber orchestra (1917–22), and then, after a long interval, twelve symphonies for large orchestra (1940–62). Honegger (5 sym., 1931–51) is possibly the most gifted, but the works of all three are substantial examples of the universal 20th-century style—dissonance, classical craftsmanship, counterpoint, driving rhythm, and striking orchestral sonorities, as well as the French national specialties of clarity, simplicity, directness, and lack of pretense. Of younger French composers, there are two symphonies of H. Dutilleul and one by O. Messiaen in ten movements.

*Germany.* Richard Strauss wrote two youthful symphonies (1881, '84), antedating his rapid succession of superb symphonic poems of the 1890's. His remaining symphonies, *Sinfonia domestica* (1902–03) and the *Alpensinfonie* (1915), are \*program symphonies. Schoenberg's chamber symphony for fifteen instruments (op. 9, 1906), with a version for large orchestra in 1935, Webern's symphony of 1928 for chamber orchestra, and Schoenberg's second chamber symphony (op. 38, 1939) constitute the complete contribution of the founders of serial music to the symphonic form. Paul Hindemith has

made notable contributions to the \*neoclassical symphony. Besides two sinfoniettas (1924, '50), he wrote the symphony \**Mathis der Maler* (1934), Symphony in E-flat (1940), *Symphonic Metamorphosis* of themes by Carl Maria von Weber (1943), *Symphonia serena* (1946), Symphony in B-flat for Band (1951), and Symphony "Die Harmonie der Welt" (1951).

*Russia.* Tchaikovsky and the nationalist composers were followed by V. S. Kalinnikov, A. S. Taneyev, S. I. Taneyev, A. N. Scriabin (3), S. Rachmaninoff (3), A. K. Glazunov (8), N. Y. Miaskovsky (27)—whose works are rarely heard today. However, after World War I Prokofiev, Shostakovich, and Stravinsky produced first-class additions to the symphonic repertory of the 20th century. Prokofiev's Classical Symphony (op. 25, 1916–17) is one of the first landmarks of neoclassicism. Neoclassic in that it is "the organization of original material within a framework of the past," it is also anticlassical in many of its melodic ideas, harmonies, tonalities, dynamics, and rhythms. Prokofiev's later symphonies (1928–52) are touched with Soviet philosophy and "meaning" as well as by his highly individual style. Shostakovich's 13 symphonies (1925–62) are marked from the start by the three most significant characteristics of Soviet music: simplicity, the rejection of any complexities and sophistication that could not be understood by the common people; emotionalism, conveyed in the most powerful and direct communication; and ardor, the belief that "there can be no music without ideology." The Shostakovich style is lyric above all, strongly and simply rhythmic, simple in texture, and conventional in harmony and tonality with an overlay of pepper and spice. It is not traditionally Russian in its use of folksong and folk dance, but more international, with strong Germanic traits especially in the scherzos. The orchestration is masterly.

Stravinsky's Symphony no. 1 (1905–07) is not followed by another (except by the Symphonies for Wind Instruments, 1920, in which the title assumes the Renaissance and baroque meaning of *sinfonia*, a soundpiece for instruments) until the cantata-like Symphony of Psalms (1930) and his great Symphony in C (1940) and Symphony in Three Movements (1945). The last two works as well as the Symphony of Psalms comprise a virtual compendium of Stravinsky's abstract and classical style and rank among the masterpieces of the century.

*England.* The English symphony is represented by E. Elgar (2 large-scale symphonies, 1908,

1910), C. V. Stanford (7), Ralph Vaughan Williams (9; 1910–57), and Arnold Bax (7; 1922–39), along with scattered works by G. Holst, W. Walton, L. Berkeley, M. Tippett, and B. Britten. Of these, Vaughan Williams' works are outstanding. They include a choral-orchestral Sea Symphony (words by Walt Whitman), a Pastoral Symphony, the London Symphony, a highly dissonant Symphony in F minor, and then, ten years later (1945), five more symphonies full of originality, variety, a native idiom nurtured in folksong and dance, and a deep spiritual kinship with the great music of Tudor England.

*Others.* An individualist like Sibelius but far more simple and naïve was the Danish composer Carl Nielsen (6 sym., 1894–1925); in the mid-20th century his works began to enjoy an increasing vogue. Other European composers worthy of note are the Italian G. F. Malipiero (9 sym., 1934–51), the Dutch Willem Pijper (3 sym., 1917–26), the Czech B. Martinu (6 sym., 1942–55), and the Polish Karol Szymanowski (3 sym., 1907–16). Neither Kodály nor Bartók wrote symphonies, though Bartók's concertos, especially the Concerto for Orchestra, are thoroughly symphonic.

*United States.* Charles Ives (4 sym., 1898–1916, with fragments of an uncompleted "Universe Symphony") is unique here as he is in every other area of composition. His Fourth Symphony finally reached public performance nearly half a century after its composition, in April, 1965. Other outstanding composers are Walter Piston (8 sym., 1938–65), Aaron Copland (3 sym., also *A Dance Symphony*, 1925–46), Roy Harris (10 sym., 1934–65), and William Schuman (8 sym., 1936–62). Somewhat less prominent in symphony composition are E. B. Hill, Randall Thompson, Howard Hanson, Roger Sessions, Peter Mennin, David Diamond, Paul Creston, Samuel Barber, Irving Fine, and Easley Blackwood. All the cross-currents of 20th-century style are present in the rich and varied production of these composers—from jazz to canon, fugue, and passacaglia; from a romantic urgency to communicate mood, thought, and idea to a single-minded interest in craftsmanship and development of musical ideas for their own sake. Two qualities would appear to be universal: a wealth of dissonance, and an endless quest for new orchestral sonorities.

Younger American composers are represented by Elliott Carter with a single symphony (1942) and Gunther Schuller with a symphony for brass

and percussion (1950) and his Symphony no. 1 (1965). The youngest generation, devoted to post-Webern \*serial techniques and \*electronic music, prefer chamber music and small forms. Indeed, there are predictions that the new music of the second half of the 20th century has no place for the grand design of the symphony, nor even for the orchestra as a medium for composition. Whatever the future, the symphony has proved durable from 1750 to 1950 and the 20th-century contributions of Sibelius, Vaughan Williams, Hindemith, Honegger, Copland, Piston, and Stravinsky would seem to equal those of any other half-century in its history.

G.W.W.

**Symphony of Psalms.** A work for chorus and orchestra (without violins or violas) by Stravinsky, completed in 1930. Its three movements are based on psalms (in Latin): I. Psalm 38, v. 13–14, treated in an archaic chordal style; II. Psalm 39, v. 12–13, a double fugue with one subject for the orchestra, the other for the chorus; III. Psalm 150, in a free, sectionalized form.

**Syncopation.** Syncopation is, generally speaking, any deliberate disturbance of the normal pulse of meter, accent, and rhythm. The principal system of rhythm in Western music is based on the grouping of equal beats into two's and

three's with a regularly recurrent accent on the first beat of each group [see Rhythm II (a)]. Any deviation from this scheme is perceived as a disturbance or contradiction between the underlying (normal) pulse and the actual (abnormal) rhythm.

Ex. 1 shows the three most common methods of shifting the accent to the normally weak beats of the measure, by: (a) holding on over the strong beat; (b) having rests on the strong beats;

(c) placing a stress on the weak beat. The examples in Ex. 2 show the practical application of these methods [a. Beethoven, Piano Sonata op. 28, no. 1; b. Beethoven, Piano Sonata, op. 57, "Appassionata"; c. Beethoven, String Quartet, op. 18, no. 4].

Normally, syncopation is only "partial," i.e., it occurs in one part only (either the melody or the bass), while other parts maintain and emphasize the normal pulse of the meter. In his late works Beethoven, however, becomes the first to use "complete syncopation," i.e., the displacement

of accents in the entire texture [Ex. 3, Piano Sonata, op. 101]. This procedure creates a complete imbalance in the listener's feeling of rhythmic security, an effect that occurs in romantic music (Schumann) in the sense of blurring, and in modern music (jazz) in the sense of a shock. Still another type of syncopation, resulting not from a displaced accent in unchanged meter but from a sudden change of the meter itself, is common in the works of modern composers, notably Stravinsky [Ex. 4, *L'Histoire du soldat*].

Syncopation first was used in the French *ars nova* (Machaut) and reached its all-time peak of complication in the music of the late 14th century (Cunelieu, Grimace, B. Cordier, Solage, et al.). In 14th-century theory, syncopation was not explained as it is today (such an explanation would have been impossible since dynamic accent or strong beat are concepts foreign to early theorists), but as a separation of a normal

group of notes by the insertion of larger values, e.g., as in Ex. 5a. Instead of rendering this rhythm by tied notes in unchanged meter [Ex. 5b], a rendition similar to the methods employed by contemporary composers [Ex. 4] is preferable in order to convey the true meaning of early syncopation, as in Ex. 5c. For the original notation of 14th-century syncopation, see *ApNPM*, pp. 395ff.

**Synemmenon** [Gr.]. In ancient Greek theory, name for an additional tetrachord, whereby the b-flat was introduced into the scale [see Greece II]. In medieval theory, the term was used for the b-flat, and later (13th cent.) also as a general indication of chromatic alteration, e.g., *deuterus synemmenon*, or e-flat [*MS Mensura Monochordi Boetii de Musica*; CS i, 345].

**Synthesizer.** An electronic instrument (tool) of great versatility and complexity that translates the composer's desires into actual sound. The RCA electronic music synthesizer consists of thousands of individual electronic circuits that generate simple wave forms and then modify them (by changing frequency, intensity, duration, etc.) and combine them to synthesize more complex wave forms characteristic of musical sounds (the Hammond organ also synthesizes its tones but with considerably less flexibility). The numerous functions of the RCA synthesizer are controlled by a punched paper tape. The output of the instrument is preserved on a phonograph record or on magnetic tape. A completed composition usually consists of several such synthesizer outputs mixed together. See also Computer. Additional bibl. under Electronic instruments.

**Syrian chant.** Syria, being one of the first countries converted to Christianity, has a long history of church music. The entire early development of Christian hymnody took place in Syria, beginning with the Gnostic Psalter (hymnlike versions of the psalms, embodying the Gnostic doctrine) of Bardesanes (d. 223) and his son, Harmonios (fl. 3rd cent.), and continuing with the hymns, still used today, of St. Ephraim (306–73), which mark the beginning of Orthodox hymnody. Antiphonal psalmody also was developed in the heretical Church of Syria, whence the monks Flavianus and Diodorus imported it into the Orthodox Church of Antiochia (c. 350). Both hymns and antiphonal psalmody were brought from Syria to Milan by St. Ambrose (c. 333–97). Important successors of Ephraim were Narses of Edessa (fl. end of 5th cent.), Jacob of Serugh (451–521), and Simeon of Gesir, the Potter (after 500). The two chief types of ancient Syrian poetry are the *madrasha* (ode), consisting of a number of stanzas for a soloist with a refrain for chorus, and the *sogitha* (hymn), which was performed antiphonally by two choruses, with soloist leaders.

Since no early MSS of Syrian chant have been preserved, the present practice of Syrian chant is the only material available for study. Modern Syrian chant is based on multimetric rhythm [see Rhythm II (b)], as appears from the accompanying example. It is a good deal more rhythmic and syllabic than Gregorian chant. To what degree modern Syrian chant is representative of

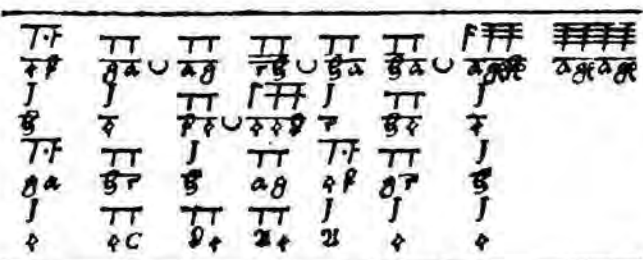

fac. 13). The letters a, b, c, etc., mean the same as they do today; however, in German terminology b means B-flat, B natural being indicated by the letter h [see the entry B (1)]. Chromatic

2 a

alterations are indicated by adding a loop or hook to the letter. This was the stenographic sign for the Latin syllable *is* (e.g., *arbor-is*) so that *c* with a loop means *cis*, German for C-sharp. The tones of the higher octave (usually from *c'* to *b'*; in some sources from *a* to *g'*) are marked with a dash above the letter: *c* (one-line *c*). Rhythmic values are indicated by the signs

illustrated [Ex. 2c], standing for (left to right) a *semibrevis*, *minima*, *semiminima*, and *fusa*.

II. *Spanish keyboard tablature*. Here a number of lines (three, four, five) represent the different voice-parts of a composition [Ex. 3, Cabezón, *Obras de música*, 1578]. The figures 1 to 7 stand

for the notes of the diatonic scale beginning with *f* (1 = *f*; 2 = *g*; 3 = *a*; 4 = *b* or *b'*, according to whether the sign *b* or *B* is given at the beginning of the piece; 5 = *c'*; etc.). Higher and lower octaves are marked by special signs, e.g., a tick on the 3 = *A* [see the third symbol on the bottom line of Ex. 3a]; the plain figure 3 = *a*; a dot beside it = *a'*; a prime beside it, *a''*. A comma (,) indicates tying of the preceding note; a diagonal slash (/) indicates a rest.

III. *Italian (Spanish) lute tablatures*. All lute tablatures are based on the idea, revived in certain modern instruments (ukulele, zither, guitar), of directing the player's fingers to the position necessary for the desired tone or chord. Thus they avoid the entire matter of "solfège" (pitch, interval, scale, key, accidentals, etc.). They are a "finger notation" [G. *Griffsschrift*], as distinguished from the usual "pitch notation" [G. *Tonschrift*]. In the Italian system, a form of which was also used for the *\*vihuela*, six horizontal lines represent the six courses of the lute, tuned (in theory) *G-c-f-a-d'-g'*, in reverse order, so that the highest line represents course *G* (only in Milán's *El Maestro* of 1535 is the highest line used for the highest course; see also under IV). On each line, figures from 0 to 9 indicate the fret on which the player is supposed to put his finger, with 0 signifying the open string, 1 the first fret, etc. Since these frets proceed in semitones, the figures 1, 2, 3, etc., represent tones that are one, two, three, etc., semitones higher than the open string; thus, 3 on the second line from the top indicates *c* (second open string) plus 3 semitones, i.e., *d#* or *e<sup>b</sup>*. The rhythmic values are indicated above the staff by the accompanying signs [Ex. 3c], the first of which represents the *semibrevis* (usually transcribed as a half note). Despite the contrapuntal character of 16th- and

17th-century lute music, no distinction is made between the different temporal values of simultaneous sounds, e.g., between an eighth note in the upper part against a simultaneous half note

in a lower part. The rhythmic signs merely give the shortest of all the simultaneous notes, e.g., the eighth note; further, in most later tablatures a rhythmic sign is to be repeated until replaced by another note value [Ex. 4a, Fuenllana, *Libro de Música . . . Orphenica Lyra*, 1554]. The two transcriptions [Ex. 4b, 4c] illustrate the "exact"

4a

b

c

rendition together with the contrapuntal interpretation usually preferred in modern editions [see *ApNPM*, pp. 59ff].

IV. *French lute tablature*. This system differs from the Italian only in details. The staff has only five lines, which represent the five highest courses in their natural order (as in Milán), while the lowest course is represented underneath on short ledger lines. Instead of figures, letters (*a*, *b*, *c*, etc.) are used, with *a* standing for the open course [Ex. 5a, G. Bataille, *Third Book of Airs*, 1611]. After 1600 this system of notation underwent various modifications that, c. 1650, led to a new system based on Denis Gaultier's novel method of tuning (*nouveau ton*),

5a

b

A-d-f-a-d'-f'. Here, the Italian staff of six lines is used for the six courses that cross the frets, while the signs

a, ā, ā̄, ā̄̄, 4

written underneath the staff indicate the bass courses, tuned (normally) G, F, E, D, C, which are unalterable in pitch.

V. *German lute tablature*. This system is much more awkward than the others, mainly because it was originally designed (15th cent.) for a lute with only five courses and was broadened later (16th cent.) by the inclusion of signs for the sixth (lowest) course. The table here shows the most common system of designation: figures 1-5 for the open courses (read from bottom to top); the letters of the alphabet (completed by two special signs designated here \* and \*\*) for the frets 1-5; the same letters with dashes for the higher frets. The table shows that, e.g., the sign *h* denotes the

		Frets							
Courses		0	1	2	3	4	5	6	7
	g'	5	e	k	p	v	**	ē	k̄
	d'	4	d	i	o	t	*	d̄	ī
	a	3	c	h	n	s	z	c̄	h̄
	f	2	b	g	m	r	y	b̄	ḡ
	c	1	a	f	l	q	x	ā	f̄
	G	1	2	3	4	5	6	7	8

tone *b* (two semitones above *a*), and the sign *x* the tone *f* (five semitones above *c*). See Ex. 6, H. Gerle, *Ein neues . . . Lautenbuch*, 1552.

Da 25

Bagliarda

VI. *Modern tablatures*. Tablature notation is used today for several popular instruments that are much easier to play when the notation directs

the player's fingers to the desired place. The notation of the modern guitar resembles the 16th-century lute tablatures, and a similar method is used for the four-stringed ukulele.

Lit.: *ApNPM*, pp. 21–81; *WoHN* ii, 1–247; *GD, GDB*, s.v. "Tablature."

**Tabor, taborel, tabour, tabourin, tabret.** See Tambourin; also Pipe (1). For ill. see under Percussion instruments.

**Tabulatur** [G.]. See Tablature.

**Tace** [It.], **tacet** [L.]. Be (is) silent. Term used in orchestral scores for parts not needed for a movement or a long section.

**Tact** [G.]. See *Takt*.

**Tactus** [L.]. The 15th- and 16th-century term for beat, both with its temporal meaning and as in "conductor's beat." However, the tactus is a relatively fixed duration of time, about M.M. 60–70 (one second), whereas the modern beat may take on any value within broad limits, according to the tempo and character of the composition. This means that throughout the 16th century there was a uniform "normal" tempo from which only slight deviations were possible. Since the tactus was normally represented by the *semibrevis* (S), the proper tempo of the motets of Obrecht, Josquin, and Palestrina can be expressed by the metronomic mark: S = M.M. 60–70. For a discussion of complications caused by the use of the *alla breve* sign  $\text{C}$  instead of the *alla semibreve* sign  $\text{C}$ , see *ApNPM*, pp. 188–95. See also Tempo marks.

From the 13th to the late 15th centuries there were similar units of time, called *\*tempus* (e.g., Franco of Cologne), which were of considerably shorter duration and which changed somewhat during the course of this period. There also was a successive shift in the note values used to represent the "normal" beat, from the *longa* (c. 1200, school of Notre Dame) to the *brevis* (13th cent.), the *semibrevis* (14th–16th cent.), the *minima* (c. 1550), and finally the *semiminima*, i.e., the modern quarter note (during the 17th century). For a tentative table of the changes in tempo prior to 1400, see *ApNPM*, p. 343.

Lit.: A. Auda, *Théorie et pratique du tactus* (1964); E. Praetorius, *Die Mensuraltheorie des Franchinus Gafurius* (1905), pp. 68ff, in *Publikationen der Internationalen Musikgesellschaft*, supp., series ii, vol. ii; A. Chybiński, *Beiträge zur Geschichte des Taktschlagens* (1908); G. Schünemann, *Geschichte des Dirigierens* (1913),

ch. iii; A. Auda, "Le 'Tactus' dans la Messe 'L'Homme armé' de Palestrina" (*AM* xiv); C. Dahlhaus, "Zur Theorie des Tactus im 16. Jahrhundert" (*AMW* xvii).

**Tafelmusik** [G.]. Table music, i.e., music to be performed at a banquet, e.g., Telemann's *Musique de table* (*DdT* 61/62) and J. A. Reutter's *Servizio di tavola* (*DTO* 31).

**Tagelied** [G.]. See under *Alba*.

**Tagliato** [It.]. Obsolete term for the *\*alla breve* sign.

**Taille** [F.]. Old name for a middle voice, particularly the tenor. See *Récit*. The term was also used for instruments performing such a part, e.g., *taille de basson*, tenor oboe; *taille de violon* or simply *taille*, viola. The indication *taille* in some of Bach's cantatas appears always to call for the tenor oboe (oboe da caccia, English horn).

**Takt** [G.]. (1) Beat (*schwerer, leichter Takt*, i.e., strong, weak beat). (2) Measure (*nach 10 Takten*, after 10 measures). (3) Meter, time (3/4 *Takt*, 3/4 meter). *Im Takt*, in strict tempo and meter; *Taktart*, meter; *taktmässig*, in strict meter; *Taktmesser*, metronome; *Taktstock*, baton; *Taktstrich*, bar line; *Taktvorzeichnung*, time signature; *Taktwechsel*, change of meter; *Taktzeichen*, time signature; *taktieren*, to indicate the beat.

**Talea**. See under Isorhythmic.

**Tales of Hoffmann, The.** See *Contes d'Hoffmann, Les*.

**Talon** [F.]. The nut of the violin bow [see Bow].

**Tambora** [Sp.]. Two-headed drum constructed from the hollowed trunk of the *lana* tree. It is considered the national instrument of the Dominican Republic. A male goatskin is used for the top head and a female one for the bottom. These are mounted on three hoops and held in place by additional sets of hoops tied to the body with a cord. The drum is played with the palm and fingers of the left hand and with a *palito* (small stick) held in the right hand. J.O-S.

**Tamborito** [Sp.]. A Panamanian dance of African origin, in which a solo singer (always a woman, called *cantaora alante*) alternates with a chorus singing an unchanging refrain. The melody is mainly syllabic, usually in the major, in the Phrygian or Hypodorian modes, and proceeding by disjunct thirds and fourths. It is always in

duple meter and involves a fair amount of syncopation. The *tamborito* is usually sung and danced to the accompaniment of percussion and hand-clapping. Toward the end of the piece, the drums often shift from 2/4 to 6/8 meter, gradually increasing the tempo. *Tamboritos* danced in street parades are known as *tunas*. J.O-S.

**Tambour** [F.]. Drum; also, drummer. *Tambour militaire*, snare drum; *tambour de Basque*, tambourine (the modern percussion instrument).

**Tambourin** [F.]. (1) A small (occasionally tiny) two-headed medieval drum, cylindrical in shape, with both heads covered with skin. It is mentioned as early as c. 1080 in the *Roman de Roland* as a *tabor*, which is of Arab origin. It was played together with the *galoubet*, a small flute (pipe and tabor; Sp. *flaviol* and *tamboril*; see Pipe (1). D.-F.-E. Auber used the tambourin in his opera, *Le Philtre* (1831). However, in modern scores the term usually means \*tambourine. (2) An old Provençal dance, originally accompanied by pipe and tambourin (or tambour de Basque, i.e., tambourine), in lively 2/4 meter. Rameau's operas contain many tambourins, in which the drum is represented by a monotonous bass accompaniment. A famous example, found among his harpsichord pieces, is from his opera *Les Fêtes d'Hébé* (1739).

**Tambourine**. See under Percussion instruments B, 4. In early music, the term usually means \*tambourin.

**Tambur**. A long-necked, round-bodied lute of Afghanistan, also called \*rabab. Also see Tanbur.

**Tambura** (also *tanbura*, *tanpura*). Long-necked, unfretted, round-bodied drone lute of India. It has four metal strings that are plucked with one finger. See India VIII.

**Tamburin** [G.], **tamburino** [It.]. Usually, the modern tambourine; rarely, the obsolete \*tambourin.

**Tamburo** [It.]. Drum, kettledrum; *t. grande*, *grosso*, old name for bass drum; *t. rullante*, tenor drum; *t. militaire*, snare drum.

**Taming of the Shrew, The**. Opera in three acts by V. Giannini (libretto by the composer and D. Fee, based on Shakespeare's play), produced in Cincinnati, 1953. Setting: Padua, 16th century.

**Tampon** [F.]. Two-headed drumstick used to produce a roll on the bass drum. It is held in the middle and moved by shaking the wrist.

**Tamtam**. Same as gong [see Percussion instruments B, 7]. Not to be confused with \*tom-tom.

**Tanbur**. A long-necked lute with a pear-shaped body that is found throughout the Balkans and Near East. It has a variable number of metal strings. See Lute II.

**Tanbura**. See Tambura.

**Tañer** [Sp.]. See under *Tastar*.

**Tangent** [G. *Tangente*]. See under Clavichord.

**Tango** [Sp.]. An urban modern dance of Argentina, performed by couples, which had adopted its characteristic features by the first decade of the 20th century in Buenos Aires. Before then it was a hybrid form, combining elements of the Andalusian tango, \*habanera, and \*milonga. It consists of two sections of equal length (14–20 measures), with the second generally in the dominant or relative minor of the original key. It is based on syncopated patterns within a 2/4 meter. Its texts usually deal with urban topics, often melodramatic or pathetic. J.O-S.

**Tannhäuser**, or *Der Sängerkrieg auf Wartburg* [G., The Singers' Contest at Wartburg]. Opera in three acts by Wagner (to his own libretto, after a medieval legend), produced in Dresden, 1845. Setting: Venusberg and in and around Wartburg, near Eisenach, early 13th century. The formal structure is essentially that of the traditional \*number opera, with distinct arias, numerous choruses, and even a ballet (first scene), although the actual numbering of the different items is abandoned. The harmonic style also is fairly traditional. It is by reason of its expressive and emotional qualities that *Tannhäuser* opens a new period in the history of opera.

**Tanpura**. See Tambura.

**Tanz** [G.]. Dance.

**Tape recording**. See under Phonograph and recorded music.

**Tapiola**. Symphonic poem by Sibelius, op. 112 (1926). The name is based on Tapio, the forest god of Finnish legend (\*Kalevala).

**Tarantella**. A Neapolitan dance in rapid 6/8 meter, probably named for Taranto in southern Italy, or, according to popular legend, for the tarantula spider whose poisonous bite the dance was believed to cure. In the mid-19th century it was frequently composed (Chopin, Liszt, S. Heller, Auber, Weber, Thalberg) in the style

of a brilliant *perpetuum mobile*. See M. Schneider, "La Danza de espadas y la tarantela" (*AnM* ii).

**Tardo, tardamente** [It.]. Slow, slowly. *Tardando*, slowing.

**Tarogato**. Hungarian instrument of ancient origin, originally a wooden \*cornett having only natural tones. It was used for sounding military signals such as occur in the well-known Rákóczy march. Later, the name was used for a wooden shawm (oboe mouthpiece) with five or more holes. The modern tarogato, built by W. J. Schunda, is a wooden saxophone, i.e., with a clarinet mouthpiece. It has a somewhat darker timbre than the normal saxophone. See ill. accompanying Clarinet family.

**Tartini's tone**. Same as differential tone [see Combination tone].

**Tartold**. A strange instrument mentioned in the inventory of the ducal collection at Schloss Ambras in the Austrian Tyrol (1596): "Tartold wie Drackhen [dragons] geformirt" [see J. Schlosser, *Die Sammlung alter Musikinstrumente* (1920), p. 85, Tafel XL]. Five instruments have been preserved (now in Vienna, Kunsthistorisches Museum, nos. 219-23). They are rackets with metal bodies of dragon shape and painted red, green, and gold. Probably they were used in masquerades.

**Tasche** [It.]. Popular name for festivals celebrated at Lucca for several centuries until c. 1800. Boccherini was among those who wrote music for them. See A. Bonaventura, in *RMI* xxxvi (Boccherini); U. Rolandi, in *Bollettino bibliografico musicale* vii.

**Taschengeige** [G.]. \*Kit.

**Tasso**. Symphonic poem by Liszt, based on a poem by Byron, composed 1849-51 and first performed as an overture to Goethe's drama, *Torquato Tasso*.

**Tastar** [It.]. Italian 16th-century term for a lute piece in the style of a free prelude (*tastar de corde*, "touching of the strings"). Ex. in *HAM*, no. 99a, and in *ApMZ* i, 20. The Spanish equivalent was *tañer* (Milán). See *Ricercar* II (a).

**Taste** [G.]. Key (of piano, organ, etc.). *Untertaste*, white key; *Obertaste*, black key.

**Tastiera** [It.]. Keyboard. For the *tastiera per luce* (*clavier à lumières*) in Scriabin's *Prometheus*, see Color organ.

**Tasto** [It.]. (1) The key of a keyboard. For *tasto solo* (i.s.), see Thoroughbass I, 6. (2) Fingerboard of the violin, etc. For *sul tasto*, see Bowing (1).

**Tattoo** [F. *rappel*; G. *Zapfenstreich*; It. *ritirata*; Sp. *retreta*]. The military signals sounded on bugles and drums for recalling soldiers to their quarters at night.

**Tecla** [Sp.]. A 16th- and 17th-century term for key and keyboard. *Música para tecla* (e.g., Cabezón's *Obras de música*, 1578) is music for keyboard instruments.

**Tedesca** [It.]. In the 17th century, name for the \**allemande*. About 1800, name for the \**Ländler* and similar dances in rather quick triple meter (e.g., Beethoven, op. 79, op. 130).

**Te Deum**. A celebrated song of praise and rejoicing, "Te Deum laudamus" (We praise Thee, O God), also known as the hymn of thanksgiving. It was formerly attributed to St. Ambrose (hence the designation Ambrosian hymn). It may have been written by Nicetus (or Nicetius; d. 568), bishop of Remesia (now Nish in Yugoslavia), but certain lines are taken from the *De mortalitate* of St. Cyprian (A.D. 272). It is one of the few remaining examples of the \**psalmus idioticus*. In the Roman Catholic liturgy it usually replaces the last responsory of Matins on feast days and Sundays [see *LU*, pp. 876, 939] and also may be sung as a hymn of thanksgiving on various occasions. Its present-day form is the result of various changes and intercalations, rarely encountered in the tradition of Gregorian chant [see P. Wagner, *Einführung in die Gregorianischen Melodien* (1911-21; repr. 1962), iii, 224ff]. It is sung to a highly archaic psalmodic melody [*LU*, p. 1832], employing formulas almost the same as some in Yemenite cantillations of the Torah.

The Te Deum has often been composed. One of its verses, "Tu patris sempiternus es filius," is used in the \**"Musica enchiriadis"* (c. 900) as an instructive example of organum of the fifth. The closing verse, "In te Domine speravi," was set in English discant c. 1300 [see Discant (2)]. Binchois composed the entire melody in a simple fauxbourdon style. There are 16th-century contrapuntal settings, all based on the Gregorian melody, by Hugh Aston [\**Editions* LI, 10; also a *Missa Te Deum*], Festa, Palestrina, Anerio, Kerle, and Vaet, and settings for organ in Attaingnant's *Magnificat sur les huit tons avec Te Deum laudamus* (1530) and in the \**"Mulliner Book"* (W. Blitheman). Since 1549 it has been

one of the canticles of Morning Prayer in \*Anglican church music. In the 17th century and later the *Te Deum* became a hymn of thanksgiving for special occasions (e.g., a great victory) and was composed in a festive and grandiose style, frequently for double chorus with orchestra (Purcell, 1694; Handel, for the Peace of Utrecht, 1713, and the victory at Dettingen, 1743; K. H. Graun, 1757, battle of Prague; Berlioz, for the Paris Exhibition of 1855; Bruckner, 1884; Dvořák, 1896; Verdi, 1898; Sullivan, for Queen Victoria's Diamond Jubilee, 1897).

The German translation (by Luther) is "Herr Gott, dich loben wir." Under this title J. S. Bach wrote a long organ piece (hardly to be classified as a "chorale prelude") in which he shows great ingenuity in providing different polyphonic settings for the frequently repeated phrases of the (somewhat simplified) plainsong melody. Settings of the 20th century include those of Britten (1945), Kodály (1936), Pepping (1956), and Vaughan Williams (1937). See E. Kähler, *Studien zum Te Deum* (1958).

**Telephone, The.** Opera in one act by Menotti, a companion piece to his \**Medium*, produced in New York, 1947. Setting: Lucy's apartment, the present.

**Telharmonium.** See under Electronic instruments.

**Telyn.** Welsh harp. See Harp III.

**Tema** [It., Sp.]. \*Theme, subject.

**Temperament** [G. *Temperatur*]. I. *General.* A system of tuning in which the intervals deviate from the "pure" (i.e., acoustically correct) intervals of the \*Pythagorean system and \*just intonation. The deviations are necessary because these two systems, although perfect within a small range of tones (mainly those of the C-major scale), become increasingly inadequate with the successive introduction of the chromatic tones. For instance, the acoustically perfect fifth [see Acoustics III] might well be used to obtain a succession of five or six fifths, c, g, d, a, e, b. However, if tones such as f♯, c♯, g♯, d♯ are added in the same manner, the resulting tones cannot be satisfactorily used for melodies such as d e f♯ g, or d♯ f g g♯ (meaning e<sup>b</sup> f g a<sup>b</sup>). Moreover, the twelfth tone of the succession of fifths, b♯, is noticeably higher than the tone c it would represent in our system of notation [see Circle of fifths]. Thus, it is necessary to devise methods that, instead of being perfect in the simple keys

and intolerably wrong in the others, spread the inevitable inaccuracy over all the tones and keys. The most consistent realization of this principle is the equal temperament [see III] universally used today. Prior to its general acceptance, various other systems of tempered intervals, generally referred to as "unequal temperament," were in use, among which the mean-tone system was the only one to attain practical significance.

II. *The mean-tone system.* This system, which was in use c. 1500 (A. Schlick, *Spiegel der . . . Organisten*, 1511; fully explained in P. Aaron's *Thoscanello de la Musica*, 1523) is based on a fifth that is one-fourth of the syntonic \*comma (c. 22 cents) smaller than the perfect fifth (697, instead of 702 cents), the result being that four such fifths in succession (c-g-d'-a'-e'') lead to a major third (e''). In the simple keys with one or two sharps or flats, the mean-tone scale is very satisfactory both melodically and harmonically. In fact, owing to the presence of a perfect third and an almost perfect fifth, the triads sound much purer than in equal temperament. However, the continuation of the series of mean-tone fifths leads to a very noticeable discrepancy between sharp and flat tones, indeed a difference of almost a quarter tone (42 cents) between any two enharmonic tones (e.g., G♯ = 772, A<sup>b</sup> = 814); this difference is known as the "wolf." Having to choose between these two tones (the corresponding choice between C♯ and D<sup>b</sup>, or between D♯ and E<sup>b</sup>, being relatively easier, i.e., in favor of C♯ and of E<sup>b</sup>), Schlick interestingly enough preferred the A<sup>b</sup>, in order to obtain the "süss und fremd lautende Konkordanz" (sweet and strange-sounding consonance) of the triad on A-flat, which actually occurs in his "Da Pacem" [new ed. by G. Harms (1957), p. 37; all the pieces here are transposed down a fourth]. Since this tone could not be used to represent G♯, Schlick recommends avoiding the G♯ or concealing it with a quick ornament [see G. Frotscher, *Geschichte des Orgelspiels* i, 93f]. A better expedient is the use of divided keys, which, as a matter of fact, were not infrequently used in organs of the 16th century. However, even this improvement did not meet the needs of the more fully developed harmonies, modulations, and keys used during the 17th century. The increased use of keys with three to six sharps and flats necessarily led to the system of equal temperament.

III. *Equal temperament.* The principle of equal temperament is to divide the octave into twelve equal semitones. Since the frequency ratio of the

octave is 2, the frequency ratio  $s$  of this semitone is given by the equation:  $s^{12} = 2$ ;  $s = \sqrt[12]{2} = 1.05946$ . The successive powers of this figure give the frequency ratios for the tones of the chromatic scale, e.g.,  $c = 1$ ;  $c\sharp = 1.05946$ ;  $d = 1.05946^2 = 1.12246$ ;  $d\sharp = e^b = 1.05946^3 = 1.18921$ ; etc. Usually a logarithmic measurement is used in which the whole octave equals 1,200 cents and each semitone 100 cents [see Intervals, calculation of, IV, V].

In equal temperament no interval other than the octave is acoustically correct or pure. The deviation of the fifth (2 cents) is too small to be perceived. With the thirds, the difference is considerably greater, the well-tempered third (400 cents) being 14 cents (one-eighth semitone) larger than the pure third (386 cents). However, the modern ear has become completely accustomed to this "error," and the advantages of the system far outweigh its flaws. The following table shows the actual frequency ratios of the Pythagorean system (P), of just intonation (J), and of the tempered tones (E):

	c''	d''	e''	f''	g''	a''	b''	c'''
P.	520	585	658	693	780	877	987	1040
J.	520	585	650	693	780	867	975	1040
E.	520	584	655	694	779	874	982	1040

The accompanying illustration shows the difference between E and J in cents.

Equal temperament is usually said to have been invented by Andreas Werckmeister c. 1700. However, the history of equal temperament can be traced back at least to 1518, when H. Grammateus recommended dividing the octave into ten equal semitones and two of somewhat smaller size. V. Galilei, in his *Dialogo* (1581), proposed using a semitone of the frequency  $1\frac{1}{17}$  (99.3 cents), a close approximation of the well-tempered semitone. The principle of equal temperament was clearly expounded by the Chinese Prince Tsai-yu in 1596 and by Mersenne in 1635. Contrary to common belief, Werckmeister never stated equal temperament correctly. The introduction of equal temperament into musical practice was very slow. Whether Bach's famous collection of pieces in all the

major and minor keys, *The Well-Tempered Clavier* (1722, '44), or its less complete predecessor, J. K. F. Fischer's *Ariadne musica* (1715), referred to equal temperament or merely a close approximation is not entirely clear. At any rate, the system was not universally adopted in Germany until c. 1800, and in France and England until c. 1850. Other systems of temperament, such as that of the mathematician Leonard Euler (1707–83) and of J. P. Kirnberger (1721–83), never attained practical significance. See also Cycle.

Lloyd, in *ML* xix, 443ff, xx, 365ff, xxi, 347ff; *id.*, in *MR* v, no. 4 (mean-tone tuning); J. Handschin, in *Schweizer Jahrbuch für Musikwissenschaft* ii; K. Hasse, in *ZMW* xiii.

**Temperatur** [G.] \*Temperament. *Gleichschwebende, ungleichschwebende T.*, equal, unequal temperament.

**Tempo.** The speed of a composition or a section thereof, ranging from very slow to very fast, as indicated by tempo marks such as largo, adagio, andante, moderato, allegro, presto, prestissimo. More accurate are \*metronome indications, such as  $\text{♩} = \text{M.M. } 100$ , i.e., the quarter note lasts  $\frac{1}{100}$  of a minute. The practical limits for the duration of the beat are M.M. 50 and M.M. 120. M.M. 60–80 represents a "normal" tempo that agrees with various natural paces, e.g., moderate walking or the human pulse. The question of the "right" tempo for a piece is a favorite one among musicians, listeners, and critics. Discrepancies in tempo among performances of a particular work are often explained as being conditioned by external factors, e.g., the size and reverberations of the concert hall, the

sonority of the instruments, or the size of the orchestra. Such explanations, however, account for only minute modifications and not the startling differences often found among performances. These are purely a matter of interpretation, and the differences encountered in the interpretation of tempo are no greater than those in style, phrasing, and orchestral treatment. Generally, it can be said that, where the classical repertory is concerned (Mozart, Beethoven, and especially Bach), modern conductors and performers play the fast movements too fast and the slow ones too slowly. See also *Tempo marks*. For tempo in early music, see *Tactus*.

Lit.: C. Sachs, *Rhythm and Tempo* (1953); S. A. Aronowsky, *Performing Times of Orchestral Works* (1959); R. Donnington, *Tempo and Rhythm in Bach's Organ Music* [1960]; C. Jacobs, *Tempo Notation in Renaissance Spain* [1964]; E. Barthe, *Takt und Tempo* (1960); I. Herrmann-Bengen, *Tempobezeichnungen . . . im 17. und 18. Jahrhundert* (1959); S. Gullo, *Das Tempo . . . des XIII. und XIV. Jahrhunderts* (1964); E. O. Turner, "Tempo Variation" (*ML* xix, 308ff); H. Gál, "The Right Tempo" (*Monthly Musical Record* lxix, 174ff); R. Kolisch, "Tempo and Character in Beethoven's Music" (*MQ* xxix). See also under *Metronome*.

**Tempo giusto.** See *Giusto*.

**Tempo marks.** To indicate the tempo of a piece, a number of Italian terms are used, the most important of which are given here, in order of slowest to quickest: *largo* (broad), *lento* (slow), *adagio* (slow; lit., at ease), *andante* (walking), *moderato* (moderate), *allegretto*, *allegro* (fast; lit., cheerful), *presto* (very fast), *prestissimo* (as fast as possible). In addition to these are terms calling for gradual change of speed, mainly *ritardando* (slackening) and *accelerando* (quickening); *\*rubato* indicates a deliberate unsteadiness of tempo.

With the use of tempo marks, the duration of any given note value becomes variable within large limits. In actual practice, the range of variation is much larger even than one might assume, owing to the practice of writing quick pieces in the larger values (whole to eighth notes) and slow pieces in the smaller ones (quarter to sixty-fourth notes). The first two examples [Ex. 1, Mozart, Piano Concerto, A major, K. 488, last movt.; Ex. 2, Beethoven, Piano Sonata op. 10, no. 3, slow movt.] show that the duration of the half note may vary from less than half a second to four seconds. The difference between "ex-

1. Allegro assai

2. Largo e mesto

3. ♩ = 70

4. ♩ = 70

tremely quick" and "extremely slow" is clear if the two examples are written according to the "natural" principle of using small values for quick notes and large values for long notes [Ex. 3, 4]. If this principle were accepted, tempo marks would become practically obsolete.

Prior to 1600, tempo marks were practically unknown, since the pace of a composition was expressed in the notation itself, the note values then used having absolute durations that were variable only within small limits [see *Tactus*]. An isolated early example of tempo indication is in the vihuela book *El Maestro* (1935) of Luis Milán [*\*Editions* XLVI, 2], who points out that certain sections of his fantasias must be played *apriessa* (quick) and others *espacio* (slow). One of the first composers to use modern tempo marks was Adriano Banchieri (1568–1634), who in his *Organo suonarino* (1611, '22) prescribes *adagio*, *allegro*, *veloce*, *presto*, *più presto*, and *prestissimo* [see *ApMZ* i, 27ff]. In the 17th and 18th centuries *presto* did not have the present-day meaning of "extremely fast" but only meant "fast." Thus, players of Bach's E-minor Prelude from *The Well-Tempered Clavier* i commit a grave error if they try to play its final section in a speed comparable to that of a *presto* etude by Chopin. It was not until the time of Mozart that *presto* had its present-day meaning.

**Temporale.** In the Roman Catholic rite, generic designation for the feasts of the Lord, as opposed to the *Sanctorale*, the feasts of Saints. They are also called *de tempore*, i.e., feasts referring to the "time" (life) of the Lord. See *Gregorian chant* I.

**Temps** [F.]. Beat; *temps fort* (*faible*), strong (weak) beat. *Temps premier*, see under *Chronos*.

**Tempus** [L.]. In 13th-century theory, the unit of musical time, comparable to the *\*tactus* of the 16th century. Franco of Cologne describes it as "minimum in plenitudine vocis," i.e., the small-

est time in which a "full sound" can be conveniently produced (c. M.M. 80). In the 13th century this duration was represented by the *brevis*, whereas with the beginning of the *ars nova* the *semibrevis* was used instead. However, the term *tempus* continued to indicate the mensuration of the *brevis*, whether it was equal to three or to two semibreves (*tempus perfectum, imperfectum*). See Mensural notation II. See S. Gullo, *Das Tempo in der Musik des XIII. und XIV. Jahrhunderts* [1964].

**Ten.** Abbr. for *tenuto*.

**Tender Land, The.** Folk drama in three acts by A. Copland (libretto by H. Everett), produced in New York, 1954. Setting: Midwestern farm, early 1930's.

**Tenebrae** [L.]. In the Roman Catholic liturgy, the service of Matins and Lauds on Thursday, Friday, and Saturday of Holy Week. It is so called [lit., darkness] because of the gradual extinguishing of the candles, one after each psalm of Matins and Lauds on Thursday [LU, pp. 626ff]. At the first nocturn of Matins the \*Lamentations of Jeremiah are sung; at the beginning of Lauds, the \*Miserere (Ps. 50).

**Teneramento** [It.]. Tenderly, gently.

**Tenor.** (1) In early polyphony (c. 1200 to 1500 and later), the part that carries the *cantus firmus* and therefore is the basis for the addition of other parts [see Successive counterpoint]. In the earliest stages of polyphony this part was called *vox principalis* ("Musica enchiriadis," c. 900) or *cantus* (11th cent.; see Part [2]). It came to be called "tenor" (from L. *tenere*, to hold) in connection with the development of melismatic organum, in which the notes of the *cantus* were drawn out and sustained. In the motets of the 13th and 14th centuries the tenor usually carries only a single syllable or word, such as NOS-TRUM, IN SE-CULUM, GO, because its melody is taken from a melisma (not a fully texted section) of a chant [see Clausula; Motet A I].

(2) With the development of four-part writing (c. 1450), "tenor" came to mean second-lowest part, since the *bassus* (originally \**contratenor bassus*) was added below it.

(3) The highest natural voice of men, of approximately the same range as the contrapuntal tenor requires [see Voices, range of].

(4) An instrument of about the same range as the vocal tenor, as tenor trombone, tenor horn, tenor saxhorn, tenor violin, etc.

(5) In plainsong psalmody, the "held" (i.e., repeated) recitation tone; see Psalm tones.

**Tenorgeige** [G.]. Tenor violin [see under Violin family (f)].

**Tenor horn.** Same as tenor tuba; see Tuba.

**Tenorhorn** [G.]. Baritone; see Brass instruments III (c).

**Tenor Mass.** A polyphonic Mass based on a *cantus firmus* that is used as a tenor. Most *cantus firmus* Masses of the 15th and 16th centuries are of this type [see Mass C II b]. See also Discant Mass.

**Tenoroön.** See under Oboe family II, C.

**Tenorschlüssel** [G.]. Tenor clef. See Clef.

**Tenor violin.** See under Violin family (f).

**Tenso.** A form of troubadour and trouvère poetry, in the nature of a dialogue or debate (real or feigned) about politics or other controversial subjects. A similar form was the *jeu-parti* (*parture*; Prov. *partimen*), an actual dialogue, usually about love [see *ReMMA*, p. 213f]. They played an important part in the competitions of the troubadours (\**puys*) and the \*minnesingers (*Sängerkriege*).

**Tenth.** See under Interval.

**Tento** [Port.]. \**Tiento*.

**Tenuto** [It.]. Held, sustained; usually equivalent to legato.

**Teponaztli.** A pre-Columbian wooden drum in the shape of a barrel, enclosed at both ends and with an H-shaped slit on top that creates two tongues facing each other. When the player strikes the drum, using a pair of rubber-tipped mallets, the tongues vibrate and the body acts as a resonator, while a rectangular opening cut on the bottom serves to increase the volume. The inside is cut away in layers so as to produce different pitches. In Central America, three- and four-key *teponaztlis* have been found. I.O-S.

**Terce.** The fourth of the canonical hours. See Office.

**Teretism.** See under Anenaiki.

**Ternary form.** See Binary and ternary form.

**Ter Sanctus** [L.]. Term used with reference to the "Sanctus, sanctus, sanctus" (Holy, holy, holy) of the \*Trisagion, of the Sanctus of the Mass, or of the \*Te Deum.

**Tertian harmony.** A harmonic system based on the third, i.e., the triad; hence, the common Western system of harmony as opposed to, e.g., \*quartal harmony. See also under Third.

**Terz** [G.]. Third. *Terzdezime*, a thirteenth, i.e., upper sixth. *Terzquartakkord*, see under Seventh chord. *Terzverwandschaft*, the relationship between keys a third apart, e.g., C and E, or C and E<sup>b</sup>. *Terzflöte* (*Terzfagott*), a flute (oboe) in E.

**Terzett** [G.], **terzetto** [It.]. A vocal composition for three voices. An instrumental piece in three parts is called \*trio.

**Terzina** [It.]. Triplet.

**Terzo suono** [It.]. Tartini's name for the \*combination tones discovered by him.

**Tessitura** [It.]. The general "lie" of a vocal part, whether high or low in its average pitch. It differs from range in that it does not take into account a few isolated notes of extraordinarily high or low pitch.

**Testo** [It.]. \*Narrator (in oratorios, Passions, etc.).

**Tests and measurements in music.** Psychological tests in all fields had their inception at the time of World War I. The history of the development of tests of musical capacities and abilities has paralleled that of psychological tests. Tests in music have been devised to measure efficiency of teaching, general musical knowledge and achievement, musical taste or preference, and innate musical capacity. They may be divided into two groups: (a) tests and measurements of musical capacities; (b) tests and measurements of musical abilities. The former are independent of training, whereas the latter depend on capacity and training. (*Capacity* means undeveloped, innate, native talent, receptive powers, i.e., potentiality for development; *ability* denotes acquisition of knowledge, skills, and techniques, i.e., development of a capacity.)

(a) *Tests and measurements of musical capacities.* Research in music tests began with experiments by C. E. Seashore in the Psychological Laboratory at the University of Iowa at the beginning of the 20th century. In 1919 the original phonograph recordings known as the Seashore Measures of Musical Talent were released for use. This set of six records purports to measure innate sense for the following musical factors: pitch, intensity, time, consonance, tonal memory, and rhythm. The 1939 revision consists

of two series. Series A is suggested for group surveys to discover talent. Series B constitutes an individual measurement where greater reliability is desired and is suggested as a basic entrance requirement for admission to music schools, assignment to musical instruments, and diagnosis of special problems. Both revised series measure the same factors: pitch, loudness, time, timbre, rhythm, and tonal memory. The 1956 revision retains Series A but discontinues the more difficult Series B of the 1939 revision.

The Kwalwasser-Dykema Music Test, developed by J. Kwalwasser and P. W. Dykema, has been available since 1930. It consists of phonograph records measuring the following abilities and capacities: tonal memory, quality discrimination, intensity discrimination, feeling for tonal movement, time discrimination, rhythm discrimination, pitch discrimination, melodic tastes, and rhythm imagery. The Kwalwasser Music Talent Test of 1953 presents three tones that are repeated with changes in pitch, time, loudness, or rhythm. The subject must determine which variable has been changed. There are two forms: Form A has forty items; Form B, the more difficult test, has fifty items.

The Wing Standardized Tests of Musical Intelligence (1939-60), which became available in 1948 on ten records, included chord analysis, pitch change, memory, rhythmic accent, harmony, and intensity phrasing. Piano music was used in an attempt to place each of these tests in an integral musical setting. The 1957-58 revision was in the form of two types of tape recording, standard and long-playing. German and French editions, as well as an edition for the blind, have been made available.

All the capacity tests are measures of auditory perception and may be given in groups or individually for the purpose of individual diagnosis and prognosis. They can be given to persons musically trained or untrained, to adults and to children as young as nine years or in the fifth grade. Early research substantiated by later investigations proved that records of musical capacities do not vary with age, training, and general intelligence. A high Intelligence Quotient is no assurance of keen pitch discrimination or superior talent in any other musical factor. Training is effective in developing the power to use a fixed capacity. Variation with age may be attributed to an increase in maturity, and may therefore mean that there is no improvement in the physiologic limit of pitch discrimination itself.

As would be expected, ratings determined by capacity measures have been high for successful musicians or students who have made satisfactory or outstanding progress in music. This and other reasons have been considered evidence of the validity of the measures of musical capacity and justify their use in vocational and avocational guidance in music. The reliability and validity of all psychological measures depend on the training and experience of the examiner. It is generally agreed that no one should assume responsibility for the administration, interpretation, and application of tests and results without knowledge of the nature of the psychology of music, principles of testing, and principles of musical interpretation and guidance.

(b) *Tests and measurements of musical abilities.* Tests in this group may be classified as (1) those measuring appreciation and information, and (2) those measuring performance. Tests of appreciation and information based on knowledge acquired in elementary school, high school, and college measure general information, recognition, and comprehension of music from notation, musical symbols, terms, musical instruments, composers, artists, and melodies. These are largely written tests in the form of completion, multiple choice, true and false, or answer to a direct question. Tests measuring performance include tests of sight-singing ability, melodic and rhythmic dictation (writing in musical notation what one has heard played), and the analysis of musical performances directly or from phonograph recordings by means of later developments in phonophotography (see Lit., *The Vibrato*, Seashore, ed.). Many college music departments have devised placement tests in music that are given to applicants in order to estimate the extent and quality of their previous musical training. These tests often combine tests of appreciation and information and tests of performance.

*PMA* lxvii; C. E. Seashore, in *MQ* i; J. C. Moos, "The Yardstick Applied to Musical Talent" (*MQ* xvi). For miscellaneous discussions, see *Mental Measurements Yearbooks* (1938—), which form a comprehensive bibliography of tests for use in education, psychology, and industry. D.D.

**Testudo** [L., tortoise]. (1) The ancient Greek \*lyra, which was frequently made of tortoise shell. (2) A 16th-century humanist name for the lute (e.g., L. Fuhrmann, *Testudo Gallo-Germanica*, 1615).

**Tetrachord.** In ancient Greek music, succession of four descending pitches, at the intervals of a whole tone, whole tone, semitone (*t-t-s*), e.g., e'-d'-c'-b, or a-g-f-e. By joining several tetrachords the entire diatonic scale from e' down to B was obtained [see Greece]. In Greek theory, a tetrachord always has the structure above; groups of four tones with a semitone at another place (e.g., d'-c'-b-a, c'-b-a-g, etc., which some writers call Phrygian, Lydian, etc., tetrachord) did not exist in the Greek system. There were, however, chromatic modifications of the tetrachord, the chromatic tetrachord e'-c'-c'-b and the enharmonic tetrachord e'-c'-x-b (x designating the quarter tone between c' and b).

The tetrachord was adopted by medieval theorists, although in a modified form, always ascending and sometimes with a different intervallic structure. According to the "Musica enchiriadis," the scale consists of four tetrachords of the type *t-s-t*, beginning respectively on G, d, a, e' and designated *tetrachordum gravium, finalium, superiorum, excellentium* [GS i, 153f]. J. Tinctoris distinguishes seven tetrachords of the type *t-t-s*, each forming the first four notes of a hexachord, hence beginning on G, c, f (with b-flat), g, c', f', g' [CS iv, 220f].

**Tetrardus** [Gr.]. See under Church modes I.

**Tetrastemorium.** Term used by Regino of Prüm (d. 915) in his "Epistola de Harmonica Institutione" for \*quarter tone [see GS i, 232b]. The term is a corruption of *tetarton morion* [Gr., the fourth part]. He also used *tristemorium* [Gr. *triton morion*, the third part] for  $\frac{1}{3}$  of a tone.

**Text and music.** In vocal music, particularly songs, the text is one of the prime considerations of the modern composer. Correct accentuation, clarity of pronunciation, emphasis of important words, etc., are basic requirements of good vocal style and indispensable to the main object of conveying musically the general character of the text as well as subtle nuances. Any song, from

Schubert's to those of the present day, will show the composer's concern about text. In fact, from 1880 on, one finds a tendency to emphasize text at the expense of melody, the latter frequently being reduced to a mere "recitation" (Hugo Wolf, Debussy, Schoenberg). Modern composers have been very discriminating in their selection of poetic texts, choosing only those of outstanding literary value. Such 19th-century poets as Goethe, Heine, Mörike, Baudelaire, and Mallarmé gave great impetus to the composition of songs. On the other hand, this has not always been the case; indeed, Bach wrote some of his greatest arias to inferior texts.

The principles of textual treatment developed gradually in the 16th century. Earlier composers seem to have been less interested in these matters, which they often considered irrelevant. Two examples are an *Ave regina* by Dufay, in which the following accentuation occurs: *ra-dix, an-gé-lô-rûm, ré-gi-nâ*; and a motet from the Roman de Fauvel (c. 1300), in which an almost deliberately absurd declamation is used with Ovidian hexameter: *In nova fert animus* [see *ApNPM*, pp. 117ff, 336]. It was not until the \**musica reservata* of the 16th century that the attitude toward textual accent changed. Of Josquin, it has been said that "Latin accents are not infrequently mishandled even in his latest works, although, inconsistently, at other times great care seems to be exercised in this matter" [*ReMR*, p. 245]. Naturally, the use of texts in the vernacular emphasized the need for more care in textual treatment. This is especially true of the Italian madrigal, which, almost from its inception, is characterized by precise and beautiful declamation of the text in all the voice-parts. Equal care was exercised by the English composers. Byrd's anthems contain many examples of a most careful interpretation of the text, J. Wilbye's "rhythmic rendition of the prosody is invariably just as regards accent and quantity" [*ReMR*, p. 829], and the declamation in Purcell's dramatic works is generally admired as a model. German composers were slower to adopt the new point of view. A striking example of misdeclamation—not lacking, however, a certain forcefulness of expression—occurs at the end of Schütz's Christmas Oratorio (1664), where the accentuation *mît Schäl-lé* is consistently used instead of the correct *mît Schállê* [cf. also *spä-de* side by side with *spä-dē* in Monteverdi's *Il Combattimento*; *HAM*, no. 189]. This cannot be considered wholly negligence or error, but a de-

liberate attempt to avoid the weakness of feminine endings. The same was true of Bach, e.g., in the tenor aria, "Geduld, Geduld" of the St. Matthew Passion, where the accentuation *rächén* is used instead of *ráchén*. In other cases in Bach's music, however, such lapses result from his preoccupation with purely musical (melodic) considerations, e.g., in his cantata no. 105 (*BWV*), *Hérr géhë nîcht ins Gêricht*, instead of *Hérr, gēhë nîcht ins Gêricht*.

Carelessness in text underlaying is very common in early sources, particularly those of the 14th and 15th centuries. A striking exception, however, is presented by the Italian MSS of the 14th century, in the works of Giovanni da Cascia, Jacopo da Bologna, Francesco Landini, and others. Possibly the difference between these and contemporary French sources is the result of negligence on the part of the copyists rather than the composers. In the earliest printed collection of vocal music, the \**Odhecaton* (1501), only the incipits of the texts are given, obviously because of the typographical difficulties involved in presenting music together with words. The Parisian publisher Attaignant was probably the first printer to place the words carefully under their corresponding notes. For the numerous problems concerning the text (more properly, the absence or scarcity of text) in 15th-century Masses, the reader is referred to special studies. The modern editorial practice of repeating words for passages lacking a text in the original (e.g., "Kyrie eleison" ten times, instead of once or, perhaps, thrice) is of very doubtful authenticity. Long \*vocalizations (on the syllable *e* of Kyrie) are much more plausible from the musical as well as the liturgical point of view. See also Word painting.

Müller-Blattau, *Das Verhältnis von Wort und Ton in der Geschichte der Musik* (1952); J. Jacquot, ed., *Musique et Poésie au XVI<sup>e</sup> siècle* (1954); L. Gamberini, *La Parola e la musica nell'antichità* (1962); H. E. Wooldridge, "The Treatment of Words in Polyphonic Music" (*MA* i); H. Monroe, "Words to Music" (*ML* i); G. Adler, "Über Textlegung in den 'Trienter Codices'" (*CP Riemann*); K. Jeppesen, "Die Textlegung in der Chansonmusik des späteren 15. Jahrhunderts" (*CP* 1927); E. Wellesz, "Words and Music in Byzantine Liturgy" (*MQ* xxxiii). For extensive bibl., see *BeMMR*, p. 319.

**Texture.** Much like woven fabric, music consists of horizontal ("woof") and vertical ("warp") elements. The former are the successive sounds forming melodies, the latter the simultaneous sounds forming harmonies [see also Counterpoint I]. It is these elements that make up the texture. The texture stands out particularly clearly in part music, i.e., music written in a given number of parts. Each part represents a horizontal line of individual design, connected with the other lines by the (vertical) relationship of consonance or harmony. Such music is said to have a *contrapuntal* or *polyphonic* texture. In accompanied melody, on the other hand, the texture is primarily vertical, based on a succession of chords that are horizontally connected by a top melody. This texture is called *chordal* or *homophonic*. Ex. 1a and 1b illustrate the two kinds of treatment of a single melody.

Between the two extremes of strictly polyphonic and strictly homophonic music lie a large variety of intermediate textures. Ex. 2 [Beetho-

ven, Piano Sonata op. 106] illustrates a mixture of horizontal and vertical elements that is particularly common in 19th-century piano music (Beethoven, Brahms). As early as the 16th century the strictly contrapuntal texture of the polyphonic era was often modified into a pseudo-contrapuntal texture described as *\*freistimmig*. Distinctive of contrapuntal music is the rhyth-

mic relationship between the parts. There are two types of polyphonic texture, one in which the four parts move in identical rhythm (as in a church hymn), and another in which they are rhythmically wholly independent (as is frequently the case in Palestrina or Bach). Only the latter texture, known as *\*polyrhythmic*, is truly contrapuntal. The former, called *\*homorhythmic*, borders on chordal texture, and indeed is often called *strict chordal style* (as opposed to *free chordal style*, where the number of notes in a chord is not fixed and there is usually no horizontal movement except in the top melody).

One may also distinguish between *light* and *heavy* texture. Light texture results from the use of few instruments, or instruments of light color (e.g., flute), or both. G. Gabrieli's *\*polychoral* compositions and Sibelius' symphonies exemplify heavy texture; Dufay's chansons and Stravinsky's *L'Histoire du soldat* are light. Many 20th-century composers prefer light texture (e.g., Stravinsky, Hindemith). See G. Dyson, "The Texture of Modern Music" (*ML* iv, 107ff, 203ff, 293ff).

**Thailand.** During the past six hundred years, Thai music has absorbed instruments and musical ideas from neighboring cultures into its indigenous musical culture. The strongest influences came from China, where the Thai resided before migrating in the 13th century into present-day Thailand, and from the Khmer at Angkor in Cambodia, through whom also came indirect influences from India and Indonesia. Because of the rich interchange among Laos, Cambodia, and Thailand, the traditional music and instruments of these countries are essentially similar today.

Three main ensembles are used in Thai traditional music: (1) the *pi phat*, consisting of xylophones, metallophones, sets of gong-kettles, hand cymbals, gong, drum, and the *pi*, a double-reed wind instrument; (2) the *khruang sai*, composed of various stringed instruments, rhythmic percussion, and a bamboo flute; (3) the *mahori*, consisting of melodic and rhythmic percussion, stringed instruments, and the flute.

In the Thai musical system, the octave is divided into seven relatively equidistant intervals. The instrumental music consists of a main melody combined simultaneously with variations of itself, a practice that may be termed "polyphonic stratification," each layer usually being performed by only one instrument and

having characteristics idiomatic to that instrument. Music in a definite tempo is always in duple meter, emphasized by accented and unaccented beats played by the small hand cymbals in patterns indicating the form of the piece. Melodies are created mainly out of a repertory of standard melodic species and cadential formulas. The rhythmic emphasis falls on beats two and four of the groups, shorter or longer, of four beats. The pitches falling on the fourth beat of each period (usually two or four measures) form a pattern that indicates the mood or mode of a piece.

Of the seven available pitches, five are used at any one time to form the principal scale; music in "Thai" style is therefore basically pentatonic. In another style, called *mǒn* (pronounced mawn), the other two pitches are used more freely as passing tones. Melodies, basically conjunct, are in one of two styles: motivic, the older style, in which the rhythms are simple and in which standard patterns are employed, and lyric, the more modern style, in which the melody is spun out in a variety of rhythms. The melodic line may shift from one pitch level to another, usually to a level a fifth above or below the preceding one.

Thai music does not employ many forms. The majority of pieces are through-composed, with elementary use of repetition and sequential treatment. A type of variation form was developed during the late 19th and early 20th centuries: a previously existing piece is enlarged to twice its original length and contracted to one-half its original length according to specific principles. The extended version may be played alone, or the extended, middle (original), and short versions may be played in that order as a three-part suite, with or without alternating vocal sections.

Vocal music uses a voice quality rich in partials with much ornamentation. Although vocal sections are used between the main divisions of the variation form described above, vocal techniques are most broadly represented in theater music, where speech, semichants, chants, simple and elaborate songs—solos, as well as leader and chorus styles—are used. Solo music for stringed and wind instruments is also characterized by much ornamentation, similar to that for the voice, often making use of pitches not in the fixed tuning system.

Within relatively limited means, Thai traditional music exhibits great variety. However, because of the restrictions imposed by the princi-

ples of the music and the discontinuance in 1932 of the royal households under whose aegis it evolved, this music has probably reached its apogee of development, beyond which it cannot go without a broadening of its strict organizational principles and the stimulation of new musical ideas. Nevertheless, although it has reached an impasse and may soon become a museum piece, Thai traditional music (together with that of Laos and Cambodia) stands as one of the high musical cultures of Asia.

There is much folk music in Southeast Asia that has not yet been fully studied. Characteristic types include ensembles of gongs and long drums used in processions, serenades, and love songs accompanied by stringed or wind instruments, and unaccompanied, extemporaneous rhymed verses, usually humorous and often bawdy, generally created by members of two opposing groups in friendly competition. Although there has been little if any influence from Western music in Thai traditional music, contemporary popular Thai music does show such influence, the melodies, generally pentatonic, being harmonized principally by primary triads.

Morton, "The Traditional Instrumental Music of Thailand" (diss. U.C.L.A., 1964); K. Pringsheim, "Music of Thailand" (*Contemporary Japan* xiii, 745–67). D.M.

**Theater music.** See Incidental music.

**Theme** [F. *thème*; G. *Thema*; It., Sp. *tema*]. A musical idea that is the point of departure for a composition, especially a sonata (symphony, string quartet, etc.), fugue, or set of variations. In sonatas and fugues it is also called \*subject. An important field of musical scholarship is the *thematic catalog*, which shows the themes (beginnings) of the works of a given composer, e.g., those of Bach (by W. Schmieder), Mozart (Köchel-Einstein), or Beethoven (M. G. Nottebohm; replaced by Kinsky-Halm). Attempts have been made to create a general catalog of musical themes, in which the themes of all compositions (or a large segment) would be listed according to some "alphabetical" system so that they could be looked up and identified.

Lit.: R. Reti, *The Thematic Process in Music* (1951); A. Check List of *Thematic Catalogues* (1954); H. Barlow and S. Morgenstern, *A Dictionary of Musical Themes* (1948); id., *A Diction-*

ary of *Vocal Themes* (1950); W. Altmann, "Über thematische Kataloge" (*CP* 1927); O. Koller, in *SIM* iv; I. Krohn, *ibid.*; N. Bridgman, in *MD* iv; W. Heinitz, in *AMW* iii.

**Themenaufstellung** [G.]. Exposition.

**Theorbo.** See under Lute III. See H. Quittard, "La Théorbe comme instrument d'accompagnement" (*BSIM* i, 221ff, 362ff).

**Theory, musical.** I. *General.* The theory of music as taught today includes elementary studies classified as fundamentals, music writing, \*solfège, and advanced studies in harmony [see Harmonic analysis], as well as \*counterpoint, \*form, and \*orchestration. In this curriculum at least one important study is missing, that of \*melody. Other aspects of musical theory, closely bound up with melody, are \*rhythm and \*phrasing. More scientific in approach are the studies of \*acoustics, \*intervals (calculation of), \*scales, etc., while the philosophical and speculative aspects are in the province of musical \*aesthetics. See also Musicology.

II. *History.* The rest of this article is devoted to a survey of fourteen centuries of Western musical theory (c. 500–1900) through a list of representative treatises. Many of these are briefly described (with bibl.) in G. Reese, *Four-score Classics of Music Literature* (1957). *SSR* (1950) contains translated excerpts; see also *RISM* B III.

#### A. 500–1200.

1. Boethius (c. 480–524). *De institutione arithmetica libri duo; De institutione musica libri quinque* (ed. G. Friedlein, 1867; *SSR*, pp. 79ff). Transmits Greek theory; considered authoritative source through the Middle Ages.

2. Aurelianus Reomensis (mid-9th cent.). *Musica disciplina* (*GS* i, 27ff). Early writing concerning the organization and character of the church modes.

3. \**"Musica enchiriadis,"* with commentary, "Scholia enchiriadis," c. 900, formerly ascribed to Hucbald (*GS* i, 152ff, 173ff; G. trans. by R. Schlecht, in *MfM* vi, vii, viii; *SSR*, pp. 126ff; L. B. Spiess, in *JAMS* xii). Earliest detailed account of \*organum and \*Daseian notation.

4. Regino of Prüm (d. 915). *Epistola de harmonica institutione* (*GS* i, 230ff); *Tonarius* (*CS* ii, 1ff). Discusses music as one of the seven liberal arts.

5. Odo de Clugny (d. 942). *Dialogus de musica* or *Enchiridion musices* (*GS* i, 252ff; G. trans. by P. Bohn, in *MfM*, xii; *SSR*, pp. 103ff); *Intona-*

*narium* (*CS* ii, 117). Presents a \*letter notation beginning with great G (Γ) and extending upward to a' (aa).

6. Guido d'Arezzo (c. 990–1050). \**Micrologus de disciplina artis musicae* (*GS* ii, 2ff; new ed. by J. Smits van Waesberghe, 1955; G. trans. by M. Hermesdorff, 1876); *Item aliae Regulae de ignoto cantu: Prologus in antiphonario* (*GS* ii, 34ff; *SSR*, pp. 117ff); *Epistola de ignoto cantu* (*GS* ii, 43ff; *SSR*, pp. 121ff). Essential text; establishes the hexachordal system of \*solmization using the six syllables *ut, re, mi, fa, sol, la*; introduces a staff similar to the modern staff.

7. Anonymous [J.-A.-L. de la Fage], *Tractatus de musica*, c. 1150 (J.-A.-L. de la Fage, *Essais de diphthéographie musicale*, 2 vols. [1864], i, 335ff). Describes six species of \*discant.

#### B. 1200–1400.

8. *Discantus positio vulgaris*, c. 1225 (*CS* i, 94ff; F. trans. in part in E. Coussemaker, *Histoire de l'harmonie au moyen âge* [1852], pp. 247ff; E. trans. J. Knapp in *JMT* vi [1962]). Description and commentary of the various species of discant in use at Notre Dame in the early 13th century; particularly emphasizes the motet. One of earliest treatises to discuss modal rhythm as a factor in polyphonic compositions.

9. Johannes de Garlandia (c. 1195–c. 1272). *De musica mensurabili positio* (*CS* i, 97ff; another version, Vatican Codex, in *CS* i, 175ff). Describes six rhythmic modes; codifies and discusses in detail concordance and discordance.

10. Franco of Cologne. *Ars cantus mensurabilis*, c. 1260 (*CS* i, 117ff; *GS* iii, 1ff; *SSR*, pp. 139ff). Improvement and standardization of system for mensural notation. Remained authoritative text for nearly a century.

11. Anonymous IV. *De mensuris et discantu*, c. 1275 (*CS* i, 327ff; new ed. with E. trans. by L. Dittmer, 1959). Deals with premensural notation; describes the literature and mentions composers of the \*Notre Dame school of 1180–1240.

12. Walter Odington. *De speculatione musicae*, c. 1300 (*CS* i, 182ff; new ed. and commentary by F. Hammond, diss. Yale Univ., 1965). Comprehensive coverage of 13th-century compositional practice in England.

13. Jacques de Liège. *Speculum musicae*, c. 1330 (Books vi, vii in *CS* ii, 193ff; comp. ed. by R. Bragard, *Corpus scriptorum de musica* 3, 1955—; *SSR*, pp. 180ff). Plea for a return to the security of "Franconian" principles.

14. Philippe de Vitry (1291–1361). *Ars nova*, c. 1325 (*CS* iii, 13ff; new ed. by Reaney, Gilles,

and Maillard, in *MD* x, xi, xii, xiv [1956–60] includes F. trans.; G. trans. by P. Bohn, in *MfM* xxii; E. trans. by L. Plantinga, in *JMT* v). *Ars perfecta in musica*, c. 1350 (CS iii, 28ff). Speaks for the inclusion of duple mensuration and presents symbols for indicating *Modus*, *Tempus*, *Prolatio*.

15. Marchetto da Padua. *Lucidarium in arte musicae planae*, c. 1318 (GS iii, 64ff); *Pomerium in arte musicae mensuratae*, c. 1319 (GS iii, 121ff; G. Vecchi, *Corpus scriptorum de musica* 6 [1961]; SSR, pp. 160ff). An account of contemporary practices in Italy. Earliest text accepting duple mensuration.

C. 1400–1600.

16. Prosdocius de Beldemandis (c. 1380). *Tractatus practice de musica mensurabili*, 1408 (CS iii, 200ff); *Tractatus de contrapuncto*, 1412 (CS iii, 193ff; G. trans. by R. Schlecht, in *MfM* ix); *Tractatus practice de musica mensurabili ad modum Italicorum*, 1412 (CS iii, 228ff; new ed. in C. Sartori, *La Notazione italiana del trecento* [1938]). Summarizes practices in Italian notation and prescribes use of chromatics that produce a complete chromatic scale.

17. Johannes Tinctoris (1436–1511). *Terminorum musicae diffinitorium*, c. 1475, printed c. 1494 (CS iv, 177ff; new ed. with F. trans. by A. Machabey, 1951; G. trans. by H. Bellermaun, in *JMW* i; E. trans. by C. Parrish, 1963); *Proportionale musices*, c. 1474 (CS iv, 153ff; SSR, pp. 193ff; E. trans. by A. Seay, in *JMT* i [1957]); *Liber de arte contrapuncti*, 1477 (CS iv, 76ff; SSR, pp. 197ff; E. trans. by A. Seay, in *Musicological Studies and Documents* 5 [1961]); *De inventione et usu musicae*, c. 1485 (new ed. K. Weinmann, *Johannes Tinctoris und sein unbekannter Traktat*, 1917). Eight other treatises (all in CS iv) are described in *ReMR*, p. 140. The twelve treatises present a sequential exposition of musical knowledge of the time.

18. Bartoloméo Ramos de Pareja (c. 1440–after 1491). *Musica practica*, 1482 (ed. J. Wolf, 1901; SSR, pp. 200ff). Presents a simpler method of dividing a string than that transmitted by Boethius. Uses the just major third. This intonation was discouraged by Gafurius, championed by Fogliani.

19. Guilielmus Monachus. *De preceptis artis musicae*, c. 1485 (CS iii, 273ff; new ed. by A. Seay, in *Corpus scriptorum de musica* 11 [1965]). Discusses fauxbourdon and gymel.

20. Franchinus Gafurius (1451–1522). *Practica musicae*, 1496; *Theorica musicae*, 1492 (fac. ed., G. Cesari, 1934; see also P. Hirsch, in *CP*

*Wolf*; *MGG* iv, cols. 1237–43). Unlike his predecessors, Gafurius did not depend on Boethius but read Latin translations of Quintilian, Ptolemy, and other Greek writers.

21. Pietro Aaron (1480–1545). *Libri tres de institutione harmonica*, 1516; *Thoscanello de la musica*, 1523; *Trattato della natura et cognitione di tutti gli tuoni di canto figurato*, 1525 (SSR, pp. 205ff); *Lucidario in musica*, 1545. Reports the abandonment of the successive manner of composing parts.

22. Lodovicos Fogliani (d. 1538). *Musica theórica*, 1529 (partly in Riemann, *History of Music Theory*, ch. xii). Describes syntonic diatonic tuning requiring just major third made up of a major and a minor whole tone.

23. Giovanni Maria Lanfranco (d. 1545). *Scintille di musica*, 1533 (trans. and comm. by B. Lee, diss. Cornell Univ., 1961). An excellent example of the Renaissance primer on music.

24. Henricus Glareanus (Heinrich Loris; 1488–1563). *Isagoge in musicen*, 1516 (E. trans. by F. Turrell, in *JMT* iii [1959]); *\*Dodecachordon*, 1547 (G. trans. by P. Bohn, in *\*Editions XLVII*, 16; SSR, pp. 219ff; E. trans. by C. Miller, in *Musicological Studies and Documents* 6, 2 vols. [1965]). In *Dodecachordon* the number of modal scales is increased to twelve.

25. Nicola Vicentino (1511–72). *L'Antica musica ridotta alla moderna prattica*, 1555 (fac. repr. ed. E. Lowinsky, 1959); *Descrizione dell'arciorgano*, 1561 (E. trans. by H. Kaufmann, in *JMT* v [1961]). Describes a tuning system and gives specifications for building an instrument with 36 pitches (in practice only 34 keys) within each octave, providing intervals of ancient Greek diatonic, chromatic, and enharmonic genera in addition to just and mean-tone scale requirements.

26. Gioseffo Zarlino (1517–90). *Le istitutioni harmoniche*, 1558 (fac. repr. by Broude, 1965; SSR, pp. 228ff; G. Marco, diss. Univ. of Chicago, 1956; *ReMR*, p. 377). Notes natural opposition of major and minor triads; rennumbers Glareanus' twelve modes, placing Ionian first.

27. Francisco de Salinas (1513–90). *De musica libri septem*, 1577 (fac. repr. M. Kastner, 1958). A comprehensive statement of contemporary knowledge of music, supporting the work of Zarlino and Glareanus.

28. Vincenzo Galilei (c. 1520–91). *Dialogo della musica antica e della moderna*, 1581 (SSR, pp. 302ff). Musical mentor of Florentine "Camerati."

29. Giovanni M. Artusi (c. 1540–1613). *L'Arte*

*del contraponto*, 1586–89. Clear statement of fundamental rules of counterpoint as taught in late 16th century.

30. Ludovico Zacconi (1555–1627). *Prattica di musica*, 2 vols., 1592, 1622. Extensive description of instruments of his time and directions for executing ornaments.

31. Ercole Bottrigari (1531–1612). *Il desiderio, overo de' concerti di varii strumenti musicali*, 1594 (fac. ed. K. Meyer, 1924; E. trans. by C. MacClintock, in *Musicological Studies and Documents* 9 [1962]). Discusses combinations of instruments.

32. Thomas Morley (1557–1602). *A Plaine and Easie Introduction to Practicall Musicke*, 1597 (mod. ed. R. A. Harman, 1952; SSR, pp. 274ff). An excellent book describing forms and compositional techniques.

33. Girolamo Diruta (b. 1550). *Il Transilvano*, 2 vols., 1593, 1609 (part in G; trans. by C. Krebs, in VMW viii). Significant for consideration of aesthetic as well as technical aspects of performance; includes many musical examples.

D. 1600–1800.

34. Michael Praetorius (1571–1621). *Synagoga musicum*, 3 vols., 1615, '18, '19 (vol. ii, *Organographia*, repr. in \*Editions XLVII, 13; fac. ed. W. Gurlitt, 1929; repr. 1958–59; E. trans. of pts. 1, 2 of vol. ii by H. Blumenfeld, 1949; vol. iii, new ed. E. Bernoulli, 1916; E. trans. of vol. iii by H. Lampl, diss., Univ. of Southern California, 1957). Encyclopedic effort. Vol. iii describes secular composition.

35. Camillo Angleria (c. 1580–c. 1630). *La regola del contraponto e della compositione*, 1622. The subtitle states "in which is treated briefly everything about consonance and dissonance with examples in 2, 3, and 4 parts." Uses the eight church modes.

36. Charles Butler (d. c. 1647). *The Principles of Musick*, 1636 (*Short Title Catalogue*). Though based on Morley's work, an interesting attempt to codify the author's later observations concerning the practice of composition and the development of the concept of harmony.

37. Marin Mersenne (1588–1648). *Harmonie universelle*, 1636 (fac. ed. F. Lesure, 1963; E. trans. "The Books on Instruments," R. Chapman, 1957). Extensive coverage of experiments on physical properties of sound. Full description of contemporary instruments.

38. Adriano Banchieri (1568–1634). *L'Organo suonarino*, 1605. Several editions; 2nd ed. includes detailed discussion of figured bass and performance practice.

39. Antoine Parran (1587–1650). *Traité de la musique théorique et pratique*, 1639. Excellent text on 17th-century techniques of composition employing the twelve modes of Glareanus as renumbered by Zarlino.

40. Christoph Bernhard (1627–92). *Von der Singe-Kunst oder Manier; Tractatus compositionis augmentatis* (both MSS, c. 1657; in J. Müller-Blattau, *Die Kompositionslehre Heinrich Schützens*, 1926). Describes motifs and compositional procedures in accordance with the doctrine of affections.

41. Christopher Simpson (c. 1610–69). *The principles of Practical Musick [Delivered in a Compendious, Easie, and New Method]*, 1665. Under the title *A Compendium of Practical Musick in Five Parts*, this book (1st ed., 1667) was reprinted in at least nine editions. The five parts are: 1. The rudiments of song. 2. The principles of composition. 3. The use of discords. 4. The form of figurate descant. 5. The contrivance of canon.

42. Giovanni Maria Bononcini (1642–78). *Musico pratico*, 1673. Deals with counterpoint, consonance, dissonance, the twelve tones, composition in two, three, and four parts.

43. Lorenzo Penna (1613–93). *Li primi albori musicali per li principianti della musica figurata*, 1st ed. 1656, 2nd ed. corrected and enlarged by author, 1679 (actually issued 1694). Includes three books: 1. The principles of singing. 2. The rules of counterpoint. 3. Fundamentals of playing from a figured bass.

44. John Playford (1623–86). *A Breefe introduction to the skill of musick for song & violl.*, 1654. Nineteen numbered and six unnumbered editions of this popular work appeared between 1654 and 1730.

45. Jean Rousseau (late 17th cent.). *Méthode claire, certaine et facile pour apprendre à chanter la musique*, 1678. In this little book on the art of singing the seventh syllable *si* appears as a normal part of the solmization system.

46. Angelo Berardi (c. 1653–c. 1700). *Il perchè musicale*, 1693. Detailed and clear rules "in which reason dissolves difficulty, examples demonstrate how to avoid errors and to weave with artifice the components of music."

47. Andreas Werckmeister (1645–1706). *Harmonologia musica*, 1702. This short book deals with composition and describes techniques of improvisation.

48. Zaccaria Tevo (1651–between 1709–12). *Il musico testore*, 1706. The work is divided into four parts, of which the last two deal extensively

with the materials and procedures of composition. The last part includes examples of composition for voices and instruments, double counterpoint, fugue.

49. Alexandre Frère. *Transpositions de musique*, 1706. An attempt to provide proper signatures for all keys and particularly a single basis for minor scale signatures.

50. Alexander Malcolm (b. 1687). *A Treatise of Musick, Speculative, Practical, and Historical*, 1721. Concerned mainly with elementary matters but notable for including the first "correct" table of key signatures, essential to the full development of the major-minor key system.

51. Jean-Philippe Rameau (1683–1764). *Traité de l'harmonie reduite à ses principes naturels*, 1722 (SSR, pp. 564ff; fac. Broude Bros., 1965). A text of prime importance to the history of music theory. Rameau's concept of *centre harmonique* firmly establishes the major-minor system. *Nouveau système de musique theorique*, 1726; *Génération harmonique ou Traité de musique theorique et pratique*, 1737; *Démonstration du principe de l'harmonie*, 1750; and *Nouvelles réflexions sur sa demonstration du principe de l'harmonie*, 1752 (all available in fac.) with numerous letters and articles. These consistently expound a belief in the *corps sonore* as the source, musical practice as the means, and psychological response as the arbiter.

52. Johann Joseph Fux (1660–1741). *\*Gradus ad Parnassum*, 1725 (E. trans. A. Mann, *Steps to Parnassus*, 1943). An 18th-century codification of contrapuntal practice, still used as a manual for the development of compositional skills.

53. Johann Mattheson (1681–1764). *Grosse General-Bass-Schule*, 1731; *Kleine General-Bass-Schule*, 1735; *Der vollkommene Capellmeister*, 1739 (fac. M. Reimann, 1954; partly trans. by H. Lenneberg, in *JMT* ii, 1 and 2; B. C. Cannon, *Johann Mattheson*, 1947). A well-organized presentation of essential theoretical knowledge and, in the last book, a complete presentation of the doctrine of *\*affections*.

54. Giuseppe Tartini (1692–1770). *Trattato di musica secondo la vera scienza dell'armonia*, 1754 (A. Planchart, in *JMT* iv, 32). Uses phenomena of "third sound" (difference tone) to explain harmonic relation.

55. Georg Joseph Vogler (Abbé; 1749–1814). *Tonwissenschaft und Tonsetzkunst*, 1776. Systematic but complicated derivation of harmonies from the first 32 partials. He is better known for producing low-pitched organ tones by combining two higher-pitched pipes.

E. 1800–1900. Of the numerous texts that appeared during the 18th century after Rameau's basic work, most were of a decidedly practical nature. Similarly, after 1800 only a few are concerned with purely theoretical problems. Among these are:

56. Gottfried Weber (1779–1839). *Versuch einer geordneten Theorie der Tonsetzkunst*, 1817–21. Practical and nonacoustical approach. Remembered for advancing the use of Roman numerals for chord identification within key structures; also contributed evaluation of harmonic constructs on artistic grounds.

57. Anton Reicha (1770–1836). *Cours de Composition Musicale*, 1818. A friend of Beethoven's and a composer of some repute. His pupils included Berlioz, Gounod, and Franck.

58. François-Joseph Fétis (1784–1871). *Traité complet de la théorie et de la pratique de l'harmonie*, 1844. Rejects mathematical and acoustical bases of harmony. The first to employ the term tonality (*tonalité*) to explain, in almost identical terms, the *centre harmonique* described by Rameau in 1722.

59. Moritz Hauptmann (1792–1868). *Die Natur der Harmonik und der Metrik zur Theorie der Musik*, 1853. Based on the philosophical method of Hegel. Though severely criticized, warrants consideration.

60. Abramo Basevi (1818–85). *Introduzione ad un nuovo Sistema d'Armonia*, 1862. Directs attention to sensation and perception. The work is mentioned by Helmholtz in *On the Sensations of Tone*.

61. Hermann (Ludwig Ferdinand) von Helmholtz (1821–94). *Die Lehre von den Tonempfindungen als physiologische Grundlage für die Theorie der Musik*, 1863 (E. trans. *On the Sensations of Tone*, A. J. Ellis, 1885; repr. 1954). Major contribution to knowledge of musical materials on physical and physiologic grounds.

62. Hugo Riemann (1849–1919). Though most important as the author of *Geschichte der Musiktheorie im IX.–XIX. Jahrhundert*, 1898 (E. trans. of books I and II [2nd ed.] by R. Haggh, 1962), Riemann wrote several additional texts on music theory, including *Musikalische Logik*, 1873; *Musikalische Syntaxis*, 1877; *Die Natur der Harmonik*, 1882; and *Vereinfachte Harmonielehre*, 1893 (E. trans. by Bewerunge, 1896). For systematic presentation of fundamental knowledge, Riemann's work is outstanding although colored by 19th-century positivism.

Among modern contributions to musical theory, the writings of Heinrich Schenker

(1868–1935; see Schenker system), Charles Koechlin (1867–1950), and Paul Hindemith (1895–1963) are noteworthy. Intentional expansion of existing tonal systems are the basis of the writings of Alois Hába (b. 1893; *Neue Harmonielehre des diatonischen, chromatischen . . . Tonsystems*, 1927); Joseph Yasser (b. 1893; *A Theory of Evolving Tonality*, 1932); and Olivier Messiaen (b. 1908; *Technique de mon langage musical*, 1944; E. trans. J. Satterfield, 1956). For serial techniques, the work of J. Rufer (b. 1893; *Die Komposition mit zwölf Tönen*, 1952; E. trans. H. Searle, 1954) is basic.

**Theremin.** See under Electronic instruments.

**Theresienmesse** [G., Theresa's Mass]. Popular name (unexplained) for Haydn's Mass in B-flat, composed in 1799.

**Thesis.** See Arsis and thesis.

**Third** [F. *tierce*; G. *Terz*; It. *terza*; Sp. *tercera*]. The third degree of a scale, and the interval thus formed with the first degree [see Interval]. The third is the most characteristic interval of the Western harmonic system, which, indeed, might be called the system of triadic (or \*tertian) harmony (c. 1400–1900), as distinguished from an earlier period (c. 900–1400) when the third was not fully admitted, and from a later one (c. 1900–) in which it has lost its former important position [see Harmony II].

Guido d'Arezzo in his "Micrologus" (ch. xviii) admits both the major and the minor third as *concordiae* of the *diaphonia* (organum), and both intervals occur in his instructive examples. They also occur sporadically in the early 12th-century organa of Fleury and Chartres, occasionally even in groups of three parallel thirds. In the five organa from Chartres 130 [see Bannister, in *RG* i, 29ff] the third actually is the most common of all intervals (66 thirds, 63 unisons, 46 fourths, etc.). The St. Martial organum *Senescente mundano filio* (c. 1150) contains an entire section in parallel thirds [see Ex.; see W. Apel, in *CP Anglés* i, 66; also Handschin, in *CP Adler*, p. 57. Whereas these findings invalidate the customary

8 Der may hat me-nig Her-cze hoch er-stai-gett

8 sprach ein maid er hatt es wol er-czai-get was

8 sein süs-ser wun-ne thut wann er klai-det swar-

8 czen dorn in

third as the third consecutive fourth (c-f-b<sup>b</sup>-e<sup>b</sup>) with the frequency  $3\frac{1}{2}_{27}$ . The consonant (pure) third of \*just intonation,  $\frac{5}{4}$ , was already known to Aristoxenos (b. c. 354 B.C.) but does not appear in medieval theory until c. 1300, in W. Odington's "De speculatione musicae." The difference (in cents) between the thirds of the various systems is shown in the following table:

	Minor third	Major third
Pythagorean	294	408
Just intonation	315	386
Mean-tone system	315	386
Equal temperament	300	400

The difference between the tempered and pure major third can easily be demonstrated on the organ by playing on one manual the tone e" with a normal 8' register, and on the second manual the tone c with a mutation stop (1 $\frac{3}{5}$ ') which produces the fifth harmonic e" in just intonation.

**Thirteenth, chord of the.** See under Ninth chord.

**Thirty-second note.** See under Notes.

**Thirty-two foot stop.** See under Foot (2).

**Thoroughbass, figured bass** [F. *basse chiffrée*, *continue*, *figurée*; G. *Generalbass*, *bezifferter Bass*; It. *basso continuo*; Sp. *bajo cifrado*]. Note: "thorough" (old spelling for "through") means the same as *continuo*, i.e., continuing throughout the piece.

1. A method of indicating an accompanying part by the bass notes only, together with figures designating the chief intervals and chords to be played above the bass notes. This stenographic system was universally used in the baroque period (1600–1750). The chief principles of the fully developed system (c. 1700) are:

1. A figure given with a bass note calls for the corresponding interval above this note in the key indicated by the signature. For instance, in A<sup>b</sup> major, a 6 written under (or above) g indicates E<sup>b</sup>, and the figures  $\frac{6}{5}$  indicate D<sup>b</sup> and E<sup>b</sup>.

2. The intervals of the third, fifth, and octave often are not indicated by figures (3, 5, 8), it being understood that these were to be added where suitable.

3. Chromatic alterations are indicated by a sharp or flat placed in front of (occasionally behind) the figure. A sharp or flat without a figure calls respectively for the major or minor third. The natural sign is used in a similar way. Sharpening is frequently indicated by a diagonal stroke through the figure or by an apostrophe.

4. A horizontal dash following a figure or a vertical group of figures indicates that the notes of the right hand are to be held, even if the bass proceeds to other tones.

5. A small diagonal dash indicates repetition of the same figures above a changed bass note, i.e., sequential transposition of the chord.

6. The figure 0 indicates *tasto solo*, i.e., no accompaniment other than the bass note.

7. Frequently, two or more successive figures do not indicate chords proper but only voice-leading, appoggiaturas, or passing tones, e.g., 4 3, or 9 8, or 5 4 3.

The accompanying examples illustrate these principles.

1

6 6 7 6 4 3 2

2

6 6 8 6 7 7 7 7

7 8 6 9 8 6

II. The principles above constitute only the rudiments of a very difficult art. A good thoroughbass accompaniment is considerably more than a mere translation of figures into musical notes. At the proper places, the musical material used in the solo parts (voice, violin) should be incorporated into the accompaniment, in free imitation, or in doubling thirds, or in contrapuntal contrast. How far this should be carried is a difficult and controversial question. Obviously, different situations are presented by different compositions and in different periods. Between the years 1600 and 1750, the style of improvised accompaniment changed from simple homophony to real counterpoint. Thus an elaborately contrapuntal realization for, e.g., arias of the mid-17th century is clearly inappropriate.

Bach himself left two records of his own thoroughbass improvisation, one in the second aria of the solo cantata *Amore traditore* and another in the second movement of his sonata in B minor for flute and harpsichord. Although both parts are designated *Cembalo obbligato*, their style differs markedly from that of other written out parts and so probably indicates his style of thoroughbass improvisation [see M. Schneider, in *JMP* xxi/xxii]. Another informative example of written out thoroughbass accompaniment is in a sonata by Handel for viola da gamba and harpsichord [*Händelgesellschaft* ed., xlviii, 112–17].

In addition to the accompanying harpsichordist, the realization of a thoroughbass part calls for a cello or viola da gamba that reinforces the bass line. It would be entirely in keeping with baroque \*performance practice for the players of such instruments to simplify the written part somewhat whenever it includes rapid figures, intelligently underlining the contours instead of disturbing the equilibrium with a forced display of virtuosity.

III. The thoroughbass practice of the baroque grew out of the improvisation techniques of the 16th century. About 1600, motets were occasionally accompanied on the organ by a *bassus pro organo*, a separate bass part from which the organist played the harmonies. The earliest known instance of this method is in a forty-part motet of 1587, "Ecce beatam lucem," by A. Striggio [see M. Schneider, p. 67]. A similar bass part, printed for Giovanni Croce's *Motetti* of 1594, has  $\sharp$  and  $\flat$  above the notes in order to indicate major or minor triads (thirds). The earliest examples of a *basso continuo* with figures

are Cavalieri's *Rappresentazione* and (less completely) Peri's and Caccini's operas *Euridice*, all from 1600. Here as well as in numerous later works, different figures are used for the different octaves, e.g., 10 for the tenth (upper third), 15 for the double octave [see, e.g., *WoHN* ii, 315]. Among the numerous 17th- and 18th-century writers on *basso continuo* are A. Agazzari, *Del sonare sopra'l basso*, 1607 (fac. ed. by Bollettino Bibliografico Musicale, 1933); M. Praetorius, in *Syntagma musicum* iii, 1619 (ch. vi: *De basso generali seu continuo*); M. Locke, *Melothesia, or Certain General Rules for playing upon a Continued-bass*, 1673; M. de Saint-Lambert, *Nouveau Traité de l'accompagnement* (1707); J. D. Heinichen, *Der General-Bass in der Composition*, 1728; J. Mattheson, *Grosse General-Bass-Schule*, 1731; G. P. Telemann, *Singe-, Spiel-, und Generalbass Übungen* 1733/4 (new ed. by M. Seiffert, 1914); K. P. E. Bach, *Versuch über die wahre Art das Clavier zu spielen*, 1753 (trans. W. J. Mitchell, 1949); D. G. Türk, *Kurze Anweisung zum Generalbassspielen*, 1791. See also *Partimento*.

Lit.: F. T. Arnold, *The Art of Accompaniment from a Thorough-bass* (1931); H. Keller, *Thoroughbass Method* [1965]; F. Oberdörffer, *Der Generalbass in der Instrumentalmusik des ausgehenden 18. Jahrhunderts* (1939); G. Kirchner, *Der Generalbass bei Heinrich Schütz* (1960); E. Ulrich, *Studien zur deutschen Generalbass-Praxis . . . des 18. Jahrhunderts* (1932); M. Schneider, *Die Anfänge des Basso continuo und seiner Bezifferung* (1918); G. J. Buelow, in *AM* xxxv; L. Landshoff, in *CP Sandberger; RiHM* ii.2, 72ff; E. Stolz, in *ZMW* xiii; L. Torchi, in *RMI* i, ii; A. Toni, in *RMI* xxvi; H. H. Eggebrecht, "Arten des Generalbasses" (*AMW* xiv); *WoHN* ii, 314ff.

**Three-Cornered Hat, The.** See *Sombrero de tres picos, El*.

**Threepenny Opera.** See *Dreigroschenoper, Die*. Also see under *Ballad opera*.

**Through-composed.** This term, which is widely accepted as a translation of *G. durchkomponiert*, is applied to songs in which new music is provided for each stanza. Its opposite is "strophic song," a song in which every stanza is sung to the same melody. The latter method is frequently used for simple lyrics, while the former is preferred for dramatic or narrative texts in which the situation changes with every stanza, e.g., Schubert's "Der Erlkönig." Schubert and Karl Loewe [see *Ballade* (G.)] were among the first

to employ the through-composed style. Since then it has been almost universally adopted for lyrical songs.

The term also applies, in a more general sense, to the use of new music where musical repeat would be possible or normal. Thus, in most church hymns the individual stanza is through-composed, but some use repeat forms such as a a b c. From the over-all view, of course, they are strophic since the music is repeated in each stanza. Similarly, in troubadour and trouvère songs, the individual stanza may be through-composed or have initial repeat [see *Canzo*].

**Through-imitation** [F. *imitation syntaxique*; G. *Durchimitation*]. The procedure of basing a composition entirely on the principle of imitation. In this sense, Bach's fugues are through-imitative. However, the term is chiefly applied to the fully imitative polyphony of the 16th-century motet [see *Motet B II*], in distinction to earlier compositions based on a *cantus firmus* or employing imitation only sporadically. Although some pieces by A. Busnois, L. Compère, and Josquin come fairly close to being through-imitative, it was Gombert (c. 1490–1556) who established through-imitation (or, as it is also called, “pervading imitation”) as the standard method of motet composition. See C. van den Borren, “Quelques Réflexions à propos du style imitatif syntaxique” (*RBM* i).

**Thunder machine** [G. *Donnermaschine*]. A device introduced by R. Strauss in his *Alpensinfonie*, op. 64 (1915), to imitate thunder. It consists of a big rotating drum with hard balls inside that strike against the drumhead.

**Thus Spake Zarathustra.** See Also *Sprach Zarathustra*.

**Tibet.** Since World War II, a considerable amount of research has been done on Tibetan music. The liturgical chant traditionally practiced in the numerous monasteries (especially in the capital, Lhasa) is a kind of recitative of a very low bass range (E to G) in an unstressed rhythm of equal pulses, accompanied by metallophones, drums, and an even lower drone held by long trumpets, often extending like telescopes to a length of twelve or more feet. There are also religious performances with dancing by large groups of masked performers, often lasting several days and making use of large orchestras similar to those of ancient China. Secular music is cultivated by touring troupes performing

plays with music, somewhat similar to Chinese opera. There is a large repertory of folk dances, folksongs, work songs, etc. A detailed description of Tibetan music is found in *GDB* viii, 456ff. Tibetan musical notation consists of elaborate scrolls of a highly ornamental design; ex. in L. A. Waddell, *The Buddhism of Tibet*, rev. ed. (1934). See also *LavE* i.5, 3084ff (examples doubtful); *NOH* i, 137ff; T. H. Somervell, in C. G. Bruce, *The Assault on Mount Everest 1922* (1923), ch. xiv; T. H. Somervell, in *Musical Times* lxiv, 107f; W. Graf, in *Studia musicologica* (Budapest) iii, 133ff.

**Tibia** [L.]. Name for the Greek \*aulos; see Oboe family III. *Tibicen* [L.], flute player.

**Tie, bind.** A curved line, identical in appearance to the \*slur, that connects two successive notes of the same pitch and has the function of uniting them into a single sound equal to their combined durations. The tie is used (1) to connect two notes separated by a bar line; (2) to produce values that cannot be indicated by a single note, e.g., the value of seven eighth notes:

The tie, together with the bar line, is the most conspicuous achievement of modern notation over the earlier system of \*mensural notation, where it does not exist (the earliest known instance occurs in a keyboard score of 1523, *Recerchari motetti, canzoni* of Marco Antonio Cavazzoni [da Bologna]; see *ApNPM*, p. 5). Owing to the nonexistence of the tie in mensural notation, a note equaling five units was never used in duple meter (*tempus imperfectum*) in any vocal composition prior to c. 1600; only in triple meter (*tempus perfectum*) could such a value be obtained, by subtracting one from six (imperfection).

Occasionally a tie calls not for a complete suppression but for a subtle repetition of the second note; see under Tremolo I.

**Tiento** [Sp.], **tento** [Port.]. A 16th- and 17th-century form that is the Iberian counterpart of the Italian *ricercar* (not, as has been stated, of the *toccata*). Like the *ricercar*, it originated in vihuela (lute) music (Milán, *Libro de música . . . El Maestro*, 1535–36) as a free “study” [see *Ricercar* II] in idiomatic style for the instrument and was later used for organ music (L. Venegas de Henestrosa, A. Cabezón; see Editions XXXII, 2, and XX, 3, 4, 7, 8), where it became a study in imitative counterpoint. However, the erudite

formal treatment often found in the *ricercar* is rarely present in the *tientos*, which also are usually much shorter than the contemporary *ricercars*. *Tientos* continued to be composed throughout the 17th century, mainly by Manuel R. Coelho (*Flores de música*, 1620), F. Correa de Araujo (*Libro de tientos*, 1626; \*Editions XXXII, 6), and Juan Cabanilles (1644–1712; *Opera omnia*, ed. by Anglés). Most of these are long compositions in which imitation appears only at the beginning, the thematic material serving only as the springboard for a wealth of playful motifs, lively figurations, and picturesque ideas.

**Tierce** [F.]. (1) Third. *Tierce de Picardie*, see Picardy third. (2) An organ stop of the mutation type that sounds a note two octaves and a major third above the key played. See Organ. (3) *Tierce coulée*. See Appoggiatura, double II.

**Till Eulenspiegels lustige Streiche** [G., Till Eulenspiegel's Merry Pranks]. Symphonic poem by R. Strauss, op. 28 (1895), based on the 16th-century German folk tale of Till Eulenspiegel. The music develops, in a free rondo form, around two themes, one representing Till as a popular hero, the other as a vagabond and prankster. There are no specific programmatic connotations except at the end, where the sentencing and hanging of Till are clearly suggested.

**Timbale** [F.], **timpano** or **timballo** [It.]. Kettle-drum [see Percussion instruments A, 1].

**Timbre** [F.]. (1) Medieval name for \*tambourin. (2) Same as \*tone color. (3) A standard melody, especially for popular tunes underlaid with new texts (*opéra comique*, vaudeville). See also the "Catalogue des timbres" in E. Misset and P. Aubry, *Les Proses d'Adam de Saint-Victor*, pp. 119ff.

**Timbrel**. Old name for \*tambourine.

**Time**. Term used loosely to indicate \*meter, tempo, or the duration of a given note.

**Time signatures**. The time (meter) is indicated at the beginning of a piece by two numbers, one above the other; the lower indicates the chosen unit of measurement (half note, quarter note, etc.), while the upper indicates the number of such units comprised in a measure. See Meter.

Early time signatures and their proportional modifications are explained under Mensural notation II and Proportions. Two of them survive, the sign C for 4/4, and the sign  $\text{C}$  for 2/2

(\**alla breve*). In the sources of the 17th century more complicated signs such as  $\text{C}_3$ ,  $\text{C}_3^2$  are still common, often puzzling the modern reader to whom a combination of C (4/4) and 3/2, 6/4, 8/9 [sic] seems contradictory and senseless. Such signs actually combine two meanings, the older proportional meaning with the more recent metrical one. Thus, the sign  $\text{C}_3^2$  [see Froberger, Suite no. 5, in *DTO* 13] means that (a) each measure contains six quarter notes, and (b) these six notes are equal in duration to the four notes of the preceding section. These signs have a strictly metronomic significance (relative to the normal tempo of the piece), a fact usually overlooked by modern readers. Particularly noteworthy is the signature  $\text{C}_3$  (3,  $\frac{3}{1}$ ), which is very frequently used for sections containing three whole notes to the measure [see Froberger, Suites nos. 1–5, *DTO* 13]. Although this may suggest a very slow tempo, the correct speed for such pieces is moderately quick, since these three whole notes will have to be played in the time normally consumed by one whole note:

If, however, the composition is notated in *alla breve* (as is usual in 16th-century vocal music; Palestrina), then the relationship is not 3:1 but 3:2 [see *ApNPM*, pp. 193ff].

Time signatures such as 8/9 or 8/12, found, e.g., in Frescobaldi [see *HAM*, no. 193] do not mean "eight ninth or twelfth notes," but serve—in accordance with 15th-century theory—to cancel previous proportional indications, 9/8 or 12/8. See explanation in *HAM* ii, 281.

About 1700 the symbol  $\Phi$  was used to indicate measures of double length, i.e., 8/4 instead of 4/4 (e.g., Bach, Partita no. 6, Gigue), a method of designation that was still used by Schubert ( $\Phi$ ; = 4/2) in his Impromptu op. 90, no. 3.

**Timing** [F. *minutage*]. The duration of a performance, a matter of importance in planning programs, particularly for radio and television. See S. Aronowsky, *Performing Times of Orchestral Works* (1959); W. Reddick, *The Standard Musical Repertoire, with Accurate Timings* (1947); T. C. York, *How Long does It Play?* (1929).

**Timpan**. (1) A medieval stringed instrument (psaltery? bowed harp?). (2) Kettledrum [see Timpani].

**Timpani** [It.]. Kettledrums. *Timpani coperti*, *t. sordi*, muffled kettledrums. For ill. see under Percussion instruments.

**Tin Pan Alley**. Slang term for anything connected with popular song publishing in the United States. The term originated in the early 1900's, when the popular music trade was concentrated on West 28th Street, New York City; it is now largely outmoded. See I. Goldberg, *Tin Pan Alley* (1930); A. Shaw, "The Vocabulary of Tin-Pan Alley Explained" (*Notes*, 2nd series, vii).

**Tintinnabulum** [L.]. Medieval term for bell.

**Tiorba** [It., Sp.]. Theorbo. See Lute III.

**Tiple** [Sp.]. Soprano, upper voice. Also, a small guitar. The meaning of titles such as "Tiple a tre" (A. Falconieri, c. 1620; see L. Torchi, *L'Arte Musicale in Italia* vii, 128, 143, 151) is not clear.

**Tipping**. See Tonguing.

**Tirade** [F.], **tirata** [It.]. Baroque ornament consisting of a scale passage of more than three notes that serves as a transition between two principal melody notes. It was written out or

indicated by the sign illustrated in Ex. 1 but often was improvised to fill in large intervals. *Tirades* are typical of the French overture style [see Ex. 2, from Bach's Goldberg Variations]. A late example appears in the fourth measure of Beethoven's Piano Concerto no. 4 in G major, op. 58. P.A.

**Tirana**. A type of Andalusian dance-song. Blas Laserna (1751–1816; see *Tonadilla*) wrote a "Tirana del Tripidi" that was famous throughout 19th-century Europe.

**Tirare** [It.]. To draw. *Tira tutti* [draw all], full organ. *Tirarsi* [to be drawn], sliding mechanism of the \*trombone. *Tirando*, slowing of tempo.

**Tirasse** [F.]. Originally, the pedals of a small organ that had no separate pipes but were mechanically connected (coupled) to the manual keys. Hence, a pedal coupler of the organ, e.g., *Tirasse du Positif* (*Tir. P.*), coupler "choir to pedal."

**Tirer, tirez, tiré** [F.]. Indication for downstroke of the bow [see Bowing], the drawing of organ stops, or slowing of tempo.

**Toada**. See *Tonada*.

**Toccata**. (1) A keyboard (organ, harpsichord) composition in free, idiomatic keyboard style, employing full chords and running passages, with or without the inclusion of sections in imitative style (fugues). The earliest toccatas, by A. Gabrieli [\*Editions III, 3], consist of full chords and interlacing scale passages only. To consider them merely virtuoso pieces (as many writers have) is scarcely appropriate, since the passages are decidedly expressive, particularly if played in the free tempo typical of the toccata [see reference to Frescobaldi under Rubato (1)]. With Claudio Merulo (1533–1604) the toccata became organized into alternating toccata (free, idiomatic keyboard style) and fugal sections, usually arranged T F T F T. Frescobaldi's (1583–1643) toccatas are written in a series of short sections, exhibiting a variety of moods in rapid succession. A special type (already written by his predecessors, Trabaci and Ascanio Mayone; see W. Apel, in *MQ* xx) is the short liturgical toccata (e.g., "Toccata avanti l'elevazione," to be played before the Elevation of the Host; see Offertory), which is a short prelude in dignified style. With Bernardo Pasquini (1637–1710) and Alessandro Scarlatti (1660–1725) the Italian toccata became the arena for empty keyboard virtuosity and soon declined into a \**perpetuum mobile* type very similar to the etudes of the early 19th century (Clementi).

The development of the toccata in Germany was twofold. The South German composers (Froberger, Kerll, Muffat) followed the Italian model (Frescobaldi), enriching its stylistic resources and enlivening its contents. More important is the North German development, which led to an entirely novel, rhapsodic toccata that has sometimes been termed \*Gothic. The new style appeared first in the toccatas of Matthias Weckmann (1619–74) and was developed with great artistry by Dietrich Buxtehude (c. 1637–1707), Nicolaus Bruhns (1665–97), and J. S. Bach (1685–1750). Most of these toccatas, particularly those of Bach, retain Merulo's five-section scheme alternating between free and contrapuntal style. Bach's great organ toccata in F major, however, combines the large dimensions of the North German type with the rhythmic precision of the late Italian toccata (Pasquini). The toccata style is also frequently used

for preludes of fugues, e.g., Bach's organ fugue in A minor.

Both the North German and Italian toccatas survive in a few isolated romantic and modern works. Schumann, Debussy (in *Pour le Piano*, 1901), Honegger, Prokofiev, and Casella have written toccatas of the *perpetuum mobile* type, whereas the free, rhapsodic style appears in the toccatas of Busoni (1921) and Petyrek (1934).

(2) About 1600, the name toccata was also used for a festive brass fanfare, e.g., in the introduction of Monteverdi's *Orfeo* (1607). The reason for using the name for pieces so different from the keyboard toccata is not clear. Possibly the latter connotation is bound up with the use of kettledrums for the bass part of such pieces [see Toccata; Toccato; *Touche* (4); Tucket; *Tusch*].

Lit.: E. Valentin, *Die Entwicklung der Tokkata im 17. und 18. Jahrhundert* (1930); L. Schrade, "Ein Beitrag zur Geschichte der Tokkata" (ZMW viii); O. Gombosi, "Zur Vorgeschichte der Tokkate" (AM vi, no. 2); S. Clercx, "La Toccata, Principe du style symphonique" (*La Musique instrumentale de la Renaissance*, ed. J. Jacquot [1955]); L. Torchi, *‡L'Arte musicale in Italia* iii; F. Boghen, *‡Antichi Maestri Italiani: Toccate* [1918]; E. Valentin, *‡Die Tokkata* (1958).

**Toccata.** A short toccata, serving as a prelude to a suite. Examples by J. K. F. Fischer and Murschhauser show a style closer to that of the orchestral toccata [see Toccata (2)] than the free style of the keyboard toccata [Toccata (1)].

**Toccato.** In 17th-century music for trumpets, the bass part of a trumpet piece, so called probably because it was originally played on, or together with, kettledrums. See bibl. under Clarino (2). See also Toccata (2).

**Tod und das Mädchen, Der** [G., Death and the Maiden]. Schubert's String Quartet no. 14 in D minor (1826), whose second movement consists of variations on his song of the same name (1817).

**Tod und Verklärung** [G., Death and Transfiguration]. The second of R. Strauss' six famous symphonic poems, completed in 1889. The music, in four sections, depicts the fevered fantasies of a patient at the crisis of a fatal illness.

**Tokkate** [G.]. Toccata.

**Tombeau** [F.]. See Lament (2).

**Tom-tom.** Set of high-pitched drums used in dance bands. The drums, which can be tuned to

a definite pitch, may be double-headed or single-headed, and represent an imitation of African drums.

**Ton** [F.]. (1) Pitch; *donner le ton*, to give the pitch. (2) \*Pitch pipe. (3) Key or mode; *ton d'ut*, key of C; *ton majeur*, major key; *ton d'église*, church mode. (4) Whole tone, as distinct from *demiton*, semitone. (5) Crook; *ton du cor*, *ton de rechange*, crook of the horn.

**Ton** [G.]. \*Tone, chiefly in the meanings (1) and (3).

**Tonabstand** [G.]. \*Interval.

**Tonada** [Sp.], **toada** [Port.]. Almost any folksong of prevailingly lyrical character, set to four-, five- or ten-line stanzas, or to quatrains with refrain. Whenever the setting is for a text in the last of these forms, contrasting tempos between a slow refrain and a lively quatrain are employed, usually a slow 3/4 meter and a fast 6/8 meter.

J.O-S.

**Tonadilla** [Sp.]. A short, Spanish, popular comic opera, with one to four characters, consisting of solo song and, occasionally, choruses. Its origins were short scenic interludes performed between the acts of a play or serious opera, but (like the Italian *opera buffa*) it later became an independent piece. It flourished from about the middle of the 18th to the early 19th centuries. One of the first *tonadillas* is a comic musical dialogue between a woman innkeeper and an itinerant Bohemian, written in 1757 by Luis Misón (d. 1766). Besides Misón, the chief composers of *tonadillas* are Pablo Esteve (b. c. 1730) and Blas Laserna (1751–1816). The *tonadilla* superseded the older \*zarzuela, which was an elaborately staged serious opera, usually based on mythological subjects.

**Tonal and real.** In a fugue, an answer is "real" if it is an exact (diatonic) transposition of the subject and "tonal" if certain steps are modified. Such modifications frequently take place if the subject contains the interval of the fifth (d–a), this being answered not by the transposed fifth (a–e') but by the fourth (a–d'), as illustrated in the accompanying example from Bach's *The Art of Fugue*. The purpose of this procedure is to avoid sudden oscillations between the keys of

the tonic and dominant. In fact, with the theme in question the “real answer” a–e’–c’ . . . would result in a somewhat irritating clash between the low d in the subject and the high e in the answer. It is difficult to formulate rules as to when tonal and real answer is properly used. In general, the fugal themes called *\*soggetto* lend themselves more readily to tonal treatment, whereas the newer types of subject called *\*andamento* are frequently too “individual” and well defined to admit any modification. In early music, before c. 1550, most fugal answers are real, if only because they are usually at the unison or the fourth. Also, the themes rarely include the fifth. An early instance of a tonal answer, by A. Gabrieli, appears in the instance given under Double theme.

The tonal-real dichotomy has also been applied to entire fugues, a fugue being called tonal if the answer is tonal and real if it is real. This distinction, however, implies that in a fugue one or the other type of answer is strictly maintained. Whereas there are numerous examples of tonal fugues, there are scarcely any of real ones.

The terms “tonal” and “real” are also used in connection with imitation at intervals other than the fifth, particularly with the imitation at the higher or lower second that occurs in sequential passages [see Sequence I]. This is called real if the intervals are imitated exactly, thus involving modulation, and tonal if it stays within the key.

**Tonale** [L.]. See Tonary.

**Tonalität** [G.]. *\*Tonality* in the sense of “loyalty to a key,” but admitting modulations into another key that are not necessarily included in the German term *Tonart*. Thus, the beginning of Beethoven’s Waldstein Sonata, op. 53, shows the *Tonarten* of C, G, B-flat, F, and C in quick succession but has only one *Tonalität*, C major.

**Tonality**. Loyalty to a tonic, in the broadest sense of the word. One of the most striking phenomena of music is the fact that, throughout its evolution—in non-Western cultures, in Gregorian chant, and in harmonized music—practically every single piece gives preference to one tone (the tonic), making this the tonal center to which all other tones are related. [Also see Key (2); Atonality.]

Although nearly all music in this sense of the word is tonal, the means of achieving tonality have greatly varied throughout history. Whereas in Gregorian chant and other monophonic music the relationships are purely melodic, a much more complex situation is encountered in harmonized music. About 1700 came general acceptance of a system of tonal functions based on the establishment of three main chords—the tonic, the dominant, and the subdominant triads—as the carriers of harmonic as well as melodic movements. Broadened by the ample use of chromatic alterations and modulation into other keys, this system prevailed throughout the 18th and 19th centuries. For subsequent developments, see Atonality.

In current usage the terms “tonality” and “modality” are mutually exclusive, the former referring to music written in a “key” (major or minor mode) and the latter to pieces written in, or showing the influence of, the church modes [see Modality]. This usage is obviously not compatible with the broad definition of tonality above, which includes all tonal relationships, whether “tonal” or “modal.” If the explanation of mode as the constituent scale is accepted [see Mode (1)], then tonality exists in different “modal” varieties, based, e.g., on the church modes, the major and minor modes, the pentatonic mode, the whole-tone mode, the diatonic mode [see Pandiatonicism] or, as in some modern music, the chromatic mode. Tonality also exists in the quarter-tone mode (e.g., in the Greek enharmonic genus), although modern *\*quarter-tone* music tends to be atonal.

Other uses of the term “tonality,” e.g., in the sense of “tonal system” (almost synonymous with what has been termed modality above), or in the sense of major-and-minor tonality (as opposed to modality in the accepted meaning of the term), also have become firmly entrenched in current usage.

Chailley, *Traité historique d’analyse musicale* (1951); F. Neumann, *Tonalität und Atonalität* (1955); D. F. Tovey, “Tonality” (*ML* ix, 341ff); J. Yasser, “The Future of Tonality” (*MM* viii); H. Reichenbach, “The Tonality of English and Gaelic Folksong” (*ML* xix, 268ff); W. H. Frere, “Key-relationship in Early Mediaeval Music” (*SIM* xiii; also in *CP* 1911, p. 114); L. Hibberd, “Tonality” and Related Problems in Termini-

nology" (*MR* xxii); M. Touzé, "La Tonalité chromatique" (*RM* 1922, no. 9). W. Margraff, "Tonalität in Machaut und Dufay" (*AMW* xxiii). Also see under Atonality.

**Tonart** [G.]. Key.

**Tonary** [L. *tonarium*, *tonarius*, *tonale*]. A medieval book similar to a "thematic catalog" [see Theme] in which the chants are listed (with their beginnings) according to mode, and often with subdivisions within each mode. Tonaries contain the chants that are (or were) connected with a psalm verse sung to one of the various recitation tones organized into a system of eight tones [see Tone (3)], e.g., antiphons, responsories, Introits, Communions. The purpose of the tonaries was to show the mode of a chant, a matter of great practical importance, since the selection of the proper tone (e.g., first psalm tone, third Introit tone) depended on the mode of the antiphon, Introit, etc. The subdivisions fulfilled the even more urgent need for determining the correct termination of the tone. The most important tonaries are those by Regino of Prüm (c. 900), Odo de Clugny (10th century), and one ascribed to Guido d'Arezzo (11th century), all published in *CS* ii, 1ff, 78ff, 117ff. Theoretical writings of a similar nature are the *Tonarius Bernonis* (*GS* ii, 79ff) and the *Commemoratio brevis de tonis et psalmis modulandis* (*GS* i, 213ff).

Different from these is the so-called Mass Tonary (*tonale missarum*) of Montpellier [\*Editions XLII A, 7 and 8], which contains all the chants of the Mass, fully written out (with an additional \*letter notation) and arranged according to their modes. See F. X. Mathias, *Die Tonarien* (1903); W. Lipphardt, *Der Karolingische Tonar von Metz* (1965); M. Runge, in *MfM* xxxv.

**Tonbuchstaben** [G.]. Tone letters [see Letter notation].

**Tondichtung** [G.]. Tone poem; also, any composition of a poetic character. See Symphonic poem.

**Tone** [F. *ton*; G. *Ton*; It., Sp. *tono*]. (1) A sound of definite pitch and duration, as distinct from noise and from less definite phenomena, such as the violin \*portamento. (2) The interval of a major second, i.e., a whole tone, as distinct from a semitone (minor second). This is the usual British meaning of the term, the word "note" being used for (1).

(3) In Gregorian chant, tone [L. \**tonus*] is the generic name for all recitation formulas, such

as lesson tones, prayer tones, gospel tones, psalm tones, canticle tones, Introit tones, responsorial tones, etc. All these consist essentially of a recitation on one pitch (reciting tone, reciting note, repercussion, tenor, tuba), which probably explains the name *tonus*. The Introit tones are used for the verses of the Introits, the responsorial tones for those of the great responsories. Both are organized as a system of eight tones, one for each mode, as are the \*psalm tones and the canticle (or \*Magnificat) tones.

**Tone cluster.** A strongly dissonant group of tones lying close together and produced, usually on the piano, by depressing a segment of the keyboard with the fist, forearm, or a board of specified length. The term was invented by Henry Cowell, who, along with Charles Ives ("Concord" Sonata), used the device extensively. See H. Cowell, *New Musical Resources* (1930), pp. 117ff.

**Tone color** [F. *timbre* (also in Eng. usage); G. *Klangfarbe*]. The quality ("color") of a tone as produced on a specific instrument, as distinct from the different quality of the same tone if played on some other instrument. As shown by H. Helmholtz and others, tone color is determined by the harmonics, or, more precisely, the greater or lesser prominence of one or another harmonic. Thus, the c of the cello and the c of the horn have the same harmonics (c', g', c'', e'', g'', . . .), but their intensities differ widely.

The sound of a tuning fork and of the stopped diapason of the organ have practically no harmonics; the "pure sound" of the flute results from its lack of nearly all the harmonics except the first (octave); the rich and mellow timbre of the clarinet result from the lack of even-numbered harmonics (c', c'') and the prominence of the odd-numbered harmonics (g', e'' . . .). The pungent, nasal sound of the oboe is caused by the presence of practically all the harmonics, which also appear, in different degrees, in the tones of the violin.

The classical theory of tone color, as outlined above, has been modified to some extent by the recent theory of the *formant*. According to the former, the characteristic constituents of, e.g., a tone on a violin, are in a fixed relation to the fundamental tone and, therefore, are shifted up or down if the fundamental changes. For example, if for the violin tone g the characteristic partials are g'' and b'', the violin tone d' would have the (much higher) characteristic partials d''' and f'''. According to more recent investiga-

tions, however, the characteristic partials of a violin tone lie within an absolutely fixed range of rather narrow limits, regardless of the pitch of the fundamental. This characteristic "absolute range of partials" is called the formant. In most violins the formant lies between 3,000 and 6,000 cycles per second. The formant theory also plays an important part in explaining the different "timbre" of the vowels in singing. For each vowel, the human voice represents a different "instrument" with the formant in a different region. See the modern books under Acoustics; *SaHMI*, p. 354; W. T. Bartholomew, "Voice Research at Peabody Conservatory" (*BAMS* vi).

**Tone poem.** \*Symphonic poem.

**Tone row** [G. *Tonreihe*]. See under Serial music.

**Tonfarbe** [G.]. \*Tone color.

**Tongeschlecht** [G.]. Distinction of a chord or key, whether major or minor.

**Tonguing.** In playing wind instruments, the use of the tongue for greater articulation. It consists of momentary interruption of the windstream by an action of the tongue as if pronouncing the letter *t* or *k*. Three types of tonguing are distinguished: single tonguing (*t-t . . .*), double tonguing (*t-k t-k . . .*), and triple tonguing (*t-t-k t-t-k . . .*). The first is employed in slower passages, the last two in rapid passages in groups of two or three notes. Single tonguing is used for practically all the wind instruments; double and triple tonguing is used chiefly for brass instruments (trumpet, horn, etc.) as well as the flute. A special type of tonguing called *Flatterzunge* (flutter-tonguing) was introduced by R. Strauss. It calls for a rolling movement of the tongue, as if pronouncing *d-r-r-r*.

**Tonhöhe** [G.]. \*Pitch.

**Tonic.** The first and main note of a key, hence, the keynote. See Scale degrees; Tonality.

**Tonic accent.** An accent caused by a higher pitch, rather than a stress or a larger note value, e.g.,

The last two kinds of accent are called *dynamic* and *agogic* respectively. The term "tonic accent" is also applied to a melody to indicate that a strong syllable of the text receives a note of higher pitch than the surrounding weak syllables. The tonic accent plays an important role in

the discussion of Gregorian chant [see *ApGC*, pp. 289ff].

**Tonic sol-fa.** An English method of solmization designed primarily to facilitate sight singing. It was developed from earlier methods (Lancashire system) by Sarah A. Glover and perfected c. 1840 by John Curwen (1816–80). It is widely used for teaching in England, and has also become known in some other countries, e.g., in Germany (as *Tonika-do*).

Tonic sol-fa is a system of "movable do," i.e., the tone syllables *do, re, mi, fa, sol, la, ti* are used with reference to the key of a piece or any section thereof where there is a change of key. The syllables, or rather, their initial consonants, *d r m f s l t*, are also used for notation in a manner reminiscent of the German keyboard tablatures of the 16th century. Octave repetitions are indicated for the higher octave thus:  $\bar{d} \bar{r} \bar{m}$  or  $d' r' m'$ ; for the lower octave thus:  $\underline{d} \underline{r} \underline{m}$  or  $d_1 r_1 m_1$ . For the minor scale the third degree becomes *do*, owing to the changed intervals of this scale: *l t d r m f s l*. Actually this succession represents the Aeolian scale (white keys from A, or any transposition). In order to arrive at the minor scale, the sixth and seventh degrees must be sharpened. Sharpened tones are usually indicated by changing the vowel to *e* (*de, re, fe, se, le*), flattened tones by changing it to *a* (*ra, ma, la, ta*). [For exceptions, see *GDB* viii, 504ff.] For the sixth degree of the ascending melodic minor scale a separate syllable *ba* is introduced, since the use of *fe* would suggest a half-step to the next note, whereas actually a whole-step follows (to *se*). Therefore the melodic minor scale is designated (up and down): *l t d r m ba se l*; *l s f m r d t l*. The tones and their relation to each other are shown in a chart called *Modulator*.

If the piece modulates into another key, the new key is indicated (in various ways), and the tone syllables are now reckoned in the new key. For the indication of meter and rhythm, additional signs (horizontal strokes, single dots, colons, commas, etc.) are used.

Lit.: J. Curwen, *The New Standard Course of Lessons and Exercises in the Tonic Sol-fa Method* (3rd ed., 1872); W. R. Phillips, *A Dictionary of the Tonic Sol-fa System* (1909); W. G. Whittaker, in *ML* v, 313, and vi, 46, 161; *id.*, in *MQ* viii; J. Taylor, J. C. Ward, in *PMA* xxiii; C. A. Harris, in *MQ* iv; J. A. Fuller-Maitland, in *MQ* vii.

**Tonika** [G.]. Tonic. *Tonika-do*, German modification of \*tonic sol-fa.

**Tonkunst** [G.]. Music. *Tonkünstler*, composer.

**Tonleiter** [G.]. \*Scale.

**Tonmalerei** [G.]. \*Word painting or descriptive music.

**Tono** [It.]. Tone; whole tone; key; mode. *Primo* (*secondo*, etc.) *tono*, first (second, etc.) church mode.

**Tono llanero** [Sp.]. Folksong of the Venezuelan plains that shows many early Spanish influences intact without any trace of the Negro influences that dominate the coastal region of the country. The music, for voices without instrumental accompaniment, uses inverted chords and plagal cadences, as well as long melodic phrases and melismatic sections. J.O-S.

**Tonos**, pl. *tonoi* [Gr.]. See under Greece II.

**Tonsatz** [G.]. Composition. *Tonsetzer*, composer.

**Tonschrift** [G.]. Notation.

**Tonysystem** [G.]. System of tones, i.e., \*tonality, used mainly in combinations such as *Euro-päisches Tonsystem*, *javanisches Tonsystem*, *Pythagoräisches Tonsystem*. See E. M. von Hornbostel, "Musikalische Tonsysteme" (in H. Geiger, *Handbuch der Physik*, vol. viii [1927]).

**Tonus** [L.]. (1) Whole tone. (2) Generic name for the plainsong recitation formulas, such as *tonus lectionum*, *toni psalmorum*, *tonus peregrinus*, *toni v. Gloria Patri ad introitum*, etc. [see Tone (3)].

(3) Church mode, e.g., *primus tonus*, *tonus authenticus*, *tonus plagalis*. Medieval writers used three designations for the church modes: *tonus*, *tropus*, and *modus*. The earliest writers, Flaccus Alcuinus (c. 753–804) and Aurelianus Reomensis (whose text incorporated all of Alcuin's) used the term *tonus*. The latter used the term in a general sense, i.e., "tone" = discrete musical pitch, as well as specifically, i.e., whole tone, and further, to mean church mode and recitation formula. In the last sense it has as a synonym *tenor*, owing to the long-standing use of both terms by Latin grammarians to refer to syllabic accent (stress or musical). Consequently, both *tonus* and *tenor* may also mean the reciting tone of a psalm formula. While both these terms (with their translations into modern languages) survive into the Renaissance and later, *tropus* in this meaning passes out of use in the later Middle Ages.

*Tonus in directum* (*indirectum*), see Psalmody I; *tonus mixtus*, *commixtus*, *perfectus*, *imper-*

*fectus*, see Church modes III; *tonus peregrinus*, see Psalm tones. See K. Speer, in *CP Apel*; O. Gombosi, "Studien zur Tonartenlehre" (*AM* x, xi, xii). rev. L.G.

**Tonverschmelzung** [G.]. See under Consonance, dissonance I (d).

**Tonwort** [G.]. A method of solmization invented in 1892 by K. A. Eitz, designed for a 53-note scale with particular reference to chromatic progressions and enharmonic changes. See M. Koch, *Einführung in das Tonwort* (1925).

**Torbellino** [Sp.]. Traditional Colombian dance in 3/4 meter with heavy accents on the strong beats and usually with elaborate fast accompaniments to vocal melodies sung in parallel thirds. Long pauses are often made on the upbeat and are used by the instrumentalists for certain tonal elaborations. J.O-S.

**Torculus**. See under Neumes I (table).

**Tordion**. See under *Basse danse*.

**Tornada**. See under Envoi.

**Tosca**. Opera in three acts by Puccini (libretto by G. Giacosa and L. Illica, based on V. Sardou's drama of the same title), produced in Rome, 1900. Setting: Rome, June 1800.

**Tosto** [It.]. Quickly, at once. *Più tosto* means either "more quickly" or the same as *piuttosto*, "rather."

**Tost Quartets**. Twelve quartets by Haydn, written 1789–90 and dedicated to Johann Tost, Viennese merchant and violinist. They comprise op. 54, nos. 1–3; op. 55, nos. 1–3; op. 64, nos. 1–6.

**Touch** [G. *Anschlag*]. See under Piano playing (particularly IV and V).

**Touche** [F.]. (1) Key of the piano. (2) Fingerboard of the violin [see Bowing (1)]. (3) A 16th-century term for fret (of a lute, guitar). (4) A 17th-century term (also used in English sources) for the "orchestral" toccata [see Toccata (2)].

**Tour de gosier** [F.]. A vocal ornament of the 17th and 18th centuries, consisting of a turn composed of five notes. The term is also applied to the closing notes of the trill. P.A.

**Tourdion** [F.]. Tordion. See under *Basse danse*.

**Tourte bow**. A violin bow made by F. Tourte (1747–1835), famous bowmaker. See Bow.

**Toye.** Title for a short light composition for virginal.

**Toy Symphony.** A playful composition often ascribed to Haydn and scored, aside from the first and second violins and double bass, for toy instruments such as cuckoo, quail, nightingale, trumpet, drum, rattle, and triangle. It is now thought to be the work of Mozart's father, Leopold (1719–87), or of Michael Haydn. See K. Geiringer, *Haydn*, rev. ed. (1963), p. 316.

**Tpt.** Abbr. for trumpet.

**Tr.** Abbr. for trill, treble, transpose.

**Tracker action.** In organs, the purely mechanical system of key action used in most organs constructed before 1900. It derives its name from the tracker, a wooden trace rod connecting the key to the pipe valve in the windchest. See Organ II, XI.

C.B.F.

**Tract** [L. *tractus*]. In Gregorian chant, an item of the Proper of the \*Mass, used instead of the Alleluia for various feasts during Lent, for Ember days, and for the Requiem Mass. It consists of two to fourteen psalm verses, without the addition of an antiphon or response, and thus is one of the few remaining examples of direct psalmody [see Psalmody I]. All the Tracts are in either the second or eighth mode, a restriction not elsewhere encountered in Gregorian chant. Also, the Tracts are sung to a limited number of standard melodies (actually, standard phrases), which are used, with minor modifications, for a large number of texts. The principle is illustrated in the two subsequent schemes, (1) for the Tract "Attende caelum," (2) for "Sicut cervus" (I, II, etc., indicate the different verses; a, b, etc., various musical phrases):

	I	II	III	IV	V
(1)	a b c	d e c	e c	d e c	d f
(2)	a e c	d e c	g d e c	f	

This method, called centonization [see Cento], is reminiscent of the use of \*melody types in many kinds of non-Western music and probably reflects a very early stage in the development of the chant. In the recent edition of the *Liber usualis* some tracts (e.g., "Attende caelum," "Sicut cervus," and "Cantemus Domino" [LU, pp. 776U; 776BB; 776R]) are named canticles, and others (e.g., those of Good Friday) responsories. See H. Riemann, in SIM ix; ApGC, pp. 312ff.

**Tragic Symphony.** Subtitle provided by Schubert for his Symphony no. 4, in C minor, composed in 1816. The work is clearly more somber than his first three symphonies.

**Tragische Ouvertüre** [G., *Tragic Overture*]. Orchestral composition by Brahms, op. 81, composed in 1880 as a companion piece to the \**Akademische Festouvertüre*.

**Trait** [F.]. \*Tract.

**Trakt** [G.]. \*Tract.

**Traktur** [G.]. \*Tracker action.

**Transcendental Etudes.** See *Études d'exécution transcendante*.

**Transcription.** See Arrangement.

**Transfigured Night.** See *Verklärte Nacht*.

**Transformation of themes.** The modification of a musical subject with a view to "changing its personality." This is a 19th-century device that differs markedly from earlier, more "technical" methods of modification, as, e.g., the augmentation and diminution of a fugal subject, or the ornamentation of a theme. A characteristic example is the various appearances of the *idée fixe* in Berlioz' *Symphonie fantastique*. Liszt exploited

the principles of "transformation des thèmes" in his symphonic poems, and Wagner applied it to the \*leitmotiv of his operas [see Ex. 1a, 1b, both from *Götterdämmerung*]. In Sibelius' symphonies the metamorphosis is more abstract, as shown in Ex. 2a, b, c (Symphony no. 5, first movt.).

**Transient modulation.** Same as passing \*modulation.

**Transition.** (1) Same as passing \*modulation. (2) A lasting change of key effected abruptly rather than through regular modulation. (3) A passage (bridge) that leads from one main section to another, e.g., from the first to the second theme of a movement.

**Transitorium.** An item of the Ambrosian Mass [see Ambrosian chant], corresponding to the Roman Communion.

**Transmutatio** [L.]. In the 13th-century theory of rhythmic modes, *transmutatio modi* means the transfer of a given composition (clausula, motet, hocket, conductus) from one mode to another, most frequently from mode 1 to mode 2 or vice versa. This practice is mentioned by Anonymous IV [CS i, 350] and other late 13th-century theorists. See *AdHM* i, 237; M. F. Bukofzer, in *AnnM* i, 90.

**Transposing instruments.** Instruments for which the music is written in a key or octave other than that of their actual sound. This method is widely used for wind instruments, such as the clarinet in B<sup>b</sup>, whose natural tones are the harmonics of B<sup>b</sup>. Since for the player of this instrument B<sup>b</sup> is the simplest key, it has become customary to present this key to him in the simplest notation, i.e., C major. The transposition to be made from the written part to the actual sound is indicated by the interval from C to the pitch note of the instrument, e.g., to B<sup>b</sup> in the case of the B<sup>b</sup> clarinet, A in that of the A clarinet [see Ex., Bruckner, Symphony no. 7]. With certain instruments the transposition includes a change to the lower octave, e.g., for the horn in E<sup>b</sup>.

Clarinet in A: 1. As written. 2. As it sounds.

The use of transposing instruments or, more accurately, transposing notation, dates from the time when only natural tones were available (18th cent.). With the introduction of valves and keys the difference in facility for playing various keys was greatly diminished and eventually almost eliminated. As a result, today

transposed notation might in a sense be considered obsolete. However, in cases where the \*tone color of a particularly pitched instrument is desired (e.g., the same pitch on a B<sup>b</sup> trumpet is "richer" than on a D trumpet) transposed notation is much more convenient for the player although, of course, it presents an obstacle to the conductor, who may have to read as many as six or seven different types of transposed notation in a single orchestral score.

Nearly all the wind instruments not pitched in C are transposing instruments, except for the trombones, which, although pitched to E<sup>b</sup>, B<sup>b</sup>, etc., are written as they sound. The term is also used for instruments such as the piccolo flute, which is, quite sensibly, notated an octave lower than it sounds, to avoid ledger lines. Here, the use of a special clef such as  $\text{C}_8$  would exclude the instrument from the category of transposing instruments. A number of 20th-century composers (Prokofiev, Schoenberg, Berg, Webern, *et al.*) have published nontransposed scores. Berg has even notated piccolo, contrabassoon, and double bass parts in their actual octaves. Many recent compositions are published in concert-pitch scores.

**Transposition.** I. *General.* Rewriting or *ex tempore* performance of a composition in another key, e.g., E-flat instead of the original D, etc. This practice is particularly common with songs in order to accommodate different voice ranges. A skilled accompanist can extemporize transposition. The easiest transposition is that of a semitone, e.g., from F to F-sharp, or from E to E-flat, since here most of the written notes remain unaltered and only a different signature has to be imagined. Transposition of a third or fourth calls for a thorough knowledge of harmonies, intervals, etc., and becomes increasingly difficult with music involving many modulations, chromatic alterations, etc.

II. *History.* Transposition is a basic part of ancient Greek theory [see Greece]. The Gregorian repertory contains a number of transposed chants, which close on one of the \**affinales*, a, b, and c'. These were originally a fifth or a fourth lower and were transposed because they involved the semitonal cluster, f-f#-g# or e<sup>b</sup>-e-f (not, of course, in immediate succession), which could be notated only as b<sup>b</sup>-b-c', a fourth or a fifth higher [see *ApGC*, pp. 157ff]. The author of "Musica enchiriadis" repeatedly emphasizes the possibility of "diatonic" trans-

position at the distance of a whole tone or semitone [GS i, 156, 165]. This method is used in Josquin's *Missa L'Homme armé super voces musicales*, in which the "L'Homme armé" melody appears in six diatonic transpositions. In the 16th century, organists were expected to be proficient in transposing compositions. Detailed instruction for transposition is given in J. Bermudo's *Declaración de instrumentos musicales* (1555); O. Kinkeldey, *Orgel und Klavier* (1910), p. 17 and *passim*; G. Diruta's *Il Transilvano*, part ii (1609); and elsewhere. Giovanni Paolo Cima, in his *Partito de ricercari e canzoni alla Francese* (1606), gives instructions and examples for transposition through all the degrees of the chromatic scale. See A. Mendel, "Devices for Transposition in the Organ before 1600" (*AM* xxi).

**Transverse flute** [F. *flute traversière*; G. *Querflöte*; It. *flauto traverso*; Sp. *flauta traversa*]. The modern flute, as opposed to the recorder. See Flute.

**Traps.** (1) In dance or theater orchestras, devices used for special effects (e.g., whistles, whip crack, ratchet, cowbell, etc.), usually notated for the percussion section, although many of the devices are not, strictly speaking, percussion instruments. (2) In jazz, term for both the devices in (1) and the complete "set of drums," which then includes such devices along with actual percussion instruments.

**Traquenard.** A dance found in German orchestral suites [see Suite V] of the late 17th century, e.g., by Georg Muffat [see *DTO* 4, p. 188], J. K. F. Fischer [see *DdT* 10, p. 54], P. H. Erlebach, J. P. Krieger, and others. In French *traquenard* means a horse's ambling gait, and the dotted rhythm of the music, usually in *alla breve*, evidently imitates this movement. See P. Nettl, in *StM* viii, 93f.

**Trascinando** [It.]. Dragging, slowing.

**Trattenuto** [It.]. Delayed, slowed down.

**Trauermusik** [G.]. Funeral music. *Trauermarsch*, funeral march.

**Trauer-Ode** [G., Funeral Ode.]. Choral work by Bach, written in 1727 on the death of the Electress Christiane of Saxony. It is based on an ode by Gottsched and is in the form of a cantata.

**Trauer-Symphonie** [G., Mourning Symphony]. Popular name (because of its somber character)

for Haydn's Symphony no. 44 (c. 1771), in E minor.

**Träumerisch** [G.]. Dreamy.

**Trautonium.** See under Electronic instruments.

**Traverso** [It.], **traversière** [F.], **Traversflöte** [G.]. See under Flute III.

**Traviata, La** [It., The Erring One]. Opera in three acts by Verdi (libretto by F. M. Piave after Dumas' *La Dame aux camélias*), produced in Venice, 1853. Setting: Paris and environs, about 1850. *Traviata* is one of the earliest instances of the use of a contemporary plot in opera, a practice that became established, c. 1890, by the *\*verismo* movement. Musically it follows the tradition of the *grand opéra*, a mixture of lyrical and pathetic elements, with popular melodies and concentration on effective vocal numbers. *\*Rigoletto* and *\*Trovatore* belong to the same category.

**Traynour.** According to the 14th-century theorist Philippus de Caserta, the use of conflicting rhythmic groupings in different voice-parts, e.g., nine or three notes against two, four notes against three, etc. [see *CS* iii, 123]. This was a common practice toward the end of the 14th century. See *ReMR*, p. 31f; W. Apel, *French Secular Music of the Late Fourteenth Century* (1950), p. 8.

**Tre** [It.]. Three. *A tre voci*, in three parts. *Tre corde*, see *Una corda*.

**Treble.** The highest part of a choral composition, hence synonym of soprano. However, treble clef is not the same as soprano clef [see *Clef*]. For treble viol, recorder, see under *Descant*. For the early (15th cent.) meaning of the term, see under *Sight*.

**Trecanum.** An item of the *\*Gallican Mass*, corresponding to the Roman Communion.

**Tredezime** [G.]. The interval of the thirteenth, i.e., the compound *\*sixth*.

**Treibend** [G.]. Hurrying.

**Tremblement.** The most important of the French *agréments* of the 17th and 18th centuries, more commonly known as *\*trill*. P.A.

**Tremolo** [It.]. I. In stringed instruments, the quick reiteration of the same tone, produced by a rapid up-and-down movement of the bow, indicated as in Ex. a. The string tremolo is an

important orchestral effect, widely used for dramatic passages or for the purpose of orchestral coloring. It appeared in some of the earliest compositions for the violin (B. Marini, *Affetti musicali*, 1617; see *RiHM* ii.2, 101). Monteverdi, in his *Combattimento di Tancredi e Clorinda* (1624; *HAM*, no. 189), used it to express excitement and danger, for which it has since been used innumerable times, e.g., in Bach's St. Matthew Passion ("Und siehe da, der Vorhang im Tempel zerriss in zwei Stück"), in the oracle scene of Gluck's *Alceste*, etc. The term is also used for rapid alternation between two notes of a chord, usually a third apart, as in Ex. b, this being called a "fingered tremolo." Some 18th-century names for the string tremolo are *bombo* [It.] and *Schwärmer* [G.].

In violin music of the 18th century (J. W. A. Stamitz, Gluck, Haydn) a special tremolo, known as "undulating tremolo" [It. *ondeggiando*; F. *ondulé*], is much used. It produces a series of moderately fast pulses, usually four to a note. It was indicated by a wavy line extending over repeated eighth or quarter notes [see table under Ornamentation], a sign that is sometimes misinterpreted as indicating a vibrato. Beethoven used the undulating tremolo several times, e.g., in the theme of his Great Fugue, op. 133, where it is indicated by placing a tie over two successive notes of the same pitch [see Ex. c].

II. In keyboard instruments the tremolo is of much less importance. In organ music a tremolo effect is produced by the \*tremulant stop, which changes the steady wind pressure into a pulsating one. In piano music the genuine tremolo is a device used mainly in highly virtuosic compositions, such as Liszt's *La Campanella*, where it also occurs in the form of quickly repeated octaves. In piano arrangements of orchestral compositions the tremolo of the strings is imitated by the rapid alternation of a note and its octave, sometimes also of its third and fifth. A famous passage in the third movement of Beethoven's Piano Sonata op. 110, which is usually referred to as an example of \**Bebung*, actually is an imitation of the undulating string tremolo,

indicated in the same manner as in the example from the Great Fugue [see Ex. d].

III. In singing, "tremolo" commonly means the excessive vibrato that leads to deviation of pitch. It usually results from lack of breath control and faulty control of singing muscles (in jaw, base of tongue). The true vocal tremolo, i.e., the quick reiteration of the same pitch, is an effect that is practically never used today. In early music, however, it was one of the most important ornaments. The *bistropa* and *tristropa* of Gregorian chant, which often occur in groups of five, six, or more notes of the same pitch [see, e.g., the Offertory "Anima nostra"; *LU*, p. 430], were originally performed as a rapid tremolo; indeed, Aurelianus Reomensis says that the *tristropa* is sung "as a rapid beat, like a vibrating hand" [*GS* i, 57]. Other 13th-century terms, such as *repercussio gutturis* and *reverberatio* [see *CS* i, 91], seem to indicate a vocal tremolo [also see *Plica*]. In the early 17th century the vocal tremolo was widely used; called *trillo*, it was usually written out in quick notes [see Ex. e, from Benedetto Ferrari's *Musiche varie a voce sola*, books i-iii (1633-41); see also *GD* v, 20 (Caccini); *GD* iv, 234, *GDB* vi, 885 (Walter Porter); *RiHM* ii.2, 28, 297 (Caccini, C. Saracini)]. During this period, the term *tremolo* meant a trill; see Ornamentation I.

In the 18th century the vocal tremolo fell into disuse and was henceforth known by such derogatory names as *chevrotement* [F.] and *Bockstriller* [G.], which liken it to the bleating of a goat.

**Tremulant.** An organ stop producing alternating increases and decreases of wind pressure, thus causing a rapid fluctuation of pitch, an expressive effect similar to the violinist's vibrato. Although considerably abused during the period of the theater and orchestral organ, to the point where it became anathema to purists, it existed in French and German organs of the baroque period and, when properly regulated and judiciously used, it has a legitimate musical function in the literature of the baroque, romantic, and contemporary periods. rev. B.J.O.

**Trenchmore.** An English country dance of the 16th and 17th centuries, in lively triple meter with dotted rhythms. An amusing description from 1689, showing that its only rival in popularity at the court of King Charles was the cushion dance, is quoted in *GD* (and *GDB*).

**Trent, Council of.** See Council of Trent.

**Trent Codices** [G. *Trienter Codices*]. Seven MS volumes of 15th-century polyphonic music, the first six of which were discovered by F. X. Haberl in the library of the Cathedral of Trent (in northern Italy, also famous for the \*Council of Trent) and described in his *Bausteine für Musikgeschichte: I. Wilhelm du Fay* (1885). In 1891 they were purchased by the Austrian government but became Italian state property through the Treaty of St. Germain of 1918 and are now back in Trent (Castel del Buonconsiglio). The first six volumes (Cod. 87–92) contain 1,585 compositions, mostly from the mid-15th century; a seventh volume, discovered later, contains mostly duplicates. The major part of the collection was copied by Johannes Wiser for Bishop Johannes Hinderbach. This collection, by far the most extensive source of 15th-century music, contains compositions by about 75 French, English, Italian, and German composers, e.g., Dunstable, Lionel Power, Reginald Liebert, J. Ciconia, J. Brassart, Dufay, Binchois, Ockeghem, Busnois, and Isaac. A large selection has been published in six volumes of *DTO* [\*Editions XV]: nos. 14/15 and 22 (all the French, Italian, and German secular songs); 38 (five complete Masses); 53 (Mass of Reginald Liebert, motets, antiphons, hymns); 61 (Masses and Mass sections by various composers); 76 (sacred and secular motets by Dunstable, Dufay, Brassart, De Vitry, and others).

Lit.: G. Adler, "Über Textlegung in den 'Trienter Codices'" (*CP Riemann*); R. von Ficker, "Die Kolorierungstechnik der Trienter Messen" (*StM* vii); A. Orel, "Einige Grundformen der Motettkomposition im XV. Jahrhundert" (*StM* vii); R. Wolkan, "Die Heimat der Trienter Musikhandschriften" (*StM* viii).

**Trepak.** A Cossack dance in quick duple time.

**Trésor musical.** See Editions L.

**Trezza.** A dance in some German suites of the 17th century, e.g., the ballets of J. H. Schmelzer [see *DTO* 56, p. 9]. It is similar to the \*courante or \*galliard.

**Triad** [G. *Dreiklang*]. A chord of three notes consisting of a root and the third and fifth above it. There are four kinds of triad: major (major plus minor third); minor (minor plus major third); diminished (minor plus minor third); and augmented (major plus major third). The first two are consonant and the last two dissonant chords. Each triad (e.g., c–e–g) has two inver-

Triads: a. major. b. minor. c. diminished. d. augmented.

sions, the \*sixth chord (e–g–c') and the \*six-four chord (g–c'–e').

The triad is the basis of the harmonic practice of the 17th to 19th centuries. See Harmony II; Harmonic analysis II. In the earliest three-part writing (13th-century organa, motets, conductus) the harmonic structure consists mainly of pure consonances, 1–5–5, 1–1–5, 1–5–8; full triads occur only sporadically. Thus, the *organum triplum* "Hec dies" (Perotinus?; see *HAM*, no. 31) contains, among c. two hundred chords, eleven triads. However, the Englishman Walter Odington was the only theorist writing about 13th-century practices to recognize the triad, both major and minor, as a consonant chord [*CS* i, 202b]. English compositions from c. 1300 use considerably more triads [see, e.g., "Alleluia psallat"; *HAM*, no. 57]. One of them, a four-voice "Pro beati Pauli," closes with 1–3–5–1, and "Sumer is icumen in" has a 1–3–5–8 in nearly every measure. French compositions of the 14th century also used more triads, but rarely at the end of phrases and almost never at the end of a composition. As late as 1500 the inclusion of the third in the final chord was unusual [see Picardy third]. A remarkable exception is the *Missa Virgo Parens Christo* by Jacques Barbireau (c. 1408–91), in which every movement closes with a full triad [\*Editions XII, 7].

**Trial of Lucullus, The.** One-act opera by R. Sessions (libretto by B. Brecht), produced in Berkeley, California, 1947.

**Triangle.** See under Percussion instruments B, 5.

**Tricesimoprimal temperament.** Division of the octave into thirty-one equal steps, advocated in the 17th century by Christiaan Huygens and revived, mainly by Dutch composers and theorists, in the 20th. See Microtone. E.S.

**Tricinium** [L.]. A 16th-century name for a vocal composition in three parts. There is a large repertory of such works in publications such as G. Rhaw, *Tricinia . . . Latina, Germanica, Brabantica, et Gallica* (1542); J. Montanus and U. Neuber, *Selectissimorum tricinium discantus* (1560); Sethus Calvisius, *Tricinium* (1603; see *SchGMB*, no. 160); Melchior Franck, *Tricinia*

*nova* (1611); Michael Praetorius, *Musae Sionae* (9 vols., 1605–10; vol. ix); and elsewhere. Praetorius' three-voice elaborations of chorale melodies in particular are true gems.

**Trienter Codices** [G.]. \*Trent Codices.

**Trigon.** See under Neumes I.

**Trihori(s).** See Triori.

**Trill** [E., formerly *shake*; F. *cadence*, *tremblement*; G. *Triller*; It. *trillo*; Sp. *trino*]. A musical ornament consisting of the rapid alternation of a given note with the diatonic second above it.

I. The trill originated in the 16th century as an ornamental resolution of a suspension dissonance at a cadence. Ex. 1 shows various forms of the 16th-century trill: 1a and 1b represent the typical vocal cadence found in the works of Palestrina, Lassus, etc. The other variants occur

frequently in instrumental transcriptions of vocal works and in independent keyboard compositions. It is probable, however, that even in vocal performances the singers of this period customarily embellished the simple written cadence in this more elaborate manner.

The cadence formulas given above have the following characteristics in common: (1) the trill begins on the penultimate strong beat of the phrase, with a dissonant note (suspension or appoggiatura); (2) it consists chiefly of the alternation of that dissonant note with its resolution; (3) the dissonant note receives the accent throughout, since it coincides with the accented subdivisions of the beat; (4) the note below the resolution may be introduced, near either the beginning or the end of the trill.

These characteristics became the basis of the most important *agrément* of the 17th century, the French *cadence* or *tremblement*, which was adopted in Germany as the *Triller*, in England as the *shake*, and in Italy as the *trillo* [for the early meaning of this term, see Tremolo III]. As the French name implies, the ornament was at first (early 17th cent.) invariably associated with

cadences. Later it was freely introduced at other positions in the musical phrase, but until the end of the 18th century it retained its primary function as the ornamental resolution of a dissonance.

II. In music of the 17th and 18th centuries the trill, instead of being written out in notes or left to the improvisation of the performer (as had hitherto been the case), was often indicated in the score by one of the following signs:

tr   t   tm   mm   n   +

These signs are exactly synonymous; the use of one instead of another has no meaning in the performance of the ornament and reveals nothing but the composer's personal preference. Since the sign is always placed over the harmony note, the accent must always fall on the upper auxiliary, which, as the dissonance, requires the greater emphasis. Apart from this factor, which is constant throughout the period, the execution of the trill was varied considerably in individual cases by adding prefixes or terminations and by varying the number and rhythm of the notes comprising the ornament. In the time of Bach and Handel, three ways of ending the trill were almost equally popular [Ex. 2]. The use of a simple sign (t, tr) for the trill left the performer free to choose interpretation a, b, or c. If the composer desired a particular execution as at 2b or 2c, he used one of the notations shown here:

The number and rhythmic distribution of the notes comprising the trill were generally left entirely to the performer's discretion. Ex. 3

shows several realizations of a cadence formula that is particularly common in the works of J. S. Bach and his contemporaries. All these interpretations are equally correct according to the traditions of Bach's time; the choice among them should depend on the tempo and character of the passage in which the trill occurs. Obviously a greater number of notes should be used for a trill on a long note than for one on a short note. Interpretations in Ex. 3e and 3f are therefore more appropriate for a rapid tempo, and Ex. 3b, 3c, and 3d for a slow tempo. Also, the most expressive interpretations are those giving the most weight to the initial dissonance, as in Ex. 3d and 3e. Sometimes the composer expressly indicates dwelling on the introductory note of the trill, known in French as *tremblement appuyé* and in German as *vorbereiteter Triller*, by (1) inserting the sign for an appoggiatura, (2) prefixing a vertical stroke to the sign for the trill, or (3) writing the introductory appoggiatura as an ordinary note. The excerpts in Ex. 4 show J. S. Bach's use of all three procedures.

In the music of this period, trills on very short notes are best rendered as four notes of equal value, or, if the tempo is too rapid to permit this, the trill should rather be abbreviated to two notes, i.e., a single appoggiatura, with which it is, in a sense, synonymous. In no case must the

trill be reduced to a triplet beginning with the main note, for the accent would then fall on the wrong note. [See under Turn.]

III. The beginning of a trill is often varied by the addition of a prefix, which may be indicated by one or more small notes or by a modification of the ordinary sign for the trill. The number of small notes used in the notation of the prefix

does not affect the interpretation. A hook extending down from the beginning of the trill sign indicates a prefix starting below the main note; a hook extending up represents an introductory turn beginning with the upper auxiliary [Ex. 5]. The prefix from below is especially

common; indeed, throughout the 18th century, it was customary to start a long trill with such a prefix, even when not indicated, whenever the main note was approached conjunctly from below, as in the illustrated passage from Beethoven's Piano Sonata op. 10, no. 3 [Ex. 6].

IV. The modern trill, which begins with the main note, was first introduced early in the 19th century by the Viennese pianists J. N. Hummel, Czerny, and Moscheles. It is usually played with a two-note termination [G. *Nachschlag*]. This

trill no longer fulfills the appoggiatura function with which the ornament had been associated for nearly two centuries; it is a virtuoso effect and serves merely to accentuate the main note or add brilliance or color to the performance, as shown in Ex. 7 [a. Chopin, *Bolero*; b. Liszt, *Hungarian Rhapsody* no. 14].

The "main note" trill did not entirely supplant the traditional form, which often appears in the works of Chopin, Schumann, and Liszt. It is customary, however, in the romantic and modern periods, for the composer to indicate the first note of the trill by means of a small grace note. In the absence of such an indication the trill should begin on the main note.

The "main note" trill also occurs in early Italian music, usually as an ornamenting prolongation of a single pitch, as in Ex. 8 (Mayone, 1603). In a MS from about 1620 it occurs repeat-

edly in its 19th-century form, leading to the upper second and therefore including an uneven number of notes [Ex. 8b, c]. P.A.; add. by W.A.

**Triller** [G.]. \*Trill. *Trillerkette*, chain or series of trills.

**Trillo** [It.]. \*Trill. In the 17th century, the true vocal tremolo [see Tremolo III].

**Trinklied** [G.]. Drinking song.

**Trio** [It.]. (1) Originally, a contrapuntal composition in three parts. This meaning applies to Bach's six sonatas for the organ [see Trio sonata] as well as the three-voice pieces in Hindemith's *Reihe kleiner Stücke*, op. 37.

(2) In the scherzo or minuet movement of the \*sonata, the middle section played between the scherzo (minuet) and its repetition [see Scherzo]. For its use in the march, see March. The term "trio" comes from the 17th-century custom of writing minuets and other dances in three parts, frequently for two oboes and bassoon (Lully), a treatment that was used particularly for the second of two dances played alternately, resulting in the arrangement *Menuet, Menuet en trio, Menuet*. A good example is Bach's Brandenburg Concerto no. 1, in which the minuet is fully orchestrated whereas the trio is written for two oboes and bassoon. The accompanying example, from Bach's French Suite no. 6, shows the use of the same type of trio for harpsichord. As late as Haydn, Mozart, and Beethoven (e.g., Symphony no. 7), the trio

usually retained the lighter texture and woodwind character of Lully's trio. Schubert and others used the term for the middle section of compositions in ternary form. See E. Blom, in *ML* xxii, 162ff.

(3) Chamber music for three players. The most important type is the piano trio, for piano, violin, and cello. In most of Haydn's 31 trios the violin and cello are chiefly reinforcements for the piano part. Mozart's 7 piano trios (K. 254, K. 496, K. 498, K. 502, K. 542, K. 548, K. 564) show greater individuality of the parts, paving the way for such great works as Beethoven's op. 70 and op. 97, and Schubert's op. 99 and op. 100. The standard trio repertory also includes those of Schumann (3), Mendelssohn (2), Brahms (3), Dvořák (3), Franck (4), Fauré (1), Ravel (1), and others. The string trio, usually for violin, viola, and cello, has attracted far fewer composers. After Haydn's 20 trios (for two violins and cello) came a divertimento by Mozart (K. 563), Beethoven's op. 3, 9, 87, and a few later compositions. See W. Altmann, *Handbuch für Klaviertriospieler; Wegweiser durch die Trios für Klavier, Violine und Violoncell* (1934).

**Triole** [G.], **triolet** [F.]. \*Triplet.

**Trionfo di Afrodite** [It., Triumph of Aphrodite]. *Concerto scenico* by C. Orff (to his own Latin and Greek libretto, after Catullus, Sappho, and Euripides), produced in Milan, 1953. Setting: timeless.

**Trionfo di Dori, II.** See under *Triumphes of Oriana*.

**Triori** (also *trihory*, *trihoris*, etc.). A 16th-century Breton dance, described by Arbeau in his *Orchésographie* (1589) as a kind of branle in duple meter.

**Trio sonata.** The most important type of baroque chamber music, written in three parts, two upper parts of similar range and design and a supporting figured-bass part. The trio sonata is usually performed on four instruments, two violins (or, in the earlier period, viols, cornetti) for the two upper parts, a cello (viola da gamba, violone)

for the bass part, and a harpsichord (organ, theorbo) for the bass part together with the realization of the thoroughbass accompaniment. Other instrumentation was occasionally employed, e.g., in Biagio Marini's Sonatas for violin and organ, op. 8 (1626), in which the organ has two written parts; in Bach's six organ trios, written for organ alone in three parts without thoroughbass figures; and in G. B. Bononcini's op. 4 (1686), for which there are five partbooks, first and second violin, cello, theorbo, and organ. Throughout the 17th century there were trio sonatas written in four voices, the cello part becoming somewhat different from the bass part for the harpsichord [see Tommaso A. Vitali, *Sonate a tre*, 1693]. There even were orchestral trio sonatas, sometimes entitled *Sinfonia*. In all these cases, however, the writing is essentially in three parts, and it is this texture that is indicated in the customary designation *a tre*.

Early three-voice compositions, mostly in the form and style of the instrumental \*canzona, were written by Salomone Rossi (*Il Terzo Libro de varie sonate*, 1623), G. B. Buonamente (Books 4, 5, 7 of *Sonate*, 1626–37), Tarquinio Merula, Marini, and others [see Editions III, 7]. Toward the end of the 17th century two types of trio sonata developed, the *sonata da chiesa* (church sonata) and the \**sonata da camera* (chamber sonata). The trio style became popular particularly in France, where it was known as *sonate en trio*. The form persisted into the classical period, the last examples being by Gluck (1746), the \*Mannheim school, and Haydn [*Six Sonates à deux violins & basse*, op. 8, c. 1766]. Thereafter it changed into the classical trio for three instruments, with a fully written out part for piano [see Trio (3)].

The literature of the trio sonata includes most of the illustrious names of the late baroque, among them Corelli (48, op. 1–4), Purcell (12), Buxtehude, Handel (28, 6 of which are for two oboes and bass), F. Couperin (14), and Vivaldi (12). Bach wrote only a few trio sonatas of the standard type (i.e., for two melody instruments and thoroughbass accompaniment), one in the \**Musikalisches Opfer* and several others. His sonatas for two violins and harpsichord as well as his organ sonatas represent the trio sonata with three obbligato parts, i.e., without thoroughbass accompaniment. However, the fact that the opening measures of the third movement of one (*BWV 1036*) have thoroughbass figures suggests (along with some other consid-

erations) that a second, "accompanying" harpsichord was used to play the main notes of the bass part and improvise the chordal accompaniment. See H. Hoffmann, *Die Norddeutsche Triosonate* (1929). See also under Sonata.

**Tripla.** (1) Term in mensural notation, i.e., *proportio tripla*; see Proportions. (2) Same as \**Proportz*. (3) Plural of *tripulum* [see *Duplum*].

**Triple concerto.** A concerto for three solo instruments, such as Bach's two concertos for three harpsichords, and Beethoven's concerto for violin, cello, and piano, op. 56.

**Triple counterpoint.** See Invertible counterpoint.

**Triple-croche [F.].** See under Notes.

**Triple fugue.** See under Double fugue.

**Triplet** [F. *triolet*; G. *Triole*; It. *terzina*; Sp. *tresillo*] A group of three notes to be performed in place of two of the same kind, indicated by a 3 and, usually, a slur:

For the indication of triplet rhythm by dotted notes, see Dotted notes II (a).

**Triple time.** Triple meter [see Meter].

**Triplum.** See under *Duplum*.

**Tris(h)agion** [Gr.]. The Sanctus in its original, Greek version, which in turn is derived from the Jewish *kadusha*, the threefold "Kadosh" (Holy) from the Book of Isaiah 6:3. As early as c. A.D. 90, Pope Clement I mentioned in a letter "Hagios, Hagios, Hagios." About 500 it passed from the Greek to the Mozarabic and Gallican rites, where it was known as *Aius*. In the Roman rite it is used during the Adoration of the Cross on Good Friday, as a part of the \**Improperia* [LU, p. 737]. It consists of three acclamations in Greek (*Agios o Theos*, etc.), each of which is answered antiphonally and to the same melody in the Latin translation (*Sanctus Deus*, etc.).

**Tristan und Isolde.** Opera in three acts by Richard Wagner (to his own libretto, based on G. von Strassburg), produced in Munich, 1865. Setting: aboard a ship, Cornwall, Brittany, in legendary times. *Tristan* is without doubt the fullest incarnation of romantic love ever presented in opera. Practically the whole second and third acts are an "unending love duet," in which every feeling and sensation, ranging

from the tenderest to the most passionate, is portrayed. Owing to the relative simplicity of the plot, the \*leitmotiv plays a secondary role in this opera (as compared with the \**Ring*), and the most conspicuous features of the music are the "unending melody" and a harmonic vocabulary full of daring chromatic progressions and bold appoggiaturas. In fact, so conspicuous are these traits that "Tristan melody" and "Tristan harmony" have become common terms.

**Triste** [Sp.]. Melancholy love song of Peruvian origin adopted in northern Argentina by the second half of the 19th century. The melody is predominantly pentatonic, although occasionally it follows patterns based on the European seven-note scale. The texts frequently combine Indian and Spanish words. J.O-S.

**Tristrotpha**. See under Neumes I.

**Trite** [Gr.]. See under Greece II.

**Tritone**. The interval of the augmented fourth (c-f $\sharp$ ) or diminished fifth (c-g $\flat$ ), so called because it spans three whole tones. It has always been considered a "dangerous" interval, to be avoided or treated with great caution [see *Diabolus in musica*]. As a melodic progression it was rarely used before 1900, except in combinations such as c-f $\sharp$ -g, where f $\sharp$  is the leading tone before g. In modern music, however, it is a legitimate interval, e.g., in the \*whole-tone scale or in various experimental devices based on the fact that the tritone is exactly one-half of the octave.

Tritonic progressions such as f-a-b-a are not uncommon in Gregorian chant, but most of them were later eliminated by the use of a B $\flat$ . Of particular interest is a standard cadential formula of the Graduals of mode 3, having the outline f-b-e and therefore involving a tritone whether sung with or without B $\flat$  [see, e.g., "Eripe me," *LU*, p. 570f]. The formula f'-d'-b occurs in practically every Gradual of mode 2 [e.g., *Haec dies*, *LU*, p. 778f, on "e-a"]. Probably the first writer to forbid the melodic tritone was Guido d'Arezzo, who said that the *b rotundum* (B-flat) was added to the scale because the F has no *concordiam* with its fourth, being at the distance of a *tritonium* (*Micrologus*, ch. viii; in *GS* ii, 8). Later the tritone was subsumed under the rule *Mi contra fa, diabolus in musica* [see *Mi-fa*].

The vertical tritone plays an important role in the early organum of the fourth ("Musica enchiriadis," c. 900), where its *inconsonantia* led to the replacement of strictly parallel motion

[Ex. b] by oblique motion [Ex. a]. However, the sources of 13th- and 14th-century polyphonic music contain numerous instances like that in Ex. c. Ramos de Pareja said that using the tritone is not a "deadly sin" (*peccatum mortale*) but a necessity (*Musica practica*, 1482; ed. J. Wolf,

p. 50f). In classical harmony the tritone is allowed only in combination with other intervals, mainly in the seventh chord (c-e-g-b $\flat$ ) and its inversions, the second of which is sometimes called tritone because it usually contains the interval in a particularly conspicuous position (e-b $\flat$ -c'-g').

**Trittico** [It., Triptych]. A cycle of three independent one-act operas by Puccini, first produced together in New York, 1918: *Suor Angelica* (Sister Angelica; libretto by G. Forzano; setting, a convent near Siena, 17th century); *Gianni Schicchi* (libretto by G. Forzano, based on Dante; setting, bedroom of a house in Florence, 1299); *Il Tabarro* (The Cloak; libretto by G. Adami, after D. Gold's play *La Houppelande*; setting, a barge on the Seine, 19th century).

**Tritus** [L.]. See under Church modes I.

**Triumphes of Oriana, The**. A collection of English madrigals, published by Morley in imitation of an Italian collection of madrigals, *Il Trionfo di Dori* (1592), and dedicated to Queen Elizabeth. The book was scheduled to appear in 1601 but was not published until 1603, after the Queen's death. It contains twenty-nine madrigals in five or six parts, by Morley, Weelkes, Ellis Gibbons, and others, all of which close with the refrain "Long live fair Oriana" (in imitation of the refrain "Viva la bella Dori" in the *Trionfo*), except for the last three, which have the refrain "In Heaven lives Oriana." List of contents in *GD* v, 385; *GDB* viii, 550; repr. in \*Editions XVI, 32.

**Trochee, trochaic**. See under Poetic meter I; Modes, rhythmic.

**Trojans, The**. See *Troyens, Les*.

**Tromba** [It.]. Trumpet, bugle. *T. a macchina* (*ventile*), valve trumpet. *T. bassa*, bass trumpet. *T. da tirarsi*, *t. spezzata* slide trumpet [see Trumpet II].

**Tromba marina** [It.]. A late medieval bowed instrument, still in use in the 18th century, that consisted of a tapering three-sided body, 5 to 6 feet long, over which a single string was stretched. The string was not stopped, as in violin playing, but lightly touched with one finger to produce harmonic notes, the bow playing above the "stopping" point (between it and the nut). Inside the long soundbox were a large number (up to twenty or more) of sympathetic strings that were tuned in unison with the playing string [see ill. accompanying Violin]. The most peculiar feature was the bridge, in the shape of a wide inverted U whose left foot, shorter than the right, was free to vibrate against the soundboard, resulting in a drumming noise (hence G. *Trumscheit*, drum log). While its trumpetlike sound probably accounts for the *tromba* part of the name, no explanation for *marina* has been found. The fantastic identification of *marina* with "marine" may have led to the name "sea-trumpet." The instrument was frequently used by nuns and hence another German name, *Nonnengeige* (nun's fiddle). The tenor marked "Trompette" in Pierre Fontaine's chanson "Jayme bien celui" (c. 1400) was probably written for the tromba marina. [See P. Aubry, in *SIM* viii, 525f.] Antonio Vivaldi (c. 1669–1741) wrote solo parts for two tromba marinas in one of his concertos [see A. Schering, *Geschichte des Instrumentalkonzerts* (1905), p. 62], and the Swiss Johann M. Gletle (1626–84) wrote duets for the instrument (new ed. in A. Stern and W. Schuh, *Schweizer Sing- und Spielmusik* vi). A *Mémoire sur la trompette marine* by J. B. Prin of 1742 is reprinted in *BSIM* iv.2, 1176ff. For a detailed description of the instrument, see N. Bessaraboff, *Ancient European Musical Instruments* (1941), 317ff; also *SaHMI* 290ff [pl. XVIII, opp. p. 304]; *GD*, s.v. "Tromba marina"; *GDB*, s.v. "Trumpet marine."

Lit.: F. W. Galpin, "Monsieur Prin and his Trumpet Marine" (*ML* xiv, 18ff); *LavE* ii.3, 1757ff (bibl.); P. Garnault, *La Trompette marine* (1926).

**Trombetta** [It.]. Old name, used by Dante, for a small trumpet.

**Trombone** [G. *Posaune*; Sp. *trombón*]. I. The modern orchestral trombone is a brass instrument with a cylindrical bore except for the lower third of its length, which gradually expands into the bell, and a cup-shaped mouthpiece. It consists of two separate pieces, one made up of the mouthpiece, cylindrical bore, and bell, held

together by a crossbar, and the other of a U-shaped middle piece that, by means of another crossbar, can be moved toward and away from the player and therefore is called slide. [See ill. under Brass instruments.] The slide takes the place of the valves used with other brass instruments and, like them, fills in the gaps of the natural tones [see Wind instruments IV (a)]. There are seven recognized positions (six plus the original one) of the slide, each a semitone lower, changing the natural tuning of the trombone successively from, e.g., B-flat to A, A-flat, etc. The range for each position is about two octaves ( $B_1^b$ – $B^b$ – $b^b$  for the normal position), but the lowest note of this series, called pedal tone, is difficult to produce in the three lowest positions. Since the movement from position to position requires a certain amount of time, a true legato cannot be executed on the trombone. On the other hand, a \*glissando (properly termed \*portamento) can. This effect has been used by some composers for comic purposes.

The trombone may be regarded as the bass of the trumpet although its tone is more dignified and solemn and less brilliant. This difference in tone color is due mainly to the trombone's larger mouthpiece. Trombones have been made in many sizes, ranging from soprano to contrabass, and in many keys. The four types used in the modern orchestra are:

(a) Tenor trombone. It is pitched in B-flat and has a complete chromatic compass as shown in Ex. a, in addition to which four pedal tones,

shown in Ex. b, are available. It is notated at its sounding pitch (not transposing as, e.g., the horn).

(b) Bass trombone. It is pitched in F, although instruments pitched in G or E-flat may be used in England. Its compass is a fourth below that of the tenor trombone. Owing to the great length of the pipe the slides are difficult to handle, and today the instrument is generally replaced by the tenor-bass trombone.

(c) Tenor-bass trombone. It has the size (and pitch) of the tenor trombone but the bore of the bass trombone, which facilitates playing pedal tones and makes the sound similar to the bass trombone's. It has a single valve that lowers the pitch a fourth ( $B^b$  to F), i.e., to that of the bass

trombone. The tenor-bass trombone has virtually supplanted the bass trombone in the modern orchestra.

(d) Contrabass trombone. It is pitched an octave below the tenor trombone (British instruments are sometimes pitched in C). The difficulty caused by the great length of its pipe was overcome in 1816 (by Gottfried Weber) with the invention of the "double slide," the pipe being bent into four parallel tubes. Wagner used it in his *Ring des Nibelungen* and other composers have followed his example (e.g., D'Indy in *Jour d'été à la montagne*). It is, however, very tiring to play, owing to the great strain on the player's lungs and lips.

Occasionally valve trombones have been made (used by D'Indy in *Le Chant de la cloche*). Their tone, however, is less noble than that of the slide trombone.

II. *History*. The trombone was the first of the modern orchestral instruments to appear in its present shape. It developed in the 15th century from a large trumpet (hence the name *trombone*, i.e., large *tromba*) through the addition of a slide, and the earliest representations, in paintings of the late 15th century, show all the essentials of the present instrument. The German name *Posaune* points to another line of descent, the large and straight *buisine*, a name that in turn goes back to L. \**buccina* [see E. A. Bowles, *AMW* xviii, 63ff]. The medieval name for the trombone was *sackbut* (derived from the old Spanish *sacabuche*, "draw tube," or from old French *sacqueboute*, "pull-push"). Throughout the 16th century trombones were commonly used in the ceremonial bands of princes and large cities as well as in churches. Their sliding mechanism made them suitable for performing art music at a time when horns and trumpets were still limited to the performance of military signals. Owing to the narrower bell of the old trombones, their sound was relatively soft and therefore combined well with voices and other instruments. They were, no doubt, often used for the performance of sustained tenors in the isorhythmic motets of the 14th and 15th centuries. Several compositions of the early 15th century have lower parts marked *trompette* or *tuba* [see H. Bessler, "Die Entstehung der Posaune," in *AM* xxii]. G. Gabrieli's *Sacrae symphoniae* of 1597 are scored for cornetti, trombones, bassoons, and strings [see Orchestra II]. Michael Praetorius, in his *Theatrum instrumentorum* (1620), *Syntagma musicum*, ii, part 6, included illustrations of alto, tenor, and bass

trombones, called *Alt Posaun*, *Rechte gemeine* (right common) *Posaun*, and *Quart-Posaun* respectively. Bach and Handel used the instrument occasionally, but mostly in unison with voices for the sake of greater sonority. Gluck was perhaps the first to make effective use of the trombone for accompanying chords, e.g., in the aria "Divinité du Styx" from *Alceste*, and Mozart gave the trombones a prominent place in his *Zauberflöte* and *Don Giovanni*. Beethoven introduced the trombones into symphonic music in the final movement of his Fifth Symphony, but it was not until after 1850, with Berlioz and Wagner, that the trombone became firmly established as a member of the orchestra. In the 20th century the trombone has been used as a solo instrument with orchestra and in chamber music combinations by A. Hovhaness, H. Cowell, Stravinsky, Poulenc, and Hindemith.

Jhs.* (*Mitteilungen des Vereins für Geschichte der Stadt Nürnberg*, 1954); H. Bessler, "Die Entstehung der Posaune" (*AM* xxii); C. Sachs, "Chromatic Trumpets in the Renaissance" (*MQ* xxxvi); F. W. Galpin, "The Sackbut, Its Evolution and History" (*PMA* xxxiii); F. Jahn, "Die Nürnberger Trompeten- und Posaunenmacher im 16. Jahrhundert" (*AMW* vii).

**Trommel** [G.]. Drum [see Percussion instruments B, 1-3]. *Trommelschlegel*, drumstick.

**Trommelbass** [G.]. Pejorative name for stereotyped bass figures, such as the piano tremolo in octaves.

**Trompette** [G.], **trompette** [F.]. Trumpet. *Trompette à coulisse*, slide trumpet.

**Trompetengeige** [G.]. \**Tromba marina*.

**Troparia**. See under Byzantine chant II.

**Troparium** [L.]. See Troper.

**Trope** [L. *tropus*]. (1) In certain medieval treatises, designation for church mode: see Tonus (3), Tropus. (2) Term used by J. M. Hauer (b. 1883) in a kind of twelve-tone system devised by him. In his *Zwölftontechnik* (1926), which differs from that of Schoenberg [see Serial music] and has not been generally accepted, Hauer divides each series of twelve notes into two hexachords and groups all the series having the

same notes in each of the hexachords into a class called *trope*. Thus, one such trope (no. 44) contains all series beginning with the tones c d e f# g# a# (in any order) and closing with c# d# f g a b (in any order). There are 44 tropes, and each represents, in a sense, a key with two fundamental chords, the change from one trope to another then being comparable to modulation.

(3) A category of plainchant that flourished from the 10th through the 12th centuries, comprising musical and textual additions to the established repertory of Mass (both Proper and Ordinary) and Office chants. The classic definition is that of Léon Gautier, "l'interpolation d'un texte liturgique" [*Les Tropes*, 1886]. The methods of interpolation are now often designated [e.g., in *ApGC*] as: (a) the addition of a new text to a melisma of a traditional "Gregorian" chant; (b) the composition of a new melody and text, which is then sung together with a traditional chant in various ways, before and/or after it, or by alternation of the phrases of the trope with those of the original chant, or, in the case of a short text like the "Benedicamus Domino," embedding the few original words or their synonyms in an elaborate new melody and text; (c) an independently composed melody without text added to an item of the standard repertory. However, such a precise classification falsely implies a far greater knowledge of the quite large and still not thoroughly studied repertory of medieval tropes, not to speak of their prehistory, than we actually possess. It is particularly difficult to apply it to the highly original (in melody and text) and numerous group of Ordinary tropes (especially, but not only, the Kyrie), which first appeared in musical notation in late 10th- or early 11th-century chant books. Before this there may have been a primitive unadorned melody to which the trope was added, but this assumption cannot be proved. The question arises whether the *entire* text and melody may not have been first composed in the elaborate, troped form. It should be observed that, although the unadorned Ordinary texts are very old and were surely used liturgically before Carolingian times, by either the *schola* or the congregation, the music of the simple Ordinary chants also may be considered an accretion to the traditional sung liturgy; such untroped Ordinary chants appear no earlier than the tropes, and in the same collections.

The practice of appending or interpolating long untexted melismas to pre-existing liturgical chant is thought by some scholars (e.g., B. Stäb-

lein, J. Handschin) to date from long before the 9th century. In any event, Amalar of Metz (c. 775–c. 850) provides, in various works between A.D. 823 and 844, the first substantial evidence for what appear to be tropes of the Alleluia (i.e., sequences, probably without text), Kyrie ("Kyrie eleison Domine pater miserere"), and responsory (a *neuma triplex*, i.e., a thrice-repeated melisma, is mentioned as having been transferred from its original use with the responsory "In medio ecclesiae" to the responsory "Descendit de caelis"). The first composers of tropes known by name are two monks of St. Gall, Notker (Balbulus; c. 840–912) and Tuotilo (d. 915). The former is associated with the \*sequence, which, although it is a trope in a broad sense, has been studied separately, perhaps because it rapidly became an independent component of the Mass. The best known of Tuotilo's works is the trope "Hodie cantandus" [*SchGMB*, no. 3] to the Introit for the third Mass of Christmas; it has often been cited as a forerunner of the \*liturgical drama. It is clear that Notker was no innovator, but rather a refiner of a technique transmitted to St. Gall from northern France about the middle of the 9th century. This may also be true of Tuotilo's work. Some 19th-century scholars overemphasized the originality of St. Gall; shortly after 1900 the situation was reversed [cf. particularly the introductory essay by C. Blume and H. Bannister to *Analecta hymnica liii*] and since then France, with special but not exclusive emphasis on St. Martial de Limoges, has been considered the cradle of the sequence, and possibly also the trope. The existence of very early (10th-century) \*trophers from Aquitaine is a significant point of evidence; however, there is a group of important early tropers from St. Gall as well. The later history of the trope parallels that of the sequence, particularly in the increased degree of poetic and tonal regularity. All the tropes were abolished by the \*Council of Trent. Their traces survive, however, in the present-day names of many Kyries [see Kyrie] and the corresponding Mass Ordinaries, e.g., *Missa Cunctipotens genitor* for Mass IV [see Mass A]. It should be observed that, in the Middle Ages, an Ordinary chant in its troped form was often proper to a particular feast or local saint.

(4) In musicological research, the term "troping" is also used in connection with the polyphonic elaborations of liturgical chants. For instance, the early motet may be considered a "polyphonic trope" (or "vertical trope"), since

here a new text, elaborating upon the idea of the original chant in the tenor, is used for the upper parts. Finally, the process of troping can also be observed in trouvère music, in which new texts were interpolated between the two halves of a refrain, a procedure that is believed to have been the origin of the \*rondeau (Gennrich) and that is clearly evident in the *motets entés* [see Enté]. See *Prosula*. (1) and (3) rev. L.G.

(1) and (3) rev. L.G.

**Troper** [*L. troparium*]. A liturgical book containing tropes. The oldest extant troopers are those from St. Martial (10th, 11th centuries). An 11th-century English MS known as the Winchester Troper (Cambridge, Corpus Christi College, MS 473) is of particular importance because it contains, in a separate section entitled *Melliflua organorum modulamina*, organa for more than 150 chants, making it by far the most extensive source of early organum. Unfortunately, it is written in nondiastematic neumes that cannot be deciphered with total certainty. See W. H. Frere, ed., *The Winchester Troper* (1894); H. Husmann, *Tropen- und Sequenzhandschriften* (*RISM*, ser. B, i [1954]); J. Handschin, "The Two Winchester Troopers" (*Journal of Theological Studies* xxxvii); A. Machabey, "Remarques sur le Winchester Troper" (*CP Besseler*); G. Weiss, "Zum Problem der Gruppierung südfranzösischer Tropare" (*AMW* xxi).

**Troppo** [It.]. Too (much). *Allegro non troppo*, not too fast.

**Tropus**. In medieval treatises, designation for mode or scale. See *Tonus*.

**Troubadour**. Name for any of a large number of 12th- and 13th-century poet-musicians of southern France (Provence), who were the first in Western history to establish a tradition of songs in the vernacular. Their Provençal name was *trobador*, possibly derived from *tropator*, i.e., writer of tropes. The movement was begun by Guilhem IX, seventh Count of Poitiers

(fl. 1087–1127), and included members of the French nobility as well as commoners, all devoted to poetry and music in the service of chivalrous love. In the mid-12th century it spread to northern France (\*trouvères) and Germany (\*minnesingers). Scholars do not agree about the origins of this movement. Arab-Spanish models as well as Carolingian love lyrics and liturgical hymns in honor of the Virgin Mary all have been cited as sources. Very likely each contributed certain elements. Another question is to what extent the noblemen were assisted by jongleurs. Probably the practice varied in different cases. Among the troubadours whose melodies survive are Guilhem IX, Marcabru, a commoner (d. c. 1150), Bernart de Ventadorn (c. 1127–95), Peire Vidal, a commoner (d. 1215), Rambaut de Vaqueiras (d. 1207), Folquet de Marseille (c. 1155–1231), Raimon de Miraval (d. c. 1220), Aimeric de Peguillan (1205–75), and Guiraut Riquier (d. 1294), the "last of the troubadours."

About three hundred troubadour poems (c. thirty with devotional texts) are preserved with melodies. The main sources are listed under *Chansonier*. The texts of most of the songs are love lyrics. Special types are the \**alba*, *pastorela* [see *Pastourelle*], *planc* [see *Lament* (2)], *partimen* [see *Tenso*], and \**sirventes*. Practically all of them are strophic poems, normally with five or six stanzas and a concluding half-stanza (*tornada*; see *Envoi*). Most often the stanza is through-composed, but the form with initial repeat, a a b, also occurs [see *Canzo*]. Of c. 270 lyrical songs, about 90 are in a a b form, but it is significant that nearly one-half of the latter are found among the works of the "last" troubadour, Riquier, who probably was influenced by trouvère music, in which the repeat form far outweighs the other. Two Provençal \**lais* also survive. The melodies of the troubadours (and of the trouvères) all are monophonic and were never accompanied in the modern sense of the word. Instrumental participation in the performance, suggested by some pictures showing a singer holding a fiddle or being assisted by an instrumentalist, was restricted to a strict or slightly varied unison duplication of the melody [see *Heterophony*] or, perhaps, to some short extemporization in the way of a prelude, interlude, or postlude. For the notation and rhythmic interpretation of the troubadour songs, see under *Trouvère*. Ex. in *HAM*, no. 18.

**Trout Quintet.** Popular name for Schubert's Quintet in A, op. 114 (1819), for violin, viola, cello, double bass, and piano, in five movements, the fourth being a set of variations on his song "The Trout" [*G. Die Forelle*].

**Trouvère.** Collective designation for the 12th- and 13th-century poet-musicians active in northern France, who imitated the movement initiated by the Provençal \*troubadours. The development began in the late 12th century with Blondel de Nesles (b. c. 1155), Grace Brulé (d. 1220), Chatelain de Coucy (d. 1203), and Conon de Béthune (c. 1160–1219); continued with Gautier d'Epinal (fl. 1220–40), Thibaut IV (Count of Champagne and later King of Navarre, 1201–53), Colin Muset, Moniot d'Arras, Perrin d'Angicourt, and others; and closed with Jehan Bretel (d. 1272), Adam de la Hale (c. 1240–87), and Gillebert de Berneville (d. c. 1300). [For the general aspects of the movement, see *Troubadour*.]

Of more than 4,000 trouvère poems, about 1,400 are preserved with their melodies. The main sources are listed under *Chansonnier*. A large majority of the songs are love lyrics in the form of strophic poems; special literary types are the *aube* [see *Alba*], \*chanson de toile, *jeu-parti* [see *Tenso*], and \**pastourelle*. Through-composed stanzas, which occur in the majority of troubadour songs, are relatively rare, whereas

the form with initial repeat, a a b, is the most important form of trouvère music. It may well be called \*ballade [F.], analogous to the 14th-century ballade (Machaut) with the same structure. Occasionally, other repeat structures are encountered, such as a a b b, a a b b c, a b b, etc. In addition to strophic songs, the trouvère repertory includes a considerable number of \*lais. The \*rondeau and \*virelai, however, cannot be considered forms of trouvère music [see *Lit.*, *Apel*].

The melodies of the trouvères (and troubadours) are practically all notated without clear indication of rhythm [see *Monophonic notation*]. The rhythmic interpretation of this notation has been widely studied and disputed. Early attempts to apply the principles of mensural notation (particularly the Franconian rules of ligatures; see *RiHM* i.2, 225) were abandoned c. 1890 (P. Runge) in favor of a rhythmic interpretation based on the meter of the text, a principle that was considerably modified c. 1905 by J.-B. Beck and P. Aubry with the introduction of modal (ternary) rhythm [see *Modal theory*]. The modal interpretation has been rather generally accepted for trouvère melodies, whereas its applicability to troubadour and minnesinger music is more open to question. Some of the songs in the *Chansonnier Cangé* (fac. ed., J.-B. Beck, 1927) are notated in long and short values (*longa, brevis*), clearly indicative of the first or third mode (*L B L B . . . , L B B L B B . . .*).

**Trovatore, II** [It., *The Troubadour*, or *The Minstrel*]. Opera in four acts by Verdi (libretto by S. Cammarone, based on a play by A. Gutiérrez), produced in Rome, 1853. Setting: Spain, 15th century.

**Troyens, Les** [F., The Trojans]. Opera in five acts by Berlioz (to his own libretto, after Virgil), in two parts, *Le Prise de Troie* (The Taking of Troy) and *Les Troyens à Carthage* (The Trojans at Carthage), composed 1856–58. Only the first part was produced during Berlioz' lifetime (Paris, 1863); the whole work was first produced (in German) in Karlsruhe, 1890. Setting: Troy and Carthage, 1200 B.C.

**Trugschluss** [G.]. Deceptive cadence. See Cadence I.

**Trumpet** [F. *trompette*; G. *Trompete*; It. *tromba*; Sp. *trompeta*]. I. The modern orchestral trumpet is a \*brass instrument with a cup-shaped mouthpiece and a narrow tube that is cylindrical for about three-fourths its length, then widening out into a moderate-sized bell. These characteristics distinguish it from the horn, which has a prevailingly conical bore and funnel-shaped mouthpiece. [For ill. see Brass instruments.] They account for the different timbres of the two instruments, the trumpet's being bright, brilliant, and penetrating, whereas the horn's is mellow and full. The horn is circular in shape and the trumpet oblong, a difference of secondary importance to the sound. The trumpet has three \*valves (rotary or piston), which, singly or in combination, lower the natural pitch of the instrument by one to six semitones; hence, the name "valve trumpet" [F. *trompette-à-pistons* or *chromatique*; G. *Ventiltrompete*; It. *tromba ventile*, *t. a macchina*, *t. a piston*] to distinguish it from the earlier natural trumpet [see II]. How tones are produced on the trumpet is explained under Wind instruments.

The modern orchestral trumpet is pitched in B<sup>b</sup> and has the chromatic compass shown:

In most scores (Beethoven, Brahms) it is notated as a transposing instrument, either in B<sup>b</sup> throughout or in different transpositions according to the crooks [see II], these being indicated in the score.

At the end of the 19th century a larger trumpet, pitched in F (or, for military bands, E<sup>b</sup>), was popular. In length of tubing and actual pitch this instrument is closer to the horn and has a much nobler tone than the B<sup>b</sup> trumpet. It lacks,

however, the latter's agility and has now been practically abandoned.

Bass trumpets, pitched in low E, D, or C, were demanded by Wagner for his *Ring des Nibelungen* but have proved impracticable. The instruments known by this name and used as substitutes are actually valve trombones, pitched in C.

II. *History*. The oldest ancestors of the modern trumpet are discussed under Brass instruments. Prior to c. 1700 the trumpet existed mainly in the form known as natural trumpet [G. *Naturtrompete*], a plain brass cylindrical bore without any such devices as side-holes, crooks, slides, or valves to bridge the gaps of the natural scale of harmonics. From the 14th century on the trumpet became associated with military and ceremonial functions. Playing it was a carefully guarded privilege of the nobility, reserved for official court trumpeters [see *Feldmusik*]. After 1600 the trumpet began to be used in art music, the *clarino* and *trombe sordine* of Monteverdi's *Orfeo* (1607; see Orchestra II) being an early though isolated instance. In 1638 Fantini's method of learning to play the trumpet appeared [see Lit.]. Toward the end of the 17th century trumpets were quite frequently used in operas, cantatas, etc., for military scenes or for expressing joyful triumph (Purcell, Buxtehude). At this time the art of playing the highest register of the trumpet, where the harmonics form a full scale, was developed; formerly only the low and middle registers, in which only fanfare-like motifs are possible, had been used [see Clarino (2)].

During the 18th century various attempts were made to overcome the limitation in the natural trumpet's compass. As early as Bach's time crooks—additional lengths of tubing—were inserted between the mouthpiece and the instrument in order to lower the pitch by several semitones or whole tones. This, of course, was only an expedient to make a single instrument useful for pieces in a variety of keys; still, in any such key only the natural tones were available. More drastic steps were taken toward the end of the 18th century with the introduction of side-holes covered with keys and a sliding mechanism. Key trumpets were invented in 1801 by the court trumpeter Anton Weidinger of Vienna, but they were soon abandoned because side-holes, though fairly satisfactory on conical instruments such as cornets and bugles (key bugle), produce a muffled sound on instruments with a cylindrical bore.

More successful was the application of the

sliding mechanism, which had always been used for trombones. In an earlier construction, documented as early as the 15th century, the slide was part of the elongated mouthpiece, which could be pulled out so that all the gaps in the natural scale could be filled. It is probably this instrument [F. *trompette à coulisse*; G. *Zugtrompete*] that Bach meant when he indicated *tromba da tirarsi* (Cantatas nos. 5, 20, 77). The terms *tromba o corno da tirarsi* (Cantata no. 46) and *corno da tirarsi* (Cantatas 67, 162) probably mean the same instrument [see *SaHMI*, p. 384f]. [See ill. under Brass instruments.] At the beginning of the 19th century another construction was made by John Hyde (1804; or by Richard Woodham, c. 1810?) in which the U of the upper coil was transformed into a movable slide, similar to that of the trombone, and provided with springs to bring it back to its normal position. This instrument was in constant use in England throughout the 19th century [see *GD* v, 395f; *GDB* viii, 567ff]. Although it had the fine sound of the natural trumpet, it lacked the agility demanded in modern scores and was therefore finally abandoned in favor of the valve trumpet.

The invention of valves (1813) opened the way for the permanent establishment of the trumpet in the orchestra. One of the first parts for the valve trumpet is that in Halévy's *La Juive* (1835), in which two valve trumpets are used along with two crooked natural trumpets. The modern development of a brilliant trumpet technique has enabled composers to use the trumpets as melody instruments equal and occasionally superior in importance to the woodwinds. The scores of Stravinsky, Shostakovich, and others contain many interesting trumpet passages, frequently of a comic nature. The repertory for trumpet includes concertos by Haydn and Hummel, a sonata by Hindemith, and works by Purcell, Bach, Vivaldi, and Enesco.

Jahrhundert" (*AMW* vii); W. Osthoff, "Trombe sordine" (*AMW* xiii); C. Titcomb, "Baroque Court and Military Trumpets and Kettledrums: Technique and Music" (*GSJ* ix).

**Trumpet marine.** \*Tromba marina.

**Trumscheit** [G.]. \*Tromba marina.

**Trutruka.** The most commonly used instrument of the Araucanian Indians of southern Chile and Argentina. It is a straight trumpet, ten feet long and two inches in diameter, made of bamboo or *küla* wood, with an upturned bell of horn at one end and a diagonal mouthpiece cut into the other. The player holds the instrument horizontal by resting it either on special supports or on the shoulders of a *kona* boy. The timbre is similar to the bassoon's, and twelve to thirteen overtones can be obtained by expert players.

J.O-S.

**T.s.** Abbr. for \**tasto solo*.

**Tuba.** (1) [L.]. Ancient Roman straight trumpet [see Brass instruments V (a)].

(2) In modern usage, generic name loosely used for any bass-pitched brass instrument other than the trombones. This group comprises instruments of many sizes and shapes, depending on where and by whom they were made, a fact partly explained by their extensive use in military and other bands. The most important of them, such as the euphonium, helicon, sousaphone, and baritone, are briefly described under Brass instruments III.

The tubas of the modern orchestra are bass instruments with an oblong shape, a conical bore, a bell pointing upward, a cupped mouthpiece, and three to five valves. There are three sizes: (a) tenor tuba [G. *Baryton*] in B-flat; (b) bass tuba, pitched either in E-flat (E-flat or EE-flat bass tuba) or in F (F bass tuba); (c)

double-bass or contrabass tuba (usually called BB-flat bass tuba or BB-flat bass), pitched an octave below the tenor tuba.

Wagner tuba or Bayreuth tuba are names given to instruments designed for Wagner's *Ring*. They have a somewhat narrower bore (similar to that of the \*cornet) and a funnel-shaped mouthpiece like that of the horns. Wagner used two tenor and two bass instruments of this type, together with a normal double-bass tuba for the lowest part. The Wagner tubas combine the agility of the cornet with the mellow timbre of the true tubas. They have also been used by Bruckner and R. Strauss (*Elektra*). See ill. under Brass instruments. See R. Bryant, "The Wagner Tubas" (*Monthly Musical Record* lxxvii).

(3) In Gregorian chant, see under Psalm tones.

**Tubaphone.** A percussion instrument like the glockenspiel, but with lengths of metal pipe instead of metal bars. It has been used by A. Khatchaturian in his ballet *Gayane*.

**Tucket, tuck.** Elizabethan name for a trumpet flourish. The word appears to be an anglicization of toccata [see Toccata (2)]. Cf. the German *Tusch* and French *touche*.

**Tudor Church Music.** See Editions LI.

**Tumba** [Sp.]. Folk dance similar to the *tarantella* that originated in Santo Domingo c. 1822. It is also known as *contradanza criolla*. Although the *tumba* replaced such group dances as the Spanish *cuadrilla* and the minuet and emphasized the importance of the individual couple, the break with tradition was not complete. Many of the traditional figures were retained but were danced to a different music and to syncopated rhythmic patterns showing African influence. In the Western portion of the island (Haiti), where French influence prevailed, the dance, known as the *tumba francesa*, was rhythmically somewhat more elaborate than the *tumba dominicana*, showing predominantly Spanish influence. The former version also became popular in Cuba. J.O-S.

**Tuna.** See *Tamborito*.

**Tune.** \*Melody.

**Tune book.** Generic term for the many volumes of three- and four-part vocal music published in the American colonies and United States in the 18th and 19th centuries, which contain psalm

tunes, hymn tunes, fusing tunes, anthems, odes, "motettos," and occasionally even a cantata. The music was written in open score with the text usually placed over the tenor (until the mid-19th century), the reason for this being that the tenor rather than the soprano had the principal melodic line. The tune books always included a theoretical introduction, those prior to 1800 being of particular importance for the study of colonial music. A few of the more important 18th-century tune books are: John Tufts, *Introduction to the Singing of Psalm Tunes* (Boston, 1721; fac. repr. of 1726 ed., 1954); James Lyon, *Urania* (Philadelphia, 1761); Oliver Holden, *The Union Harmony* (Boston, 1793); William Billings, *The Continental Harmony* (Boston, 1794; fac. repr., 1961); O. Holden, Samuel Holyoke, and Hans Gram, *The Massachusetts Compiler* (Boston, 1795).

Soon after 1800 the theoretical introductions become stereotyped music-reading manuals. Typical of this stage are Thomas Hastings, *Musica Sacra* (Utica, 1816); Lowell Mason, *The Boston Handel and Haydn Society Collection of Church Music* (Boston, 1822); *id.*, *Carmina Sacra* (Boston, 1841); *id.* and G. J. Webb, *The Psalter* (Boston, 1845); William Bradbury, *The Jubilee* (New York, 1858).

The tune books of the Midwest and South, which emerged after 1800, used shape notes [see Fasola]. Their introductions deal with the rudiments of music, but in terminology and content they often show more affinity to 18th-century tune books than those published in the Northeast at the same time. Among the Midwestern and Southern tune books are: Ananias Davisson, *Kentucky Harmony* (Harrisonburg, 1815?); Allen Carden, *Missouri Harmony* (St. Louis, 1820); B. F. White and E. J. King, *The Sacred Harp* (Philadelphia, 1844; repr., 1936, as *The Original Sacred Harp*); William Walker, *The Southern Harmony and Musical Companion* (New Haven, Conn., 1835; repr., 1939). Three earlier works should also be mentioned: William Little and William Smith, *The Easy Instructor* (New York, 1802), the first publication to use shape notes; Andrew Law, *The Art of Singing* (4th ed., 1803), which has shape notes without staves; and John Wyeth, *Repository of Sacred Music, Part Second* (Harrisburg, 1813), which had considerable influence on Southern tune books.

The publication on microcards of *Early American Imprints, 1639-1800* (Worcester; American Antiquarian Society, 1955ff) has

made available the most valuable segment of tune-book literature. The key to that series is Charles Evans' *American Bibliography*, 14 vols. (1903–59).

**Lit. General:** G. Chase, *America's Music* (1955), ch. 2, 7, 10, 11; W. S. Pratt, "Tune Books," *GD, American Supplement* (1930); F. J. Metcalf, *American Psalmody (1721–1820)* (1917); I. Lowens, *Music and Musicians in Early America* (1964). **Specific:** A. Britton, "Theoretical Introductions in American Tune Books to 1800" (diss. Univ. of Michigan, 1950); G. P. Jackson, *White Spirituals in the Southern Uplands* (1933); E. C. Krohn, "The Missouri Harmony, A Study in Early American Psalmody" (*Missouri Historical Society Bulletin* vi, 25–33); *id.*, "A Check List of Editions of the Missouri Harmony" (*ibid.*, pp. 374–99); I. Lowens, "John Wyeth's *Repository of Sacred Music, Part Second*" (*JAMS* v, 114–31); *id.*, "John Tufts' *Introduction to the Singing of Psalm Tunes*" (*Journal of Research in Music Education* ii, 89–102); *id.* and A. Britton, "The *Easy Instructor* (1798–1831): A History and Bibliography of the First Shape Note Tune Book" (*ibid.* i, 31–55); F. J. Metcalf, "The *Easy Instructor*, A Bibliographical Study" (*MQ* xxiii, 89–97). L.B.S.

**Tuning.** Adjustment of the strings of stringed instruments (including the piano and harpsichord) or the pipes of the organ to their proper pitch. Modern piano tuning is based on the pure octave and the well-tempered fifth. The former is tuned so as to give no \*beats, while the latter is obtained (in practice) by lowering the pure fifth (no beats) to the point where it gives one beat per second. In this manner, a succession of fifths (with their lower octave)—a, e, b, f#, etc.—is tuned. As soon as a third is available (a–c# being the first), it is used for testing. After the middle section of the keyboard (the groundwork) has been tuned, the higher and lower registers are tuned by octaves. A later system of tuning, introduced by O. C. Faust and widely accepted (outside piano factories), begins with c' and uses major thirds upward and fifths downward. The accompanying scheme illustrates the general procedure. Even more radical is a method

advocated by E. Neugebauer, which has pure fifths but slightly sharp fourths and octaves. See J. Redfield, *Music: A Science and an Art* (1928); A. H. Howe, *Scientific Piano Tuning and Servicing* (1947); F. Hubbard, *Harpsichord Regulating and Repairing* (1963); J. W. Link, *Theory and Tuning* (1963). Also see Temperament.

**Tuning fork** [F. *diapason*; G. *Stimmgabel*; It. *corista*; Sp. *diapasón*]. A two-pronged steel fork used to indicate absolute pitch. Modern tuning forks usually give the international pitch for the tone a (440 vibrations per second). The instrument was invented by John Shore in 1711 and improved c. 1850 by Rudolph König of Paris. For acoustical demonstration entire sets of tuning forks are built. They retain their pitch for long periods and produce almost pure tones, without harmonics. See E. A. Kielhauser, *Die Stimmgabel* (1907).

**Tuning slide.** In organ building, a movable metal clip or tube attached to the upper end of an open flue pipe. By lowering or raising it the length of the pipe, and hence its pitch, can be adjusted.

**Tuning wire.** In organ building, a wire whereby the length of the vibrating tongue of reed pipes is changed. Tuning only "on the wire" can seriously alter a pipe's volume and tone color; skillful tuners find the balance between tuning "on the wire" and "on the top" [see *Tuning slide*] of the resonator.

**Tuono** [It.]. \**Tono*.

**Tupan.** A cylindrical drum (also called *topan*) of the Balkans, used in combination with a shawm (*zurla*) to accompany dancing. See Y. Arbatsky, *Beating the Tupan in the Central Balkans* (1953).

**Turandot.** Unfinished opera in three acts by Puccini, completed by F. Alfano (libretto by G. Adami and R. Simoni, based on C. Gozzi's play), produced in Milan, 1926. Setting: China, legendary times.

**Turba** [L.]. In oratorios, Passions, etc., name for a choral movement representing the Jews or heathens. It is usually an allegro in fugal style, using short motifs in close imitation. There are numerous examples in Bach's *St. Matthew Passion*. See G. Adler, in *CP Liliencron*.

**Turca, alla** [It.]. In the Turkish style, i.e., in imitation of Turkish military music (\*Janizary music), which became popular in Europe in the late 18th century.

**Turkey.** I. *Theory.* Turkish classical music as practiced at the court and the great monasteries of Constantinople (Istanbul) is based on a fundamental scale containing twenty-four notes to the octave. Earlier, octaves of seventeen and twenty-three notes were used. The tones of the scale are calculated mostly on the basis of the Pythagorean system (consecutive fifths), thus differing from those of the European \*quarter-tone system [see *LavE* i.5, 3016]. From this fundamental scale about one hundred different "modes" are selected. Among them are the mode *Tchariguiah*, which is the Pythagorean scale of C, and the *Raste*, the most common mode of all, in which the E and B are those of \*just intonation ( $\frac{5}{4}$  and  $\frac{15}{8}$ ), i.e., a comma lower than the corresponding tones in the Pythagorean mode. Thirty of the modes are illustrated in *LavE* i.5, 2997ff. No less elaborate is the Turkish system of rhythm, called *oussoul*. It is based on the playing of the kettledrum with two fundamental kinds of drumstroke, one in the center (called *dum*, i.e., muffled) and one at the side (called *tek*, clear). There are about fifty standard combinations of these beats, which correspond to Western meters, each combination being repeated throughout the entire composition. Rhythmic schemes involving nine or seven beats are common.

II. *Practice.* The religious music "consists of *Ilahi*, hymns for all the months of the Mohammedan calendar, *Tevchih*, hymns in praise of Mohammed, and *Ayni Cherif*, offices of the whirling dervishes. Together these make up an important body of music. Important individual works are the famous *Nat* by Itri, the magnificent *Bayram Tekbiri*, also by him, and the *Sala*, *Temdjid*, *Sabah essalati*, and *Miradjiye*" [see E. Borrel, in *GD*, Sup. vol., p. 633]. Secular art music is derived largely from \*Arab practices. The most important form is the *Fasl*, a kind of suite made up of several pieces, instrumental and vocal, all in the same "key," i.e., *maqam* [see Arab music]. The instruments (tanbur, 'ud, \*kanun) are also those used in Arab music. Of particular interest is the music of the \*Janizary.

Modern Western music was introduced in Turkey by Joseph Marx and Paul Hindemith, who taught at Ankara from 1935 to 1937. The best-known modern Turkish composer is Ahmed Adnan Saygun (b. 1907), who wrote an oratorio *Yunus Emre* (1946) and an opera *Kerem*, the first Turkish opera performed at Ankara (1953).

Lit.: K. Reinhard, *Türkische Musik*; H. G. Farmer, *Turkish Instruments of Music in the Seventeenth Century* (1937); *LavE* i.5, 2945–

3064; A. Adnan Saygun, "La Musique turque," *Histoire de la musique* i, 573–617, in *Encyclopédie de la Pléiade*, ed. Roland-Manuel, ix (1960); V. Belaiev, "Turkish Music" (*MQ* xxi); B. Bartók, "Collecting Folk Songs in Anatolia" (*The Hungarian Quarterly* iii [1937], 337–46); E. Borrel, "La Musique turque" (*RdM* 1922, p. 149; 1923, p. 26); R. Yekta, "Musique orientale" (*RMC* vii, viii); G. Oransay, "Das Tonsystem der türkei-türkischen Kunstmusik" (*MF* x).

**Turkish crescent** [also *Turkish* or *Chinese pavilion* or *hat*, *jingling Johnny*; F. *chapeau chinois*; G. *Schellenbaum*; Turk. *chaghāna*]. A percussion instrument consisting of a wooden stick surmounted by crescent-shaped crossbars and an ornament shaped like a pavilion or Chinese hat, all hung with numerous small bells and jingles. [For ill. see under Percussion instruments.] The instrument was used in Turkish \*Janizary music, whereby it was introduced into the military bands of many European nations. See H. G. Farmer, *Turkish Instruments of Music in the Seventeenth Century* (1937).

**Turmsonaten** [G.]. A type of 17th-century German \**Gebrauchsmusik* that was played by brass instruments from the tower of the town hall or a church to signal the hours at noon, sunset, etc. It consisted of harmonized chorales, plain tunes, military signals, or "sonatas" [see Sonata B I]. Interesting collections of such pieces are Johann Christoph Pezel's (Petzold) *Hora decima* (1670) and *Fünfstimmige blasende Musik* (1685). New ed. in *Ddt* 63; see also *SchGMB*, no. 221.

**Turn.** [F. *double cadence*, *doublé*, *brisé*; G. *Doppelschlag*; It. *fioritura*; Sp. *grupito*]. An ornament consisting of a group of four or five notes that turn around the principal note. The most common form of turn in the music of the 17th and 18th centuries is indicated by a curved line, contains four notes, and begins on the beat with the note above the written note [Ex. 1]. It is important to note that the melodic form of the turn is identical with that of a trill with closing notes. For this reason the turn was regarded in the 17th and 18th centuries as synonymous with the short trill; it may be substituted for the latter whenever the tempo is too fast to permit the clear execution of a greater number of notes.

The sign for the turn was originally used only for the first trill of the compound ornament known as a \**double cadence*. The formula, shown in Ex. 2 and occurring frequently in the works of J. S. Bach and his contemporaries, actually con-

stitutes a single ornament; there should be no break between the turn and the ensuing trill. So closely was the sign in question associated with this formula that it was retained for the isolated turn along with its name, *double cadence*.

In Ex. 2 the sign for the turn is placed slightly to the right of the written note instead of directly above it, showing that the main note should be

sounded first. In Bach's works this occurs only when another ornament (generally a trill) is to be played immediately afterward, as in the *double cadence*. Later, however, this practice became quite common, as seen in the accompanying examples by Mozart [Ex. 3] and Beethoven [Ex. 4].

Until c. 1750 the turn was regularly performed as four equal notes, taking up the whole time value of the written note. J. S. Bach frequently wrote out this execution in ordinary notes [see Ex. 5, from *The Well-Tempered Clavier* ii, no. 24]. K. P. E. Bach introduced the custom of playing the first two notes of the *Doppelschlag* (as the turn was now called) more rapidly than the last, as in Ex. 6 [Mozart, *Violin Sonata*, G minor]. This execution does not apply, however, to a turn that is played after the written note or to a turn on a very short note.

The practice of indicating the turn with small grace notes (which became popular during the classical period) is more ambiguous than the use of the sign, since it is not always easy to determine whether a turn on a note or a turn between two notes is intended. Ex. 7 and 8 show

that the turn upon the note requires three small notes, while the turn after the note requires four.

The romantic composers often used five- or six-note turns. Their rhythm is exceedingly flexible, the only definite rule being that they are to be performed in the time value of the preceding note [Ex. 9 and 10, Chopin, *Nocturnes* op. 37, no. 1, and op. 48, no. 2].

Among the unusual forms of turn are: (1) The *geschnellter Doppelschlag*, a rapid five-note turn beginning with the main note [Ex. 11, K. P. E. Bach]; it was known in Italy as *gruppo* (*gropo*) or *gruppetto*, and in Germany as *Rolle*. (2) The *prallender Doppelschlag*, a turn combined with an appoggiatura and short trill [Ex. 12, K. P. E. Bach]. (3) The *inverted turn*, sometimes indicated by the ordinary sign upside down or in a vertical

~ 2

position but more often represented by tiny notes as in Ex. 13 [Mozart, *Rondo in A minor*, K. 511].

P.A.

**Turn of the Screw, The.** Opera in two acts and a prologue by B. Britten (libretto by M. Piper, based on H. James' tale), produced in Venice, 1954.

**Tusch** [G.]. A fanfare played on brass instruments. See Tucket.

**Tutti** [It.]. In orchestral works, particularly concertos, indication for the parts for the whole orchestra as distinct from those for the soloist.

**Tuyau** [F.]. Tube, pipe. *T. à anche*, reed pipe; *t. à bouche*, flue pipe.

**Tvisöngur** [Icel.]. In Icelandic folk music, a type of two-part singing that represents a survival of the 9th-century organum at the fifth. As in the English \*gymel, the voice-parts often cross, so that the "organal" part (sung by a soloist) moves alternately a fifth above and a fifth below the "principal" part (usually sung by a small group). See A. Hammerich, in *SIM* i; H. Helgason, in *CP* 1958.

**Twelve-tone technique.** A 20th-century method of composition devised (c. 1920) by A. Schoenberg. See under Serial music. Others, e.g., Hauer, had invented similar systems prior to Schoenberg [see Trope (2)].

**Twentieth-century music.** Among the most important styles and trends since 1900 are \*expressionism, \*atonality, \*serial music, \*neoclassicism, and, since World War II, \*electronic music, \*aleatory music, and \*musique concrète.

The second decade of the century, dominated by World War I, saw daring and widespread musical experimentation. Of basic importance was the work of Schoenberg, who, casting away the harmonic system and formal methods of the past, arrived at \*atonality (*Drei Klavierstücke* op. 11, 1909). Simultaneously, new possibilities in rhythm were exploited, e.g., by Bartók in his *Allegro barbaro* (1911) and Stravinsky in *Petrushka* (1911) and *Sacre du printemps* (1913). The French writer Cocteau aptly expressed the spirit of this period: "After the music with the silk brush, the music with the axe." Provocative terms such as *bruitisme* (noise music), \*futurism, motorism, and machine music appeared, although most of them left no lasting imprint. Experimentation with tonal material led to \*quarter-tone music. Besides the leaders already mentioned, composers such as Kodály, Malipiero, Casella, Honegger, Milhaud, Berg, and Webern contributed their experiments.

The neoclassical movement, which began in the early 1920's, fostered a return to the aesthetic ideals and formal methods of the 17th and 18th centuries, recast in modern idioms. Stravinsky took the lead with such compositions as the *Octet for Wind Instruments* (1923). Bartók and Hindemith, the major composers of the move-

ment (along with Stravinsky) began to receive international recognition. Hindemith helped develop \**Gebrauchsmusik* and provided a useful theoretical explanation of the new harmonic and tonal concepts. Bartók represents another major development of the post-1920 period: the assimilation and synthesis of the experimental techniques of the second decade into a colorful, expressive musical language. Other noteworthy features of the 1920's are the development of \*serial music and the influence of American jazz on serious music (e.g., in Stravinsky's *Ragtime*, 1918; Hindemith's *Suite* 1922; Krenek's jazz opera *Jonny spielt auf*, 1926).

For further developments, see Aleatory music; Electronic music; *Musique concrète*; Serial music.

See also under Atonality; Electronic music; *Musique concrète*; Neoclassicism; Serial music.

**Twilight of the Gods, The.** Wagner's *Götterdämmerung*. See under *Ring des Nibelungen, Der*.

**Two-step.** See under One-step.

**Tymbalon, tymbal.** An early Provençal kettle-drum.

**Tympanon, tympanum** [Gr., L.]. A frame drum beaten with the hand. In the Middle Ages the name meant kettledrum, although some writers

(e.g., Giraldus Cambrensis) applied it to the dulcimer. In modern writings tympani occurs as a misspelling of timpani.

**Tyrolienne.** A Tyrolean folksong, in the rhythm of a \**Ländler*, and sung with that sudden change from chest voice to falsetto known as \*yodel. The name is also used for operatic ballets (e.g., Rossini, *Guillaume Tell*, Act III) and popular pieces written in the style of Tyrolean folk dance.

## U

**Über-** [G.]. Over, above. *Überblasen*, to over-blow; *Übergang*, transition; *übergreifen*, to cross the hands (in piano playing); *Überleitung*, transition; *übermässig*, augmented (for intervals); *überschlagen*, to cross the hands; *übersetzen*, to put over (in piano fingering).

**Übung** [G.]. Exercise, study.

**U.c.** \**Una corda*.

**'Ud, oud** [Arab.]. See under Arab music; Lute II.

**Uguale** [It.]. Equal, uniform.

**Uilleann pipes.** Irish \*bagpipe. The name was later corrupted into "union pipes." See A. Baines, *Bagpipes* (1960), pp. 103, 120ff.

**Ukrainian Symphony.** Tchaikovsky's Symphony no. 2, in C minor, op. 17 (1872), also called *Little-Russian Symphony*, "Little Russia" being the common 19th-century name for the Ukraine.

**Ukulele.** A Hawaiian instrument of the guitar family, with four strings and a long fingerboard, usually fretted. It probably developed from a Portuguese guitar called *machete* [see Guitar family] and became popular in the United States c. 1920. The notation for this instrument follows the principles used in the lute tablatures of the 16th century but was invented independently [see Tablature VI]. See ill. under Guitar family.

**Umfang** [G.]. Compass, range (of a voice, etc.).

**Umkehrung** [G.]. Inversion (of intervals, chords, melodies).

**Umstimmen** [G.]. To change the tuning, e.g., of kettledrums.

**Una corda** [It.]. In piano playing, direction (abbr. *u.c.*) to use the left pedal (soft pedal; F. *pédale douce*; G. *Verschiebung*), which, by moving the entire action, keyboard, and hammers, a little to the right, causes the hammer to strike a single string (in modern instruments usually two strings) instead of all three. The indication is canceled by *tre corde* or *tutte le corde* (*t.c.*). Beethoven, the first composer to use the indication *una corda*, calls for not only a gradual increase in volume (*una corda, due, e poi tre corde*; G-major Concerto op. 58, slow movt.), but a gradual execution of the shift. *Nach und nach mehrere Saiten* (Piano Sonata op. 101, slow movt.). The latter is, of course, impossible to execute literally. See Mute.

**Una Cosa rara** [Sp., A Rare Thing]. Opera by Vicente Martín y Soler, a Spanish composer (1754–1806). It was produced in Vienna, 1786, and is remembered today only because Mozart included a long section from it in the finale of Act II of *Don Giovanni*, as part of the music played during the Don's supper.

**Un Ballo in maschera** [It.]. See *Ballo in maschera, Un*.

**Undezime** [G.]. Eleventh.

**Unequal temperament.** A \*temperament midway between pure intonation and equal temperament, i.e., any system of tuning in which the pure intervals are retained for some keys (C, G, F)

and adjustments are made for the more remote keys, with the result that the most remote keys (G-sharp, C-sharp) cannot be used. Various systems were in use prior to the general acceptance of equal temperament, e.g., the mean-tone system (which some writers do not consider an unequal temperament; see *GD* v, 301; *GDB* viii, 388), and the systems of L. Euler and J. P. Kirnberger. See Temperament.

**Unequal voices.** Mixture of men's and women's voices.

**Unfinished Symphony.** Schubert's Symphony no. 8, in B minor, so called because only the first two movements exist. They were written in 1822, six years before the composer's death. That Schubert intended to complete the work appears from the fact that he had sketched out the beginning of the Scherzo. Probably he was too busy with other compositions to finish this symphony. Schubert sent the two movements to his friend Hüttenbrenner, and not until the latter's death in 1868 was the work published, though its first performance took place in 1865.

**Ungaresca** [It.]. A 16th-century name for dance tunes of Hungarian derivation. Found in lute books (Wolf Heckel, 1556, '62; P. Phalèse, 1583) and collections of keyboard music (B. Schmid the elder, 1577; J. Paix, 1583; A. Nörmiger, c. 1590; G. Picchi, 1621), they usually consist of short repeated phrases supported by a 1-5-8 drone. See E. Haraszi, in *RdM* 1930, p. 176ff.

**Ungarische Tänze.** See *Hungarian Dances*.

**Ungebunden** [G.]. Unrestrained, free.

**Ungestüm** [G.]. Violent, raging.

**Ungrader Takt** [G.]. Uneven, i.e., triple meter.

**Union of Soviet Socialist Republics.** See Russia.

**Union pipes.** See under Uilleann pipes.

**Unis** [F.]. In orchestral music, unison (after *\*divisi*). In organ music, it means 8' pitch (stops) only; also, without octave couplets.

**Unison** (1) Simultaneous performance of the same notes or melody by various instruments or by the whole orchestra, either at exactly the same pitch or in a different octave, e.g., violin and cello in unison (*all'unisono*). (2) The pseudo-interval formed by a tone and its duplication [G. *Prime*], e.g., c-c, as distinguished from the second, c-d, etc.

**Unisono, all'** [It.]. See Unison; *A due*.

**United States.** The history of American music may be divided into two major periods, (1) music written before America achieved artistic and aesthetic parity with the rest of the West (c. 1607–c. 1929), and (2) the internationally important music of the recent past (1929 to present). Two factors determined the development of American music: immigration within a relatively short time to a largely empty continent and the predominance of the English settlers in the new land. The virtually unopposed tenure of the English thoroughly defined America's politics, religion, and language during the first two centuries, so that all succeeding ethnic groups had to choose between assimilation with or isolation from the Anglo-Saxon mainstream. Unequivocal evidence of English influence is found in traditional religious and folk or popular music, but there are indications of other influences, less easily traced to their origins. Although the precise process is difficult to determine, it would seem that various melodic inflections and rhythms of later ethnic groups were grafted onto the Anglo-Saxon stock. Thus, though the immigrants' native languages were abandoned for English, those elements of language, accent, and inflection that are essentially musical were integrated into the dominant Anglo-Saxon culture as music.

Also important was the importation of European art music and of professional European musicians. For example, the English version of Weber's *Der Freischütz* (Berlin, 1821), performed in London in 1824, was brought to New York in 1825. The same year, also in New York, Rossini's *Il Barbiere di Siviglia* (Rome, 1816) was produced in Italian by Manuel Garcia. Such performances by traveling companies could not help but influence musical taste. Just as significant was the influx of professional musicians, many of whom left Europe because of political upheavals ranging from the French Revolution to the present. They transmitted European standards of musical excellence and craftsmanship; without them American music would have remained provincial.

The development of American music took place in four stages: 1607–1790, the period of English influence; 1790–1865, the period of European professional influence; 1865–1929, the period of the second school of New England composers; 1929 to the present, the arrival of American music on the international scene.

I. 1607–1790. Presumably many of the early colonists at Jamestown (1607), Plymouth (1620),

and Massachusetts Bay (1629) brought with them their native English music, sacred and secular, but only in the case of the northern settlements is the record clear. The Pilgrims sang psalms to thirty-nine different tunes, or a Psalter originally compiled in Holland by Henry Ainsworth in 1612. Some of these melodies came from Calvin's French Psalter, and until 1692, after annexation by the larger Massachusetts Bay Colony, the Ainsworth Psalter was used exclusively in Plymouth [see Psalter].

Massachusetts Bay settlers around Boston first used the Sternhold and Hopkins Psalter of 1562, but in 1640 the Puritan ministers made their own translation of the psalms. Popularly called the *\*Bay Psalm Book*, it was the first book printed in British North America and was widely used in many succeeding editions. The chief feature of these Protestant psalters was their rhymed and metered English poetry, which made the text easy to memorize and permitted a few tunes, having the same rhythms as the poetry, to be used as melodies for many psalms. In 1698, the ninth edition of the *Bay Psalm Book*, issued with thirteen traditional tunes and basses that supplied music for all the psalms, became the first book of music printed in America.

Until 1700, however, the smallness of the population, the hard pioneer life, and the Puritan attitude of disapproval toward the lively arts inhibited more active musical development. Scholes [see Lit., *The Puritans*] claims that the Puritans were not hostile to music and that the tradition of intolerance toward music in New England is fallacious. However, although there are references in contemporary records to a few musical instruments and even indications of musical scholarship, the Puritan colonists seem to have viewed secular amusements and excessive pleasures with suspicion and distrust.

As skill in reading both text and tune waned in the late 17th century, the practice of "lining out" [see Lining] became popular. A deacon would sing one line of a psalm, which the congregation would then repeat by rote. Abuses of this manner of performance, variously interpreted as improvised folk singing by some [see Lit., G. Chase], but regarded by contemporaries as an "odd noise," led in the early 18th century to a reform movement that stressed singing "by note" or sight-singing instead of "lining out." Several instruction books for sight-singing appeared: first, John Tufts' *A Very Plain and Easy Introduction to the Singing of Psalm Tunes* (earliest existing ed., 1721; 5th ed., 1726), and then

Thomas Walter's *The Grounds and Rules of Musick Explained* (1721), to which at first there was strong opposition. Gradually, the new pedagogy gained acceptance. After c. 1750, a considerable number of \*tune books were published, among them an American edition of William Tans'ur's *The Royal Melody Compleat* (London, 1755; Boston, 1767), James Lyon's *Urania* (1761, containing six original pieces by Lyon), and Josiah Flagg's *Collection of the Best Psalm Tunes* (1764).

From these beginnings grew the singing schools, whereby generations were taught to read and sing music by itinerant singing masters. Nathaniel D. Gould (1781–1864), one of the last of his profession, claimed to have instructed 50,000 pupils between 1799 and 1843 in classes ranging from New Jersey to New Hampshire [see his *Church Music in America* (1853), p. 238]. A further indication of the popularity of singing was the large number of tune books published in the late 18th and 19th centuries. From before 1810, more than 370 tune books have survived. See Tune book.

It was in this milieu that the Yankee composers, a veritable first school of New England composers, flourished. Most famous of the tunesmiths was a Boston tanner, William Billings (1746–1800), who published six books of original vocal compositions, among which are examples of the conscious use of dissonance and a type of imitative counterpoint called *fuging* [see Fuge tune]. Another master of the fuge tune was Daniel Read (1757–1836), who, with such composers as Jacob French (b. 1754), Timothy Swan (1758–1842), Justin Morgan (1747–98), and Jeremiah Ingalls (1764–1828), formed a school bound together by such stylistic features as the use of parallel fifths, strange voice-leading, modal pentatonic melody, and cadences on chords lacking the third. Even more striking was the characteristic manner of performance: in four written parts, the soprano was doubled an octave lower, and the tenor, carrying the tune, was doubled an octave higher. The resulting six-part texture is perhaps closest to the medieval organum.

With an increasing vogue for European music c. 1800, the native tunes and the whole singing-school movement were driven from the urbanized East Coast to the more rural Midwest and South. There the Yankee hymn tunes, as "white spirituals," doubtless influenced the late Negro "spirituals."

Some immigrants chose isolation from the

dominant English culture and therefore had little influence on American music. Among them were the German-speaking, musically sophisticated members of the Ephrata (Pa.) Cloister under Johann Conrad Beissel (1690–1768). At Ephrata worshipers sang hymns in five, six, and seven parts, and it is said that Beissel composed more than a thousand of them. Benjamin Franklin printed an Ephrata hymn collection in 1730. Another group of isolated immigrants were the members of the United Brethren or Moravians, who settled Bethlehem (Pa.) in 1741 and later Salem (N.C.). Recent discoveries of large manuscript collections written by Moravian musicians in the then prevailing idiom of serious European music have revealed a musical tradition unequaled elsewhere in America. Among the more gifted Moravian composers were Johannes Herbst (1735–1812), John Antes (1740–1811), and Johann Friedrich Peter (1746–1813); see *Collegium musicum*.

Concerts in American colonial cities began to be held in the 18th century and apparently followed closely the advent of professional musicians who played for church, chamber, and theater. Organs were used in Episcopal services from an early date (King's Chapel, Boston, after 1713). According to newspaper advertisements, the first concert of record was held in Boston in 1731, followed by Charleston, S.C. (1732), New York (1736), and Philadelphia (1757). Such men as William Selby, who came to Boston (c. 1771) from London and was organist of King's Chapel, and William Tuckey, who came to New York from Bristol Cathedral in 1753 to become organist and choirmaster at Trinity Church, were active as composers and conductors of choral concerts. Tuckey directed the first American performance of excerpts from Handel's *Messiah* in 1770.

Such musical amateurs as Benjamin Franklin and Francis Hopkinson (1737–91), a signer of the Declaration of Independence and the first native-born American composer, stand out, Hopkinson for his songs in the simple and tuneful style of the contemporary London stage and Franklin for his "armonica," a species of mechanically spun musical glasses [see *Glass harmonica*].

II. 1790–1865. The American Revolution interrupted musical activities, but afterward they were resumed, this time more intensively. In the last decade of the 18th century, a large-scale immigration from Europe brought musi-

cians from England and, after the French Revolution, from France. Attracted by opportunities arising from the growing urban culture of the East Coast, singing actors, instrumentalists, and dancing masters immigrated, many of them equally at home in choirloft and theater. Unlike the Moravians, they had a lasting effect on American music. They molded musical taste, and through their publishing firms and music shops they satisfied the demand for the new music, instruments, and instruction books. As teachers, they trained almost two generations of amateurs.

The most important of the newly arrived professional musicians were Raynor Taylor (c. 1747–1825), an English organist and theatrical conductor; his one-time pupil, Alexander Reinagle (1756–1809), who came to New York from London in 1786 and later settled in Philadelphia, where he was conductor at the Chestnut Street Theater (1794); Benjamin Carr (1768–1831), also of London, who established America's first music store in Philadelphia (1793), where he was active as a composer, singer, and organist as well as a founder of The Musical Fund Society (1820); James Hewitt (1770–1827), leader of the Old American Company orchestra, who wrote the opera *Tammanny* (1794) and began a publishing firm (1798); J. C. Gottlieb Graupner (1767–1836), son of a German oboist, who came to America in 1795 after having played under Haydn in London and settled in Boston, where he kept a music shop and publishing business and was active in the Handel and Haydn Society (1815); and Victor Pelissier, horn player and composer of the opera *Edwin and Angelina* (New York, 1796).

The impact of the professionals began to be felt after the War of 1812. Once exposed to the sophisticated sounds of Handel, Haydn, Grétry, and J. W. A. Stamitz, church music committees, musical societies, and even some Yankee tune-smiths turned away from the less elegant hymn tunes. Conscious of their mission to uplift cultural standards, these groups began to publish and perform only the music they considered "scientifically" correct. Although their activities may have driven away poorly trained but imaginative native composers, this was, perhaps, an inevitable result of the quest for cultural parity with Europe. Whether or not motivated by intellectual and aesthetic needs or merely by fashion, the establishment of such organizations for the performance of European masterworks as the Handel and Haydn Society (Boston,

1815), The Musical Fund Society (Philadelphia, 1820), and the Philharmonic Society (New York, 1842)—all of which survive today—laid the foundation for serious American art music.

Lowell Mason (1792–1872), grandson of a Yankee singing-school teacher, was leader of this movement. In 1822 he published his first volume of sacred music, the *Boston Handel and Haydn Society Collection of Church Music*, which included melodies from Handel, Mozart, and Beethoven. Later, as president and conductor of the Society (1827), founder of the Boston Academy of Music (1832), head of music in the Boston public schools (1838–45), and organizer of music teachers' conventions, Mason spread the gospel of good (if not always inspired or original) music and himself composed more than 1,200 hymns. He also established a musical dynasty that included the founders (Lowell, Jr. and Henry) of the Mason and Hamlin Pianoforte Company; William Mason (1829–1908), a pianist and composer; and Daniel Gregory Mason (1873–1953), composer and teacher.

During the first few decades of the 19th century there emerged five highly original composers who seemed to dominate American music: Anthony Philip Heinrich (1781–1861), William Henry Fry (1813–64), George Frederick Bristow (1825–98), Louis (Moreau) Gottschalk (1829–69), and Stephen Foster (1826–64). Heinrich, born in Bohemia to wealth and position, lost his fortune in America, and then turned to his violin and to composition, working in the Kentucky wilderness. His uninhibited imagination is seen in his *The Sylviad; or Minstrelsy of Nature* [1825], published by J. C. G. Graupner and containing almost 400 pages of music for all media. As a token of affection for his adopted land, he often used national tunes like "Yankee Doodle." Some of his music has the simplicity of folksong, whereas other of his works are more grandiose in conception than Beethoven's (with whom he was compared) or Berlioz'. W. H. Fry composed the first American grand opera, *Leonora* (Philadelphia, 1845), in which the influence of Donizetti and Bellini is seen. A colleague of his in New York, George Frederick Bristow, son of an English immigrant musician, wrote the first American grand opera on an American subject, *Rip van Winkle* (New York, 1855). Louis (Moreau) Gottschalk went from his native New Orleans to Paris, where he captivated French audiences with his brilliant piano playing, especially of his own compositions. Many of his works were based on Latin American,

Negro, and American popular and folk music, thus anticipating some of the important stylistic trends of 20th-century American music. His contemporary, Stephen Foster, also capitalized on Negro and folk elements. Foster songs, such as "Old Folks at Home," "Oh, Susanna," and "Camptown Races" (parodied in Gottschalk's piano fantasia, "The Banjo"), have become American folksongs.

III. 1865–1929. Between the end of the Civil War and the Great Depression of the 1920's, a spectacular growth took place in American music, fostered by rapid industrialization and an almost fourfold increase in population. After 1848, the arrival of German musicians with technical skills and aesthetic concepts of music far superior to any known in America influenced the quality of the development. By the 1920's American music had achieved an independence nurtured by the less dogmatic musical ideologies of France, Italy, and Russia.

By 1870, no major city was without its contingent of resident German musicians, many of whom attained key positions in musical institutions. Carl Zerrahn (1826–1909) was conductor of Boston's Handel and Haydn Society; Carl Bergmann (1821–76) led the New York Philharmonic Society; Hermann Kotschmar (1829–1909) was the leading musician of Portland, Maine; and Theodore Thomas (1835–1905) did much for the performance of contemporary music, including compositions by Americans, as conductor of his own and later the Chicago Symphony Orchestra (1891). Their precise yet sensitive readings of romantic music had a tremendous impact on audiences accustomed to hymn tunes and oratorios, and they inspired the young generation of Americans who were to become a second school of American composers (Billings and the tunesmiths comprising the first).

Among the members of this second school were John Knowles Paine (1839–1906), Dudley Buck (1839–1909), Arthur Foote (1853–1937), George Whitefield Chadwick (1854–1931), Edward A. MacDowell (1861–1908), and Horatio W. Parker (1863–1919). All were united by ties of friendship, geographical proximity, and, with the exception of MacDowell, whose ancestry was Scottish, all were proud of their Yankee heritage. They were the first Americans trained in both the United States and Germany. Paine, Kotschmar's most brilliant pupil, studied in Berlin with Karl August Haupt (1810–91) and Friedrich Wilhelm Wieprecht (1802–72). Some

years later (1867) he conducted his Mass in D at the Berlin Singakademie. In 1875 he was appointed professor of music at Harvard, and for thirty years he occupied the first such chair established in an American university. Among his major works are two symphonies, incidental music to *Oedipus Tyrannus*, and an opera, *Azara*, published in 1901 (but never staged).

G. W. Chadwick's career followed the pattern set by Paine. He was educated by American musicians with German training and later studied at Leipzig with Salomon Jadassohn (1831–1902) and at Munich with Josef Rheinberger (1839–1901). Back home, Chadwick gained a reputation as a composer, teacher, organist, and conductor. In 1897 he became director of the New England Conservatory of Music. He wrote in every form, ranging from musical comedy (*Tabasco*, Boston, 1894) to a verismo opera dealing with Italian immigrants (*The Padrone*, 1915), and from symphonies to program music. His best-selling textbook on harmony is noteworthy for its pragmatism. Although reflecting European techniques, Chadwick's music is distinguished by originality derived from the pentatonic melodies, modal harmonies, and boisterous rhythms of his hymn-tune, folk heritage. In his later works, especially in the symphonic ballad *Tam O'Shanter* and in *The Padrone*, he broke away from German influence.

Edward A. MacDowell, the most celebrated composer of the period, was not, strictly speaking, a member of the second school (or New England group), since he worked chiefly in New York, where he was the first professor of music at Columbia University (1896). His early training was as a pianist under Maria Teresa Carreño (1853–1917) in New York, and later under Antoine-François Marmontel (1816–98) at the Paris Conservatory. The most influential of his teachers was Joseph Joachim Raff (1822–82), with whom he studied composition in Frankfurt. Less solid a craftsman than Paine and less versatile than Chadwick, MacDowell far surpassed his colleagues in melodic and harmonic originality, as can be seen in his two piano concertos and even more in his solo piano music, especially the *Sea Pieces* op. 55 (1898) and the Sonata no. 4 (Keltic), op. 59 (1901). The youngest member of the group, Horatio W. Parker, began as Chadwick's pupil. After studying also under Rheinberger, Parker returned to the United States. There he worked as an organist and composed the oratorio *Hora Novissima*

(1893), which made him nationally famous. In 1894 he was appointed professor of music at Yale, a position he retained until his death. His two operas, *Mona* (New York [Metropolitan], 1912) and *Fairyland* (Los Angeles, 1915) won prizes of \$10,000 each.

With the second New England school, American composition won a position of respect. As early as the 1889 *Exposition Universelle* concert of American works in Paris, critics noted a special American flavor and the technical finesse of what Julien Tiersot called the *jeune école américaine*. As teachers of composition, heads of academic departments and institutions, and conductors, they gradually supplanted German musicians. Many of their pupils went to France for further instruction, and there was a noticeable tendency to adopt French, Russian, and Italian ideals.

Another significant force in the American search for a musical identity was Antonin Dvořák, who taught at the National Conservatory of Music in New York (1892–95). Though he was not the first composer to see artistic merit in Negro melody (Chadwick had used a "plantation song" in his Second Symphony in B<sup>b</sup> major), the success of Dvořák's symphony "From the New World" (1893), in which similar material was employed, served as an example to younger American composers, some of whom studied with him, among them Rubin Goldmark (1872–1936) and Harvey Worthington Loomis (1865–1930).

Generally speaking, the second school and its pupils dominated American composition until the Depression. Ethnically Anglo-American and by temperament conservative, such composers as Frederick S. Converse (1871–1940), John Alden Carpenter (1876–1951), Daniel Gregory Mason (1873–1953), Henry Hadley (1871–1937), Edward Burlingame Hill (1872–1960), Arthur Shepherd (1880–1958), Charles Wakefield Cadman (1881–1946), and Mrs. H. H. A. Beach (1867–1944), along with Paine, Chadwick, and MacDowell, continued a style of composition that amalgamated sturdy hymnic melody with a variety of late 19th-century harmonic idioms and orchestral techniques. Though many of them lived through the epochal innovations of Schoenberg and Stravinsky, they tended to reject the new ideas of sonority and rhythm and strove for what they felt was beautiful rather than attempting 20th-century musical idioms.

But there were some exceptions. Chief among them were Charles Martin Loeffler (1861–1935),

an Alsatian-born violinist-composer whose *A Pagan Poem*, op. 14, is one of the most striking American works, and Charles E. Ives (1874–1954), Horatio Parker's most famous pupil. Not only did Ives anticipate such modern devices as polytonality, dissonant counterpoint, polyrhythm, and serial construction, but he evolved a musical philosophy, which he called "musical relativism," based on such variable factors as tempo and feeling. Other unconventional features of his music were the use of \*tone clusters and the omission of time signatures and bar lines. Ives' importance does not rest entirely on his imaginative approach; rather, it lies in the blending of these devices with the *melos* of the hymn tune, popular song, and dance that make his music so universal and at the same time so American. Perhaps the most interesting aspect of Ives' career is the fact that he did not study in Europe or become a professional musician. Instead, he organized an insurance agency whose financial success, Ives felt, was aided by his composition, which in turn was helped by his business activities. After decades of relative obscurity, Ives has become the best-known composer of the older American school, largely through his Second Symphony (completed 1902; first perf. 1951), a symphonic piece, *Three Places in New England* (composed 1903–1914), his *A Book of 114 Songs* (pub. 1922), and the second piano sonata, or *Concord Sonata* (completed 1915).

IV. 1930—. With this generation of composers American music arrived on the world scene. Performances of American music, which had been sporadic at best, now became quite common in Europe and, especially after World War II, trends in American composition began to influence musicians the world over.

World War I helped upset the equilibrium that balanced the leading Yankee composers, teachers, and church musicians against the largely European personnel of the opera houses and symphony orchestras. Also, first- and second-generation Americans of non-Yankee stock began to become known as composers with modernist tendencies, much to the dismay of the older conservatives. In contrast to their predecessors, after early study in the United States they went to Paris, where many were guided by Nadia Boulanger (b. 1887). French pedagogy tended to cultivate taste rather than instill dogma, and so there developed a third school of American composers, united by neither ethnic ties nor geography but by a desire to

explore the advancing horizons of music while creating an uninhibited American musical idiom. This they accomplished by integrating popular and folk idioms and modern stylistic elements.

The music of Aaron Copland (b. 1900) reveals this duality. In *Music for the Theatre* (1925), *Concerto for Piano and Orchestra* (composed 1926), *Billy the Kid* (1938), and *Appalachian Spring* (1944), he consciously created an "American" sound; other of his works, such as the *Piano Variations* (composed 1930), *Sextet* (composed 1937) and *Piano Fantasy* (1957), are essays in a contemporary learned style in which nationalist features are notably absent. Similarly, the music of Virgil Thomson (b. 1896) shows a polarity between an American and a cosmopolitan style. He established a definite American style in his two operas, *Four Saints in Three Acts* (1934) and *The Mother of Us All* (1947), through scrupulous attention to the natural accent and inflection of American speech and the use of characteristic melodic lines, but in the *Missa Pro Defunctis* (1960) he used a more universal manner that explores the limits of polytonality and contrapuntal parallelism. Contemporaries such as Roy Harris (b. 1898), Walter Piston (b. 1894), Roger Sessions (b. 1896), Douglas Moore (b. 1893), Howard Hanson (b. 1896), and Randall Thompson (b. 1899) all exhibit, with due consideration for their individuality, similar tendencies. Piston and Harris became basically symphonic composers, while Moore found success in operas and Thompson carried on a tradition of choral composition with roots going back to the early tunesmiths.

The succeeding generation of 20th-century American composers, many of them pupils or followers of the above-named, pursued both musical Americanism and cosmopolitanism. It includes Samuel Barber (b. 1910), Leonard Bernstein (b. 1918), David Diamond (b. 1915), William Schuman (b. 1910), Paul Bowles (b. 1910), Morton Gould (b. 1913), Paul Creston (b. 1906), Irving Fine (1914–62), Vincent Persichetti (b. 1915), Norman Dello Joio (b. 1913), Elliott Carter (b. 1908), Lukas Foss (b. 1922), Alan Hovhaness (b. 1911), George Rochberg (b. 1918), Vittorio Giannini (b. 1903), Leon Kirchner (b. 1919), Ross Lee Finney (b. 1906), and Gunther Schuller (b. 1925).

Experimentation has been a hallmark of American music from Billings to Ives, and it is not surprising that American music today should emphasize novelty, imagination, and experimen-

tation with new materials and media for musical construction. A leader in the quest for new sonorities was Edgard Varèse (1885–1965), who came to the United States from Paris in 1915. Chief among his works are *Ionisation* (1931), where sounds of indefinite pitch are organized musically, and *Poème Électronique* (1958), composed for 400 spatially arranged loudspeakers. Independent composers in this genre are Carl Ruggles (b. 1876), John J. Becker (1886–1961), Henry Cowell (1897–1965), George Antheil (1900–1959), John Cage (b. 1912), Henry Brant (b. 1913), and Vladimir Ussachevsky (b. 1911), who have constructed pieces out of various materials, from tone clusters and random elements to tape-recorded and synthesized sounds. Milton Babbitt (b. 1916), a most articulate theoretician, has stressed the elements of control and serialization in his compositions, which successfully combine vocal and synthesized sounds. [Also see Electronic music; Serial music; Aleatory music.]

Despite the recognized stature of contemporary American composition, it would be misleading to ignore the significance of all kinds of popular music in the United States. Actually, some of the most unique and influential American music has come from the dance hall, theater, and motion picture (\*film music). Ever since the appearance of Negro-style minstrel music in the early 19th century, popular entertainment music seems to have been the most typical American musical manifestation to the world at large. Notable examples have been Foster's song-dance idiom, which joined Negro traits to the sentimental theater song, the various adaptations of Irish and Scotch vaudeville songs and dances, and the coalescence of these with other folk material from work songs, blues, and marches into \*ragtime and \*jazz in the bordellos and saloons of the South and West. [Also see Negro music.] Jazz is more a matter of performance than a specific form or technique, and so its recordings rather than scores are historically important. Aside from being an important idiom in itself, jazz has also influenced art music. See Jazz.

A new popular melodic idiom, developed after 1900 in numerous Yiddish-language theaters of New York City, signaled the contribution of one of the last immigrant groups to arrive in America before the gates were closed in 1924. Its features resulted from the mutual assimilation of Jewish, American, and Negro musical elements and later had an impact on the style

of Broadway musical comedies and plays. The apex of this style is reached in George Gershwin's (1898–1937) opera *Porgy and Bess* (1935). Besides Gershwin, Irving Berlin (b. 1888), Jerome Kern (1885–1945), Vincent Youmans (1898–1946), Cole Porter (1893–1964), Richard Rodgers (b. 1902), and Marc Blitzstein (1905–64) all have made important contributions to an internationally popular music that is recognizably American. [Also see Operetta.]

**Unit organ.** A type of organ in which one rank of pipes is arranged to serve for several stops through the medium of an electric coupling device. See *Organ*.

**Unmerklich** [G.]. Imperceptible.

**Un peu** [F.], **un poco** [It.]. See *Peu*; *Poco*.

**Unruhig** [G.]. Restless.

**Unter-** [G.]. Below, under. *Unterdominante*, subdominant; *Untermediante*, submediant; *unter setzen*, to put under (the thumb, in piano playing); *Unterstimme*, lower or lowest part; *Untertaste*, white key; *Unterwerk*, \*choir organ.

**Upbeat** [G. *Auftakt*]. One or several initial notes of a melody that occur before the first bar line. The upbeat plays a central part in the theory of H. Riemann and others that every melody or phrase begins with an upbeat (real or imaginary). This is a gross exaggeration of the fact that the beginning or end of a phrase frequently does not coincide with the bar line (particularly in Bach's music). See *Phrasing and articulation* [G. *Auftaktigkeit*].

Before 1600 the upbeat was rarely used. Various scholars have suggested that in 13th-century music the second mode, normally a downbeat iambic pattern [see *Modes, rhythmic*], could also have meant an upbeat trochaic pattern—in other words, an upbeat variant of the first mode [see H. Husmann, in *AMW* xi, 14, 15, 299]. In 14th- and 15th-century music only about one composition in a hundred begins with an upbeat. Examples are Machaut's "Comment qu'a moy," B. Cordier's "Belle Bonne," and Binchois' "De plus en plus" [see *HAM*, nos. 46a, 48b, 69]. It is probably no coincidence that all these are from the secular repertory. In contrast to their scarcity in vocal music, upbeat formations in the form of a quick turn (f–e–d–e–f) are a characteristic trait of early organ music, in the Codex Faenza (c. 1400) as well as in 15th-century German sources (Ileborgh, C. Paumann, Buxheim Organ Book). Several of the 17th-century dance types begin with an upbeat, and the \*gavotte with a doubled upbeat of two quarter notes.

**Urlar.** See under *Pibroch*.

**Urlinie, Ursatz** [G.]. See under *Schenker system*.

**Uruguay.** Colonial church music in Uruguay got a later start than in Mexico, Peru, Venezuela, or Brazil, not becoming clearly established until the end of the 18th century. At that time the first three- and four-part Masses with organ accompaniment written in Uruguay began to replace the older, semipopular religious hymns used in churches from the time of the Spanish Conquest. The earliest example preserved is a *Misa para día de Difuntos*, written in 1802 by Father Manuel Ubeda (1760–1823). However, the names of a number of Brazilian and Argentinian church composers were well known before this time, and their music was used extensively in Uruguayan churches. In addition to such compositions, the archives of the Church of San Francisco in Montevideo contain the manuscript of a *Misa a duo* by Father Juan José de Sostoa (c. 1750–1813).

From c. 1830 to the early 20th century, music in Uruguay was strongly influenced by Italian opera. A few native composers, together with a number of Spaniards, Brazilians, and Argentinians who settled for short periods in Montevideo, were responsible for maintaining Uruguay's distinctive musical life. To this period belong Fernando Quijano (1805–71), a talented actor, pianist, singer, choreographer, and amateur composer; Luis Preti (1826–1902), an outstanding composer and conductor, who as founder of the *Sociedad Filarmónica* in 1868 was the first to conduct Beethoven's symphonies in Uruguay; Oscar Pfeiffer (1824–1906), a composer and pianist of international repute; and Francisco José Debali (1791–1859), who composed more than 143 works, including the national anthem. Late 19th-century composers such as Luis Sambucetti (1860–1926) and León Ribeiro (1854–1931) continued to write music in the Italian tradition.

The founders of the modern school of composition in Uruguay are Carlos Pedrell (1878–1941), Alfonso Broqua (1876–1946), César Cortinas (1892–1918), a composer of much promise who produced a concerto for piano and several other compositions, and, most important, Eduardo Fabini (1883–1950). Fabini, an impressionist and a strong proponent of \*nationalist music, won fame in Latin America through his *Campo* and *La Isla de los Ceibos*. Other 20th-century Uruguayan composers are Vicente Ascone (b. 1897), Luis Cluzeau Mortet (1893–1957), Carlos Estrada (b. 1909), and Guido Santórsola (b. 1904). The leading figure

of the next generation is Héctor Alberto Tosar Errecart (b. 1923), composer of a *Te Deum* for chorus, baritone, and orchestra, *Stray Birds* for voice and chamber ensemble, and many instrumental compositions. José Serebrier (b. 1938), in addition to composing, became an outstanding conductor, while Sergio Cervetti (b. 1940) and Leon Biriotti (b. 1942) have produced works of international significance.

Musical life in Uruguay owes a great deal to the musicologist Francisco Curt Lange (b. 1903), founder of the *Instituto Interamericano de Musicología* of Montevideo (1940) and editor of the *Boletín Latino-Americano de Música* (1935–47).

Uruguayan folk music has virtually the same characteristics as Argentine folk music. The \*tango, \*triste, \*estilo, and many other forms are as popular in Uruguay as in Argentina, although they are sometimes known by different names. Perhaps the only form that can be considered wholly Uruguayan is the \*pericón. See L. Ayestarán, *La Música en el Uruguay* (1953). Also see under Latin America. J.O-S.

**U.S.S.R.** See Russia.

**Ut.** The first of the Guidonian syllables of solmization; see Hexachord II. In French nomenclature, name for C [see Pitch names]. *Ut-re-mi-fa-sol-la* has been used as a title for compositions based on the tones of the hexachord (by Byrd, J. Bull, Sweelinck, *et al.*).

**Utility music.** See *Gebrauchsmusik*.

**Ut supra** [L.]. As above, as before.

## V

**V.** Abbr. for (1) *vide*, i.e., "see"; (2) violin (also V°); VV, violins; (3) *voci*, e.g., 3 v, for three voices; (4) in liturgical books, V means \*verse or versicle.

**Va.** Abbr. for viola.

**Vagans** [L.]. In 15th- and 16th-century Masses and motets, name for the fifth part (also called *quinta vox*). The most probable reason for the name is that this part had no specific range but

could be a second *superius*, tenor, or bass, especially in a partbook containing a number of compositions.

**Vaghezza, con** [It.]. With grace, with charm.

**Valkyrie, The.** See *Ring des Nibelungen, Der*.

**Valor** [L.]. In mensural notation, the time value of a note, particularly as represented by its equivalent in smaller values, e.g., of a semibreve

by two or three minims. For *integer valor*, see Proportions.

**Valse** [F.], **vals** [Sp.]. \*Waltz. *Valse à deux temps*, a waltz whose melody proceeds in units of two beats instead of three, in cross-rhythm with the accompaniment. The best-known example is in Gounod's *Faust*. Others are in the works of Tchaikovsky (*Eugen Onegin*; piano suite, *The Seasons*).

**Valse, La.** "Poème choréographique" (dance poem) for orchestra by Ravel, composed 1920, imitating and cleverly parodying the Viennese waltz of Johann Strauss, Jr. It is often used for ballet performances.

**Valses nobles et sentimentales.** A set of waltzes for piano by Ravel, composed in 1911 and orchestrated by the composer to serve as music for the ballet *Adélaïde, ou le Langage des Fleurs*. The adjectives "noble" and "sentimental" (already used by Schubert) are used to distinguish between the "elegant" and the "lyrical" types of waltz.

**Valse Triste.** A popular waltz for orchestra by Sibelius, originally composed (1903) as part of the incidental music to the play *Kuolema*.

**Valve** [F. *piston*; G. *Ventil*; It. *pistone*; Sp. *pistón*]. A mechanism invented c. 1815 by Blümel (Silesia) and, simultaneously, by H. Stölzel (Berlin), that makes available all the tones of the chromatic scale on brass instruments. The device alters an instrument's pitch by increasing or decreasing the tube length through which the wind must pass. Descending valves bring extra lengths of tube (loops) into play, lowering the pitch; ascending valves eliminate a portion of the main tubing, raising the pitch. Horns and trumpets usually have three valves, which lower the pitch a whole tone, semitone, and minor third respectively. By using two or all three valves together, the pitch can be lowered by six semitones, resulting in a complete chromatic scale [see Wind instruments IV (c)]. The simultaneous use of two valves produces tones that are slightly sharpened, since an additional tubing calculated to lower the normal pipe by a semitone is a little too short to produce the same effect on a pipe already lengthened by another tubing. The effect is even more extreme when three valves are combined. This drawback is corrected by "compensation valves" (numerous patents; see the article in *GD*; *GDB*) and avoided in Adolphe Sax's "ascending valves," which shorten the original

pipe. Neither kind, however, has gained acceptance.

Two types of valve are in use, piston valves and rotary (or cylinder) valves. In the former a piston works up and down in a casing. This type is used in France, Belgium, Holland, England, and the United States. The rotary valve, preferred for the French horn in the United States and on the Continent though not in England, is a four-way stopcock turning in a cylindrical case and controlled by a metal spring. The four ways form part of the main pipe, and the other two, on being rotated 90°, admit it to the bypath. See Horn; Trumpet; Tuba; Wind instruments IV (c).

**Valve instruments.** Brass instruments provided with a \*valve mechanism. Today all brass instruments (trumpets, horns, tubas, etc.) except the trombone are built with valves. The terms "valve horn," "valve trumpet," etc., distinguish the modern instruments from the earlier natural or keyed instruments.

**Vamp.** An extemporized accompaniment consisting of simple chords. *Vamping tutor*, a book of instruction in this type of accompaniment.

**Vamphorn.** A megaphone, 2 to 8 feet long, that was used in English churches during the 18th and 19th centuries for making announcements.

**Vanessa.** Opera in four acts by S. Barber (libretto by G. C. Menotti), produced in New York, 1958.

**Variante** [G.]. In H. Riemann's system of harmonic analysis, term for parallel key (substitution of minor for major, or vice versa).

**Variation, technique of.** In the most general sense, a restatement that retains some features of the original while others are discarded, altered, or replaced. One of the most fundamental techniques of composition, it takes such forms as ornamentation, transposition, inversion, retrograde motion, augmentation, rhythmic modification, \*transformation, etc. Even the twelve-tone technique is a variation technique [see Serial music]. Some writers go so far as to maintain that all music is a variation of certain basic structures of pitch (scales) and duration (rhythm, meter).

Usually, however, the term refers to a specific, fairly simple practice: the immediate restatement, in varied form, of a musical theme (tune). Examples are the varied repeat, the *double*, and the musical form known as "theme with variations." The varied repeat is often used in the

late 16th-century English \*pavane, each of whose three sections is repeated in a varied form. The \*double is a simple variation on a dance of a suite. In the theme with variations the musical idea is presented in a number of successive modifications; see Variations.

**Variation canzona.** See Canzona (5) I.

**Variations.** A musical form (variation form) resulting from the consistent application of \*variation techniques so that a musical theme is followed by a varying number of modified restatements, each being a "variation." Such compositions appear as independent works (Bach, Goldberg Variations, *Clavier-Übung*, part iv; Beethoven, Diabelli Variations op. 120) or as a movement of a sonata or symphony, usually the slow movement (Beethoven, Appassionata Sonata op. 57; Ninth Symphony).

I. *Theme.* The theme is usually a simple tune in binary form, from 16 to 32 measures long and frequently borrowed from another composer (e.g., Beethoven's variations on a theme by Diabelli; Brahms' variations on a theme by Handel op. 24, for piano solo with fugue). There is, however, a special kind of variations where the theme is not a complete tune but only a four- or eight-measure scheme of harmonies or a bass line of the same length. Of this kind are the examples known as \**chaconne*, *passacaglia*, \**ground*, and *basso ostinato*. The difference between these two kinds of variations might be described as "sectional variations" versus "continuous variations." In sectional variations the theme is a full-grown tune with a definite ending and hence each variation has a definite end (except in cases where the composer prescribes *segue subito*, "follow immediately," with the next variation). In continuous variations the theme is a short succession of harmonies to be repeated over and over without interruption. In sectional variations the theme always has a distinct melody, whereas in continuous variations it consists only of a scheme of harmonies, frequently (but not necessarily) represented by a reiterated bass. To distinguish between the two as "variations of a melody" and "variations of a bass" is not too helpful, since numerous chaconnes and passacaglias lack a clearly defined bass line [see Chaconne and passacaglia]. A borderline case is the \**strophic bass* of the 17th century, whose theme is a bass so long and so complete that a sectional structure results. The discussion below refers chiefly to the normal (sectional) "theme with variations."

II. *The fixed elements.* Those features that a variation on a theme has in common with the theme are the so-called "fixed elements." Some writers distinguish between variations in which the original melody is preserved, or "melodic" variations, and those in which the original harmonies are preserved, or "structural" or "harmonic" variations [see the article in *GD (GDB)*, which, however, is not always consistent in the use of these terms]. This distinction is unsatisfactory, however. Stability of the harmonic scheme (at least in its main outlines) is a prerequisite for practically all variations, except the entirely free variations of modern composers (e.g., Stravinsky, *Sonata for Two Pianos*, 2nd movt. [1943-44]). Stability of the melody is an additional restriction that was traditionally observed in the early period of variation (16th, 17th cent.) but is the exception rather than the rule with composers such as Mozart, Beethoven, Schubert, and Brahms.

There are four basic kinds of variation: *A*, a variation that preserves both melody (though perhaps with new ornamentation) and harmony of the theme; *B*, one that preserves the essential harmony of the theme; *C*, one in which the harmonies deviate but the over-all structure, such as the number of measures, the structure of sections and phrases, and the cadential endings, is preserved; *D*, the entirely free variations of modern composers in which even the structural outlines of the theme are no longer recognizable.

Historically, category *A* prevails throughout the 16th and 17th centuries, category *B* throughout the classical period, category *C* is common among romantic composers, and *D* is characteristic of the most recent style (beginning with D'Indy, Reger, and R. Strauss). All continuous variations [see I above] belong to category *B* (not *A*), since in these the thematic substance does not include a melody, so that of necessity each variation will be melodically independent. This type of variation prevailed mainly during the baroque era, when, it appears, categories *A* and *B* existed side by side, *A* for sectional variations (such as Scheidt's *Passamezzo* with twelve variations) and *B* for continuous variations (passacaglias, chaconnes, grounds).

There is still a fifth kind of variation, in which the melody is retained but the harmonies are altered. In the classical period this type was used occasionally as a "trick," as, for example, variation no. 6 of Beethoven's *Eroica Variations* op. 35, in which the original melody is harmonized in C minor instead of E-flat major.

However, it was more important somewhat earlier, in the contrapuntal variations of the baroque, in which the melody is treated as a *cantus firmus* [see e.g., variation no. 4 of Samuel Scheidt's "Wehe, Windgen, wehe"; *DdT* 1; *HAM*, no. 196].

III. *The variable elements.* Although it is difficult to generalize, there are some standard ways in which themes are varied. In category *A* [see II above], the most common procedure is to ornament the melody (*ornamenting variation*; see Ex. 1). Another method, frequently used in the 16th and 17th centuries, is to present the theme as part—often an inner part—of a contrapuntal-imitative web (*contrapuntal variation*; see Ex. 2). In category *B* are practically all the variations of the classical period except the ornamenting variations. Among these are: (a) *melodic variations*, in which a new melody is invented to the original scheme of harmonies

[Ex. 3]; perhaps the earliest instances of full-scale melodic variations are Bach's Goldberg Variations; another striking example is the first variation in the final movement of Beethoven's Piano Sonata op. 109; (b) the *figural variation*, in which a characteristic figure is employed throughout [Ex. 4]; (c) the *canonic variation* [Ex. 5]; (d) the *harmonic variation* [Ex. 6]; (e) the *tempo variation*, involving a change of tempo; (f) the *modal variation*, involving a change from major to minor or vice versa; (g) the *character variation*, which bestows on the theme a special character, such as that of a dance, a military march, etc. The last three methods are summarily illustrated in Ex. 7. Naturally, most of these procedures may occur in any of the four categories of II; however, the ornamenting variation is restricted to category *A*, the melodic variation cannot occur in *A*, and the harmonic variation belongs to category *C*.

IV. *History.* (1) To 1600. In some books on music history, a late 14th-century composition entitled *Di molen van Pariis* (translated as "The Windmills of Paris") is given as the earliest extant example of a theme with variations [see, e.g., R. Haas, *Aufführungspraxis der Musik* (1931), p. 103f]. Actually, it is a rondeau, "Amis tous dous," of which there are two versions with differently ornamented upper parts [see F. Kam-

merer, *Die Musikstücke des Prager Codex XI E 9* (1931) i, 145ff; also *CP* 1924, p. 101ff]. The view that this is a "theme with two variations" is farfetched. The same applies to the different versions of "Frowe all myn hoffen" in the Illeborgh Organ Tablature of 1448, and to those of Binchois' "Je loue amours" in the Buxheim Organ Book of c. 1460–70.

The documented history of variations as a musical form begins in the early 16th century. Judging from the surviving examples, Spain and England have about an equal claim to precedence, England in continuous variations (H. Aston's "Hornepype," in *ApMZ* ii, 5; "My Lady Careys Dompe," both c. 1525; see Hornpipe; Dump; Ostinato), and Spain in both continuous variations and sectional variations based on a fully developed theme (vihuela variations by Narvaez, 1538; see *HAM*, no. 122; *ApMZ* ii, 14). The advanced style of the "Hornepype" as well as of Narvaez' variations indicates an extensive earlier development, all traces of which are lost. By 1550 the evolution of the Spanish variations, called *\*diferencias* [see also *Glosa*], had culminated in the works of Antonio de Cabezón (1510–66; see *HAM*, no. 134). Cabezón's variations are mostly contrapuntal, a type that continued to prevail with the later masters (Sweelinck, Scheidt, Frescobaldi). Toward the end of the 16th century the English virginalists (Byrd, Bull, J. Munday, Gibbons) established the figural variation, frequently in brilliant virtuoso style (rapid scales, broken-chord figures, figures in parallel thirds, etc.; see *HAM*, no. 177). While with Byrd the technical and musical qualities are well balanced, Bull's variations are conspicuous for their exploitation of technique, frequently at the expense of artistic quality. Another great master of the variation was Sweelinck, who used the technical achievements of the virginalists but with superior ingenuity. His variations on "Mein junges Leben hat ein End" are among the masterpieces in this form. Measured against this standard, the variation technique of Samuel Scheidt is rather elementary, but his variations on "Wehe, Windgen, wehe" [*DdT* 1; *HAM*, no. 196] charm through their very simplicity.

(2) 1600–1750. In Italy the traceable history of variations begins with the Neapolitan composers Valente, Trabaci, and A. Mayone, who, probably influenced by Cabezón, wrote *\*partitas* to popular bass patterns such as the *\*romanesca*, *\*ruggiero*, *zefiro*, etc. [see also *Folia*]. Their tradition was continued, more artistically, in the numerous *partitas* of Frescobaldi [see *HAM*,

no. 192; also no. 199 by Marini]. Froberger's (1616–67) *partitas* "Auff die Meyerin" are one of the first examples of character variations, in the style of a courante or saraband. They represent a trend, quite common in the baroque era, toward merging the form of variations with that of the *\*suite*. Thus Wolfgang Ebner's "Trentasei Variazioni sopra un' Aria del l' Imperatore Ferdinando III" (c. 1660; *TaAM* vii) consist of three groups of twelve variations each, the first dozen in the style of an allemande and the second and third in the styles of the courante and saraband (regarding the absence of the gigue, see under Suite III). A remarkable specimen is Alessandro Poglietti's "Aria allemagna" (1677; *DTO* 27, pp. 13ff), which consists mainly of programmatic character variations such as "Lyra," "Böhmisch Dudlsackh," "Holländisch: Flagolett," "Bayrische Schalmay," "Alter Weiber Conduct," "Gaugler Seiltantz," "Französische Baiselemens" (French kiss-the-hand). Although not very refined, these pieces are amusing portrayals or caricatures. They were dedicated to the Austrian Empress Maddalena Theresa in 1677. Of particular importance is the German 17th-century tradition of variations based on a chorale [see Chorale variations]. For other types, see Chaconne and passacaglia; Ground; Strophic bass; Noel. At the end of the baroque period came a fitting climax, Bach's *\*Goldberg Variations*, in which category *B* [see II above] prevails for the first time.

(3) 1750–1900. Compared to the elaborate variation technique of the baroque, that of Mozart's piano variations is fairly simple and standardized. The first variations usually are ornamented with triplets or sixteenth notes, followed by some with special pianistic or contrapuntal devices. After these there is usually a slow variation, sometimes in a minor key, and then a final fast variation in a different meter (duple instead of triple or vice versa). Haydn's greatest contributions to the repertory are in his symphonies and, particularly, in his late quartets, notably the Emperor Quartet (op. 76, no. 3, 2nd movt.) with its variations on "Gott erhalte Franz den Kaiser." With Beethoven the variation form reached its ultimate peak. For the more conventional methods, particularly ornamentation, he substituted a wealth of individual treatments and ideas. He also was the first to organize the succession of variations into contrasting groups, a procedure particularly evident in his "continuous" variations in C minor op. 32 (sometimes described as a cha-

conne). In his *Eroica Variations* op. 35 the theme is preceded by a short group of "negative variations," based on the bass motif only. His *Diabelli Variations* op. 120 (1823) are incomparably ingenious, and in the variations of his late quartets and piano sonatas superb technique is combined with the finest artistic quality (e.g., the "ornamenting" variations of piano sonatas op. 109 and 111).

Close behind Beethoven is Franz Schubert in such great though little-known works as his variations for four hands in B minor op. 84, no. 1, and in A-flat major op. 35. Schumann's greatest contributions are the *Études symphoniques* op. 13, the first instance of free variations, since in some of them the theme serves as no more than a springboard.

Franz Liszt made very effective use of a brilliant virtuoso-like variation technique in many of his rhapsodies, as well as in his variations on a theme by Paganini (*Paganini Études*, no. 6), which was also used by Brahms for a series of extremely difficult and interesting variations. However, Brahms' fame as a master of this form rests chiefly on his *Variations on a Theme by Handel* (op. 24) for piano and his *orchestral Variations on a Theme by Haydn* (op. 56; also for two pianos). His variations belong mostly to category C, owing to the freedom with which he treats the harmonies while still retaining the structural outlines of the theme. Following the precedent of Beethoven's *Eroica* and *Diabelli Variations*, he climaxes the series of variations with an elaborate fugue (in the *Haydn Variations* a *passacaglia*).

(4) 1900—. Shortly before 1900 two important examples of "free variation" appeared, Vincent d'Indy's *Istar Variations* [1897] and Richard Strauss' *Don Quixote* [1898]. The former are "variations in reverse" in so far as the "theme" (properly, two thematic motifs) appears at the end, a procedure of "disrobing" that is implied by the story of Istar, the Babylonian goddess of love. Compared to these two works, Elgar's *Enigma Variations* are considerably more conventional, approximately along the lines of Schumann's *Études symphoniques*. The last composer to work in this fashion was Max Reger, who wrote numerous variations for piano, organ, and orchestra, among which the *Variations and Fugue on a Theme by Bach* (op. 81, 1904) for piano and the *orchestral Variations and Fugue on a Theme by Mozart* (op. 132, 1914) are outstanding. His *Variations and Fugue on a Theme by Telemann* (op. 134,

1914) for piano attempts, not very successfully, to revert to the tradition of Mozart. Later composers have shown more interest in the baroque type of the *chaconne* (Busoni, Krenek) than in the traditional 19th-century variation.

Gress, *Die Entwicklung der Klaviervariation von Andrea Gabrieli bis zu Johann Sebastian Bach* (1929); L. Neudenberger, *Die Variationstechnik der Virginalisten im Fitzwilliam Virginal Book* (1937); E. Reichert, *Die Variationsarbeit bei Haydn* (1926); A. Albrecht, *Die Klaviervariationen im 20. Jahrhundert* (1961); I. Horsley, "The Variation before 1580" (diss. Harvard Univ., 1954); W. Schwartz, *Robert Schumann und die Variation* (1932); P. Mies, in *AMF* ii (Mozart); V. Luthlen, in *StM* xiv (Brahms); K. von Fischer, in *RBM* vi (K. P. E. Bach); I. Horsley, in *JAMS* xii (16th cent.).

**Variations on a Theme by Diabelli (Handel, etc.).** See under *Diabelli Variations*, *Handel Variations*, etc.

**Variations symphoniques** [F., Symphonic Variations]. Work for piano and orchestra by Franck (composed 1885) in which the expected theme-and-variations structure is expanded by a developmental treatment more characteristic of a symphony with two themes.

**Varsovienne.** A Polish dance, named for the city of Warsaw, in slow mazurka rhythm, usually with an accented dotted note on the first beat of every second and fourth measure. It was popular in ballrooms from about 1850 to 1870.

**Vater unser** [G., Our Father]. German version of the Lord's Prayer [L. *Pater noster*]. It is sung as a hymn [G. *Chorale*] to a 16th-century melody (by Luther?), which has been used as the basis for compositions by Hans Leo Hassler ("Vater unser," in ten sections, each based on a phrase of the chorale; in *Psalmen und Christliche Gesäng*, 1607; new ed. by R. von Saalfeld, 1957), Johann Ulrich Steigleder (*Tabulatur Book Darinnen dass Vatter unser . . . vierzig mal varit würdt*, 1627), Bach (organ chorales), and others. See *HAM*, nos. 190a-d.

**Vatican Edition** ("Editio Vaticana"). See under Liturgical books II.

**Vaudeville** [F.]. In the late 16th century, a song with a short lyrical or amorous text, composed in a simple chordal style with the melody in the highest voice. The form *vaul de ville* occurs as

early as 1507 in a morality play by Nicole de La Chesnaye. Some 16th-century publications include F. Layolle's *Chansons et vaudevilles à 4* (1561; no copies remain), Le Roy's *Premier Livre de chansons en forme de vau de ville* (1573), and Jehan Chardavoine's *Le Recueil des... chansons en forme de voix de ville* (1576). The preface to A. Le Roy and R. Ballard's *Livre d'airs de cour* (1571) states that the songs formerly called *voix de ville* (= vaudeville?) were now called *airs de cour*. Despite this alleged transformation, the *vaudeville* continued an independent existence as a satirical poem sung to a popular melody (usually pre-existent). The same melody or *timbre* commonly served for many different texts. The *vaudeville* was the principal type of song in the early *opéra comique* (1715–c. 1735). Large collections of *vaudevilles* are in A. R. Le Sage's *Le Théâtre de la foire* (10 vols., 1721–37), J. B. C. Ballard's *La Clef des chansonniers* (2 vols., 1717), and other contemporary publications, as well as in the numerous editions of *La Clé du caveau* by P. Capelle (2 vols., 1807). In the 19th century, *vaudeville* was the name given to short comedies interspersed with popular songs. More recently, in the U.S., the name has been used for miscellaneous popular entertainments, including songs, which are presented in cafés or variety theaters.

Coirault, *Formation de nos chansons folkloriques*, 4 vols. (1953–63); *id.*, *Notre Chanson folklorique; étude d'information générale* (1941). D.J.G.

**Vcl.** Abbr. for violoncello, i.e., cello.

**Vela** [Sp.]. In the Dominican Republic, name for certain semireligious celebrations in which singing plays an important role. The *vela de muerto* is a ceremony honoring the dead; when the deceased is an infant, it is similar to the *\*angelito*. The rural population of the Dominican Republic hold celebrations in honor of saints, known as *vela de ofrecimiento*. These usually consist of processions to roadside shrines during which religious songs such as the "Salve" and "Ave Maria" alternate with litanies and improvised verses praising the Saints or the Virgin. Accordions and the *\*tambora* are used to accompany the procession, but the religious vocal episodes are essentially solo songs with choral responses of a strongly modal character. J.O.S.

**Velato** [It.]. Veiled, subdued.

**Veloce** [It.]. Fast.

**Venetian school.** A 16th-century school of Flemish and Italian composers working in Venice. It was inaugurated by Adrian Willaert (c. 1490–1562; appointed *maestro di cappella* at St. Mark's in 1527) and included, among others, Andrea Gabrieli (c. 1520–86), Cipriano de Rore (1516–65)—both pupils of Willaert—and Gioseffo Guami (c. 1540–1611), Giovanni Gabrieli (c. 1555–1612), Giovanni Croce (c. 1560–1609), the organ composers Jacques Buus (d. 1565), Annibale Padovano (1527–75), Vincenzo Bell'Haver (c. 1530–87), and Claudio Merulo (1533–1604), and the theorists Nicola Vicentino (1511–72) and Gioseffo Zarlino (1517–90).

Whereas the contemporary \*Roman school represents the culmination of a long development of polyphonic music, the Venetian school is important mainly for its innovations and progressive tendencies, which, together with Florentine \*monody, paved the way for the 17th century. Among these contributions are Willaert's chromaticism and freer use of modulation, the toccata style of A. Gabrieli and C. Merulo, Vicentino's daring speculations and experiments with microtones [see Arcicembalo], Zarlino's investigations of \*just intonation, \*dualism, and, to some extent, equal temperament, and finally—and most important—Giovanni Gabrieli's magnificent "Venetian style" with its broad masses of sound, \*polychoral treatment, \*echo effects, and progressive use of instruments, winning him the name "father of orchestration" [see Orchestra II]. The movement spread, especially to Germany, where Jacobus Gallus (Händl, 1550–91), Hieronymus Praetorius (1560–1629), Hans Leo Hassler (1564–1612), and Michael Praetorius (1571–1621) became the most important representatives of the Venetian style.

Although temporarily eclipsed by the novelty of Florentine monody (c. 1600), the Venetian school continued to exercise a lasting influence throughout the baroque, a period whose roots are as much in Florence (vocal music) as in Venice (instrumental music). See Baroque music.

Lit.: C. von Winterfeld, *Johannes Gabrieli und sein Zeitalter*, 3 vols. in 2 (1834); R. B. M. Lenaerts, "La Chapelle de Saint-Marc à Venise sous Adrian Willaert (1527–1562)" (*Bulletin de l'institut historique belge de Rome* xix).

**Venetian swell.** See under Swell.

**Venezuela.** In 1591 the *Ayuntamiento de Caracas* provided funds for the establishment of a school whose curriculum included the teaching of plainsong; two years later a further subsidy was granted to Don Juan de Arteaga to continue this program. In 1698 the services of a music master were engaged by the *Colegio Seminario*. With the founding of the *Universidad de Santiago de León* in Caracas in 1725, a chair of music was established, to which Francisco Pérez Camacho (1659–c. 1725), an organist, was appointed.

The most homogeneous school of composers in South America was flourishing in Venezuela by the end of the colonial period and remained active during the first decades after independence. A great deal of its success was due to Father Pedro Palacios y Sojo (1739–99), who founded the religious order of the Oratory of S. Filippo Neri in Caracas. In addition, there was added, under the leadership of Juan Manuel Olivares (1760–97), the *Academia de Música*, where the outstanding composers of the time were trained. Notable members of this school were José Francisco Velásquez (c. 1755–1805), José Antonio Caro de Boesi (c. 1760–1814), Pedro Nolasco Colón (c. 1750), José Cayetano Carreño (1774–1836), Juan José Landaeta (c. 1780–1812), José Luis Landaeta (1772–1812), Lino Gallardo (c. 1775–1837), who was director of the *Academia de Música* and also conductor of the first concert of the *Sociedad Filarmónica*, and Juan Francisco Meserón (d. c. 1850), an outstanding flutist and composer. The greatest figure of this period was José Ángel Lamas (1775–1814), composer of many forms of church music, among them his well-known *Popule Meus*. Many of his compositions are preserved in the archives of the *Escuela de Música* of Caracas.

The first opera written in Venezuela was *Virginia* (1873) by José Ángel Montero (1839–81), member of a large family of musicians and an outstanding figure in 19th-century Venezuelan music. He also composed church music and *zarzuelas*. His contemporary, Felipe Larrazábal (1816–73), was a pianist of international prestige and a composer whose trio for piano, violin, and cello is one of the few of his works that were saved from shipwreck during an Atlantic crossing. The most prolific composer of this period in Caracas was Federico Villena (1835–c. 1900), who wrote chamber music, orchestral compositions, songs, church music, and *zarzuelas*. Another well-known Venezuelan-born musician

was Reynaldo Hahn (1875–1947), whose family moved to Paris when he was eight years old.

While the turn of the century saw little activity in composition, Venezuelan music of this period became prominent through Maria Teresa Carreño (1853–1917), a great pianist who also wrote several piano compositions, a string quartet, and other chamber music. Among her pupils was Edward MacDowell.

By the end of World War I, there emerged a group of composers who brought music beyond its amateurish prewar level. Among them were Vicente Emilio Sojo (b. 1887), director of the *Escuela de Música* and the choral society *Orfeón Lamas*; Juan Bautista Plaza (1898–1965), a musicologist who edited many of the works of colonial composers; José Antonio Calcaño (b. 1900); Juan Lecuna (1898–1964); Miguel Ángel Calcaño (1904–58); and María Luisa Escobar (b. 1903).

Many younger 20th-century Venezuelan composers continued to adhere to French impressionism as well as to Venezuelan folk traditions. The best-known composer of this generation is Antonio Estévez (b. 1916). Others are Inocente Carreño (b. 1919), Blanca Estrella, Gonzalo Castellanos (b. 1926; also an outstanding conductor), Evencio Castellanos (b. 1915), Carlos Enrique Figueredo, Antonio Lauro (b. 1917), and Ángel Sauce (b. 1911). Among those following more progressive lines are Rhazés Hernández López (b. 1918) and Alejandro Enrique Planchart (b. 1935).

Folk music of Venezuela's coastal region largely shows prevailing Negro influences. That of the inland plains has retained its early Spanish traditions, free from indigenous or other influences. The *\*joropo* and *\*guasa* are typical of the coastal forms, and the *tono llanero* and *\*corrido* of inland songs and dances. A third, more urban group, includes the *\*merengue* and *\*pasillo*.

**Ventil** [G.], **ventile** [It.]. Valve. *Ventilhorn* [G.], valve horn.

**Veränderungen** [G.]. Variations.

**Verbunkos** [Hung.]. A Hungarian soldiers' dance that was used to attract recruits for enlistment in the army. The name is a corruption of G. *Werbung*, enlistment. The dance was used from c. 1780 until 1849, when the Austrian government imposed conscription, and it has survived as a ceremonial dance. In its fully developed form it consisted of two or more sections, some in the character of a slow introduction (*lassu*), others very rapid and wild (*friss*). Among the numerous composers of *verbunkos* were János Bihari, A. G. Csermák, and János Lavotta (early 19th cent.). Many collections of *verbunkos* were published during the 19th century. In art music, the *verbunkos* was imitated by Liszt (Hungarian Rhapsody, no. 2), Bartók (rhapsodies for piano or violin with orchestra), and Kodály (Intermezzo from the opera *Háry János*). See E. C. Rearick, *Dances of the Hungarians* (1938); B. Szabolcsi, *A Concise History of Hungarian Music* [1964], pp. 53ff; *id.*, "Probleme der alten ungarischen Musikgeschichte" (ZMW vii, viii).

**Verdoppeln** [G.]. To double. See Double (2).

**Ver[e]eniging voor [Noord-] Nederlands[che] Muziekgeschiedenis**. See Editions LII.

**Vergleichende Musikwissenschaft** [G.]. Comparative musicology, now called \*ethnomusicology.

**Vergrößerung** [G.]. Augmentation.

**Verhallend** [G.]. Fading away.

**Verismo** [It.]. An Italian operatic school of the late 19th century that is the musical counterpart of the literary realism of Zola, Flaubert, Ibsen, and others. Instead of the idealistic librettos of earlier operas, realistic subjects from everyday life were chosen, often embellished with violent and theatrical incidents. Coloratura arias and other features of earlier Italian opera were abandoned in favor of a melodramatic recitative that was more naturalistic. Mascagni's *Cavalleria rusticana* of 1890 (scenes from peasant life) and Leoncavallo's *Pagliacci* of 1892 (circus life) were the first products of the new movement. They were followed, in 1900, by Charpentier's more naturalistic *Louise*. Puccini's *La Bohème* (1896) represents a somewhat modified, more lyrical

veristic opera. See M. Rinaldi, *Musica e verismo* [1932].

**Verkaufte Braut, Die** [G.]. See *Bartered Bride, The*.

**Verklärte Nacht** [G., Transfigured Night]. Sextet in one movement, for two violins, two violas, and two cellos, by Schoenberg (op. 4, 1899). It was inspired by a poem of R. Dehmel describing how the happiness of two lovers, despite personal tragedy, can transfigure a bleak winter's night into a thing of great beauty. The style of this early work derives from the "love music" of Wagner and R. Strauss, and shows the first traces of \*atonality. It was later arranged for full string orchestra, and finally became the music for the ballet, *Pillar of Fire*. Also see Expressionism.

**Verkleinerung, Verkürzung** [G.]. Diminution.

**Vermindert** [G.]. Diminished (interval).

**Vers** [F., G.]. (1) See under Verse (2). (2) See under *Canzo*.

**Verschiebung** [G.]. Soft pedal. See *Una corda*; Mute.

**Verschwindend** [G.]. Disappearing, fading away.

**Verse** [F. *vers*; G. *Vers*; It., Sp. *verso*; L. *versus*]. (1) In poetry, a line of metrical writing or a larger unit, e.g., a stanza of a poem. In German, *Vers* always means a stanza, the single line being called *Zeile*. (2) In Gregorian chant, the term (abbreviated *℣*) denotes a verse of a psalm or canticle, or a sentence from other scriptural texts. Single verses of this kind are found chiefly in Graduals, Alleluias, and Introits (where they are indicated Ps., i.e., psalm; see Psalmody II, III). They are always sung by the soloist (though usually with a short choral opening). The soloist connotation of the plainsong verse survived in the verse service and verse anthem of the Anglican Church, settings that include sections for solo voices as distinguished from the purely choral full service and full anthem. (3) For organ verse, see *Verset*.

**Verset** [F. *verset*; G. *Versett*, *Versettl*; It. *verso*, *versetto*; Sp. *versillo*]. Organ verse, i.e., a short organ piece, usually in fugal style, designed to be played in place of a plainsong \*verse of a psalm, canticle, or other short items of the service (section of a Kyrie). From the 16th to 18th centuries it was customary to have alternate (usually the odd-numbered) verses of a psalm or canticle replaced by organ versets, in alternation with

plainsong performance for the others [see Magnificat], in order to relieve the monotony of traditional psalm singing. Although from the liturgical point of view this practice represents an abuse, it gave great impetus to organ composition. Composers usually provided a number of versets (four to eight) for each church mode (*Versi octo tonorum*). The vast repertory of such versets includes contributions by P. Attaingnant (*Magnificat sur les huit tons*, 1530), Girolamo Cavazzoni (*Intavolatura cioè recercari canzonni himni magnificati*, 1542, '43), A. de Cabezón (*Obras de música*, 1578; see *HAM*, no. 133), A. Valente (*Versi spirituali*, 1580), C. Erbach (after 1600; see *DTB* 7), M. R. Coelho (*Flores de música*, 1620; see *HAM*, no. 200); J. E. Kindermann (*Harmonia organica*, 1645); J. Speth, (*Ars magna consoni et dissoni*, 1693); F. X. A. Murschhauser (*Octi-tonium novum organicum*, 1696; *DTB* 30); J. K. E. Fischer (*Blumen Strauss*, c. 1700; new ed. R. Walter, 1956); and Gottlieb Muffat (*Zwölf Toccaten und 72 Versetl*, 1726; *DTB* 58). In the more recent of these collections the first verset is often in freer style and therefore called "Toccatina." For the versets designed especially for the Magnificat, see Magnificat.

The practice of replacing plainsong with organ music still exists, particularly in France, and is known as "supplying." While the organist plays, the clergy and choir merely repeat the words to themselves. Pope Pius X, in his *\*Motu Proprio* of 1903, abolished much of this practice.

**Versetto** [It.]. \*Verset.

**Versetzung** [G.]. Transposition. *Versetzungszichen*, accidental.

**Versicle**. In the Roman Catholic and Anglican rites, a short text from the Scriptures or another source sung by the officiant, to which the choir (or the congregation) responds in like fashion, e.g., *V. Dominus vobiscum. R. Et cum spiritu tuo* (*V. The Lord be with you. R. And with thy spirit*). In the Roman Catholic service, the *V. Deus in adjutorium* with *R. Domine ad adjuvandum . . .* is sung at the beginning of each Office [*LU*, pp. 221, 224, etc.]. Also, the hymns and brief responsories close with a versicle and response. See also Preces; Suffrages.

The term "versicle" is also loosely used for subdivisions of longer texts, particularly for the two parallel lines of a sequence, which are called double versicle.

**Versillo** [Sp.]. \*Verset.

**Versmass** [G.]. \*Poetic meter.

**Vers mesuré** [F.]. A late 16th-century practice of applying to French poetry the quantitative principles of classical Greek and Latin, also known as *vers mesurés à l'antique*. Attempts in this direction had been made as early as 1497 by Michel de Bouteville. However, it was not until the 1560's that the practice became established, mainly through Baif, founder of the *Académie de poésie et musique*, who in 1567 translated the psalms into *vers mesuré* and also wrote *Chansonnettes mesurées*. The method, although a failure from the literary point of view, was readily adopted by musicians, who set the texts to music so that the accented syllables received doubled values, resulting in an irregular succession of half and quarter notes (*musique mesurée*). The foremost composers of *musique mesurée* were Claude Le Jeune (1528-1600; *Le Printemps*, 1603 [see *HAM*, no. 138]; *Psaumes en vers mesurez*, 1606 [\*Editions XXV, nos. 11-14]); Jacques Mauduit (1557-1627; *Chansonnettes mesurées*, 1586; see *HAM*, no. 10), and François-Eustache Du Caurroy (1549-1609; *Meslanges de la musique*, 1610; *HAM*, no. 17). The practice survived in some of the *\*airs de cour* of the 17th century.

Lit.: P.-H. Masson, "L'Humanisme musical en France" (*CP* 1906); D. P. Walker, "The Influence of *Musique mesurée* . . . on the *Airs de cour*" (*MD* ii); *id.*, "Some Aspects . . . of *Musique mesurée*" (*MD* iv); *id.* and F. Lesure, "Claude Le Jeune and *Musique mesurée*" (*MD* iii).

**Verso** [It.]. \*Verse; \*Verset.

**Verstärken** [G.]. To reinforce (the sound).

**Versus** [L.]. Psalm verse. *Versus alleluaticus*, the verse added to \*Alleluia. *Versus ad repetendum*, see *Repetenda*.

**Verwechslung, enharmonische** [G.]. \*Enharmonic change.

**Verzierung** [G.]. Ornaments indicated by signs or small notes.

**Vesperal** [L. *vesperale*]. See under Liturgical books I (7).

**Vespers**. The seventh of the canonical hours. See Office.

**Via** [It.]. Away. *Via sordini*, remove the mutes.

**Vibraharp, vibraphone**. A percussion instrument originating in the United States. It is similar to

the \*marimba but has metal bars and electrically driven rotating propellers under each bar, causing a vibrato sound. Other special effects can be obtained. The instrument, although mainly used in dance bands, has occasionally been used in art music (A. Berg, *Lulu*; O. Messiaen, *Trois Petites Liturgies*; K. H. Stockhausen, *Nr. 11 Refrain*, 1961; etc.). See also *GDB* viii, 763.

**Vibrations.** See under Acoustics I.

**Vibrato.** (1) In stringed instruments, a slight fluctuation of pitch produced on sustained notes by an oscillating motion of the left hand. Violinists and cellists use vibrato freely in order to increase the emotional quality of the tone. Some great violinists have strongly objected to such application, holding that vibrato should be reserved for moments of heightened expression. Sensible as such advice may be, most players consider vibrato a basic technique but usually apply it with sufficient moderation so as to produce no noticeable fluctuation of pitch.

Lute players of the 17th century distinguished between vibrato produced by a motion of the finger [E. *closed shake*; F. *languer*; It. *ondeggimento*] and one performed with the aid of a second finger that lightly taps the string as close as possible to the stopping finger [E. *sting*; F. *\*battement*]. A particularly expressive vibrato is possible on the clavichord [see *Bebung*].

(2) In singing, there is some uncertainty as to what vibrato actually means, as well as some confusion of it with \*tremolo. According to some authorities, vocal vibrato is the quick reiteration (usually eight times per second) of the same pitch produced by a quickly intermittent stream of breath with fixed vocal chords. This effect corresponds to what string players call "tremolo." Most singers use the term "vibrato" for a scarcely noticeable wavering of the tone, an effect that would correspond to the violinist's moderate vibrato, since it increases the emotional effect of the sound without resulting in a noticeable fluctuation of pitch. Excessive vibrato results in a real wobble, caused by a lack of control of the vocal apparatus, extreme fatigue, or even psychological factors. This unwelcome effect in singing is called "tremolo," which hence has an altogether different meaning from that used by string players.

Lit.: C. Seashore, ed., *The Vibrato* (1932); *id.*, *Psychology of the Vibrato in Voice and Instrument* (1936); F. C. Field-Hyde, *Vocal Vibrato, Tremolo, and Judder* (1946); A. Bonaccorsi,

"Terminologia confusa: Vibrato, Tremolo, *Bebung*" (*LRM* xix, 52ff).

**Victimae paschali laudes** [L.]. The sequence for Easter Sunday. See Sequence II D.

**Vidala** [Sp.]. A traditional song, also known as *vidalita*, generally performed by northern Argentine Indians during carnival. Its texts consist of alternation of refrains and couplets, with occasional additions of a kind of versified parody called *trova*. The melody is either modal (Dorian or Lydian) or pentatonic. The song is usually performed by two voices in parallel thirds accompanied by a drum and arpeggiated guitar chords.  
J.O-S.

**Vide** [F.]. (1) Empty. *Corde à vide*, open string. (2) [L.]. See. The term is used, with its syllables *Vi-* and *-de* placed at separate places of the score, to indicate an optional omission, the player being permitted to proceed from the place marked *Vi-* immediately to the place marked *-de*.

**Vielle** [F.]. The most important stringed instrument of the 13th to 15th centuries, mentioned by numerous writers and described in detail, though not quite clearly, by Hieronymus de Moravia, according to whom it had a drone string and four fingered strings [*CS* i, 153]. Its prominent role is also attested in the inscription "In seculum viellatoris" found with instrumental pieces of the 13th century [see *In seculum*]. Later (15th cent.) the name was applied to the \*hurdy-gurdy, properly called *vielle à roue* (wheel viol). See ill. under Violin.

**Vielstimmig** [G.]. For many voices, polyphonic.

**Viennese classical school** [G. *Wiener Klassiker*]. Collective name for the masters of classical music, Haydn, Mozart, and Beethoven, who worked in Vienna. See Classicism. The term "Viennese school" is sometimes used in a wider sense, including such of their predecessors as Johann A. K. G. von Reutter, Jr. (1708–72), Georg C. Wagenseil (1715–77), and Georg M. Monn (1717–50). For the latter two, see Mannheim school.

**Vierhebigkeit** [G.]. A term introduced by H. Riemann for musical phrases involving four accents (four measures) or multiples thereof. The great majority of all melodies and themes are of this kind, a fact strongly emphasized by Riemann, who claimed for it almost universal validity throughout the entire history of music.

Actually, it was not until the end of the 17th century that the four-measure phrase became established as a structural principle in music other than dance music and simple songs. Composers such as Cesti and Carissimi were among the first to use it with some consistency, giving their music a novel touch of "popularization." The somewhat obvious and facile regularity of music written in four-measure phrases is a pitfall of which the great masters have usually been aware but that lesser composers have not always avoided. The accompanying example from Haydn's Quartet op. 20, no. 5 (second movt.; the "trio" of Menuetto) is a striking warning against the idolization of four-measure phrases.

Riemann's attempts to use *Vierhebigkeit* as a scholarly principle in interpreting medieval monophonic music were particularly unfortunate [see his interpretations of Gregorian chants, *RiHM* i.2, 32ff, or the two-voice "Ut tuo propitius," *ibid.*, p. 141; cf. *ApNPM*, p. 208]. Riemann's principle was applied, with equally unfortunate results, by F. Liuzzi to the 14th-century *laude* [in *La Lauda*, 2 vols. (1924)]. See also Monophonic notation.

**Viertel** [G.]. Quarter. *Viertelnote*, quarter note; *Viertelton*, quarter tone.

**Vietnam.** Musically, Vietnam is one of the nations that shares the \*Chinese tradition, along with \*Japan, \*Korea, and Mongolia. In these countries one finds a similar terminology, similar musical instruments, similar systems of notation, and scales of the anhemitonic pentatonic type. Their traditional music is essentially melodic. Vietnam has also come into contact with \*Indian civilization, which has affected the traditional music of Vietnam in the use of the *trống cơm*, a long barrel drum with two skin-covered heads, each with a patch of tuning paste made of rice

applied to the center, like the *mridanga* of South India; in the importance of the improvised prelude, the *rao* or *zao*, comparable to the Indian *alap*; and in the teaching of cyclical rhythmic patterns by onomatopoeia, as in the Indian system of *bols* and *theka*.

The Vietnamese have assimilated both Chinese and Indian music and have made their own contributions through original instruments, like the *đàn bầu* or *đàn độc huyền*, a monochord that produces sound exclusively by \*harmonics and the variation in tension of the single metal string. Another original instrument is the *đàn đáy*, a rectangular long-necked lute with three silk strings, used to accompany singers, which combines characteristics of the moon-shaped lute (*nguyệt cầm*), pear-shaped lute (*tỳ bà*), and three-string lute (*đàn tam*). Another instrument is the *sinh tiền* (coin clappers), which unites in a single instrument the characteristics of the scraper, clappers, and bells.

The history of Vietnamese music can be divided into four main periods, beginning in the 10th century with the founding of the first Vietnamese dynasty, the Đinh (968–980). Of the music prior to that time, dating from earliest antiquity, no records remain. The first period (10th–14th cent.) is characterized by the combined influence of Indian and Chinese elements. The second period (15th–18th cent.) is characterized by the predominance of Chinese influence. The third period (1800–1940) is characterized by the affirmation of original Vietnamese music and the beginning of at least superficial Western influence. The fourth period (1945 to present) is characterized by the decline of and attempts to restore traditional music, as well as the development of a new music in the Western style.

Vietnamese music uses scales of two, three, four, or five tones with or without auxiliary degrees. Its art music has modal characteristics. There is a close relationship between melody and linguistic intonation (the Vietnamese language has six different linguistic tones). Polyrhythm and polyphony (or heterophony) are present in ritual music, theater music, and entertainment music.

There are many varieties of folk music. Vietnam's population includes more than fifty ethnic minorities. Besides Vietnamese folk music, there is the music of the Thái, Mường, Lolos, Kha, etc., in the north, and of the Rhadés, Mông Maa, Mông gar, Djorai, etc., in the high central plateaus. It includes work songs (the *hò*), songs of rural feasts (*hát hội*), alternating songs

(*cò lã, trổng guân, quan họ*), songs of the blind (*hát xãm*), songs of possession (*chầu văn*), healing songs (*phủ thùy*), songs of the theater (*hát chèo, hát bội*), and songs accompanied by dancing (*xoe*).

Art music includes ceremonial music, both court and popular, the music of entertainment and of the theater. The court repertory is very rich: music of the "esplanade of heaven," music of the temples, music for formal audiences, banquet music, palace music, music executed by large instrumental ensembles of more than forty players (*Đại Nhạc*), with such dances as civil dance (*văn vũ*), military dance (*võ vũ*), dance of fabulous animals, and dance of the flowers. Popular ceremonial music includes funeral music, Buddhist music, and Cao Dai music. Entertainment music has three main traditions: that of the north, with the *hát a đào* (song of the professional women singers); the central region, with the *Ca Huế* (music of Huế); and the south, with the *dân tài-tũ* (so-called amateurs' music). Traditional theater music (*hát tuồng, hát bội*), like court music, is disappearing. But both the music of the popular theater (*hát chèo*) in the north and the so-called "renewed theater" (*hát cải lương*) in the south are very popular.

The recent influence of Western music has given rise to a music called "renewed" music (*nhạc cải cách*) and a new music (*tân nhạc*), made up largely of songs, dance or variety music, and sometimes compositions for Western instruments, like the piano and violin, and symphonic works. But this music is of too recent an origin to be discussed with any perspective.

Vif [F.]. Lively.

**Vihuela** [Sp.]. Early name for various stringed instruments. (1) *Vihuela de arco*, a viol [see *GD* iii, opp. 260; *GDB* v, frontis.]. (2) *Vihuela de Flandres* (from Flanders), the lute.

(3) *Vihuela de mano*, or simply *vihuela*, a six-course guitar of the 16th century [see *Guitar* family]. The tuning was similar to that of the lute and the notation like Italian lute tablature, though with distinctive features, such as the use of red ciphers to indicate a singing part (e.g., in Fuenllana's tablature). An impressive repertory of music for vihuela survives in seven printed tablatures [see *Spain II*; also *Tablature*].

A repertory for the vihuela is also indicated in the titles of the two remaining books of Spanish 16th-century organ music, by L. Venegas de Henestrosa (1557) and Antonio de Cabezón (1578), which both bear the remark, "para tecla, [h]arpa y vihuela" (for keyboard, harp and vihuela). However, they contain only strictly polyphonic organ music, most of which could not be played on a harp or vihuela without considerable adaptation.

Lit.: J. B. Trend, *Luis Milan and the Vihuelistas* (1925); J. M. Ward, "The Vihuela de mano and Its Music (1536-1576)" (diss. New York Univ., 1953); G. Morphy, ‡*Les Luthistes espagnols du XVI siècle*, 2 vols. (1902; the transcriptions are unreliable); L. Schrade, *Luys Milan* [\*Editions XLVI, 2]; E. Martínez Torner, ‡*Colección de vihuelistas españoles del siglo XVI* (1923); E. Pujol, editions of Luys de Narvaez and Alonso Mudarra (*MME* iii and vii); W. Apel, "Early Spanish Music for Lute and Keyboard Instruments" (*MQ* xx); G. Chase, in *BAMS* vi.

**Villancico** [Sp.]. In the 15th and 16th centuries, a type of Spanish poetry, idyllic or amorous in subject matter and consisting of several stanzas (*copla*) linked by a refrain (*estribillo*): E C<sub>1</sub> E C<sub>2</sub> E . . . The *copla* consists of two sections, *mudanza* and *vuelta*, which correspond exactly

to the *piedi* and *volta* of the Italian \*ballata, while the *estribillo* corresponds to the Italian *ripresa*. The resulting form is:

estribillo		copla		estr.		copla	
		mudanza	vuelta			mud.	vuelta
music	A	b b	a	A	b b	a	
text	a a	b b	b a	a a	b b	b a etc.	

A characteristic trait of the *villancico* (and *ballata*) is a rhyme scheme that does not wholly correspond to the musical form; see under *Virelai* II.

Numerous *villancicos* composed for three or four voices are preserved in the Spanish \**cancioneros*, e.g., the *Cancionero musical del palacio* (c. 1500; see Sources, no. 27). Some of them, presumably representing an older tradition, are in a fairly elaborate polyphonic style, and others in a simple chordal style. Juan Urreda (or Jean Wreede, a Fleming) and Francisco de la Torre are among the earliest composers, while Juan del Encina (1468–1529) is probably the most important. After 1500 the *villancico* was also composed as a solo song with vihuela accompaniment. Luis Milán, Miguel de Fuenllana, and Alonso Mudarra wrote a number of Spanish and Portuguese *villancicos* that are outstanding for their grace and refinement, and indeed might be considered the earliest examples of song in the modern sense of the word.

The earliest documented use of the term *villancico* is the title of a poem written shortly after 1400 by Íñigo López de Santillana. However, the late 13th-century MS *Cantigas de Santa María* contains numerous songs showing the metrical and musical form of the *villancico*, the only difference being the subject, which is religious.

In the 17th century the *villancico* reappeared as a religious composition comparable to the church cantata or anthem. The text consists of an introductory *estribillo* of irregular versification and a number (six, nine, or more) of *coplas*, each of four lines. The *estribillo* is composed in a rather elaborate style for four-part (sometimes eight-part) chorus with organ accompaniment, while the *coplas* are short solo songs with organ accompaniment. Instruments were also used. Usually, all the *coplas* are sung to the same melody, but sometimes three or four melodies are used in alternation. Occasionally the composition closes with a short choral movement, called *respuesta*. Possibly, the *estribillo* could also be repeated at the end. Among the com-

posers of such *villancicos* are Carlos Patiño (d. 1683) and Fray Juan Romero (fl. c. 1670; see *LavE* i.4, 2050ff). A number of *villancicos* are preserved in MSS at the library of Munich [see the catalog by J. J. Maier, *Die musikalischen Handschriften* (1879)]. These and other sources have not been investigated, so it is difficult to obtain an accurate idea of this phase of Spanish music. Fortunately, the gap has been filled to some extent by the publication of the *villancicos* of Joan Cererols (1618–76), a member of the school of Montserrat [see Editions XXVI, *Vocal Music*, 1–3; *HAM*, no. 227].

During the 17th and 18th centuries a considerable number of *villancicos* were produced in Latin America, all using Spanish texts. Most of them were intended for church use, and approximately one-third of the entire repertory were settings of texts dealing with Christmas. Although the Church discouraged the use of this form, mainly because of its secular origin, *villancicos* were written for every saint's day, sung at Matins, and even interpolated in the Mass. The foremost writer of *villancicos* in colonial Mexico was Sor Juana Ines de la Cruz (1651–95). Settings for her texts were composed by Joseph de Agurto y Loaysa (fl. 1690), Antonio de Salazar (fl. 1690), and others. Simultaneously the *villancico* was cultivated in Peru by Juan de Araujo, Tomás de Torrejón, Sebastián Durón, and many others, while a prominent Colombian composer was Juan Ximenez [see Colombia].

Beginning in the first decades of the 18th century, the *villancico* in Latin America developed into a sort of cantata, with an opening chorus, interspersed arias, and a choral ending. This expanded form was cultivated by such composers as Manuel Zumaya [see Mexico] and Estaban Salas [see Cuba]. The *villancico* also developed into several types of traditional Latin American folksong, known variously as *adoración*, *alabanza*, *aguinaldo*, *esquinazo*, etc.

(1959), pp. 47ff; V. Ripollés, *El Villancico i la Cantata del Segle XVIII a València* (1935); *LavE* i.4, 2006ff; A. Geiger, "Bausteine zur Geschichte des iberischen Vulgär-Villancico" (*ZMW* iv).

add. by J.O.S.

**Villanella.** A 16th-century type of vocal music that originated in Naples (*v. alla napoletana*) and that, in both text and music, represents a

sharp contrast to—probably a reaction against—the refinements of the contemporary madrigal. M. Praetorius' description of the villanella as "eine Bäurisch Music zu einer Bäurischen Matery" is less apt than Morley's "clownish musick to a clownish matter," since the villanella, although suggested by folk music, had no more relation to the Italian peasantry than the 18th-century style *galant* did to the shepherds of France. A sophisticated parodistic device of the villanella is its frequent use of "forbidden" par-

Dol - ce mi - se - ri - a u - scir di af - fann e pe - ne

allel fifths [see Ex.]. The earliest collections of villanella are by G. D. da Nola (1541), Tomaso Cimello (1545), A. Willaert (1545), and Baldassare Donati (1550). The villanella style spread, particularly to Germany, where it was used for drinking songs, jesting songs, etc., not without losing a good deal of its Italian flavor and becoming either more civilized (Orlando di Lasso) or simply dull.

Subspecies of the villanella are the *greghesca*, *giustiniana*, *mascherata*, and *moresca*. The *greghesca* is a villanella alla napoletana in three parts, the text a mixture of Venetian and Greek. Its creator was the Venetian-Levantine poet-musician Antonio Molino, to whose dialect texts many Venetian composers, from Willaert to Bell'Haver, composed music. The *giustiniana* is a type of villanella, always in three parts, whose text ridicules the ineffectual stuttering Venetian patrician. The poems have no relationship whatever to the choice lyrics, called *giustiniani*, of the early 15th-century poet Leonardo Giustiniani (1385–1446). [See, however, Rubsamen, Lit.] The *mascherata* is a type of villanella to be sung during a masked ball or procession [ex. by Da Nola in *EiBM*, no. 18]. Collections of such songs were published by G. Scotto (*Il Primo Libro delle justiniane*, 1578), A. Gabrieli (*Greghesche et justiniane*, 1571; *Mascherate*, 1601), Orazio Vecchi (*Selva di varia recreatione*, 1590), and others. The *moresca* is a type in which the singers represent Moorish girls (examples in Lasso, *Sämtliche Werke* [1894–1926], vol. x). It has no relationship to the dance called *\*moresca*. See also *Maggiolata*; *Villanesca*.

More recent composers, among them Berlioz, Chabrier, Dukas, Granados, and Loeffler, have

used the term "villanelle" or "villanesca" for instrumental pieces in the style of a rustic dance, usually in quick 6/8 meter. An early example of such a piece (in 4/4) is in a suite by G. P. Telemann (no. 5 of *Overture 'La Putain'*, c. 1725).

Lit.: W. Scheer, *Die Frühgeschichte der italienischen Villanella* (1936); E. Gersen-Kiwi, "Studien zur Geschichte des italienischen Liedmadrigals im XVI. Jahrhundert" (diss. Heidelberg, 1937); B. M. Galanti, *Le Villanelle alla napoletana* (1954); G. M. Monti, *Le Villanelle alla napoletana* (1925); A. W. Ambros, *Geschichte der Musik*, 5 vols. (1868), iii, 510f; E. Hertzmann, *Adrian Willaert in der weltlichen Vokalmusik seiner Zeit* (1931), pp. 55ff; A. Einstein, *The Italian Madrigal*, 3 vols. (1949), i, 352ff; P. Bellasio, ‡*Villanelle*, ed. G. Vecchi (1952); G. de Antiquis, ‡*Villanelle alla Napolitana*, ed. S. A. Luciani (1941); A. Einstein, "The Greghescha and the Giustiniana of the Sixteenth Century" (*MD* i); *id.*, "Die Parodie in der Villanella" (*ZMW* ii); F. Nicolini, "La Villanella napoletana" (*RMI* liv).

**Villanesca.** An earlier name for what was later called \*villanella. It first appears in an anonymous collection of 1537, then in G. D. da Nola's *Canzoni villanesche* of 1541. See *ReMR*, pp. 332ff, 443ff.

**Villota.** A type of 16th-century Italian song of irregular structure, often including a popular or street song in its texture. Some villote close with a more rapid section, called *nio*. Its local character is indicated in such titles of publications as *Villote alla veneziana* (1535), *Villote padovane* (1550), *Villote alla napoletana* (1550), and *Villote mantovane* (1583). An attempt by F. Torrefranca to prove that the villota is a "missing link" between the Italian music of the 14th and 16th centuries rests on very weak evidence.

Vecchi (1953); O. Kinkeldey, "Fausto Torrefranca's Theory of the 'Villota'" (*BAMS* vi); H. Springer, "Vilota und Nio" (*CP Liliencron*).

**Vīṇa.** The main melody instrument of India, somewhat resembling a guitar but actually a zither. See under India VIII; ill. under Zither.

**Vingt-quatre Violons du Roi.** A string orchestra of twenty-four players, in the service of the French Kings Louis XIII, Louis XIV, and Louis XV (c. 1650–1761), which became particu-

larly famous under Lully. Lully first (1655) directed a smaller group of sixteen players, called "petite bande," but later became conductor of the "grande bande." Its main function was to play at court balls, at the king's levée, banquets, etc. Lully organized the band into a string orchestra that became famous all over Europe and was imitated by various sovereigns, e.g., by Britain's Charles II, whose group was called "King's Music."

**Vinnula, vinola** [L.]. An ornamenting neume or special vocal effect of Gregorian chant, mentioned by Aurelianus Reomensis [GS i, 57] and others. Its meaning is not known. See Neumes I; Vox.

**Viol. I. General.** Name for a family of stringed instruments in use mainly during the 16th and 17th centuries, replacing the various types of medieval fiddle (\*rabab, \*vielle) and in turn superseded by the \*violin family. The viols have about the same relationship to the violins as the harpsichord to the piano and the recorder to the flute. They are very delicate and soft in timbre, lacking the brilliance and versatility of the modern instruments. Thus they are suited for the intimacy of a small room and for amateur players more than for the concert hall and for professional virtuosos. The making and playing of viols has been revived to some extent, owing chiefly to the initiative of Arnold Dolmetsch in England.

The viols differ from the violins in the following ways: (a) the shoulders slope from the neck instead of being set at right angles to it; (b) the back is usually flat instead of bulging; (c) the ribs are deeper; (d) the normal number of strings is six instead of four; (e) the fingerboard generally has frets in the form of pieces of gut tied around it; (f) the sound holes are usually in the shape of a C instead of an F [see Sound hole]; (g) the bridge is wider and less arched, facilitating the playing of full chords; (h) the strings are thinner and less tense; (i) it is played with an older type of bow whose stick curves outward from the hair [see Bow], and the hand is held palm up; (j) the instrument is held upright, resting on the player's lap or between his legs. See ill. under Violin.

**II. Standard types.** In the 17th century, the classical period of the viols, they were built in three sizes, treble viol [F. *dessus de viole*], tenor viol [*taille de viole*], and bass viol [*basse de viole*], the last also known as \*viola da gamba [mod. G. *Gambe*]. According to T. Mace [*Musick's Monu-*

*ment*, 1676], a good set of viols (a so-called "chest of viols") consisted of "2 basses, 2 tenors, and 2 trebles: all truly, and proportionably suited." The tuning of these instruments followed that of the 16th-century lute, i.e., in fourths around a central third: bass viol, D G c e a d'; tenor viol, A d g b e' a'; treble viol, d g c' e' a' d''. Toward the end of the 17th century French musicians added a small viol tuned a fourth above the treble viol, called the *pardessus de viole*. The corresponding English term is "descant viol," a name also used for the treble viol. The French bass viol often had a seventh string, usually tuned A<sub>1</sub>.

**III. Viol music.** Although instrumental ensemble music of the 16th century, such as the *ricercars* of Willaert, *canzonas* of Maschera, etc., were doubtless played on viols (as well as other melody instruments, such as recorders or cornetts), it was in England that viol making, viol playing, and viol composition reached its "golden age," mainly c. 1625–75. Preceded by the \*"In nomines" and \*brownings, the English \*fancy of the 17th century became the chief form of English viol music [see also Consort]. About 1660 the appearance of the violin in England quickly ended this splendid development [see England V]. The bass viol had a long career as a solo instrument, from about 1550 to 1750; see Viola da gamba.

**IV. Special types.** In addition to the standard types, the viol family included several other instruments.

1. Double-bass viol [F. *contre-basse de viole*; It. *violone*; Sp. *contrabajo*]. A six-stringed instrument tuned an octave below the bass viol. It is the ancestor of the modern \*double bass, which has retained some features of the viols together with the alternate name "bass viol." The *violone* frequently called for in Bach's cantatas probably was an intermediate instrument between the old six-stringed type and the modern double bass. See Violone.

2. Division viol. A slightly smaller bass viol, which was preferred for playing \*divisions upon a ground and similar solo performance.

3. Lyra viol. An instrument still smaller than the division viol. Since its size was between the bass viol and tenor viols, it was also called *viola bastarda*. [See ill. under Violin.] The lyra viol, or "bass viol lyra-way," as John Playford called it (1658), was tuned in fifths and fourths, e.g., C G c e a d' or A<sub>1</sub> E A e a d', unlike the other viols but like the older *lira da gamba*; hence the name *lyra-way* [see GDB v, 453, for additional

lyra tunings]. This manner of tuning, which greatly facilitated playing chords, was also known as "harp-way tuning" (T. Mace). The music for this instrument was not written in ordinary notation but in \*tablature [ex. in *WoHN* ii, 226f].

4. Viola d'amore. See separate entry.

5. Baryton. An 18th-century instrument that might be regarded as a viola da gamba provided with sympathetic strings, or as a larger \*viola d'amore. The broad neck was usually carved out under the fingerboard (leaving only an oblong frame) so that the sympathetic strings could be plucked from underneath with the thumb of the left (!) hand [see ill. under Violin]. A number of late 18th-century compositions for the baryton survive. Many of them were written for Prince Nikolaus Esterhazy, who was very fond of the instrument. They include *Neun Partien auf die Viola Paradon* by J. G. Krause (c. 1700), 175 compositions by Haydn [see C. F. Pohl, *Joseph Haydn* i, 249ff], 24 divertimenti by Luigi Tomasini (1741–1808), and pieces by Joseph Weigl (1766–1846) and others.

Hayes, *Musical Instruments and Their Music*, vol. ii (1930); *LavE* ii.3, 1753ff; E. van der Straeten, *History of the Violoncello, the Viol da Gamba, Their Precursors and Collateral Instruments* (1915); *id.*, "The Revival of the Viols" (*The Strad*, Feb. 1909–June, 1912); J. Pulver, "The Viols in England" (*PMA* xlvii); C. Bouvet, "Les Pièces de viole de François Couperin" (*RdM* 1922, no. 2); W. Coates, "English Two-Part Viol Music, 1590–1640" (*ML* xxxiii, 141ff).

Baryton: *LavE* ii.3, 1779ff; W. O. Strunk, "Haydn's Divertimenti for Baryton, Viola, and Bass" (*MQ* xviii); L. Greilsamer, in *BSIM* 1910, pp. 45ff.

**Viola.** (1) In modern usage, the second member of the violin family [F. *alto*; G. *Bratsche*]. It is tuned a fifth lower than the violin, c g d' a'. Nonetheless, it is only one-seventh larger than the violin, a disproportion that makes its timbre more nasal and veiled than those of the violin and cello. For modern constructions in various sizes, see Violin family (c), (d). [For ill. see under Violin.] In contrast to the violin, the viola has been used almost exclusively as an ensemble instrument, in the orchestra or in chamber music [see String quartet]. Notable exceptions are P. Hindemith's Sonatas for viola solo (op. 11, no. 5; op. 25, no. 1) and for viola and piano

(op. 11, no. 4; op. 25, no. 4; without op. number, 1939).

About 1600 the viola was called *violino (violino ordinario)*, the smaller violin being called *violino piccolo* [see Violin II]. It would seem, therefore, that at this time the viola was the normal type of the violin family. In the 17th and 18th centuries it was frequently called \*violetta, the name "viola" being used for the viola da gamba [see, e.g., J. Rosenmüller's *Symphoniae*, in *DdT* 18].

(2) In the Renaissance and baroque periods, *viola* was the generic Italian name for all bowed stringed instruments. There were two main classes: *viole da gamba* (leg viols) and *viole da braccio* (arm viols). The former, which were held on or between the legs, are the \*viols; the latter, which were held against the shoulder (at least the smaller sizes), are the immediate forerunners of the violins [see Violin II]. Later, each of these collective terms became identified with a particular member of the group, the viola da gamba [G. *Gambe*] with the bass viol [see Viol II] and the viola da braccio [viola; G. *Bratsche*] with the alto violin.

Zeyringer, *Literatur für Viola* (1963); C. Meyer, ed., *†Alte Meister des Violaspiels* [1958]; R. Clarke, "The History of the Viola in Quartet Writing" (*ML* iv, 6); E. van der Straeter, "The Viola" (*The Strad*, July 1912–April 1916).

**Viola alta.** See under Violin family (c).

**Viola bastarda** [It.]. Name for the lyra viol [see Viol IV, 3]. See C. Sachs, in *ZIM* xv.

**Viola da gamba** [It.]. Originally, name for all the viols, because they were held on or between the legs; see Viola (2). Specifically, the bass size of this family, also called bass viol [ill. under Violin]. It had six strings, normally tuned D G C e a d'. The instrument is especially important because it was often used as a solo instrument. Silvestro Ganassi's *Regola Rubertina* of 1542 contains *ricercars* for viola da gamba (unaccompanied) involving double stops, fourth and fifth positions, and other elements of virtuoso playing [ex. in *HAM*, no. 119]. The *Tratado de glosas* by Diego Ortiz (1553) contains a number of *ricercars* that can be played by "Violon con el Cymbalo," i.e., for viola da gamba and harpsichord. Famous players of the 17th century were Christopher Simpson (c. 1610–

69; *The Division Violist*, 1659), André Maugars (c. 1580–c. 1645), Hotman (d. 1663), and Jean Rousseau (*Traité de la viole*, 1687). Important composers were Marin Marais (1656–1728; 5 vols. of pieces for 1–3 viole da gamba, 1686–1725), his son Roland Marais (two books of *Pièces de violes*, 1735, '38), Jean Schenck (1656–c. 1700; *Scherzi musicali*, c. 1692; see Editions LII, 28; also *SchGMB*, no. 245), Ernst Christian Hesse (1676–1762), August Kuhnel (1645–c. 1700; *Sonate ô partite ad una ô due viole da gamba*, 1698; several repub. by A. Einstein, Döbereiner, Bennat), Antoine Forqueray (1672–1745; *Pièces de viole*, ed. by his son Jean Baptiste; several repub. by Karl Schröder), Louis de Caix d'Hervelois (c. 1670–c. 1760; 6 books, *Première [Seconde, etc.] Livre de pièces de viole*, 1725–52; several sonatas repub. by Karl Schröder), and Karl Friedrich Abel, the last of the violists (1723–87; numerous MS pieces, one sonata pub. by R. Engländer; see Lit., Einstein). Bach wrote three fine sonatas for viola da gamba (BG ix, 175ff), and the aria "Komm süßes Kreuz" of the St. Matthew Passion is for viola da gamba and bass. There also is an early sonata by Handel [see under Thoroughbass II].

Lit.: J. Bacher, *Die Viola da gamba* [1933]; A. Einstein, *Zur deutschen Literatur für Viola da gamba im 16. und 17. Jahrhundert* (1905); C. W. Hughes, "The Music for Unaccompanied Bass Viol" (*ML* xxv); E. Albin, "La Viola da gamba in Italia" (*RMI* xxviii).

**Viola d'amore** [It.; F. *viole d'amour*; G. *Liebesgeige*]. An instrument the size of a treble viol but having \*sympathetic strings made of thin wire that were stretched behind the bowed strings, producing a silvery resonance. Unlike the viols proper, it had no frets and was held like a violin. Along with this type there existed viole d'amore without sympathetic strings, and with metal strings replacing the gut strings of the ordinary viols. This instrument had a metallic timbre. The name viola d'amore may refer to the instrument's scroll, which usually was fashioned like a blindfold face resembling that of the god Amor [see *SaHMI*, pp. 364ff]. The *English violet* mentioned by Leopold Mozart probably was a larger variety of viola d'amore with seven bowed and fourteen or fifteen sympathetic strings [see N. Bessaraboff, *Ancient European Musical Instruments* (1941), p. 286f]. See ill. under Violin.

The literature for the viola d'amore is quite extensive. It includes compositions by Attilio

Ariosti (1666–c. 1740; 6 sonatas, new ed., Augener, Durand); J. S. Bach (1685–1750; St. John Passion); Michel Corrette (1709–95; sonata, new ed. Lemoine); Haydn (1732–1809; divertimento, new ed. Nagel); and Karl Stamitz (1745–1801; *DTB* 28; also new ed., Schott). In 1782 Milandre published a *Méthode facile pour la viole d'amour*. In the 19th century the instrument was used by Meyerbeer (*Les Huguenots*), Charpentier (*Louise*), Puccini (*Madama Butterfly*), R. Strauss (*Sinfonia domestica*), and C. M. Loeffler (*The Death of Tintagiles*). It was also revived for concert performance by Louis van Waefelghem (1840–1908), Carl Zoeller (1840–89), François Casadesus (1870–1954), and others. Hindemith wrote a sonata (op. 25, no. 2) and concerto (op. 46, no. 1) for viola d'amore.

Lit.: C. Zoeller, *The Viole d'amour* [n.d.]; R. Dolejší, *Modern Viola Technique* (1939), pp. 38ff, 133; K. Stumpf, *New School for Viola d'Amore* (1956); P. Shirley, *The Study of the Viola d'Amore* (1958); *LavE* ii.3, 1781ff; W. Altmann and W. Borissowsky, *Literaturverzeichnis für Bratsche und Viola d'amore* (1937); W. E. Köhler, *Beiträge zur Geschichte und Literatur der Viola d'amore* (1938); F. Scherber, in *Musikbuch aus Österreich* (1910); H. Danks, in *ML* xxxviii.

**Viola da spalla** [It.]. An 18th-century variety of cello that was held across the player's chest suspended by a strap over the shoulder [*spalla*, shoulder].

**Viola di bordone** [It.], **viola paradon** [E.]. Other names for baryton; see Viol IV, 5.

**Viola pomposa**. An 18th-century instrument of the violin (not viol) family, whose invention is erroneously ascribed to J. S. Bach (in unreliable sources dating from 1782 to 1792). The only works for the instrument are two compositions by Telemann, a concerto by J. G. Graun, and a *Sonata per la Pomposa col Basso* by Cristiano G. Lidarti from c. 1760. From these pieces it has been deduced that the viola pomposa was a larger viola held on the arm (not under the chin) and with five strings, tuned c–g–d'–a'–e'. The *violino pomposo* found in some sources denoted the same instrument. [For ill. see under Violin.] See F. W. Galpin, in *ZMW* xiv, 35ff; *id.*, in *ML* xii, 354ff; H. Engel, in *ZMW* xiv, 38; G. Kinsky, in *ZMW* xiii, xiv; F. T. Arnold, in *ZMW* xiii, xiv; *SaHMI*, pp. 367f.

**Viole** [F.]. \*Viol. *Viole d'amour*, see Viola d'amore.

**Violet.** A name sometimes given to the \*viola d'amore.

**Viole-ténor** [F.]. See under Violin family (g).

**Violetta.** (1) A 16th-century three-stringed instrument of the violin type [see Violin II]. (2) A 17th- and 18th-century name for the viola, used by J. Rosenmüller, Bach, and other German composers; *violetta marina*, for viola d'amore; *violetta piccola*, according to M. Praetorius (*Syntagma musicum*, 1614–20), a small viol, but it may also have meant a violin.

**Violin** [F. *violon*; G. *Violine*, *Geige*; It. *violino*; Sp. *violín*]. I. *General.* The most important of the stringed instruments, in the orchestra as well as in chamber and solo music. Its main parts are: (a) the body, consisting of the table (soundboard), back, and ribs (side walls); (b) the fingerboard, ending in a pegbox and scroll; (c) the string holder (tail piece); (d) the bridge. [See the accompanying illustrations.] Inside the body is the \*bass-bar, which is glued to the table, reinforcing blocks glued to the corners of the bouts and to the back, and the \*sound post, fixed between the table and the back. The violin has four strings tuned in fifths, g d' a' e'.

The prominence of the violin in Western music rests on its singular qualities, among them an expressiveness ranging from soft lyricism to extreme dramatic excitement, a soulful, sensitive timbre, crescendos and diminuendos unequalled by other instruments, and vast opportunity for variety in performance, including many types of \*bowing as well as \*pizzicato and the use of \*harmonics.

Whereas all other modern instruments (except the organ) were not perfected until the late 19th century, the great period of violin building followed soon after the instrument emerged as a definite type. From 1600 to 1750 Cremona was the center for great masters of violin making, notably Niccolò Amati (1596–1684), Antonio Stradivari (1644–1737), and Giuseppe B. Guarneri (Giuseppe del Gesù, 1698–1744). Their instruments are priceless treasures for which fabulous sums have been paid. Although the craftsmanship and beauty of these instruments are unsurpassed, modern makers have produced instruments whose sound cannot be distinguished from that of a genuine "Strad." The widespread notion that the composition of the varnish has a decisive influence on a violin's sound has been proven false. The luster of the old instruments adds greatly to their beauty but nothing tangible to their tone quality.

II. *History.* The violin, the main representative of bowed chordophones, or "fiddles" [see Instruments IV, B, 2], has a relatively short history. There is no evidence of the use of a bow prior to the 9th century, when it is mentioned in Persian and Chinese sources. There is some evidence that the fiddle originated in Central Asia, whence it spread to the Far East as well as to Europe. A Chinese fiddle called *huchyn* (*hu ch'in*) has a small cylindrical soundbox made of bamboo, wood, or coconut, with the lower end open and the upper end covered with snakeskin. A long neck, in the form of a stick, pierces the body, and over it two strings are stretched. The bow cannot be removed since it passes between the strings, rubbing some from below and others from above. A similar instrument is the Persian *kemânge* or *kamânja* [see Persia]. In India a folk instrument called *sârangi* comes in a variety of strange shapes [see *SaHMI*]. The Arab *rabab* was imported into Europe, where it was usually called *rebec* [see Rabab].

The earliest European fiddles were shaped like a slender bottle or pear and were known by various names, among them *rebec*, \**gigue*, and \**lyra*. The slightly pear-shaped form was retained in the Italian \**lira da braccio* and *lira da gamba*. The slender fiddle (*rebec*) persisted in the *klein geigen* [see below] and \**kit*. The most important medieval fiddle was the \**vielle* of the 13th century. The development during the next two centuries is obscure, but sometime between c. 1550 and 1600 the violin developed from several earlier types, each of which contributed some essential features. Bearing in mind the differences between the violin and the earlier viols [see under Viol], a number of the violin's forerunners can be singled out. The practice of leaning the instrument against the shoulder and bowing palm-downward was used with the *vielle*. Tuning in consecutive fifths is documented as early as 1533 (G. M. Lanfranco, *Scintille di musica*) and was consistently used with the three-stringed *klein geigen* (descendants of the slender *rebec*) throughout the 16th century (M. Agricola, *Musica instrumentalis deudsch*, 1528). The rectangle between the fingerboard and upper end of the body is present in a \**lira* designed by Rafael (c. 1510) as well as in the \**violettas* mentioned by Lanfranco and Ganassi (1543). The latter instruments, which had no frets and three strings tuned in fifths, were very similar to the classical violin. A picture by Gaudenzio Ferrari from c. 1535 shows *violettas* with shallow ribs,

pointed corners, round shoulders, a depression running around the edge, F-holes, and a scroll [see *SaHMI*, p. 357]. Only the addition of a fourth string was needed to create what might be called "the first violin."

The emergence of the name "violin" did not coincide with the emergence of the instrument. Throughout the 16th century names such as *violini* and *violons* were used for viols and similar instruments. About 1600, *violino* meant \*viola rather than violin, as, e.g., in G. Gabrieli's *Symphoniae sacrae* (1597). In Monteverdi's *Orfeo* (1607), *violino ordinario* means viola and *violino piccolo* probably means violin [see Violin family (a)].

The first known makers of true violins were Gasparo (Bertolotti), called after his birthplace "da Salò" (1540–1609), G. Paolo Maggini (1580–c. 1630), both working in Brescia, and the brothers Amati (Antonio, 1550–1638; Girolamo, 1556–1630), who made Cremona famous as the center of violin making. Girolamo's son Niccolò Amati (1596–1684) was the first of the great three violin makers. The Amatis created the classical shape of the violin, flattening the body (which is deeply bulging in instruments of Gasparo da Salò) by deepening the middle bouts, sharpening the corners, rounding the holes in a more elegant shape, and improving the varnish.

Niccolò Amati's pupil Antonio Stradivari (1644–1737) built the most famous of all violins. Working at first along the lines of his master, he created in 1690 the model that came to be known as the "Long Strad" (length 14 $\frac{3}{16}$  in., width 8 in., vs. ordinary length 14 in., width 8 $\frac{1}{2}$  in.). In 1698 he returned to the shorter pattern and made violins about 14 in. long but in widths similar to those of the "Long Strad." It was in this pattern that, from 1700 on, Stradivari made his finest instruments, such as the "Betts" (1704), now in the Library of Congress, "Viotti" (1709), "Parke" (1711), "Boissier" (1713), "Dolphin" (1714), "Messie" (1716), "Cessol" (1715), "Maurin" (1718), "Rode" (1722), "Sarasate" (1724), "Wilhelmj" (1725), and "Song of the Swan" (1737). All together Stradivari is believed to have made more than 1,000 instruments between 1666 and 1737; of these, 400 violins, 16 violas, and 39 cellos are actually known to be his.

Giuseppe Guarneri (1666–c. 1740) worked along different lines from Stradivari's. He revived the bold and rugged outline and with it the massive build and powerful tone of the earlier Brescian masters, Gasparo da Salò and G. Paolo

Maggini. He was interested mainly in tone quality. Unlike Stradivari, he worked with no uniformity of design, size, appearance, or finish, relying only on his intuition and experience.

Other famous violin makers of Italy were the Ruggieri (Francesco, known as "il Per," Giovanni Battista, and others), whose instruments bear a general resemblance to the Amatis'; the Rogeri (Giovanni and Pietro) of Brescia; and the Testore (Carlo Giuseppe, Carlo Antonio, and Paolo Antonio) of Milan. A famous German violin maker, scarcely second to the great Italians, was Stainer of Absam, Tyrol (1621–83), whose tradition was continued by the Klotz family of Mittenwald, Bavaria (Matthias, 1653–1743; Sebastian, 1696–1768; and others). Nineteenth of the violins that pass as "Stainers" were made by the Klotz family and their followers. In England violin making began with Thomas Urquhart (active 1648–80) and continued with Edward Pamphilon (fl. 1670–90) and Barak Norman (1688–1740). A French maker of note was Nicolas Lupot (1758–1824), known for his valuable copies of Stradivari violins.

For information concerning other instruments illustrated under Violin and Violin family, see Gusle; Hardingfele (Hardanger fiddle); Hurdygurdy; Lira (Lira da braccio); Tromba marina; Viol (bass viol; lyra viol; baryton); Viola da gamba; Viola d'amore; Viola pomposa.

**Violin concerto.** See under Concerto II, III (b).

**Violin family.** The chief members of this family

are the \*violin, \*viola, \*cello, and \*double bass. These four instruments form the string section of the orchestra, the first three also being used in chamber music (\*string quartet) and the last in \*jazz. For more details, see the separate entries.

A great number of in-between sizes have been constructed, none of which achieved permanent importance. Among them are (in order of size):

(a) Violino piccolo [G. *Quartgeige*]. Tuned a fourth above the violin. Bach scored for this instrument in his Cantata no. 140 and his first Brandenburg Concerto. The *violini piccoli* of

Violin family: 1. Violin. 2. Cello. 3. Viola. 4. Viola pomposa.

Violin family: 5. Vielle (fidel). 6. Hardanger fiddle. 7. Hurdy-gurdy. 8. Lira da braccio. 9. Bass viol. 10. Viola da gamba. 11. Viola d'amore. 12. Lira viol.

Violin family: 13. Kamānja. 14. Gusle. 15. Rebec. 16. Kit. 17. Tromba marina. 18. Sārangi. 19. Rabab. 20. Baryton.

Monteverdi's *Orfeo* (1607) have been interpreted as true violins (*SaHMI*, p. 358), as Bach's *violino piccolo* (A. Moser, in *ZMW* i), as the *pochette* or *\*kit* (*GD* v, opp. p. 524; *GDB* viii, opp. p. 146), and as the modern  $\frac{3}{4}$ -size violin, a major third above the violin (Forsyth).

(b) Contra-violin, introduced (1917) by H. Newbould, slightly bigger than the normal violin and designed to take the place of the second violin in chamber music.

(c) Viola alta, introduced by H. Ritter and used during the Bayreuth festivals 1872–75. This was a larger viola (length 19 in.) and was later provided with a fifth string tuned e".

(d) Contralto, a larger viola with a fuller tone, constructed by J.-B. Vuillaume, 1855.

(e) Violotta, constructed by A. Stelzner in 1891, a tenor violin, measuring 28 in., tuned G d a e'. F. Draeseke, Max von Schillings (*Pfeifertag*), and others have scored for it.

(f) Tenor violin. Name for various instruments between the viola and cello in size (27½ to 29½ in. in length). They were used from the mid-16th century but became obsolete in the 18th century. The most common baroque tuning appears to have been F c g d'. Later attempts to build similar instruments include those of Vuillaume (1855), H. Ritter, A. Stelzner [see (c), (d), (e)], and others. See H. Bessler, *Zum Problem der Tenorvioline* (1949).

(g) Viole-ténor [F.], constructed by R. Faramon in 1930; it is held like a cello. Also called *alto-moderne*.

(h) Violoncello piccolo. An instrument 36 to 38 in. long that Bach frequently preferred to the cello because its smaller size facilitated the execution of solo passages. It was tuned like the cello. The *violoncello à cinque corde*, which Bach scored for in the sixth of his Suites for cello solo, was probably only slightly smaller than the usual cello.

(i) Cellone, constructed by Stelzner [see (e)], a large cello (length 46 in.), tuned G<sub>1</sub> D A e (a fourth lower than the cello) and intended chiefly as a contrabass for chamber music.

(j) Octobasse, constructed by J. B. Vuillaume in 1849, a giant double bass, about 13 feet high, with three strings tuned C<sub>2</sub> G<sub>2</sub> C<sub>1</sub>. They were stopped by a mechanical system of levers and pedals. An American model made by John Geyer in 1889 measures almost 15 feet.

See also Quinton.

**Violin music.** The violin first appeared in Italian polyphonic compositions of the late 16th cen-

tury, with one part marked *Violino*. In this period, however, the term was also used for the *\*viola*, so only the range can indicate which instrument was intended. The *violino* part in Giovanni Gabrieli's celebrated *Sonata pian'e forte* (*Sacrae Symphoniae*, 1597; see *HAM*, no. 173) is obviously written for a viola (range d to a'). On the other hand, many of the canzonas in the same publication have undesignated upper parts that could hardly have been performed on any instrument other than the violin (e.g., Canzona IX, with sixteenth-note passages up and down from f#'' to a''). From similar evidence, it appears that the two *Violini* accompanying the aria "Pos-sente spirito" of Monteverdi's *Orfeo* (1607) are probably violins. Among the first composers of solo violin music were Salomone Rossi (1587–c. 1630) and Giovanni Battista Fontana of Brescia (d. 1631). Rossi published four books, the first three (1607, 1608, with only 2nd ed. of third book preserved, 1623) designated for "due viole," and the fourth (1622) for "due violini" [see W. Newman, *The Sonata in the Baroque Era* (1959), p. 111]. Most probably they all contain music for two violins (and accompaniment). Fontana's compositions are preserved in a posthumous edition of 1641, containing eighteen sonatas, the first six for solo violin and accompaniment [see *HAM*, no. 198; also Wasielewski, *Instrumentalsätze*]. Two composers who treated the instrument with striking virtuosity were Biagio Marini (c. 1595–1665) and Carlo Farina (c. 1600–c. 1640). Their sonatas and other pieces make use of double-stops, trills, and tremolos [see *HAM*, no. 199; *SchGMB*, nos. 182, 183], and in Farina's "Capriccio stravagante" (in *Ander Theil newer Paduanen, Gagliarden*, 1627) these techniques as well as pizzicato, *col legno*, and harmonics are used to imitate the barking of dogs, caterwauling, fifes and drums, etc. [see Wasielewski, *Instrumentalsätze*, no. 11]. Double-stops and higher positions (up to the 5th) are common in the pieces of Marco Uccellini (b. c. 1610; see Wasielewski, Torchi). While virtuoso exploitation of the instrument continued in Germany under J. H. Schmelzer (c. 1623–80), Nicolaus Adam Strungk (1640–1700), Heinrich Ignaz Franz von Biber (1644–1704; see *DTO* 11 and 25; *HAM*, no. 238; *SchGMB*, no. 238; see Scordatura), and J. J. Walther (b. 1650), the Italian composers after 1650 turned to the true musical qualities of the violin and developed its "singing" style. Giovanni Legrenzi (1626–90), G. B. Vitali (c. 1644–92), G. Torelli (1658–1709), and others led up to the "classical" simplicity of

Arcangelo Corelli (1653–1713), who, despite somewhat academic tendencies, holds a central position in the history of violin music [see also Bologna school]. Still another type of violin music, characterized by animated flow and rhythmic precision, was inaugurated by Antonio Vivaldi (1669–1741), whose violin concertos attracted the interest of Bach. Francesco Maria Veracini (1690–c. 1750), Giuseppe Tartini (1692–1770), and Pietro Locatelli (1695–1764) represent the acme of Italian baroque violin music. Their sonatas opened new possibilities of lyric and passionate expression, while their concertos, particularly those of Tartini, are written in a highly virtuoso style. The contemporary French school is represented by J.-B. Anet (c. 1661–1755) and J. M. Leclair (1697–1764).

Bach wrote an early suite (A major) and six sonatas for violin and harpsichord. His six sonatas for violin without accompaniment (actually three sonatas and three suites, one of which includes the celebrated Chaconne) represent a peak in the extensive literature for violin solo, which includes pieces by Thomas Baltzar (c. 1630–63; see *SchGMB*, no. 237), J. J. Walther (*Hortulus Chelicus*, 1688), Nicola Matteis (fl. c. 1672), H. I. F. von Biber (1644–1704), F. Geminiani (1687–1762), G. P. Telemann (1681–1767), and Johann Georg Pisendel (1687–1755) [see A. C. Roncalio, in *The Journal of Musicology* ii, no. 2, 72ff]. The violin pieces of the \*Mannheim group, particularly the sonatas of J. Schobert (c. 1720–67), are written in a dynamic style that foreshadows the idiom of Mozart and Beethoven [see *DdT* 39]. A happy amalgamation of this style with the achievements of the Italian school is represented by G. B. Viotti (1755–1824), of whose twenty-nine violin concertos no. 22 is outstanding (also eighteen violin sonatas and numerous duets). Of his predecessors, Antonio Lolli (c. 1730–1802) and Gaetano Pugnani (1731–98) merit mention.

With Mozart and Beethoven begins a new period of violin music. Throughout the 19th century the favored type of violin music was the concerto [see Concerto II]. Violin sonatas were written by Schumann (3), Brahms (3), Grieg (3), Franck (1), Reger (7; also 11 for unaccompanied violin), Debussy (1), Ives (5), Hindemith (3; also 3 for unaccompanied violin), Bartók (2), Bloch (2), Prokofiev (3), Martinu (3), and many others.

**Violino piccolo.** See Violin family (a).

**Violin playing.** See Bowing.

**Violon** [F.]. Violin. *Violón* [Sp.], viol, bass viol, double bass.

**Violoncello.** See Cello.

**Violoncello piccolo.** See under Violin family (h).

**Violoncino.** Old name for violoncello (cello), e.g., in G. B. Fontana, *Sonate . . . per il violino or cornetto, fagotto, chitarone, violoncino* (1641).

**Violone** [It.]. The largest size of the viols [see Viol IV, 1]. In Diego Ortiz' *Tratado de glosas . . . en la música de violones* (1553) it obviously is a synonym for viola da gamba. Praetorius, in

"Syntagma musicum," describes it as a much larger instrument, approximately of double-bass size. That the name also meant a member of the violin family, "intermediate between the violoncello and the double bass" (*SaHMI*, p. 363), is doubtful. See B. Disertori, in *RMI* xlv.

**Violotta.** See under Violin family (e).

**Virelai** [F.]. I. An important form of medieval French poetry and music (also called *\*chanson balladée*), consisting of a refrain (R) that usually alternates with three stanzas (S): R S<sub>1</sub> R S<sub>2</sub> R S<sub>3</sub> R. The stanzas begin with two rhyming versicles and close with a versicle paralleling the refrain (the term *\*versicle* here means a section of the text; it may consist of one, two, three, or more lines of the poem). The musical structure corresponds exactly to that of the poem, the two parallel versicles being sung to the same music and the closing versicle to that of the refrain. In the following diagram, for R S<sub>1</sub> R and a two-line refrain, the refrain is indicated by italics in the textual structure and by capital letters in the musical structure:

	R	S <sub>1</sub>	R
Text	<i>a b</i>	c c a b	<i>a b</i>
Music	A	b b a	A

The entire musical structure is A b b a A b b a A b b a A, but usually the virelai form is understood to comprise only the first five units. In modern scores it is represented as follows:

A	:B	:
1.5. (refr.)	2. ....	
4. ....	3. ....	

The music B usually has different endings for lines 2 and 3 (*\*ouvert* and *clos*).

A few examples of the virelai have been found in 13th-century sources, one of them, "C'est la fin" (*HAM*, no. 19f), in a late trouvère *chansonnier* (Vaticana, *Fond Christ.*) and three or four others in tenors of motets, among them "E, dame jolie" (*HAM*, no. 19g). Two examples are among the monophonic songs of Jehannot de l'Escurel (d. 1304), preserved in an appendix to the *Roman de Fauvel* [see Sources, no. 8; see P. Aubry, ed., *Le Roman de Fauvel* (1907)]. It was Machaut who established the virelai as one of the *\*formes fixes* of French poetry and music. It continued to be composed in the late 14th century, and sparingly throughout the 15th, by Dufay and Ockeghem [see *HAM*, nos. 74, 75] and by Busnois, who preferred the shorter *\*bergerette*, as did others after him.

II. The virelai is not a form of *\*trouvère* music, as was formerly assumed. More likely its origins are Spanish, and perhaps ultimately Arab [see *Zejel*]. The Spanish *\*cantigas* of the second half of the 13th century (some possibly even earlier) include, among c. 400 songs, more than 100 in strict virelai form and many more showing essentially the same form with some modifications [see below]. The Italian *laude* of the same period also have a general virelai structure but with some variants of the musical form. The strict form appears in 14th-century Italian music, known as the *\*ballata*, and in Spanish music of the 15th and 16th centuries as the *\*villancico*. Unlike the French type, the Italian and Spanish forms do not always restate the refrain after each stanza, nor do they always have the strict conformity of poetic structure to musical form that is characteristic of the French virelai. This is especially evident in their rhyme structure, which in many cases is asymmetrical, e.g., a b | c c c b, instead of symmetrical, a b | c c a b. Practically all the Italian *ballate* (Landini) are asymmetrical. In the Spanish repertory both types are encountered, in the 13th-century *cantigas* as well as in the polyphonic *\*cancioneros* of the 15th and 16th centuries, where the name *villancico* is reserved for the asymmetrical type, the symmetrical one being called *\*canción*. Below are some examples of each type (a, b, etc. indicate rhymes; the designations *ripresa*, *piedi*, *volta* are adopted from the *ballata*):

	<i>ripresa</i>	<i>piedi</i>	<i>volta</i>
Music	A	B B	A
Symmetrical text	1. aa	b b	aa
	2. abba	cd cd	abba
	3. abab	ca ca	abab
Asymmetrical text	4. aa	b b	ba
	5. aa	bc bc	ca
	6. abb	cd cd	dbb

1. *Cantigas*, no. 86 (*\*Editions* IV, 15).
2. *Cancionero del palacio*, no. 30 (*\*Editions* XXXII, 5).
3. *Machaut, Virelai*, no. 3 (L. Schrade, ed., ‡ *Polyphonic Music of the Fourteenth Century*, vol. iii).
4. *Cantigas*, no. 114 (*HAM*, no. 22c).
5. Landini, "Amor c'al tuo soggetto" (*HAM*, no. 53).
6. *Cancionero del palacio*, no. 54 (*\*Editions* XXXII, 5).

Besides the normal virelai form, there are various modified types, particularly in the *laude* and *cantigas*, e.g.:

	<i>ripresa</i>	<i>piedi</i>	<i>volta</i>
Normal.	A B	c c	A B
1.	A B	a a	A B
2.	A B	b b	A B
3.	A B	a a	B A
4.	A B	c c	D B
5.	A B	c d	A B

Types 1, 2, and 3 involve more repeat than the normal form, while the others represent "weakened" modifications.

Lit.: See under Rondeau (1); F. Gennrich, *Rondeaux, Virelais, und Balladen*, 2 vols. (1921, '27); E. Heldt, *Französische Virelais aus dem 15. Jahrhundert* (1916); I. Pope, "Musical and Metrical Form of the Villancico" (*AnnM* ii); G. Reaney, in *MD* xiii; *id.*, in *CP Fellerer*.

**Virga** [L.]. See under Neumes I.

**Virgil clavier.** A practice piano, patented by the American A. K. Virgil in 1892, that has no sound-producing parts but that, by means of a slight click accompanying the depression and the release of the key, gives perfect control over legato playing.

**Virginal.** A type of \*harpsichord with one choir of transverse strings described as early as 1511, in S. Virdung's *Musica getutscht*, a fact that clearly refutes the idea that the name refers to the "maiden Queen Elizabeth." Whether it is so called because "like a virgin, it sound with a sweet and tranquil voice" (Paulus Paulirinus, 1460; see J. Reiss, in *ZMW* vii) or because "virgins play on them" (John Minshen, 1617; see his *Ductor in Linguas*), or with reference to L. *virga* (rod, i.e., jack; see *SaHMI*, p. 335), is uncertain. The earliest virginals were in the shape of a small oblong box, to be placed on a table or even held in the player's lap. Toward the end of the 16th century the term was indiscriminately applied to all types of harpsichord, whether rectangular, wing-shaped, or trapezoidal [see Spinnet]. Thus it cannot be assumed that the virginalist composers wrote for the oblong virginals. The common term was "pair of virginals," an idiom whose origin is not known.

Lit.: F. Hubbard, *Three Centuries of Harpsichord Making* (1965); D. Boalch, *Makers of the Harpsichord and Clavichord 1440-1840* (1956).

**Virginal music.** The earliest extant examples of virginal music are a few dances in an English MS of c. 1530 (Brit. Mus., *Roy. App.* 58), including a "Hornepype" by H. Aston, "My Lady Carey's Dompe" [*HAM*, no. 103], and "My Lady Wynn-

fyld's Rownde." The \*Mulliner Book (c. 1560) also contains some dances, among them "A Pavan" by Newman in the key of C minor. A large repertory of such music exists in the so-called virginal books of the late 16th and early 17th centuries. The most important of these are (in approximate chronological order): (a) "My Ladye Nevells Booke" (1591), containing 42 compositions by William Byrd (ed. H. Andrews, 1926); (b) "Fitzwilliam Virginal Book" (also called, erroneously, "Queen Elizabeth's Virginal Book"), the most extensive and most important collection, containing 297 compositions by practically every composer of the virginalist school (2 vols., ed. J. A. Fuller-Maitland and W. Barclay Squire, 1894-99; for a detailed list of contents, see *GD* v, 545ff; *GDB* ix, 4ff); (c) "Benjamin Cosyn's Virginal Book," containing 98 pieces, chiefly by John Bull, Orlando Gibbons, and Benjamin Cosyn; (d) "Will. Forster's Virginal Book," containing 78 pieces, mostly by William Byrd. Numerous later MSS of less importance are in the libraries of London, New York, and Paris. A printed collection is the \**Parthenia*.

The most important composers of virginal music, arranged in three generations, are: I. William Byrd (1543-1623); II. Thomas Morley (1557-1602), Peter Philips (1561-1628), Giles Farnaby (c. 1560-1640), John Bull (c. 1562-1628); III. Thomas Weelkes (c. 1575-1623), Thomas Tomkins (1572-1656), Orlando Gibbons (1583-1625). The "three famous Masters William Byrd, Dr. John Bull and Orlando Gibbons," as they are called in the title of the *Parthenia*, were born twenty years apart and all of them died in the 1620's. Although Byrd seems to have been the first to concentrate on the virginal, his music qualitatively dwarfs that of all the other virginalists except Gibbons. John Bull is noted mainly for his exploitation of the technical means of the instrument (rapid passages, scales in parallel thirds, broken-chord figures, etc.), a contribution that left traces in the works of Sweelinck and Scheidt.

The repertory of the virginalist composers comprises dances (mainly \*pavanes and galliards), variations, \*preludes, fantasias, liturgical pieces (organ hymns; see also *In nomine*), and transcriptions of madrigals.

*Composers*, rev. ed. (1934); W. Niemann, *Die Virginalmusik* (1919); H. Andrews, ‡*My Ladye Nevells Book* (1926); J. A. Fuller-Maitland and W. Barclay Squire, ‡*The Fitzwilliam Virginal Book*, 2 vols. (1894–99; repr. 1949); *id.*, ‡*Twenty-five Pieces for Keyed Instruments from Benjamin Cosyn's Virginal Book* (1923); William Byrd, ‡*Forty-five Pieces for Keyboard Instruments*, ed. S. D. Tuttle (1939); K. Stone, ed., ‡*Parthenia* (1951); J. M. Ward, ed., ‡*The Dublin Virginal Manuscript* (1954); Thomas Weelkes, ‡*Pieces for Keyed Instruments*, ed. M. H. Glyn (1924); \*Editions XXXIV, 5, 14, 19, 20, 24; H. Andrews, "Elizabethan Keyboard Music" (*MQ* xvi); M. H. Glyn, "Famous Books on Virginal Music . . . in the New York Public Library" (*Musical Courier* lxxviii, 12); T. Dart, "New Sources of Virginal Music" (*ML* xxxv, 93); M.-L. Pereyra, "Les Livres de virginal de la Bibliothèque du Conservatoire de Paris" (*RdM* 1926–33, nos. 20, 21, 24, 28, 29, 37, 42, 45).

**Virtuoso.** A performer who excels in technical ability; sometimes, one who excels in this only. Perhaps the first virtuoso was Arnolt Schlick (c. 1460–after 1517), whose *Ascendo ad patrem meum* [see Arnolt Schlick, ‡*Hommage à l'empereur Charles-Quint*, ed. M. S. Kastner and M. Querol Gavalda (1954)], in six parts for the manuals and four parts for the pedal, indicate he was an amazingly accomplished organist. John Bull (c. 1562–1628) was an eminent master of the harpsichord, as was, more than a century later, Domenico Scarlatti (1685–1757). The virtuoso qualities of the violin were exploited by Carlo Farina (c. 1600–c. 1640), Heinrich Ignaz Franz von Biber (1644–1704), Giuseppe Tartini (1692–1770), and others [see Violin music]. In the 18th century, the famous \**castrati* developed a vocal technique that has never been equaled. The 19th century saw the spectacular rise of virtuoso pianists (Chopin, Liszt, Anton Rubinstein, Leschetizky, Busoni), violinists (Paganini, Sarasate, Jan Kubelík), singers (Mallibran, Sontag, Lind, Melba, Caruso, M. Battistini), and other performers.

**Visigothic chant.** See Mozarabic chant.

**Visitation, The.** Opera by Gunther Schuller (libretto by the composer, based on Kafka), produced in Hamburg, Germany, 1966.

**Vista** [It.]. Sight. *A prima vista*, at sight [see Sight-reading].

**Vite, vitement** [F.]. Fast, quickly.

**Vivace** [It.]. Quick, lively. *Vivacissimo*, very quick.

**Vivement** [F.]. Lively.

**VI.** Abbr. for violin. *Vla.*, viola. *Vlc.*, violoncello. *Vll.*, violins.

**Vocalization** [F. *vocalise*; G. *Vokalise*; It. *vocalizzo*; Sp. *vocalización*]. A long melody sung on a vowel, i.e., without text. The term is used chiefly for vocal exercises (\**solfège*) and so has a somewhat pejorative connotation, implying technical display for its own sake. However, without a text the singer can concentrate on using pure tone in the sense of the instrumentalist, unimpeded by words, for expressive purposes. In the case of study vocalises, the added hazard of a text is eliminated until the sensation of making pure tone has been firmly established. Throughout the early history of singing (i.e., prior to 1800) composers have fully appreciated this fact. Bach's and Handel's works contain numerous highly artistic vocalizations (usually called \**coloraturas*), and the untexted melismas of Gregorian chant are even more remote from any inference of virtuosity for its own sake [see *Neuma*].

Particularly interesting is the role that vocalization played in the polyphonic music of the 13th to 15th centuries. The textless tenors of 13th-century motets, which have frequently been interpreted as "instrumental tenors," are actually vocalizations on the vowel of the \**incipit* [see *Clausula*; Motet A, I]. For an example of a long vocalization in the upper parts of a 13th-century motet, see *ApNPM*, pp. 315ff. Most of the accompanied songs (*ballades* [F.], madrigals) of the 14th century contain long passages without a text, passages that no doubt were to be sung as vocalizations. Unfortunately, some modern editors, such as H. Riemann and A. Schering, have interpreted such passages as "instrumental preludes" (or interludes, postludes), a procedure that frequently leads to an artificial interruption of a continuous melodic line [see, e.g., *RiHM* i.2, 306–34, and *SchGMB*, no. 19; for a correct rendition of Giovanni da Cascia's "Nel mezzo a sei paon," cf. *WoGM* iii, 92ff.]. See also Text and music (reference to Kyrie).

There is a considerable literature of pieces to be performed in vocalization throughout. This manner of performance is indicated in various 16th-century publications inscribed "da cantare e sonare" (to sing and to play), e.g., Willaert's *Ricercari* of 1559 or C. Merulo's *Ricercari da*

*cantare, a quattro voci* (1574). These long pieces (in three or four parts) have no text, and they probably are meant (judging from the precedence given to the word *cantare*) to be vocalized throughout in all the parts. This practice persisted in the numerous two-part *ricercars* of the 17th century, some of which are expressly designated as "vocal exercises" [see *Ricercar* II (d)]. Spontini, in his opera *Nurmahal*, chose vocalization for the "Chorus of Heavenly Spirits," and several later composers have written for vocalizing voices, e.g., Debussy ("Sirènes," movt. 3 of *Nocturnes*, 1899), Ravel (*Vocalise en forme d'habanera*, 1907), Rachmaninoff (*Vocalise*, op. 34, no. 14, 1912), Medtner (*Sonata-Vocalise*, op. 41, no. 1; *Suite-Vocalise*, op. 41, no. 2); and Roussel (*Padmâvatî*, comp. 1914, perf. 1923). See W. Apel, "Die menschliche Stimme als Instrument" (*Zeitschrift: Stimmen* [1949], p. 404); M. Dauge, "Essai sur la vocalise" (*RM*, 1935, no. 16).

**Vocal music.** Music written for voices, either solo or chorus [see Choral music]. Practically all music prior to 1500 is vocal, as is nine-tenths of the music of the 16th century. During the baroque period vocal and instrumental music were about equal in quality and prominence, but after 1750 instrumental music gained the upper hand [see Instrumental music]. Below is a survey of the most important types of vocal music (*italics* indicate accompanied vocal music):

A. Period of superior importance (to 1600). 6th–9th centuries: Gregorian chant. 9th–12th (13th) centuries: Sequence; trope; organum. 12th–13th centuries: Troubadours; trouvères; minnesingers. 13th century: Clausula; conductus; motet. 14th century: Motet; Mass items; *ballade*; *virelai*; *rondeau*; *madrigal*; *ballata*; *caccia*. 15th century: Motet (Flemish); Mass; chansons. 16th century: Motet; Mass; madrigal; polyphonic lied; chanson; frottola; *lute song*; villanella.

B. Period of equal importance (1600–1750): *Cantata*; *opera*; *oratorio*; *aria*; anthem; glee.

C. Period of inferior importance (1750–present): *Lied*; French, English, etc. *song*; *opera*.

Regarding vocal versus instrumental style in early music, see under Ensemble (3). See also S. Kagen, *Music for the Voice: A Descriptive List of Concert and Teaching Material* (1949); J. M. Knapp, ed., *Selected List of Music for Men's Voices* (1952); L. Hibberd, in *MQ* xxviii, no. 2, xxxii, no. 1. Also see under Choral music.

**Voce**, pl. **voci** [It.]. Voice. *A due (tre) voci*, for two (three) voices. *Colla voce*, see *Colla*. *Voce di gola*, throat voice, guttural voice; *voce di petto*, chest voice; *voce di testa*, head voice, \*falsetto. *Voci pari* or *eguali*, equal voices.

**Voces** [L.]. See *Vox*.

**Vodoum**. See Voodoo.

**Voice**. The physical process of voice production was for a long time understood only superficially. Formerly, it was thought that the larynx, containing the "vocal cords," initiates the tone much as the lips do in the mouthpiece of a brass instrument. The breath is pressed upward from the lungs through these "vocal lips," which are held close together, at varying tensions according to the pitch desired, setting the lips and breath into vibration. However, in the case of brass instruments, the player presses his lips together deliberately and learns how much to do so for a desired pitch. The muscular motion of his lips is thus a matter of conscious control. The vocal cords, on the other hand, are not among the muscles that can be controlled consciously. Thus the origin of the sound must lie elsewhere.

Observation of children reveals that sound in singing, as in speech, is originated by an impulse to produce it. A spontaneous, strong impulse of this kind starts deep in the body, moving the muscles of the lower abdomen, which in turn cause the diaphragm to push air from the lungs through the vocal apparatus. The vocal mechanism in turn has been set in position to produce a desired pitch as preconceived by the singer. The resulting tone is modified by contact with all the inner surfaces of the mouth, nose, throat, and even the lungs.

While singers generally concur on what constitutes an agreeable tone, there is a great difference of opinion as to how to achieve this ideal. Physically, singing is intensified and prolonged speech, and the same complex of muscles is used in both processes. Therefore attempts to achieve conscious control over all the muscles is futile. There are, however, initial and important points of control that involve positioning the body, jaw, larynx, and tongue, which in turn shape speech. So-called "natural singers," untutored vocally, among them such figures as F. I. Shaliapin and A. Galli-Curci, have instinctively known how to use and coordinate the proper muscles.

What, however, creates good tone quality? Almost any singer will agree that muscular

tension is the main cause of bad tone. Most often, muscular tension results from undue pressure or restraint of the tone, and such forcing or holding the tone is in turn caused by self-consciousness. Self-consciousness diverts the singer's attention. If he could concentrate wholly on the expression of his song, he would relax and sing well. However, such total concentration is very difficult to attain, and the very presence of tension in a particular area (jaw, throat, etc.) tends to compound the problem.

To counteract tension, teachers use many devices to divert the singer's attention from such problems. For example, the tongue under tension thickens and draws back, partly closing the throat. The back nasal passages become too stretched, or too relaxed; the jaw becomes set and stiff, and a corresponding distortion appears in the tone. If the pupil is taught to "place the voice" or imagine the vibration of the tone gently in the front mouth surfaces and nose, his throat and tongue tend to relax and the nasal passages become free of their own accord. Unfortunately, the singer may then feel that he must push his tone into place, causing a new set of tensions. Various devices are then employed to teach the pupil to "support the breath," leading him to find the knack of avoiding this "forcing." Thinking now of his breath, the pupil tends to strain breathing, feeling that he is aiding the process. Tension returns and he finds his throat closing again.

The great problem of singing, therefore, is to coordinate all of the many areas involved, and different teachers tend to concentrate on different areas and techniques.

For a historical view of the art of singing, see *Singing*.

**Voice exchange** [G. *Stimmtausch*]. The restatement of a contrapuntal passage with the voice-parts exchanged, so that, e.g., the soprano part sings the alto part and vice versa (without the octave transposition found in \*invertible counterpoint). The result of duple or triple exchange can be indicated as:

b a	or	c a b
a b		b c a
		a b c

This method is described by Walter Odington (CS i, 246f), who called it *rondellus* and gives an example of the triple form [see OH i, 320f].

Sporadic examples of voice exchange occur in the 12th-century sources of St. Martial and Compostela [see NOH ii, 302] and are common in the upper parts of the *organa tripla* and *quadrupla* of the school of Notre Dame, as well as in the conductus [see Y. Rokseth, *Polyphonies du XIIIe siècle* iv, 87ff]. The accompanying example shows a double voice exchange from the conductus "Quod promisit" [Wolfenbüttel

MS 677, f. 130']. The conductus "Veris ad imperia" [Florence, *Plut.* 29.i, f. 228; see F. Gennrich, *Grundriss einer Formenlehre* (1932), p. 85] begins with a duple exchange over a repeated tenor, whereas a "Benedicamus Domino" [*ibid.*, f. 47v, also in Codex Huelgas, f. 25v; see Gennrich, p. 88] consists entirely of triple exchanges:

<b>"Veris"</b>	<b>"Benedicamus"</b>
c b c	c a b c a b c
b c b	b c a b c a b
a a a etc.	a b c a b c a etc.

In the late 13th century the technique of voice exchange was taken over by English composers, who used it as a structural device rather than a stylistic element. Many of the compositions of

the so-called school of Worcester are, or include, *rondelli*, usually duple *rondelli* over a repeated tenor [ex. in *HAM*, no. 57a].

Voice exchange, although usually not recognized as such, is used in all \*rounds. It also occurs in the two upper parts of baroque trio sonatas. See J. Handschin, in *ZMW* x, 535; *id.*, in *ZMW* xvi, 119; M. Bukofzer, in *MQ* xxvi, 35.

**Voice-leading.** In contrapuntal music, the principles governing the progression of the various voice-parts (particularly those other than the soprano), especially in terms of the individual lines. Among such principles are preference of step-wise motion (at least in the three upper parts), contrary motion in at least one part, and avoidance of parallel fifths and octaves.

**Voices, range of.** Human voices are usually divided into six ranges: three female voices, soprano, mezzo-soprano, and contralto, and three male voices, tenor, baritone, and bass. In choral singing the middle voice of each group may be omitted. The normal range of these voices is roughly an octave (or a seventh) below and above the notes d, f, a, and e', g', b' [see Ex.]. The

Bass Baritone Tenor Contralto Mezzo Soprano

indication of range differs markedly in different countries, e.g., England, Italy, Germany, Russia.

Trained soloists frequently exceed these ranges. The soprano Lucrezia Agujari (1743–83) could reach c''', and a bass part in Handel's *Aci, Galatea e Polifemo* (1708), written for Giuseppe Boschi, shifts, within one measure, from a' to C#, more than two and one-half octaves. Some Russian basses have reached F<sub>1</sub>, a fifth below low C. Contemporary composers often demand such tremendous ranges.

Opera singers are further classified, mainly with regard to the character and timbre of the voice:

*Dramatic soprano*, with powerful voice and marked declamatory and histrionic ability; *lyric soprano*, with lighter quality and pleasant cantabile style; *coloratura soprano*, with great agility and a high range.

*Dramatic contralto*, with slightly lower range than the dramatic soprano (one or two tones) but capable of producing a powerful sound, as well as great dramatic expression.

*Tenore robusto* (robust tenor), with full voice and vigor; *lyric tenor*, corresponding to the lyric soprano; *Heldentenor* (heroic tenor), combining agility, brilliant timbre, and expressive power.

*Basso profondo* [F. *basse profonde*], with low range, powerful voice, and solemn character; *basso cantante* [*basse chantante*], with qualities similar to the lyric soprano; *basso buffo*, comical, agile bass.

**Voicing.** In organ building, adjustment of the timbre and pitch of the pipes. In piano building, the adjustment of the hammer felts to produce a pleasing timbre.

**Voilé** [F.]. Veiled, subdued.

**Voix** [F.]. Voice. *Voix de poitrine*, chest voice; *voix de tête*, head voice; *voix mixte*, the medium register. *Voix céleste*, organ stop; see Organ IX (c).

**Voix de ville** [F.]. See under *Vaudeville*.

**Vokal** [G.]. Vowel. *Vokalisieren*, to vocalize; *Vokalise*, vocalization.

**Volante** [It.]. Rushing.

**Volkslied** [G.]. Folksong.

**Volkstümliches Lied** [G.]. The German art song of the latter part of the 18th century, which, in reaction to the alleged artificiality of the coloratura aria [G. *Kunstlied*], reverted to a somewhat affected simplicity of expression and style approximating folk music. Representative composers of such songs include J. A. P. Schulz (1747–1800), J. F. Reichardt (1752–1814), K. F. Zelter (1758–1832), and F. Silcher (1789–1860). See Lied IV; Berlin school. Ex. in *SchGMB*, no. 309b.

**Volles Werk** [G.]. Full organ.

**Volo di Notte, II** [It., The Night Flight]. Opera in one act by L. Dallapiccola (libretto after A. Saint-Exupéry), produced in Florence, 1940. Setting: Buenos Aires airport, about 1930.

**Volta, volte** [It.]. (1) A dance of the period c. 1600, usually in dotted 6/8 meter. It was extremely popular, perhaps owing to its lascivious connotations (e.g., in the dance, the woman was lifted high in the air). English writers (Shakespeare) and musicians often called it *Lavolta* or *Levalto*. (2) See under *Ballata*. (3) In modern scores, *prima* and *seconda volta* indicate the first and second ending of a section to be repeated: *Ta* || *2a*. See also *Ouvert* and *clos*.

**Volteggiando** [It.]. Crossing the hands (in piano playing).

**Volti** [It.]. Turn over (the page); *volti subito* (abbr. u.s.), turn quickly.

**Voluntary.** Name for an English organ piece played at the church service. As suggested by the name, voluntaries originally were free, quasi-improvisatory pieces. Thus, Morley says in his *A Plaine and Easie Introduction to Practicall Musicke* (1597): "To make two parts upon a plainesong is more hard then to make three parts into voluntary." The earliest voluntaries (*Mulliner Book*, c. 1550) are short pieces in imitative counterpoint, not based on a *cantus firmus* (plain-song). Three voluntaries by Byrd are in "My Ladye Nevells Booke" [see Virginal music]; others are among keyboard works by O. Gibbons and T. Weelkes [see the editions by M. H. Glyn]. During the 17th and 18th centuries the voluntary changed along with general changes in style, incorporating elements of the prelude, toccata, operatic aria, suite, sonata, etc., and frequently far exceeding the limitations of proper church style. Among the composers of such voluntaries are Benjamin Rogers (1614–98), John Blow (1648/9–1708), Purcell (c. 1659–95), John Stanley (1713–86), Maurice Greene (1695–1755), Thomas Roseingrave (1690–1766), Samuel Wesley (1766–1837; see *GD* v, 700ff; *GDB* ix, 262ff), and numerous lesser composers of the 18th and 19th centuries.

The voluntary had no fixed place in the service but was most commonly played either between the reading of the psalms and the first lesson, or between the end of Morning Prayer and the beginning of Communion. During the 19th century voluntaries began to be used as preludes and postludes, those written for this use generally being called opening and concluding voluntaries. In many churches today a voluntary is played as an \*offertory piece. Voluntaries were and still are frequently improvised, and during the late 19th and early 20th centuries they often degenerated into transcriptions from anthems, oratorios, and instrumental works, a practice that by now has fortunately almost vanished through the efforts of contemporary composers of voluntaries, such as H. Willan, E. Thiman, and many others.

Lit.: C. H. Trevor, ed., ‡*Old English Organ Music for Manuals*, 4 vols. (1966); G. Frotscher, *Geschichte des Orgelspiels und der Orgelkomposition*, 2 vols. [1935, '36], *passim*. add. by B.J.O.

**Voodoo, vodoum.** Haitian ritual that represents a mixture of European and African traditions. It is a sort of social and religious code to which most of the songs and dances of the country are related and with which the most important native instruments are associated. Hence the term is also used for certain drums [see *Arada* drums], for various styles of dancing and singing, and for a vast system of magical practices in which music plays an important role. J.O.S.

**Vorausnahme** [G.]. Anticipation.

**Vorbereiten** [G.]. To prepare in advance (organ stops).

**Vordersatz** [G.]. First subject.

**Vorhalt** [G.]. Suspension (*vorbereiteter Vorhalt*) or appoggiatura (*freier Vorhalt*).

**Vorimitation** [G.]. In organ chorales or vocal settings of chorales, the fugal treatment of a

chorale line (or its initial motif), frequently in halved or quartered note values (\*diminution), in preparation for the final appearance of the chorale line in full note values. Usually each line of the chorale is preceded by such a *Vorimitation*. See Ex., from Bach's organ chorale *Ach Gott und Herr* (BG xl, 5).

**Vorschlag** [G.]. See Appoggiatura (2). *Kurzer, langer Vorschlag*, short, long appoggiatura.

**Vorspiel** [G.]. Prelude, overture. Also, performance (*vorspielen*, to perform before an audience).

**Vortrag** [G.]. Interpretation; performance.

**Vortragszeichen** [G.]. Expression marks.

**Vorwärts** [G.]. Go ahead, continue.

**Vorzeichnung** [G.]. Signature, both of key and of meter.

**Vox**, pl. *voces* [L.]. In medieval treatises, the word has the following meanings: (1) Sound, tone color. Aurelianus Reomensis (c. 850) enumerates, in a chapter called "De vocum nominibus" [GS i, 34f], a large number of types, e.g., *vox*

*harmonica* (human voice), *v. organica* (organ, wind instruments), *v. spissa* (thick, low?), *v. acuta* (high), *v. aspera* (rough), *v. pinguis ut virorum* (fat, as that of men), *v. vinola . . . flexibilis* (charming, flexible), etc. Adhemar von Chavanne (d. 1034) speaks of *voces tremulas, vinnolas, collisibiles*, which the Franks supposedly could not master [see *ApGC*, p. 116]. (2) In the "Musica enchiriadis," *vox principalis* and *vox organalis* mean the two voice-parts of organum (*GS* i, 152ff). (3) Same as note, pitch; i.e., the seven notes of the scale (Guido, *septem discrimina vocum*; *GS* ii, 7). Later the term was used especially for the six notes of the hexachord, called *sex voces* or *voces musicales*. In Josquin's *Missa*

*L'Homme armé super voces musicales*, the *L'Homme armé* melody is used successively on the degrees of the hexachord from c to a. In Senfl's *Fortuna ad voces musicales* [*SchGMB*, no. 86], the counterpoint to the *Fortuna* melody consists of the *hexachordum naturale* as it was used in elementary instruction: c c-d c-d-e c-d-e-f, . . . c-d-e-f-g-a, and descending.

**V.s.** Abbr. for *\*volti subito*.

**Vuoto** [It.]. "Empty," toneless. *Corda vuota*, open string.

**Vv.** Abbr. for violins.

## W

**Wachsend** [G.]. Growing, increasing.

**Wagner tuba.** See under Tuba.

**Wait.** Originally, an English town watchman who (like the *Nachtwächter* in Wagner's *Meistersinger*) sounded the hours of the night. In the 15th and 16th centuries the waits developed into bands of musicians, paid by the town and supplied with handsome uniforms, who played on ceremonial occasions. At Christmas they performed before the houses of notables; it is this meaning that has survived, a wait today being a street performer of Christmas music. The term wait (wayte) was also used for the waits' characteristic instrument, a shawm, as well as the tunes played by the various local guilds, e.g., London Waits, Chester Waits. Many of these tunes are preserved in 17th- and 18th-century dance books, such as J. Playford's *The English Dancing Master* (1651). See W. L. Woodfill, *Musicians in English Society from Elizabeth to Charles I* (1953); G. Hayes, *King's Music* (1937); L. Langwill, *The Waits* [1953]; A. H. Frere and F. W. Galpin, "Shawms and Waits" (*ML* iv, 170ff); J. C. Bridge, "Town Waits and Their Tunes" (*PMA* liv).

**Waldhorn** [G.]. The French \*horn, either natural or with valves.

**Waldstein Sonata.** Beethoven's Piano Sonata in C, op. 53 (1803–04), dedicated to Count Ferdinand von Waldstein. It consists of three movements, the second being a relatively short Adagio in somewhat improvisory style, serving as an introduction to the Finale, a long movement in rondo form.

**Wales.** See under Bard. Also see P. Crossley-Holland, *Music in Wales* (1948).

**Walküre, Die.** See *Ring des Nibelungen, Der*.

**Waltz.** A dance in moderate triple time that originated c. 1800 and not only has retained its popularity to the present day, but has, time and again, inspired composers. The waltzes of Beethoven [sup. vol., ser. xxv of B.-H. edition; cf. also the well-known theme of the Diabelli Variations] still resemble the earlier *Ländler* or *deutsche Tanz*, as do, to some extent, Schubert's numerous waltzes [vol. xii of comp. ed.]. Weber's "Aufforderung zum Tanze" (1819) is the first example of the characteristic rhythm and accompaniment associated with the waltz. Later notable composers of waltzes include Chopin, Johann Strauss (father and son; see *DTO* 63 and 68), Berlioz (*Symphonie fantastique*), Brahms (*Liebeslieder*), Richard Strauss (in *Der Rosenkavalier*), and Ravel (*Valses nobles et sentimentales*; also *La Valse*, for orchestra).

The waltz developed from an Austrian peasant dance, the \**Ländler* (the erroneous theory of its French origin and derivation from the \**volta* is discussed in *GD* v, 623; *GDB*, ix, 165). As early as 1700 its characteristic idiom appeared in the ritornello of a pastoral Singspiel [see Ex.].

As a dance in which the partners embraced one another, the waltz evoked both enthusiastic response and violent protest. Burney, in Rees' *The Cyclopaedia* (c. 1805), speaks of the "familiar treatment" and "obliging manner in which the freedom is returned by the females" and, probably confusing *walzen* with *sich wälzen*, makes an allusion to "rolling in the dirt of mire." Although the waltz was already popular in Vienna in the time of Haydn and Mozart—the Irish singer Michael Kelly records its vogue in 1783 [*The Reminiscences of Michael Kelly*, 2 vols. (1826)]—it is misleading to assume that Haydn and Mozart wrote waltzes. Mozart's *Deutsche Tänze* (K. 509, 536, 567, etc.) are true *Ländler* in musical style. Beethoven's name has been associated with a number of waltzes ("Beethoven's Last Waltz," "The Spirit Waltz," "Jubelwalzer") so utterly trivial that such attribution is clearly false.

Lit.: E. Reeser, *The History of the Waltz* [1949]; M. Carner, *The Waltz* (1948); B. Weigl, "Die Geschichte des Walzers" (*Musikalisches Magazin* xxxiv [1910]); I. Mendelssohn, in *StM* xiii; P. Nettl, in *BUM* iii; H. J. Ullrich, in *Musicology* ii, no. 2.

**Walze** [G.]. (1) Crescendo pedal of the organ. (2) An 18th-century term for stereotyped undulating figures, such as an \**Alberti* bass.

**Wanderer-Fantasie** [G., Wanderer Fantasy]. Schubert's Fantasy (actually a sonata) in C for piano, op. 15 (1822), so called because the second movement is a series of variations on a theme from his song "Der Wanderer" (1816). The initial pattern of this theme is also used at the beginning of the other three movements, making this work the earliest example of a completely \*cyclic sonata.

**Wärme, mit** [G.]. With warmth.

**War of the Buffoons** [F. *querelle (guerre) des bouffons*; G. *Buffonistenstreit*; It. *guerra dei buffoni*]. A famous quarrel that developed in 1752 between two parties of Parisian musicians and opera enthusiasts—those favoring the national French serious opera (exemplified by the works of Lully, Rameau, Destouches) and those preferring the Italian *opera buffa* (e.g., that of Pergolesi). Pergolesi's comic opera *La Serva padrona*, composed in 1733 as an \*intermezzo, had been first given in Paris in 1746 without arousing more than moderate interest. The second performance, however, given in 1752 by a troupe of Italian comedians (*buffi*), led to a quarrel that split Paris in two. The national party consisted largely of the aristocracy (including Louis XV and Madame de Pompadour) and plutocracy, while the Italian side was taken by intellectuals and connoisseurs of music (including the Queen, Rousseau, D'Alembert, and Diderot). The latter considered Italian opera superior because it had more melody, expression, and naturalness, and had shaken off completely the "useless fetters of counterpoint." In effect, the *querelle des bouffons* was a fight between the rising rococo and the dying baroque. [For a similar movement in Spain, see *Zarzuela*.] Rousseau's famous *Lettre sur la musique française* of 1753 (repr. in part in *SSR*) was one of numerous pamphlets issued during this controversy. The efforts of French musicians to compete with the popular *opera buffa* resulted in a new kind of French comic opera known as *comédie mêlée d'ariettes* [see Comic opera II C].

Lit.: G. Cucuel, *Les Créateurs de l'opéra-comique français* (1914); L. Richebourg, *Contribution à l'histoire de la "Querelle des Bouffons"* (1937); N. Boyer, *La Guerre des bouffons et la musique française 1752–54* (1945); E. Hirschberg, *Die Encyclopädisten und die französische Oper im 18. Jahrhundert* (1903); L. de La Laurencie, in *BSIM* viii (1912); A. van der Linden, in *CP Masson* ii.

**Wasserorgel** [G.]. \*Hydraulos.

**Water Music**. Orchestral suite by Handel, composed in 1715 for a celebration that took place in boats on the Thames. See W. Michael, in *ZMW* iv.

**Wechsel-** [G.]. Change. *Wechseldominante*, the dominant of the dominant, i.e., the (major) supertonic. *Wechselgesang*, alternating or antiphonal singing. *Wechselnote* is somewhat loosely used for \*nonharmonic tones involving

a change of direction, e.g., *cambiata*, *échappée*, *appoggiatura*; *verlassene* or *Fux'sche Wechselnote* is always the *cambiata*, particularly in combination with a suspension:

**Wedge Fugue.** Popular name for Bach's great organ fugue in E minor, so called because of the increasingly wider intervals in the subject.

**Wehmütig** [G.]. Sad, melancholy.

**Weihnachtsmusik** [G.]. Christmas music.

**Weihnachts Oratorium** [G.]. See *Christmas Oratorio*.

**Wellingtons Sieg** [G., Wellington's Victory]. A "battle symphony" by Beethoven (full title: *Wellingtons Sieg oder die Schlacht bei Vittoria*, op. 91, 1813), written in celebration of Wellington's victory over Napoleon. It consists of English and French fanfares, settings of "Rule Britannia" and "Marlborough s'en va-t-en guerre," the Battle (punctuated by English and French guns), a Charge, and, in the second part, a Victory Symphony containing a quotation from "God Save the King." It was originally written for a mechanical instrument invented by Mälzel but was orchestrated by the composer.

**Well-Tempered Clavier, The** [G. *Das Wohltemperierte Clavier*]. Bach's collection of 48 [see Forty-eight] preludes and fugues, published in two parts (1722, '44), each of which contains 24 preludes and fugues, one for each major and minor key (C major, C minor, C# major, C# minor, etc.). The name refers to the then novel system of equal temperament [see Temperament III], which made it possible to play equally well in all the keys and of which Bach's collection was the first complete realization [see, however, the reference to Cima (1606) under Transposition II]. The first printed edition appeared in 1799 (Kollmann, London). The pieces in the two collections date from various periods of Bach's life. The most obvious difference in style between the first and second parts lies in the preludes in aria style and binary form, which appear in the second collection but not in the first. The "proper" instrument for these pieces, i.e., harpsichord or clavichord, has long been disputed. In this problem, as in many others concerning early music, the "either-or" point

of view has proved detrimental. Some writers have gone so far as to maintain that certain preludes of the *Well-Tempered Clavier* are written for clavichord while the corresponding fugue is written for the harpsichord.

An important forerunner of Bach's work is J. K. F. Fischer's *Ariadne musica* (c. 1700; ed. by E. von Werra, 1901), which contains 20 preludes and fugues in 19 different keys. Particularly interesting is the unmistakable thematic similarity between some of Fischer's fugues and those of Bach in the same key, e.g., those in G minor (*Wt. Cl. i*), E major (*Wt. Cl. ii*), and F major (*Wt. Cl. i*), a similarity too striking to be coincidental [see *HAM*, no. 248]. On the other hand, a collection of 24 preludes and fugues by B. C. Weber, with the same title as Bach's first collection, is not a forerunner but an imitation of Bach's work (the date 1689, which appears on the MS of the Brussels Conservatory, is spurious; Weber lived from 1712 to 1758). See W. Tappert, in *MfM* xxxi, no. 8, 123-27 and no. 9, 129-33; ed. in *Veröffentlichungen der Neue Bach-Gesellschaft* xxxiv (1933).

Lit.: J. A. Fuller-Maitland, *The "48," Bach's Wohltemperiertes Clavier* (1925); C. Gray, *The Forty-eight Preludes and Fugues of J. S. Bach* (1938); W. Emery, "The London Autograph of 'The Forty-Eight'" (*ML* xxxiv, 106ff). See also under Keyboard music.

**Welsh music.** See under Bard; Wales.

**Werk principle.** In organs, a rule often followed in the 16th, 17th, and 18th centuries, according to which the pipework controlled by any one keyboard of the organ is set forth in its own separate tone cabinet, separated both aurally and visually from the pipework controlled by the other keyboards. Implicit is the concept of each keyboard, including the pedal, as a separate instrument in its own right. See Organ VII.

C.B.F.

**Werther.** Opera in four acts by J. Massenet (libretto by E. Blau, P. Milliet, and G. Hartmann, based on Goethe's *Die Leiden des jungen Werthers*), produced (in German) in Vienna, 1892. Setting: Germany, 1772.

**Western Wynde.** An English tune of the 16th century, known from three Masses, by Taverner, Tye, and J. Shepherd, that use it as a *cantus firmus*. In Taverner's setting [\*Editions LI, 1] the melody is stated 34 times, so that the Mass consists of 34 sections, each a "variation" of

the tune [see H. B. Collins, in *PMA* xxxix, 58]. Two of the sections, "Benedictus" and "Osanna," are in *HAM*, no. 112. J. Shepherd followed this plan but reduced the number of sections to 23. The *Qui sedes* from Tye's setting is partly reproduced in *OH* ii, 326f.

**Whistle.** A small, simple, end-blown pipe, made of wood, cane, metal, or plastic.

**Whistle flute.** In the classification of instruments, generic designation for flutes blown by means of a "flue" [see Instruments III, B, 2, c]. A synonymous term is fipple flute. The upper end of the pipe is stopped by a plug or fipple [G. Block, hence *Blockflöte* for recorder], with a narrow slit remaining (flue). The breath is led through the flue toward the sharp edge of a small opening below the fipple. The same principle is used in organ flue pipes [see Organ VIII]. The whistle flutes include the \*recorders and flageolets. The flageolets differ from the recorders mainly in that they have fewer finger holes, four in front and two thumb holes in the rear. In the 19th century the flageolet acquired keys. See N. Bessaraboff, *Ancient European Musical Instruments* (1941), pp. 60ff. For ill. see under Flute.

**Whole note.** See under Notes.

**Whole tone.** The interval of the major second. See Interval.

**Whole-tone scale** [G. *Ganztonleiter*]. A scale consisting of whole tones only, six to the octave. Only two such scales exist: c-d-e-f $\sharp$ -g $\sharp$ -b $\flat$ -c' and c $\sharp$ -d $\sharp$ -e $\sharp$ -f-g-a-b-c $\sharp$ '. The whole-tone scale lacks three fundamental intervals of traditional music, the perfect fifth, perfect fourth, and leading tone. Thus its use by Debussy represented a rebellion against the harmonic system of the 19th century. Owing to the presence of only one kind of interval, the whole-tone scale completely lacks the feeling of "centralization" and "localization" that, in the normal scales or in church modes, is indicated by the term "tonic." Its inherent indecision and vagueness make it appropriate for the impressionist style but at the same time limit its usefulness for other styles. Indeed, after a short vogue in the first decade of the 20th century, it lost most of its appeal and is seldom used today. Rebikov's (1866-1920) *Les Démones s'amuse* is written entirely in the whole-tone scale, as are sections of Debussy's "Voiles" (from *Préludes pour piano*, 1910; see Ex.). Whole-tone formations in earlier composi-

tions (Schubert, Rossini, Berlioz) are merely modulatory progressions within the conventional system of melody and harmony. An "Ut, re, mi, fa, sol, la" by John Bull [\*Editions XXXIV, 14, p. 56] is based throughout on such progressions. A true whole-tone scale occurs repeatedly in Glinka's opera *Russlan and Ludmilla* (composed 1842).

**Whole-tube instruments.** See under Wind instruments II.

**Wie aus der Ferne.** See *Ferne*.

**William Tell.** See *Guillaume Tell*.

**Winchester Troper.** See under Troper.

**Wind band.** See Band.

**Wind cap** [G. *Windkapsel*]. In 16th-century double-reed instruments, a cylindrical cap (also called reed cap), with a blowhole on top, that was placed over the upper end of the pipe, enclosing the reeds from the lips of the player. Thus the reed was set in vibration by a wind pressure comparable to that of the organ. The wind cap was used mainly on the crumhorns [see Oboe family III; also see ill. of crumhorn under Oboe family].

**Wind chest.** In organs, an airtight box that receives the wind from the bellows and controls its passage to the pipes. See Organ I.

**Wind gauge.** (1) Device for indicating the pressure of air in the bellows of organs. It is usually a simple S-shaped tube partly filled with water, the pressure being measured in inches of water. It is used by organ builders to check chest pressures before \*voicing. (2) In older organs, a device that indicated to the organist when sufficient pressure was available for playing.

**Wind instruments.** Generic name for all instruments in which the sound-generating medium is an enclosed column of air. They are also known as aerophones, although strictly speaking the aerophones also include the "free aerophones," which usually are not included in the category wind instruments [see Instruments III A, B]. The main wind instruments are the \*brass instruments (\*trumpets, \*horns, \*trombones, \*tubas, etc.), and \*woodwinds (\*flutes, \*clari-

nets, and \*oboes); there is a separate entry for each of these [see also Reed].

I. In each wind instrument an enclosed column of air, cylindrical or conical (depending on the bore of the instrument), is set into vibration [see Acoustics V]. Neither the material (whether brass or wood) nor the shape (whether straight or bent) is important. The pitch of the sound produced depends on the length of the pipe and whether the pipe is an open or closed resonator; its timbre depends mainly on the mouthpiece (single reed in the clarinets, double reed in the oboes, mouth-hole in the flutes, cupped mouthpiece in the trumpets, funnel mouthpiece in the horns, etc.), shape of the bore, widening of the bell, etc.

II. A pipe of given length gives one tone only. However, by proper control of the breath and lips, called *overblowing*, a pipe can easily be made to sound not only its normal tone, the fundamental, but also the higher harmonics. These tones constitute the "natural tones" of a wind

instrument, e.g.:  $c \ c' \ g' \ c'' \ e'' \ g'' \ b^{b''} \ c''' \ d''' \ e'''$ , etc. Another name for the fundamental tone is *pedal tone*. In a number of instruments the pedal tone is practically unobtainable, and a distinction is made between *whole-tube instruments*, in which the air column can be made to vibrate as a whole, thus producing the pedal tone, and *half-tube instruments*, in which even the slightest air pressure is likely to set up vibrations of the half length, thus producing the first harmonic ( $c'$ ). To the former category belong all the woodwinds and the brass instruments of wide bore (tubas); to the latter, nominally, the brass instruments of narrow bore (trumpets, horns, trombones, higher saxhorns). Today, however, skilled players can obtain the pedal notes on trumpets and saxhorns, so that the French horn and the trombone in the lower positions of the slide remain, for all practical purposes, the only half-tube instruments.

III. The description above applies to the so-called *open pipes*, i.e., pipes that are open at their lower end. If a pipe of the same length is closed at the lower end (*stopped pipe*), its fundamental is an octave lower than in the open pipe [see Acoustics V], and, moreover, only the odd-numbered partials above this fundamental are obtainable. If an open pipe and a stopped pipe half its length are compared, the fundamentals will be the same but the natural series will differ as follows:

	1	2	3	4	5	6	7	8	9	10
Open 4' pipe	$c$	$c'$	$g'$	$c''$	$e''$	$g''$	$b^{b''}$	$c'''$	$d'''$	$e'''$
Stopped 2' pipe	$c$		$g'$		$e''$		$b^{b''}$		$d'''$	

Stopped pipes are frequently used in organ building to obtain lower tones from relatively short pipes [see Organ IX (b)]. Wind instruments with a cylindrical bore usually act as stopped pipes although they are not actually stopped at the lower end. The most important instrument of this type is the clarinet, which is said to "overblow at the fifth" (actually, at the twelfth), whereas the instruments with a conical bore (oboes, horns, etc.) overblow at the octave. The German name for the former is *quintierend* [F. *quintoyer*] and for the latter *oktavierend* [F. *octavier*].

IV. In a wind instrument that consists simply of a pipe, only the natural tones are available (e.g., the "natural" horn or trumpet). In order to obtain the numerous tones between the gaps of the natural series, there must be a means of temporarily shortening or lengthening the pipe. Four main kinds of device are so used: (a) slides; (b) crooks; (c) valves; (d) side holes.

(a) Slide. The instrument consists of two separate portions of tubing, one sliding inside the other so that it can be drawn out. Thus the tube can actually be lengthened, and in each position a new series of natural tones, beginning respectively with C, B,  $B^b$ , etc., becomes available. Since the largest gap in the series of overtones is the fifth ( $c-g'$ ), a complete chromatic scale can be obtained by the combined tones of seven series of overtones, e.g., from  $c-g-c'$ ... down to  $F\sharp-c\sharp-f\sharp$ .... This principle is used with the \*trombone.

(b) Crook or shank. An additional piece of tubing is inserted by the player when needed. Since adding a crook or shank takes time, it does not really serve to fill in the gaps of the natural scale but only gives the instrument a different (lower) tuning for different pieces or different sections of a piece. This method was used with trumpets in the 18th century [see Trumpet II; also Horn II].

(c) Valves. The name is misleading, since what is really meant are crooks attached permanently to the instrument, to be opened and closed momentarily by means of a valve. Normally the instrument is provided with three valves (I, II, III), which lower the pitch respectively by 2, 1, or 3 semitones, while their combined use yields a lowering of 5 (I + III), 4 (II + III), and 6 (I + II + III) semitones. Thus seven series of over-

Miscellaneous wind instruments: 1. Sheng. 2. Bagpipe. 3. Harmonica (shown twice its actual size in relation to the others). 4. Accordion. 5. Mélophone.

tones become available, resulting in a complete chromatic scale, as explained under (a). Also see Valve.

(d) Side holes. These are holes bored in the side wall of the instrument (today, in woodwinds only; formerly, also in trumpets and cornets, e.g., key trumpet, key bugle) that can be opened and closed by the fingers, usually with the help of a key mechanism [see Key (1)]. If all the holes are closed, the pipe sounds its fundamental. If some of the holes are opened, the acoustical length of the air column is shortened and higher tones are produced.

In the horns pitch can also be altered by "stopping" [see Horn].

For the miscellaneous wind instruments illustrated in this article, see the separate entries for each.

For bibl. see under Brass instruments; Woodwinds.

**Wind machine** [F. *Éoliphone*; G. *Windmaschine*]. A device designed to imitate the sound of wind, occasionally used for descriptive purposes (R. Strauss, *Don Quixote*, *Eine Alpensinfonie*). It consists of a barrel framework covered with cloth, which is rotated so that the cloth rubs against cardboard or wood.

**Winterreise** [G., Winter Journey]. Cycle of twenty-four songs by Schubert, in two parts, composed in 1827 to poems by Wilhelm Müller. They are romantic pictures of a rejected lover's lonely journey in wintertime.

**Wirbel** [G.]. (1) Peg of a violin; *Wirbelkasten*, pegbox. (2) A drum roll.

**Wohltemperierte Clavier, Das** [G.]. See *Well-Tempered Clavier, The*.

**Wolf** [G.]. Any disagreeable effect resulting from imperfect tuning in instruments, e.g., by organ pipes not quite in tune. Specifically: (1) The slight difference in pitch between G $\sharp$  and A $\flat$  in the mean-tone system, and similar discordance in other systems of unequal temperament [see Temperament II]. (2) In violins and cellos, *Wolf-note* is a term used for certain tones that differ markedly in both intensity and quality from those in adjoining parts of the compass. This undesirable effect is particularly noticeable near the F $\sharp$  on the D-string of the cello, a tone that has a poor and somewhat wobbly sound. In the violin a similar effect occurs near the C $\sharp$  on the A-string. The wolf is found in practically all instruments, regardless of their quality. In fact,

the more sonorous the general sound of the instrument, the more obtrusive the wolf. The wolf has often been attributed to some defect in construction of the particular instrument, e.g., uneven thickness of the belly, unequal elasticity of the wood, etc. However, later investigators have shown that it is a defect inherent in the design of the violin and other instruments of the same family, the result of particularly strong vibration patterns of the belly. See C. V. Raman, in *Nature*, vol. xcvi (1916), 362f, and in *Philosophical Magazine* xxxii (1916); J. A. Kessler, "Mechanical Operation of Stringed Instruments: Wolf notes" (honors thesis Harvard Univ., 1942).

**Woodwinds**. See under Orchestra I; Wind instruments.

**Worcester, school of**. A repertory of English compositions of c. 1300, many of which seem to have originated at the Cathedral of Worcester. They are preserved only in fragments, the original sources having been cut up to serve as fly-leaves. A characteristic trait of the Worcester style is the frequent use of \*voice exchange. Some pieces are remarkable for their extensive employment of \*sixth-chord style. Ex. in *HAM*, nos. 57a, b.

Lit.: Dom A. Hughes, ‡*Worcester Mediaeval Harmony* (1928); L. A. Dittmer, ‡*The Worcester Fragments* (1957); *id.*, "An English Discantuum Volumen" (*MD* viii); *id.*, "Binary Rhythm, Musical Theory and the Worcester Fragments" (*MD* vii); K. J. Levy, "New Material on the Early Motet in England" (*JAMS* iv).

**Word painting**. The expression through music of the ideas presented or suggested by the words of a song or other vocal piece. The term usually refers to the portrayal of single words or phrases

that lend themselves to specific treatment, rather than the rendition of the "general mood" of the text. Modern composers usually reject word painting as naïve. In earlier music, however, particularly in the baroque period, it played a prominent role. It is hardly an exaggeration to say that, in the entire vocal literature of the baroque, it would be difficult to find the word "heaven" or "water" without an ascending or undulating motion in the music. As explained under Program music II, there are two main kinds of direct word painting: imitation of natural sounds (laughing, fanfares, birds), and imitation of physical movements (running, falling, ascending, descending). Both may, of course, occur with associated words, such as "war" (fanfare), "heaven" (ascent), "death" (fall). The accompanying examples from Bach's cantatas nos. 8, 26, and 12 illustrate the descriptive treatment of the words "Ruhstatt" (resting place), "Tropfen" (drops), and "Ich folge" (I follow). There are, of course, other associations that can

1

sei - ne Ruh - statt

2

wie sich die Trop - fen plötz - lich thei -

3

Ich fol - ge Chris - to nach

be "translated" into music. For instance, Weelkes in *As Vesta Was from Latmos Hill Descending* successively uses voices numbering two, three, six, and one for the words, "First two by two, then three by three together, Leaving their goddess all alone." In Schütz's oratorio *Die sieben Worte am Kreuz*, Christ's words "Warum hast du mich verlassen" (Why hast thou forsaken me) are accompanied by two violins playing mere fragments and ending without the final notes (as if "forsaken") [see *HAM*, no. 201b]. Word painting is aptly summed up by Joachim Thuringus (*Opusculum bipartitum*, 1625; see F. Feldmann, in *AMW* xv, 130, fn. 2), who classifies it as: (1) *Verba affectuum*; (2) *Verba motus et locorum*; (3) *Adverbia temporis, numeri*. To category (1) belong "rejoicing, weeping, laughing," etc., as well as words suggestive of a sound (bird

calls, etc.); to (2), "to stand, to run, to jump, heaven, hell, mountains," etc.; to (3), "quick, slow, twice, often, rarely," etc.

Less direct and highly suggestive word painting can be achieved mainly through scoring. Some of the best examples of this technique are in the works of Josquin. For instance, in his motet "Tu pauperum refugium" the harmonic and contrapuntal treatment is orthodox up to the point where the words *via errantium* (the life of the erring ones) occur; here the ensuing aimlessness of lines and the absence of harmonic agreement between them result in a startlingly vivid portrayal of the idea of the text, a portrayal strengthened by the clear and obviously appropriate harmonic implications of the music at the words *veritas et vita* (truth and life).

Countless instances of word painting of one sort or another might be cited in every period from the time of Josquin on. Some contemporary composers, to be sure, seem little concerned with this matter, perhaps because the idiom they employ is better suited to the conveyance of abstract musical ideas expressed instrumentally. Many stimulating examples, however, may be found in the vocal works of such composers as Milhaud, Honegger, Walton, R. Thompson, Vaughan Williams, Pizzetti, and Holst.

**Words and music.** See Text and music.

**Wozzeck.** Opera in three acts by Alban Berg (to his own libretto, based on G. Büchner's drama of 1836), produced in Berlin, 1925. Setting: Germany in the 1830's. The entire score, atonal without adhering to the twelve-tone technique, is organized in abstract musical forms. The first act is a suite in five movements; the second, a symphony in five movements with the usual classical forms; the third, a series of inventions in the form of variations. The opera, revived in the mid-20th century after years of neglect, is widely admired for its musical craftsmanship and emotional appeal.

**W.-T. C., Wt. Cl.** Abbr. for Bach's *\*Well-Tempered Clavier*.

**Wuchtig** [G.]. Weighty, heavy.

**Würdig** [G.]. Stately, with dignity.

**Wurstfagott** [G.]. Racket bassoon; see under Oboe family III.

**Wydaawnictwo dawnej muzyki polskiej** (*Publications de musique ancienne polonaise*). See Editions LIII.

# X

**Xácará** [Sp.]. See *Jácará*.

**Xango**. Afro-Brazilian invocation to St. Jerome, employing the \**macumba* ritual music. The saint, who is regarded as one of the most powerful spirits guiding the people's daily life, is honored in these ceremonies, which are part of a folk heritage based on the fusion of Christian and African traditions.

J.O-S.

**Xerxes or Serse**. Opera in three acts by G. F. Handel (It.; librettist unknown), produced in London, 1738. Setting: Persia, 5th century B.C.

**Xota**. \**Jota*.

**Xylophone**. A percussion instrument consisting of graduated bars of hardwood that are struck with a stick. For the modern orchestral instrument, see Percussion instruments A, 3; also Marimba. Xylophones are commonly used in

non-Western cultures, particularly in Africa, and have attained a high degree of perfection in the \*Javanese orchestra. About 1500 they became known in Europe as *hültze glechter* ("wooden percussion"; Arnolt Schlick, *Spiegel der Orgelmacher und Organisten*, 1511) and *Strohfiedel* (straw fiddle, so called because the bars lay on straw). Still other names are *Holzharmonika* [G.], *gigelira* [It.], and *lignum psalterium* [L.]. About 1830 a Russian Jew, J. Gusi-kow, a famous Strohfiedel player, aroused the interest of Mendelssohn [see *GD* v, 765n; *GDB* ix, 379]. The instrument has been employed by Saint-Saëns in his *Danse Macabre* (1874) to describe the rattling of skeletons, and in several later works, e.g., Shostakovitch's Fifth Symphony.

Lit.: O. Boone, *Les Xylophones du Congo Belge* (1936); D. Vela, *La Marimba* (1962); A. M. Jones, *Africa and Indonesia* (1964).

# Y

**Yankee Doodle**. A popular American tune that, in the course of 130 years, has been used for numerous humorous texts. The origin of the tune is as mysterious as that of the words "Yankee" and "Doodle." It first appeared in James Air's *Selection of Scotch, English, Irish and Foreign Airs* (c. 1775), where it is given with its title but without words. It may have originated as a tune for the flute. Dvořák used it, somewhat modified, in the last movement of his *New World Symphony*. See O. G. T. Sonneck, *Report on "The Star-Spangled Banner," "Hail Columbia," "America," "Yankee Doodle,"* (1909), pp. 79-156.

**Yaraví** [Sp.]. A plaintive song of the Bolivian Andes, also known in Peru and Ecuador, generally in slow 3/4 meter and set to an elegiac text. Metaphors and mythological allusions are often used by the singer. The Indian name for this type of song is *llaqui-arú*.

J.O-S.

**Yevgeny Onyegin**. See *Eugen Onegin*.

**Yodel** [G. *Jodel*]. A special type of singing practiced by the mountain peoples of Switzerland and Austria (Tyrol) and characterized by frequent and rapid passing from a low chest voice to a high falsetto. A *Jodler* is a vocalization appended to a song, with low vowels (a, o) used for the low tones and high vowels (e, i) for the high ones. Possibly this type of singing in Europe originated as a vocalization, in imitation of the harmonic intervals of the \*alphorn, although African Pygmies also yodel. See W. Sichert, *Der alpenländische Jodler* (1939); W. Wiora, *Zur Frühgeschichte der Musik in den Alpenländern* (1949); E. M. von Hornbostel, in *CP* 1924; G. Kotek, in *CP* 1927; C. Brailoiu, in *CP* 1949.

**Youth's Magic Horn, The**. See *Knaben Wunderhorn, Des*.

**Yuehchyn** (yüeh ch'in). A Chinese guitar. See under Guitar family.

**Yugoslavia.** Since the political entity of Yugoslavia has existed only since 1918 and represents a union of several related southern Slavic peoples, it is impossible to speak of Yugoslav music as a uniform body. In western Yugoslavia the Slovenes and Croats were for centuries dominated and influenced by the culture of Austria and Italy, and as a result art music had an earlier beginning in those areas. Of Slovenian origin was the internationally famous Jacobus Gallus (1550–91), who worked chiefly in Bohemia. Under the influence of Venice a very active musical life developed in the 17th and 18th centuries on the Dalmatian coast, where the most prominent figures were Ivan Lukačić (c. 1574/87–1648), Vinko Jelić (1596–1636?), and the Italian composer and organist Tomaso Cecchini (c. 1580–1644). In the city of Dubrovnik, Luka Sorkočević-Sorgo (1734–89) wrote preclassical symphonies. J. B. Novak (c. 1756–1833) wrote a *Singspiel*, *Figaro*, in 1790. Romanticism appeared in the works of Vatroslav Lisinski (1819–54). Since the mid-19th century almost all contemporary trends in music were represented in both Slovenia and Croatia. Probably the greatest composer from that region of Yugoslavia was Josip Slavenski (1896–1955), who in his

works combined modernist trends of the avant-garde with nationalist and folk elements.

In eastern Yugoslavia, the strong cultural influence of the Byzantine Empire and the long period of Turkish domination delayed the beginnings of art music. In this area is a strong tradition of epic poetry [see *Gusle*] among the Serbs, Montenegrins, Bosnians, and Macedonians, as well as a folk tradition of great variety and intricacy. The first important composer, Stevan Mokranjac (1856–1914), wrote choral works based on folksongs, not merely stylizing them but revealing a great artistic talent. Prominent also are the works of Stevan Hristić (1885–1958), composer of the ballet *The Legend of Ohrid*, and of Petar Konjović (b. 1882).

Among the Yugoslav composers born after 1918, internationally known is Milko Kelemen (b. 1924), one of the leaders of the avant-garde.

M.V.

## Z

**Zählzeit** [G.]. Beat.

**Zajal.** See *Zejel*.

**Zaleo.** Same as \**jaleo*.

**Zamba** [Sp.]. Argentine *danza de pañuelos* (scarf dance) in 6/8 meter, slightly slower than the \**gato*, consisting of a guitar introduction followed by a vocal section based on a four-measure theme repeated twice. It came to Argentina from Peru in colonial times, when it was called *zambacueca* or *zamacueca*, and thereafter it was divided into two different dances, the *zamba* and *cueca*.  
J.O.-S.

**Zambumbia.** See under *Caramba*.

**Zampogna** [It.]. A mouth-blown \*bagpipe.

**Zanfona** [Sp.]. \*Hurdy-gurdy.

**Zapateado** [Sp.]. A Spanish solo dance in triple time, the rhythm being marked by stamping of the heels, frequently in syncopation and other rhythms contrasting with the rhythm of the melody.

**Zapfenstreich** [G.]. A \*tattoo; on special occasions the *Zapfenstreich* is a much more elaborate performance of military music, including signals as well as marches played by a large band.

**Zarabanda** [Sp.]. See *Saraband*.

**Zarge** [G.]. The ribs of the violin.

**Zart** [G.]. Tender, soft.

**Zarzuela** [Sp.]. The most important type of Spanish opera, distinguished from ordinary opera in that the music is intermingled with

spoken dialogue, as in \*comic opera. Its subjects, however, are not restricted to comedy. Its name comes from the Palace of La Zarzuela (a royal country seat near Madrid, comparable to Versailles), where festive representations called *Fiestas de Zarzuela* were given. The earliest on record is Lope Felix de Vega Carpio's \*eclogue *La Selva sin amor* (The Forest without Love) of 1629. The earliest known composer of zarzuelas is Juan Hidalgo, whose *Los Celos hacen estrellas* (text by Velez de Guevara; produced 1644?) uses recitative [see *LavE* i.4, 2066] as well as choruses in the style of a madrigal. He also composed the music for Pedro Calderón de la Barca's *Ni amor se libra de Amor* (c. 1640; see F. Pedrell, *Teatro lírico español*, iv, v) and *Celos aun del aire matan* (1662; first act pub. by Subirá, 1933). In the latter part of the 17th century the zarzuela resembled the French *ballet de cour*, with its emphasis on elaborate stage production and the addition of ballets and popular dances accompanied by guitar and castanets (José Clavijo y Fajardo, 1730–1806). This type of "aristocratic opera," based largely on mythological subjects, reached its zenith with Sebastián Durón (c. 1650–c. 1716) and Antonio Literes Carrión (1670–1747). At the same time there arose a "popular" reaction against the zarzuela in the \*tonadilla, a development parallel to the \*War of the Buffoons. The increasing influence of Italian opera—clearly present in the works of José de Nebra (c. 1688–1768)—also contributed to the decline of the zarzuela, a decline that went hand in hand with that of the Spanish drama.

An attempt at revival in a more popular form, made c. 1770 by the dramatist Ramón de la Cruz in collaboration with the composer Antonio Rodríguez de Hita (d. 1787), was only briefly successful. It was not until the middle of the 19th century that a forceful national movement led to a new era for the zarzuela. This revival began chiefly with Francisco A. Barbieri (1823–94; *Jugar con Fuego*, 1851) and Pascual Arrieta y Corera (1823–94; *Marina*, 1871). In 1865 the *Teatro de la Zarzuela* was founded, and the movement found numerous participants, e.g., Ruperto Chapí y Lorente (1851–1909), M. Fernández Caballero (1835–1906), Tomás Bretón y Hernández (1850–1923), Joaquín Valverde (1846–1910), and Amadeo Vives (1871–1932). The modern zarzuelas are classified as *zarzuela grande*, in three acts, and *género chico* or *zarzuelita*, in one act. The former tend to deal with serious, dramatic subjects; the latter are essentially comic. Bretón y Hernández' *La*

*Dolores* (1895) and *La Verbena de la paloma* (1897) are outstanding examples of each type. Later important composers of the *zarzuela grande* are Francisco Alonso (b. 1887) and Federico Moreno-Torroba (b. 1891); of the *género chico* (with features derived from Viennese operetta and even American jazz), Jacinto Guerrero (1895–1951), and others.

Muñoz, *Historia de la zarzuela y el género chico* (1946); *LavE* i.4, 2052ff; H. Anglés and J. Pena, *Diccionario de la música Labor*, 2 vols. (1954), s.v. zarzuela; A. Salazar, "Music in the Primitive Spanish Theatre" (*PAMS* 1938); G. Chase, "Origins of the Lyric Theatre in Spain" (*MQ* xxv); *id.*, "Barbieri and the Spanish Zarzuela" (*ML* xx, 32); J. Subirá, in *AM* iv, no. 2; A. Pedrell, in *SIM* iv.

**Zauberflöte, Die** [G., The Magic Flute]. Opera in two acts by Mozart (libretto by E. Schikaneder), produced in Vienna, 1791. Setting: magical world. *Zauberflöte*, Mozart's last opera, is a blending of diverse operatic elements into a truly German style which transcends \*Singspiel. The Italian *opera buffa* idea, which prevails in \**Nozze di Figaro* and \**Don Giovanni*, is replaced here by a seriousness of purpose and sincerity of feeling that presage Beethoven.

**Zeitmass** [G.]. Tempo.

**Zeitmesser** [G.]. Metronome.

**Zejel** [also *zajal*]. A type of medieval Arab poetry characterized by the alternation of a refrain and various stanzas. Abén Guzmán (Ibn Kuzmān, c. 1080–1160) wrote numerous *zejels*, most of them in a form such as ab ccc ab ddd ab, etc., which has been cited as the model for the \*virelai or, more properly, its Spanish counterpart as found in many of the 13th-century \*cantigas. However, the most characteristic trait of the virelai form, the inclusion of two lines paralleling the refrain at the end of the stanza, is not found in the *zejel*. See *ReMMA*, p. 245f; H. Spanke, in *AnM* i, 13ff.

**Zeunertanz** [G.]. Old term for *Zigeunertanz*, i.e., gypsy dance (in H. Newsidler, *Lautenbuch*, 1536).

**Zhizn za Tsarya**. See *Life for the Czar*, A.

**Zibaldone** [It.]. Same as \*quodlibet.

**Ziehharmonika** [G.]. \*Accordion.

**Ziemlich** [G.]. Rather. *Ziemlich schnell*, rather fast.

**Zigeunerbaron, Der** [G., The Gypsy Baron]. Operetta in three acts by J. Strauss, Jr. (libretto by I. Schnitzer after a story by M. Jókai), produced in Vienna, 1885. Setting: Austro-Hungarian Empire, mid-18th century.

**Zigeunermusik** [G.]. Gypsy music.

**Zimbalon**. \*Cimbalom.

**Zingarese, alla** [It.]. In the style of Gypsy music.

**Zink(en)** [G.]. \*Cornett.

**Zirkelkanon** [G.]. Circular canon.

**Zither** (1) A folk instrument used chiefly in Bavaria and Austria, consisting of a flat wooden soundbox over which 4 or 5 melody strings and as many as 37 accompaniment strings are stretched. The melody strings, nearest to the player, are stopped on a fretted fingerboard with the fingers of the left hand and are plucked by a plectrum worn on the right thumb. The accompaniment strings are plucked by the fingers of the right hand. See T. Norlind, *Geschichte der Zither* (1936); C. Maclean, in *ZIM* x. (2) A large class of stringed instruments, also called \*psalteries [see Instruments IV, A, 1, a]. Also see accompanying ill. For the instruments illustrated under Zither, see the separate entries for each; also Finland (kantele); India VIII (vīṇa). (3) Old German spelling for cittern. See Guitar family.

Lit.: J. Brandlmeier, *Handbuch der Zither* (1963).

**Znamenny chant**. The chant of the Russian Church, as used from the 12th through 17th centuries. The name is derived from *znamia*, sign or neume. The oldest extant musical sources date from c. 1200 and are notated in signs very similar to those of early Byzantine notation. Later sources (11th to 17th cent.) are written in the so-called *kriuki* (or *znamenny*) notation, a system including more than ninety different signs for single notes as well as for stereotyped melodic formulas. They have not yet been deciphered. In time the number of signs was reduced and certain auxiliary symbols were added, usually in red ink (hence the name Cinnabar letters) by I. Schaidurov (16th cent.). About the same time the simple outlines of the original chant were amplified into rich and ornamented contours, the two types being distinguished as "lesser" and "greater" chant.

Beginning in the 17th century there were abuses [see Anenaiki] that finally led to the decline of the chant. See also Russia I.

Lit.: A. J. Swan, "The Znamenny Chant of the Russian Church" (*MQ* xxvi; shortened version in *PAMS* 1938); *ReMMA*, pp. 97ff (bibl. p. 435f); P. Panóff, *Die altslavische Volks- und Kirchenmusik* (in *BüHM* i); *WoHN* i, 89ff; O. von Riesemann, *Die Notationen des alt-russischen Kirchengesanges* (1909); *AdHM* i, 141.

**Zopf, Zopfstil** [G.]. A derogatory term for the conventional style of the period when a pigtail [G. *Zopf*] was fashionable attire, particularly the latter part of the 18th century.

**Zoppa, alla** [It.]. Inverted dotted rhythm [see Dotted notes III]. The term *zoppa* also was used for 17th-century dance movements in synco-pated rhythm, e.g., by Vitali [see Editions III, 7].

**Zortziko**. A Basque folk dance in quick 5/8 time and dotted rhythm. The Castilian \**rueda* is also in quintuple time but without dotted notes. See the examples in *LavE* i.4, 2363.

**Zuffolo** [It.]. General name for a primitive shepherd pipe, whistle flute, flageolet, etc.

**Zug** [G.]. Slide. *Zugposaune*, slide trombone, the ordinary trombone. *Zugtrompete*, slide trumpet.

**Zunge** [G.]. Reed. *Zungenpfeife*, reed pipe.

**Zurückhalten** [G.]. To hold back, *rallentando*.

**Zwerchflöte**. Old name for transverse flute.

**Zwischendominante** [G.]. Secondary dominant.

**Zwischensatz** [G.]. The middle section in ternary form, also used for the development section in sonata form.

**Zwischenspiel** [G.]. Interlude, particularly the instrumental interludes between the stanzas of a song (*ritornello*) or the *tutti* sections in a concerto. Also, name for fugal episodes [see *Durchführung*], or the episodes in rondo form.

**Zwölftonsystem** [G.]. Twelve-tone technique. See Serial music.

**Zyklisch** [G.]. \*Cyclic, always in the sense explained under Cyclic (1).

**Zymbel** [G.]. \*Cymbal.

Zithers: 1. Zither. 2. Kantele. 3. Kanun. 4. Psalterium. 5. Vina. 6. Chyn. 7. Cimbalom (Hungarian). 8. Koto.

**Zymelstern** [G.]. A percussion stop found in many organs of the baroque period that produces a random tinkling sound of fairly high pitch. It is found in several forms, from a rotating star with bells at its points on the outside of the organ case (from which its name derives) to a

pneumatically operated device inside the organ that spins suspended steel plates centrifugally against fixed bars. This device is again coming into use, although modern versions generally consist of small brass bells or telephone bells revolved electrically.
